JOHNSTON, JOSEPH ECCLESTON, an American gen., b. Prince Edward co. Va., 1807; graduated at the military academy, West Point, in 1829; was engaged in garrison duty and as aide to Gen. Scott in the Seminole war until 1837, when he resigned his commission and became a civil engineer, but re-entered the army in July, 1838, as first lieu. of topographical engineers; and brevetted capt. for gallantry in the Florida war. After this, until the commencement of the Mexican war, he was engaged in river and harbor improvements, and occupied with various surveys of the boundaries between the United States and the British possessions. In the Mexican war, 1846-47, he served with distinction, was twice wounded, and was brevetted maj., lieu.col., and col. In 1853-55 he had charge of western river improvements, and afterwards was engaged in various duties in Utah, Kansas, and elsewhere. In June, 1860, he was appointed quarter-master-gen., with the rank of brig.gen. April 22, 1861, he resigned his commission, being appointed maj.gen. or gen. in the confederate service by Jefferson Davis. In May he commanded a force at Harper's Ferry, where he was opposed by Gen. Patterson. Moving on to Manassas he formed a junction with Beauregard. In the early part of the campaign of 1862 he had command of all the confederate forces in Virginia, and at the battle of Fair Oaks, near Richmond, May 31, 1862, was severely wounded, and for several months disabled for service. On reporting for duty in Nov. he was assigned, notwithstanding the hostility of Jefferson Davis, to the military department of Tennessee. In April, 1863, he reported himself still unfit for active service. In the spring following he made an attempt to relieve Vicksburg, which was besieged by Grant, but was defeated at Jackson, May 14, and retreated to Canton. After the defeat of Bragg by gen. Grant at Chattanooga, Nov. 25, 1863, Johnston was put in command of all the forces of the s.w. With 55,000 men he first occupied the fortified position of Dalton, Ga. Gen. Sherman attacked him with a superior force, and he was obliged to fall back first to Resaca, thence, after a severe battle, to Altoona pass, to Kenesaw mountain, and across the Chattahoochee. Gen. Sherman threatening his line of communication with Atlanta, his base of supply, and a place of great military importance, Johnston reached Atlanta in July, and determined to hold it to the last. But the authorities at Richmond were dissatisfied, and, July 17, ordered him to turn over his command to Gen. Hood. Near the close of Feb., 1865, after Sherman had captured Atlanta, and marched without opposition to Savannah and into South Carolina, Johnston, at the earnest request of Gen. Lee, was assigned to the command of the remnant of the army of the Tennessee, and of all the troops in South Carolina, Georgia, and Florida, and "to concentrate all available forces and drive back Sherman." But his force being inferior to that of Sherman, he was defeated at Bentonville, N. C. Having learned that Lee had surrendered the army of Virginia to Grant, he capitulated to Sherman at Durham's station, N. C. After the war he resided for several years in the south, holding offices in railroad, express, and insurance companies. He was elected to congress from the Richmond district of Virginia in 1877; was appointed U. S. commissioner of railroads in 1885; and was a pall-bearer at Gen. Sherman's funeral. He d. in 1891.

JOHNSTON, SAMUEL, LL.D., 1733-1816; b. Dundee, Scotland; brought to North Carolina in infancy; was admitted to the bar; was a member of four provincial con-

gresses, presiding over the first two; a member of the continental congress, 1781-82; governor of North Carolina, 1788-89; U. S. senator, 1789-93; judge of the supreme court, 1800-3.

JOHN STONE, a manufacturing t. of Scotland in the co. of Renfrew, was founded in 1781, and is situated on the Black Cart, about 3 m. w. of Paisley. It contains several cotton factories, collieries, brass and iron foundries, and machine-shops. Pop. '90, 9700.

JOHNSTONE, JAMES F. W., an eminent chemist, was b. at Paisley in 1796, and died at Durham in 1855. He was of humble parentage, and was for the most part self-educated. In 1825 he removed to Durham, where he opened a school, which he continued till 1830, when, having married a lady of considerable fortune, he resolved to carry out the plan which he had long desired, of devoting himself to the study of chemistry. He accordingly repaired to Stockholm, and became the pupil of Berzelius, the most celebrated chemist of the time; and his reputation rose so rapidly, that in 1833, while still pursuing his studies abroad, he was invited to take the readership in chemistry and mineralogy in the newly-established university of Durham. For some time after his return from the continent he resided in Edinburgh. His *Catechism of Agricultural Chemistry and Geology* has gone through more than fifty editions, and has been translated into almost every European language; and his *Lectures on Agricultural Chemistry and Geology* are held in high esteem. The last of his works was his *Chemistry of Common Life*.

JOHNSTONE, ROBERT, b. in the latter half of the 16th c., was a historian whose works were at one period highly valued. Of his personal history little is known, except that he went to London; accumulated a large fortune, bequeathed considerable sums to the university of Edinburgh, and to various towns in Annandale, the home of his ancestors, and died about 1636. His *Historia Rerum Britannicarum, etc., ab anno 1572 ad annum 1628*, intended as a supplement to Buchanan's work, possessed real merit.

JOHNSTOWN, city and co. seat of Fulton co., N. Y.; on Cayadutta creek and the Fonda, Johnstown and Gloversville railroad; 48 miles n.w. of Albany. It was named after Sir William Johnson (q.v.), whose mansion is still standing, and was chartered as a city in 1895. There are electric lights and street railroads, court-house built in 1772, high school, school library, national and savings banks, several churches, nearly 100 glove and mitten factories, and daily and weekly newspapers. Pop. '90, 7,768.

JOHNSTOWN, a city in Cambria co., Pa.; on Conemaugh river, Stony creek, and the Pennsylvania and Baltimore and Ohio railroads; 78 miles e. of Pittsburgh. On May 31, 1889, as a result of heavy rains, a dam across the Little or South Fork of the river, 10 miles e. of the city, was carried away. The valley was engulfed, Johnstown and surrounding villages were swept away, property worth more than \$10,000,000 was destroyed, and a large number of lives, estimated at from 2,280 to 5,000, lost. The new city contains the great Cambria iron and steel plant, motor, wall paper, switch, paint, brick, and radiator works, Conemaugh valley memorial hospital, Cambria hospital, Cambria free library, national and savings banks, over 50 churches, and electric light and street railroad plants. Objects of special interest are Grand View cemetery with plot containing 800 unknown victims of the flood, and the stone bridge that arrested the flood. Pop. '90, 21,805.

JOINDER OF PARTIES, in law, is a phrase signifying that persons having a common interest and a common responsibility in any matter or subject are to be joined in any action at law relating thereto. Such joinder arises generally out of joint contract, ownership, or wrong done. When two or more persons are joined in a contract, they must be joined also in any action arising therefrom. If one of two joint parties die, the rule gives way, and the survivor either sues or is sued as the case may be. When the parties are so numerous that they cannot all be brought into court, one of them may sue for the benefit of the whole; as where an administrator is called to render an account to many creditors of moneys in his hands, one creditor may bring an action not only for himself, but also for all the others. In cases of tort the parties responsible are not necessarily all joined as defendants, but where two or more persons are jointly injured they should be joined as plaintiffs, but not where the injury is to the person. The practice in respect to husband and wife is modified by the rule of the common law which merges the legal existence of the latter in that of the former. But by the common law they must be joined for torts committed by the wife before or during marriage, and must join as plaintiffs for personal injuries to the wife, or injuries to her property before marriage. And they must join and be joined in actions or contracts made by the wife before marriage, in actions arising from the wife's position as executrix and administratrix, and in many other cases. In New York and several other states, however, this rule has been set aside in many cases by recent legislation, which recognizes the personality of the wife in the same way as if she were unmarried.

In courts of law a failure to make the proper persons parties is fatal to the action; but courts of equity are not so strict.

JOINERY, the art of joining or framing together the wooden finishings of buildings, such as the doors, windows, shutters, stairs, etc. See **CARPENTRY**.

JOINT AND SEVERAL is a legal phrase defining the liability of two or more persons for a debt which they owe in common. It implies that each individual debtor is responsible not merely for a relative proportion of the indebtedness, but for the whole, and may be sued therefor if the creditor so elect. It might happen that all the debtors save one have become insolvent, in which case the one who is solvent may be compelled to pay the whole debt. In that case he will have a claim in law upon his co-debtors for their respective portions of the common indebtedness, and no more; their responsibility to each other being determined by a different rule from that which applies to their common relation to the creditor. In equity, however, those who are solvent are required to contribute equally toward the discharge of the entire debt. A joint and several obligation may either be created by the express language of a contract or covenant, or arise by necessary or fair implication of terms. It is usual to employ the words, "we jointly and severally," but any other language fairly implying the same thing is equally binding. A joint and several obligation may also arise from the legal relations of the parties. If the creditor grant a release under seal to one of several joint debtors, he will thereby release them all. If a judgment against one be returned unsatisfied, it will not bar an action against the others. A joint and several liability may also arise in cases of tort; and when this happens the injured party may sue one, any, or all, of the responsible parties. Full damages may be recovered from the person prosecuted, and he will have no claim upon the other wrong-doers unless he can show that he was not himself willfully or intentionally a participant in the wrong complained of.

JOINT-FIR. See **SEA-GRAPE**.

JOINT OWNER is in American law a person who is one of several owners of property. The property may be either personal or real, goods or land. One of the characteristics of this ownership is, that if one of the parties dies, his interest accrues to the others, and does not go to the deceased co-owner's heirs or representatives. Thus, if A and B are joint owners of a horse, and A dies, the horse then belongs entirely to B. So it is with real property, such as houses, lands, and estates. This is called the doctrine of survivorship. Sometimes in wills and deeds it is not clearly expressed whether the property was given to A and B as joint tenants or owners, or as tenants in common. The chief difference between these two descriptions of owners is, that if one tenant in common dies, his share does not go to the other tenants in common, but belongs to his representatives or heirs. Hence, in doubtful cases, a court of equity generally inclines to hold that a tenancy in common was meant rather than a joint tenancy, for the former is the more fair of the two kinds of ownership. In all cases, however, it is in the power of a joint owner to convert his joint tenancy into a tenancy in common, by simply executing a deed of partition or alienation, if the property consist of land; or selling his share, if it consist of personality. And there is an exception as to the survivorship in the case of a firm of partners, for in that case, when one partner dies, his share does not accrue to his co-partners, but belongs to his own personal representatives. This is said to be an exception to the general rule of joint ownership, created for the benefit of trade, so that, in the case of a firm, the ownership is an ownership in common, and not joint ownership. In Scotland the general rule is different from what prevails in England, and joint property is there always equivalent to what is called in England property held in common, and not joint in the above sense. It requires express words in Scotland to make the property be held so as to be equivalent to what is joint property in England.

JOINTS, in anatomy. A joint or articulation may be defined to be the union of any two segments of the skeleton of an animal body through the intervention of a structure or structures of a different nature. The textures which enter into the formation of the more complex joints are bone, cartilage, fibro-cartilage, ligaments, and synovial membrane. Bone forms the fundamental part of all joints; ligament, in various modifications, is employed as the bond of union between the bony segments; while the three remaining textures chiefly occur in those joints in which there is free motion. The joints vary in the degree of motion from almost perfect immobility to the greatest amount and extent of motion that are compatible with the maintenance of the bony segments in their proper relation with each other.

Joints have been divided by anatomists into two great classes, to which the terms *synarthrosis* and *diarthrosis* are applied. In *synarthrosis* the parts are continuous—that is to say, there is no synovial sac intervening between the bones; and the joints belonging to this class are so very limited in their motion as to be considered by some as immovable; while in *diarthrosis* the articular surface of each of the bones is covered with cartilage, and between these cartilaginous plates is a synovial sac; and mobility is the distinguishing feature of this class of joints. In briefly describing the leading varieties of these two classes of joints we shall, as far as possible, avoid the barbarous terms which have been introduced into this department of anatomy.

In synarthrosis the articulation is said to be by *suture* when the bones seem to grow somewhat into one another, and to become interlocked and dovetailed together, each bone having a jagged or serrated margin, or when there is a degree of beveling of one bone, so that it is overlapped by the other. Both these kinds of suture are at once seen in the human skull, the serrated suture being well seen in the union of the two parietal bones, the beveled suture being shown in the overlapping of the temporal bone above the side of the parietal, and a combination of the two being exhibited by the coronal suture between the frontal bone and the anterior edges of the parietal bones. In all these there is a thin ligamentous membrane interposed between the bones, which disappears as the growth of the cranium becomes completed.

When a slight amount of motion of one bone upon another is required to be combined with great strength, the contiguous surfaces of the bones are united by a thick and strong layer of fibro-cartilage, with which a little elastic tissue is intermixed. This is an intermediate variety between the two classes of joints, but approximates most nearly to synarthrosis. As examples of this kind of joint may be mentioned the articulation between the bodies of the vertebræ and that between the two pubic bones at what is termed the symphysis. See PELVIS.

In diarthrosis the degree and nature of the motion are very various. There may be merely a little *gliding* motion between the ends of the bones, as, for example, in the articulations between the various bones of the carpus and tarsus. See HAND and FOOT. In these cases the surfaces are plane, or one is slightly concave and the other slightly convex; and the motion is limited in extent and direction by the ligaments of the joint, or by some projecting point of one of the bones. In some cases, instead of a slight concavity and convexity, one bone presents a cup-like depression, while the termination of the other assumes a hemispherical, or more or less globular shape. Hence the name of *ball and socket* that is applied to such joints. The best example of this variety is the hip-joint (q. v.), and the next best is the shoulder. In these joints the ball is kept in apposition with the socket by means of what is termed a *capsular* ligament, which may be described as a barrel-shaped expansion of ligamentous structure, attached by its extremities around the margin of the articular surfaces composing the joint, and forming a complete investment of it, but not so tight as materially to restrict its movements. This species of joint is capable of motion of all kinds, as any one may readily test for himself, especially in the shoulder-joint.

Another important variety of articulation is the hinge-joint, in which the contiguous surfaces are marked with elevations and depressions, which exactly fit into each other, so as to restrict motion to one direction. The elbow and ankle joints, and the joints of the fingers and toes, are the best examples of this variety. The knee-joint is a less perfect example, because in certain positions it is capable of a slight rotation. These hinge-joints are always provided with strong lateral ligaments. The shells of bivalve mollusks are united by a very strong and perfect hinge-joint.

The last kind of joint requiring notice is that which admits only of rotatory motion. A pivot and a ring are the essential parts of this joint, the ring being generally formed partly of bone and partly of ligament. The best example of this articulation is that between the atlas (the first vertebra) and the odontoid or tooth-like process of the axis (the second vertebra). See HAND.

Diseases of the Joints.—Formerly all the severer forms of diseases of the joints were vaguely designated under the one general term *white swelling*; but during the last half century, thanks to the labors of modern surgeons, amongst whom the name of the late sir Benjamin Brodie stands prominently conspicuous, the diseases of the joints are tolerably well understood, and can be discriminated from one another with very considerable accuracy.

In diseases of the joints we may have one or more of the following textures affected: (1) the synovial membrane; (2) the cartilage; and (3) the bones themselves.

The synovial membrane may undergo either acute or chronic inflammation, giving rise to the serious affections known as acute and chronic synovitis (see SYNOVIAL MEMBRANES AND FLUID).

Loose substances of a fibrous structure, and usually resembling a small bean in size and shape, sometimes occur in joints, especially in the knee-joint. They commence as little pendulous growths upon the synovial membrane, which after a time become detached. When they get between the ends of the bones, which they are apt to do during exercise, they cause a sudden and often a most excruciating pain, which is often followed by inflammation, and arrest all motion of the joint. These symptoms are not relieved till, by gentle flexion and manipulation, the loose cartilage (as it is usually termed) has been removed to a position in which it ceases to give annoyance. When the displacement of the loose body is only occasional, and does not cause intensely severe pain, the treatment should be limited to the application of an elastic bandage or a tightly fitting knee-cap, which should be constantly worn, with the view of restraining the loose body to a position in which it is inoffensive. If, however, this palliative treatment fails, the offending body must be removed by subcutaneous incision, which avoids the danger of a direct wound into the joint.

The cartilage may be affected in various ways. There may be (1) simple destruction of cartilage; (2) scrofulous destruction of cartilage; (3) hypertrophy of cartilage; (4)

atrophy of cartilage, and other modified forms of disease of this texture, all of which, especially the second, are of a very serious character, but not of a nature that admits of popular explanation.

The most important diseases of the osseous structures of the joints are (1) ulcer and (2) caries. These diseases often, but not always, begin with the disorganization of cartilage, and then extend to the bones. Sometimes, however, they commence in the bones. The consideration of the symptoms and general treatment of these diseases would be out of place in these pages, but a reference to one very important mode of treating articular caries will be found in the article RESECTION OF JOINTS. Several of the preceding diseases, even when the result of our treatment may be regarded as satisfactory, leave a certain amount of stiffness of the joint (sometimes extending to perfect immobility), to which the term *ankylosis* (q. v.) is applied.

JOINT-STOCK COMPANY, an association of individuals who unite to carry out a particular object of a private nature by each taking and paying for shares in the common stock. The object of the association may be to manufacture some species of article, to conduct some branch of trade or commerce, the business of banking or insurance, or in general to do whatever work of a private nature any individual can do; but when the object is to execute a public undertaking, such as a railway, a canal, harbor, or other work of importance, the company is not called a joint-stock company, but a public company, and a special act of parliament is required in order to establish it and regulate its proceedings. In many respects the proceedings of railway, canal, and public companies resemble those of what are called joint-stock companies. In ordinary circumstances, the capital or stock of a joint-stock company is beyond what any single individual, however wealthy, would be able or inclined to adventure; it is mainly on this account that the joining of parties together to undertake risks is expedient and unavoidable; though there may be instances, as in the case of co-operation (q. v.), where a union of small sums by a large number of persons is for peculiar reasons recommendable. Joint-stock companies are of comparatively modern origin, and they can exist with a chance of success only in a community possessing good business notions and habits, along with a spirit of enterprise, and where there is that degree of mutual confidence which will give stability to the concern. Accordingly, from a concurrence of favorable circumstances, Great Britain has taken the lead in this kind of undertakings, which, however, have also been carried to maturity on a comprehensive plan in the Netherlands and United States. In France this method of commercial association is of more recent growth, and appears still to require the fostering care of the state.

The usual process of commencing a joint-stock company is to issue a prospectus, detailing the object of the undertaking, inviting the subscription of shares, and specifying the probable profits. As the proposed company necessarily requires a paid secretary, who is in effect to be its constructor and future *attaché*, it too frequently happens that in periods of ease in the money market, scheming attorneys and others devise projects of this kind, and induce inexperienced capitalists to take shares; the result often being a collapse of the company, to the loss of all concerned, the projector alone excepted. On this account scrupulous care is necessary in making such investments, to see that the proposed companies are of genuine worth, and to be administered by persons of thorough integrity.

For a long time, and, in fact, until a very recent period all the joint-stock companies in the states of the American union were organized according to the rules of the common law; but now they are formed generally under statutory provisions intended to secure the rights of stockholders and to protect the public from imposition. These provisions are not precisely the same in all the states, though they have a common purpose and rest upon a common principle. In the state of New York the law prescribes the mode of organization, and when the conditions have been complied with the company is not dissolved by the death of one or more of its stockholders, but only by judgment of a court for fraud or other adequate cause. They may purchase, hold, and convey real estate within certain limitations growing out of the nature of their business; and, if the association is composed of seven or more stockholders, it may sue or be sued in the name of its president or treasurer. If judgment against it in such a suit be returned unsatisfied, then suits may be instituted against any or all of the shareholders individually as at common law. It is not a corporation in the usual sense, though possessing certain corporate powers; it is rather an enlarged copartnership under special regulations. In some of the American states there are no joint-stock companies distinct from corporations, but there are provisions for organizing similar associations, and modifying, for their benefit, the rule respecting the personal liability of the shareholders. Instead of following the example of England in assimilating partnerships to corporations, the laws here assimilate corporations to partnerships by making the shareholders personally responsible, to a greater or less degree, for the debts of the association; and this while the associations formed in accordance with the provisions of law are designated as corporations.

JOINTRESS, in English law. means a lady who has a jointure (q. v.) secured to her.

JOINT TENANCY is a technical term of the common law signifying the ownership—either in fee-simple, fee-tail, for life, for years, or at will, by two or more persons, with unity of interest, time, title, and possession—of an estate in real property. They must all hold upon one and the same conditions in every respect, each of them being regarded as having possession of every parcel and of the whole estate, not indeed for every purpose, but in respect of tenure and survivorship. For the purpose of alienation each joint tenant has a right only to his undivided relative share of the property, and the purchaser of such right simply succeeds to the position of the seller, but is not a joint tenant. If there are two tenants, each may dispose of an undivided half; if four, an undivided quarter, and so on; but the purchaser cannot enter upon the exclusive possession of his share, for the estate must remain undivided, subject to an entirety of interest on the part of each joint tenant, and to what is called the principle of survivorship, by which is meant the right of the last survivor to the whole property. In other words, when one of several joint tenants dies his share passes to the survivors, and so on until the last survivor takes the whole interest, whatever it may be, and upon his death it will pass to his heirs. An estate in joint tenancy can be created only by the specific act of the parties thereto. In this country such tenancy is very rare, the law presuming nothing in its favor, but inclining rather toward tenancy in common, which excludes the principle of survivorship and implies that the estate may be divided and each tenant take his proportionate share. Joint tenancy, in fact, is a relic of feudal times, when it was the policy of the law to keep large estates intact; whereas in this country the law favors the largest increase in the number of landholders, it being assumed that an interest in the soil enhances the dignity and loyalty of the citizen. As long ago as 1786 estates devised to two or more persons in the state of New York, without express provision that they were to be held in joint tenancy, were declared to be tenancies in common, and similar legislation exists in some other states. Joint tenancy is not favored in courts of equity, except when granted to co-trustees. Joint tenants are regarded in law as a single owner as respects third parties, and they must therefore all be joined in any suits that concern their joint estate. Possession by one tenant is deemed the possession of all, and a conveyance to one a conveyance to all. The possessor is liable, however, to his co-tenants for their share of the rents and profits, and liable, also, to an action for refusal to join them in making necessary repairs.

JOINT TRADE, or **ADVENTURE**, means a partnership limited as to a particular undertaking, and not, as in the usual case, for a series of years or a definite period of time. Hence the parties so joining have not the same liabilities as ordinary partners of a firm. Thus, a partnership of this kind may be limited to the working of a patent. In all such cases, the rights and liabilities of the parties are much less extensive than those of ordinary partnerships; but everything depends on the particulars of the contract.

JOINTURE, in law, is a settlement made for a wife, or for the husband and wife jointly, to be taken by her in lieu of dower (q.v.), if she survive her husband. It is either legal or equitable. Legal jointure was provided for by the statute 27 Hen. VIII., ch. 10, §§ 6, 7, 8, 9, and has the following requisites: 1. It must be expressly declared to be given in full satisfaction of her dower; 2. It must be real property; 3. It must be for her own life at least; 4. It must be made to herself, and not to another in trust for her; 5. It must be made to take effect immediately upon the death of the husband; 6. It must be made before the marriage. If all these requisites be complied with, her dower is barred, even though she did not consent to the settlement of the jointure nor to the amount thereof. Equitable jointure does not require so many formalities; but in a court of equity any provision made for her before the marriage, and then assented to and accepted by her as a jointure, may effectually bar her dower. In that court, proof of her assent given before the marriage obviates the necessity of showing that the formalities prescribed by the statute of jointures have been complied with. If she be a minor, such assent may be properly given by herself and her guardian or parent. If the jointure, whether legal or equitable in its nature, be not settled upon the wife until after the marriage, it is no further binding upon her than that she must elect, at the husband's death, to take it in lieu of dower, or to take her dower; she cannot have both. In some of the United States she is required, by statute, to make such election within a prescribed time—usually one year—after the husband's death, or if she do not so elect, she is conclusively presumed to have accepted the jointure. In some of the states of this country, also, legal jointure is abolished and only such as is equitable—i.e., made with her consent before marriage, can absolutely bar her dower. Substantially the same causes may operate to bar jointure as those which may defeat dower; but at law a wife does not lose her jointure, as she would her dower, by eloping and living in adultery.

JOINVILLE, a t. of France in the department of Haute-Marne, on the Marne; pop., '91, 4152; 27 m. n. of Chaumont. In its vicinity was the castle of the dukes of Guise.

JOINVILLE, FRANÇOIS FERDINAND PHILIPPE LOUIS MARIE D'ORLÉANS, Prince de, the third son of Louis Philippe, king of the French; b. Neuilly, 1818; began his naval studies soon after his father's accession in 1830, went to sea at the age of thirteen as pupil on board the frigate *Artémise*; received a liberal education in the colleges of France, and thenceforth devoted himself with zeal to his profession. In 1838 he received command of the corvette *Créole*, and joining the fleet of admiral Baudin, took a prominent part in the bombardment of St. Juan d'Ullua and Vera Cruz, was the first to enter the gates of the city under a heavy fire, and was saved from death by the devotion of one of his officers.

In this attack he captured the Mexican general Arista, for which he received the cross of the legion of honor, and was made captain. In 1840 he was sent by the king to St. Helena in command of the frigate *La Belle Poule*, to bring to France the body of the emperor Napoleon. Returning from a visit to the United States he went to Rio de Janeiro, and in 1843 married Donna Francisca de Braganza, sister of Dom Pedro II. In the same year he was made rear-admiral, and took part in the sittings of the admiralty board, greatly assisting in solving the question of adapting steam to vessels of war, and urging the necessity of taking measures to effect it. In 1844, war breaking out between France and Morocco, he commanded the squadron that bombarded Tangiers and took Mogador. For his gallantry he was raised to the rank of vice-admiral. When the revolution of 1848 broke out and overthrew the constitutional monarchy, the prince de Joinville was in Algiers with his brother the duc d'Aumale. They immediately sailed for England, and joined Louis Philippe in his exile at Claremont. While the ship *Ocean Monarch* was burning off Southampton, Aug. 24, 1848, the prince distinguished himself by aiding in the rescue of many of the passengers. In his seclusion he devoted himself to the education of his children, the colonization of his estates in Brazil, and writing for the press. In 1844 he had commenced in the *Revue des Deux Mondes* a series of articles on the French navy, one of which appearing in 1865 was a comparative review of the fleets of the United States and France, and excited much attention. In 1852 his estate in France was confiscated by Louis Napoleon. About twelve months after the war of the rebellion broke out he visited the United States with his two nephews, the count de Paris and the duke de Chartres. The nephews joined the staff of gen. McClellan, taking an active part in the Chickahominy campaign. At the battle of Gaines Hill especially they showed great courage. Gen. McClellan highly appreciated the military experience and sound judgment of the prince. Returning to England in 1862 he published an account of those events in a well-written article in the *Revue des Deux Mondes*. After the downfall of the empire in 1870 he returned with the other Orleanist princes. They were ordered to depart at once, but the prince, under an assumed name, took part in the campaign of the army of the Loire. His arrest was ordered by Gambetta, minister of war, and the police escorted him to a vessel to take him back to England. In 1871 the edict of banishment was abrogated by the French assembly, and he and his brother, duc d'Aumale, took their seats in the national assembly, Dec. 19, 1871. Among his articles in the *Revue des Deux Mondes* are *Note sur l'Etat des Forces Navales de la France*; *Etude sur l'Escadre de la Méditerranée*; *La Guerre de Chine*; *La Guerre d'Amérique*, *Campagne du Potomac*.

JOINVILLE, JEAN, SIEUR or SIRE DE, one of the earliest French historians, whose works possess much interest or value, was b. about 1224, of an old family, in Champagne, and held high offices under Thibaut IV., king of Navarre. In 1248 he joined Louis IX. of France with nine knights and 700 armed men in his crusade; shared that monarch's captivity; and returning to France in 1254 was frequently at his court, but declined to accompany him in his second crusade. After the death of Louis IX. the sieur de Joinville wrote his *Histoire de St. Louis*, one of the most valuable works in the whole literature of the middle ages, combining an excellence of style, then very rare, with a most interesting exhibition of individual character in the minute record of events. He died about the year 1318. The *Histoire de St. Louis* was first published in 1546; one in modernized French was published by Natalie de Wailly in 1874; and an *Édition Classique* (1894).

JOISTS, horizontal timbers (of lighter scantlings than the beams) used to support doors. See **FLOORS**.

JOKAI, MOR.; Hungarian poet laureate, b. at Komorn, Hungary, Feb. 19, 1825. At the age of seventeen he wrote his first drama, *The Jew Boy*, and in 1845 his first novel, *Working Days*, which have been followed by almost 200 other volumes, among which are: *A Hungarian Nabob*; *Sad Times*; *The Last Days of the Janissaries*, and *Black Diamond*.

JOKJOKERTA. See **JAKJOKERTA**.

JOKTAN, one of the sons of Eber, a descendant from Shem, the progenitor of several tribes in southern Arabia, called Joktanites. The Arabs call him Kahtan. The principal Joktanite kingdom and the chief State of ancient Arabia was that of the Yemen, founded, as the Arabs say, by Yaarub, son or descendant of Kahtan or Joktan. This was the biblical kingdom of Sheba.

JO'LIBA. See **NIGER**.

JOLIET, city and co. seat of Will co., Ill.; on both sides of the Des Plaines river, the Illinois and Michigan canal and the Atchison, Topeka and Santa Fé, the Chicago and Alton, the Chicago, Rock Island and Pacific, the Elgin, Joliet and Eastern, and the Michigan Central railroads; 40 miles s.w. of Chicago. The city contains the Silver Cross hospital, St. Joseph hospital, public library, the State penitentiary, Swedish orphan home, Illinois steel company's athenaeum, St. Francis and St. Mary academies, high school, Bush park, national and State banks, and over 35 churches. There are electric lights, electric street railroads, artesian water supply, and daily, weekly, and monthly periodicals. Industrial interests are represented by the Illinois steel company, one of the largest concerns of its kind in the country, by several other steel and barbed wire plants, stove and boiler works, machine shops, tinplate works, horseshoe works,

several of the largest limestone quarries in the United States, boot and shoe factories, flour mills, breweries, etc. Manufacturing is largely promoted by power from the river and canal. Pop. '90, 23,264.

JOLIET, CHARLES, b. in the department of Doubs, 1832. Until 1864 he was in the civil service, and subsequently devoted himself to journalism and miscellaneous literature. His *Le roman de deux jeunes Maries* and *Mademoiselle Chérubin* were very popular, and his novels on subjects pertaining to the Franco-German war, 1870-71, gained for him a high reputation.

JOLIET, LOUIS, 1645-1700, b. Quebec; educated at the Jesuits' college for the priesthood, but abandoned the design, and going west engaged in the fur trade. In 1672 he was appointed by Frontenac, governor of Canada, to explore the Mississippi. He and père Marquette, starting from Michilimackinac, May 17, 1673, proceeded to Green bay, ascended the Fox river, obtained Indian guides to the Wisconsin, entered the Mississippi, June 17, 1687, and passing down, reached the Arkansas. Satisfied that the river flowed into the gulf of Mexico, and not into the Pacific ocean, they returned to lake Michigan, by the way of the Illinois river. Joliet proceeding alone to Quebec, his canoe upset in the Lachine rapids, and he lost his maps and manuscripts. From memory he prepared a map and report of the expedition. He was appointed royal hydrographer at Quebec. In 1680 he received the grant of the seignury of Anticosti island, to the development of whose fisheries and trade he devoted himself. In 1697 he obtained the seignury of Joliette, which still belongs to his family.

JOLIETTE, a co. in Quebec, Canada, bordering on the St. Lawrence, drained by the river L'Assomption and several smaller streams, and traversed by the Canadian Pacific railroad; 2,670 sq. m.; pop. '91, 22,021. Co. seat, Joliette.

JOLIETTE, a t., capital of Joliette co., Quebec, on L'Assomption river, 42 m. n.e. of Montreal; pop. '91, 3372. A railway of 12 m. connects it with the St. Lawrence. It is on the Canadian Pacific railroad. It contains grist and saw mills, a large foundry, a tannery, several stores, a college, convent, hospital, mechanics' institute, and a French weekly newspaper. It has a weekly market, and does an extensive trade in agricultural products and in timber; and has quarries of limestone.

JOLLIVET, PIERRE JULES, b. Paris, 1803; an historical painter. After spending some time in Madrid, he returned to Paris, and in 1831 exhibited *genre* pictures relating to Spanish history. In 1835 he gained the medal of the first class. His principal works are, "Louis VIII. taking the Oriflamme at St. Denis;" "Lara," in the Luxembourg; "Le Massacre des Innocents," at the museum of Rouen; "The Installation of the Magistrates in 1849." Among other paintings are "Art in the Time of Pericles;" "The Jewels of Cornelia." He d. 1871.

JOLLY-BOAT (Dutch, *jolle*, a yawl), a small boat kept on board ship for the purpose of communicating with the shore. It is a broad, safe boat, and is specially devoted to the use of the steward and to the conveyance of his purchases from shore.

JOMARD, EDMÉ FRANÇOIS, 1777-1862; b. Versailles; studied at the École Polytechnique; accompanied the army to Egypt in 1798 as a member of the scientific commission; was distinguished for his researches; returned in 1802, and was appointed secretary to the commission. He prepared the *Description de l'Égypte*, and directed the engraving and printing of it for 20 years. The portions of this work which Jomard himself wrote were published separately under the title of *Observations on Ancient and Modern Egypt; or, a Historical and Picturesque Description of its Monuments*. In 1821 he took part in founding the geographical society of Paris. In 1828 he was appointed *conservateur administrateur* in the royal library. At his suggestion Mehemet Ali sent several young men to Paris for education, who were placed under the direction of Jomard, forming what was called *Institut des Égyptiens*. Mehemet's successor conferred upon him the honorary title of bey. Besides his work on Egypt referred to he published *Voyage à l'Oasis de Syonah; Remarques sur les Rapports de l'Éthiopie et de l'Égypte*, etc.

JOMINI, HENRI, Baron, b. Mar. 6, 1779, at Payerne, in the canton de Vaud, began his military career in a Swiss regiment in the French service, and afterwards, chiefly through the friendship of Ney, was raised to high military rank by the emperor Napoleon. In 1804 he began the publication of his *Traité des Grandes Opérations Militaires*. He distinguished himself in active service during the retreat from Russia, but, offended at the treatment which he received from Napoleon, he passed over to the allies after the armistice of Plaeswitz, and entered the service of Russia. In 1828 he took an active part in the military operations at Varna; and in 1855 he settled at Brussels. Besides the work already mentioned, his *Histoire Critique et Militaire des Campagnes de la Révolution* (5 vols. Paris, 1806); his *Vie Politique et Militaire de Napoleon* (4 vols. Paris, 1827); and his *Tableau Analytique des Principales Combinaisons de la Guerre* (Petersb. 1830), are of great value to the military student. Baron Jomini died at Passy, Mar. 22, 1869.

JOMELLI, NICOLO, 1714-74; b. Aversa, near Naples. Initiated in music by Muzillo, he visited Naples in 1730, where he studied under Protta and Mancini, and afterwards at a conservatory under Feo and Leo. His first compositions were cantatas. Devoting himself to dramatic music he composed at the age of twenty-three his first opera, *L'errore amoroso*, which was received with so much favor that he determined

to cultivate theatrical composition. In 1738 he composed his first serious opera, *Odoardo*. In 1740 he was summoned to Rome, where he was warmly patronized by cardinal York, and composed two operas. The next year he went to Bologna, and composed *Ezio*. Returning to Rome he produced *Didone*, one of his best works. Invited to Venice he produced *Merope* for the Teatro Fenice, and a *Laudate* for the church of Santo Marco. While at Naples he brought out his opera *Eumene*, which was greatly applauded. At Bologna he studied church music under padre Martini. In 1745, visiting Vienna, he became an intimate friend of Metastasio, to whose conversation and criticisms he acknowledged his great indebtedness. He remained here two years, giving instruction in music to the empress Maria Theresa. In 1748, again called to Rome, he composed his opera *Artaserse*, also his famous oratorio, *La Passione*, and through the influence of cardinal Albani he was made the next year chapel-master of St. Peter's in the Vatican. In 1754 he resigned that position and became chapel-master and court-composer to the duke of Würtemberg at Stuttgart. Here he remained about 18 years, composing a large number of operas, among which was his *Missa pro Defunctis*, or *Requiem*, which displayed uncommon genius. In 1772 he returned to Naples, but his style had so much changed through the influence of German music that his operas were not popular. He was attacked with paralysis, but rallied, and composed a *Miserere*, which is pronounced the finest of his works. His known compositions are forty operas, five cantatas, four oratorios, thirty-four church compositions. Jommelli has been styled the "Glück of Italy."

JONAH (Heb. *Yonah*, a "dove;" Gr. *Jonas*), a Hebrew prophet, son of Amittai, was, as we learn from 2 Kings xiv. 25, a native of Gath-hepher, a t. of Galilee in Zebulun, and not far from Phenicia. He appears to have flourished about the second half of the 8th c. B.C., in the reign of Jeroboam II., and was probably, therefore, the earliest of those prophets whose writings are extant. It has been urged by Rosenmüller and other critics that the miracle recorded in the book known under his name is not to be regarded as a historical fact, but only as an allegory, founded on the Phenician myth of Hercules rescuing Hesione from the sea-monster by leaping himself into its jaws, and for three days and three nights continuing to tear its entrails. The design of the author in incorporating this myth with the actual voyage of Jonah and the conversion of the heathen Ninevites was, it is suggested, to bring out more vividly the truth that God will not permit his merciful intentions to be frustrated by the disobedience even of a prophet. On the other hand, it has been thought by orthodox theologians generally that the language of Christ (Matt. xii. 39-41; xvi. 4; Luke xi. 29), and the manner in which it is mentioned in Josephus and the Apocrypha preclude the possibility of our supposing this miracle to be other than strictly historical. Jonah has been supposed by early authorities to have been the son of the widow of Sarepta (1 Kings xvii. 24), also to have been the pupil of Elisha. Jonah's tomb is shown at Nebi-Yunus (Prophet Jonah), near Mosul.—Leusden, *Jonas Illustratus* (Traj. 1692); Friedrichsen, *Kritischer Ueberblick der Ansichten vom Buch Jonas* (Altona, 1817); Rosenmüller, *Proleg. in Jonam*; Drake's *Notes* (1853); also Ewald and the more recent commentators and critics.

JONAH, BOOK OF (see **JONAH**), has always been placed by the Jews among their canonical books, and is referred to as historical several times in the apocryphal books and by Josephus. The Savior also quoted it as historical, comparing his continuing three days in the grave to Jonah's continuing three days in the belly of the fish; and his preaching to the Jews to Jonah's preaching to the Ninevites. There is nothing incredible in its statement that God had prepared a great fish to receive Jonah after he had been cast into the sea. There are evidences of design in the constitution of all fish that swim in the sea, showing that they have been prepared for different purposes; and this fish could be prepared for this specific purpose as easily and wisely as any other fish for any other work. The book, though written by a prophet, is chiefly historical, and may be divided into three parts: I. The command to proclaim the threatened destruction of Nineveh; Jonah's attempt to evade the duty by taking a sea voyage; the storm, the falling of the lot on Jonah, followed by his confession and his being, at his own suggestion, cast into the sea; his apparent destruction by the sea monster, which, however, after three days threw him up again alive upon the shore. II. His thanksgiving after the deliverance, in which he recorded the prayers he had offered during his imprisonment and, with gratitude for the mercy shown to him, promised obedience to God's commands. III. The renewal of the command to go to Nineveh; Jonah's obedience and faithful utterance of the message intrusted to him; the humiliation and repentance of the Ninevites, from the king to the lowest subject, expressed by a universal fast, during which men and beasts were covered with sackcloth and did not taste either food or water (that in times of fasting beasts of burden were sometimes subjected to the same forms of humiliation as men, both Herodotus and Plutarch state); the withholding of the threatened destruction on their repentance, in accordance with a general principle of the divine government, announced afterwards to Jeremiah (xviii. 8); Jonah's discontent with the result, because it compromised his reputation as a prophet, and the emblematic method by which the Lord reproved him.

JONAS. JUSTUS, 1493-1555; b. Nordhausen, Saxony; was professor of law at Erfurt, and, in 1531, of theology, at Wittenberg; preacher at Halle in 1541, and at Coburg in

1551. He was a prominent German reformer, an intimate friend of Luther; accompanied him to the diet at Worms and at Augsburg; assisted him in the translation of the Bible, and by his preaching and translation of the works of Luther and Melancthon did much to promote the reformation. At the time of his death he was pastor and superintendent at Eisleben. He published *Discussio pro Conjugio Sacerdotali*, and translated Melancthon's *Defense of the Augsburg Confession* from Latin into German. He was a ready writer and speaker.

JONATHAN, son of Saul, who was the first king of Israel. With his armor-bearer only he attacked an army of the Philistines, who, in their surprise and confusion, turned their swords upon each other. Saul seeing this brought up his forces, and completed the rout. Jonathan, faint with hunger, tasted honey which dropped in a wood, not knowing that his father had prohibited food until evening, and would have been slain by his father but for the interference of the people. He loved David devotedly, though he knew that David was to succeed Saul in his stead, and his efforts to shield him from his father's wrath led Saul to seek to kill Jonathan also. He died in a disastrous battle with the Philistines on mount Gilboa, where, on the same day, his father and his two brothers also were slain.

JONATHAN BEN-UZZIEL, the translator of the Hebrew prophetic writings into Chaldee. He was a disciple of Hillel I., and lived about B.C. 30. Tradition has ascribed to him also the paraphrase of the Pentateuch known under the name of *Pseudo-Jonathan*, and the targums of the five books. The last is a compilation from ancient materials made by several persons, and is generally published, with the Hebrew text, in the Jewish editions of the Pentateuch. A Latin version of it is given in Walton's polyglott. His expositions were mostly on Haggai, Zachariah, and Malachi.

JONES, a co. of central Georgia, bounded w. by the Ocmulgee river; traversed by the Central of Georgia railroad; 386 sq. m.; pop. '90, 12,709. The surface is hilly and the soil fertile. The staples are cotton and maize. Iron ore, granite, and quartz are found. Co. seat, Clinton.

JONES, a co. of e. Iowa, traversed by the Chicago and Northwestern and the Chicago, Milwaukee and St. Paul railroads; 576 sq. m.; pop. '90, 20,233. The surface is undulating, diversified by prairie and forest; the soil is fertile. The chief products are wheat, oats, maize, potatoes, and hay. There are several manufactories for carriages, saddlery, tin, copper, and sheet-iron ware. Co. seat, Anamosa.

JONES, a co. of s.e. Mississippi, drained by the Pascagoula river and its tributaries; 680 sq. m.; pop. '90, 8333. It is thickly wooded, has a rolling surface and sandy soil. The staples are rice, maize, and sweet potatoes. Co. seat, Ellisville.

JONES, a co. of s.e. North Carolina, traversed by the river Trent; 430 sq. m.; pop. '90, 7403. It is generally level, marshy, or sandy. Cypress and pine forests abound. The staples are cotton, tobacco, and maize. Co. seat, Trenton.

JONES, a co. of northern Texas; 900 sq. m.; pop. '90, 3797. It is drained by the Brazos river. The soil is generally fertile. It is mostly prairie, and adapted to stock-raising. Co. seat, Anson.

JONES, ANSON, 1798-1858; b. Mass.; began the practice of medicine in 1820; resided in Philadelphia, New Orleans, and South America, and finally settled in 1833 in Brazoria, Texas. He took part in the war between Texas and Mexico as a private soldier and surgeon in the Texan army. After Texas became an independent republic he was a member of the Texan congress, and in 1838 was sent as a minister to Washington. Afterwards he was a senator in the Texan congress, and in 1841 was appointed secretary of state by president Houston. In 1844 he was elected president of Texas for three years, retaining the office until Texas was annexed to the United States. He passed the latter years of his life in agricultural pursuits. He died by his own hand.

JONES, CHARLES COLCOCK, jr., b. Savannah, 1831; graduated at Princeton with honor in 1852; studied law in Philadelphia one year, and took his degree in the Dane law school of Harvard university in 1855; admitted to the bar in Savannah in 1856, soon taking high rank in his profession; was elected mayor of the city in 1860. On the passage of the ordinance of secession in 1861 he became lieutenant in the Confederate army serving under gen. J. E. Johnston. After the war he removed to New York, where he practiced law till 1877. His publications include *Historical Sketch of the Chatham Artillery during the Confederate Struggle for Independence*; *Ancient Tumuli in Georgia*; *Antiquities of the Southern Indians*; *History of Georgia*; *English Colonization of Georgia* (1887), etc. He d. in 1893.

JONES, INIGO, a well-known English architect, was b. in London in 1572. Of his early history little is known till the time when the earl of Pembroke, attracted by his great aptitude at drawing, sent him abroad for four years to study the masterpieces of architecture in France, Germany, and Italy. While in Venice he paid particular attention to the works of Palladio, whose style he introduced into England, whence we sometimes hear Jones designated as the English "Palladio." In 1605 he was employed by James

I. in arranging the scenery, etc., for the masques of Ben Jonson, which were at that time the chief amusement of the court. Jonson afterwards satirized his fellow-laborer in *Bartholomew Fair*. In 1612 Jones revisited Italy, still further to improve his style, and on his return to England was appointed surveyor-general of the royal buildings. Jones was at this time accounted the first architect of England, and according to some the first of the age. He died in 1653. The state of architecture in England during Jones's time was an excellent foil to his genius, as the praise bestowed upon his works shows, but still in any age he would have ranked high as an architect. His masterpiece is considered to be the Banqueting House at Whitehall. Other works of his are the church of St. Paul, in Covent Garden, Ashburnham House, and Surgeons' Hall, which, however, are very mediocre.

JONES, JACOB, 1770-1868; b. Del.; studied medicine and graduated at the university of Pennsylvania, but abandoned practice and became clerk of the supreme court of Delaware; was midshipman in the U. S. navy in 1799; captured in the frigate *Philadelphia* under Bainbridge in 1803, in the harbor of Tripoli, and remained a prisoner 18 months; was made commodore in 1810; commanded the U. S. sloop of war *Wasp* in 1812 when it captured the British ship *Frolic*. Both vessels were afterwards captured by the British ship *Poictiers* and taken to Bermuda. Released on parole he returned to the United States with the other Americans. He received from congress a vote of thanks and a gold medal, and was promoted in 1813 to the rank of post-captain, and placed in command of the *Macedonian* in the squadron of Decatur. After the peace he commanded the squadron in the Mediterranean and the Pacific, served some years as a commissioner of the naval board, and was governor of the naval asylum at Philadelphia.

JONES, JOEL, LL.D., 1795-1860; b. Coventry, Conn.; graduated at Yale in 1817; practiced law at Easton, Penn.; was appointed in 1830 on a commission to revise the civil code of Pennsylvania; was one of the judges of the Philadelphia district court; elected president of Girard college in 1848; mayor of Philadelphia in 1849, returning to his profession after serving one term. He was distinguished not only for his legal learning, but for his theological and biblical researches. He contributed largely to literary journals and quarterlies, and published several works, the most important of which are: *The Story of Joseph; or, Patriarchal Age*; *The Knowledge of One Another in the Future State*; *Jesus and the Coming Glory*. He edited several English works on prophecy under the title of the *Literalist*, in 5 vols., with valuable additions of his own; and translated from the French *Outlines of a History of the Court of Rome and of the Temporal Power of the Popes*, with many original notes appended. *Notes on Scripture* was published by his widow. Judge Jones was an elder in the Presbyterian church, and held important positions in ecclesiastical boards.

JONES, JOHN, 1729-91 b. Jamaica, N. Y., of Welsh descent; studied medicine at Rheims and Leyden; visited Edinburgh; returning, settled in New York, where he obtained an extensive practice and high reputation as an operator in surgery; was surgeon in the army at Crown Point in 1755; professor of surgery at the medical school of the college of New York in 1767. While New York was occupied by the British he relinquished his practice in the city, and retired to the country. He was for a time in the medical department of the army in 1780, where he was elected one of the physicians of the Pennsylvania hospital; and in 1787, on the institution of the college of physicians of Philadelphia, he was elected vice-president, and contributed to its transactions a valuable paper on anthrax. He was Washington's family physician in Philadelphia, and the intimate friend and physician of Franklin, whom he attended in his last illness—publishing an account of his death. He held a high rank in his profession. He published in 1776 *Plain Remedies upon Wounds and Fractures*, and subsequently other surgical works. A volume of his medical writings, with a memoir, has been published by Dr. Mease.

JONES, JOHN GLANCY, b. in the valley of the Conestoga, Penn., 1811; educated for the ministry, but devoted himself to the law; was deputy attorney-general of the state; member of congress, 1850; in 1858 appointed by president Buchanan minister to Austria, remaining there till Nov. 14, 1861. He d. 1877.

JONES, JOHN PAUL, 1747-92, was born in Kirkcudbrightshire, Scotland. His name was properly John Paul, that of Jones being afterwards assumed by him for a reason not given. At the age of 12 he was apprenticed to a merchant of Whitehaven engaged in the American trade, and soon went to sea in a vessel bound for Virginia. While in port he staid with his brother who was settled as a planter, improving his leisure in study, especially of navigation. The affairs of his merchant employer being embarrassed, his indentures were canceled, and he was almost immediately engaged as third mate of a slave. In 1766, at the age of 19, he was received as chief mate to a slave of Jamaica, but after a few voyages abandoned this life in disgust, and in 1768 sailed for

Scotland as a passenger in a brigantine, but the master and mate dying on the voyage, Paul assumed command, and brought the vessel safely into port. For this service the owners, in 1768, made him captain and supercargo, and sent him to the West Indies. In a second voyage he was involved in difficulty with the carpenter, whom he was obliged to punish for mutiny and disrespect, and who afterwards joined another vessel, took fever, and died; his death was ascribed to the punishment inflicted by his commander. Paul was tried and honorably acquitted. He made his last visit to Scotland in 1771 where he was looked upon with distrust on account of his alleged cruelty to the carpenter. He continued after this in the West India trade, acquiring quite a fortune by commercial speculations. In 1773 he went to Virginia to settle the affairs of his brother, who had died intestate and childless, and remained on the estate which had fallen to him, devoting himself to agriculture. The American revolution now breaking out, having identified himself with the colonies, he offered himself to congress to serve in the navy, was accepted, commissioned as lieutenant, Dec. 23, 1775, and appointed first lieutenant of the *Alfred*, flag-ship. When the commander came on board Jones hoisted the American flag, now for the first time displayed, and bearing, it is believed, the device of a pine tree with a rattlesnake coiled at its root. From the *Alfred* he was transferred to the sloop *Providence*, in which he cruised among the West India islands, and in 47 days made 16 prizes, and destroyed the fishery at Isle Madam and Canso. Having finished this cruise he was put in command of the *Alfred* and *Providence* as captain, and sailed Nov. 2, 1776, from Newport, on an expedition to destroy the cape Breton fishery, capture the coal fleet, and liberate a hundred Americans confined at hard labor in the mines. The expedition was successful, four prizes being brought to Boston. In June, 1776, Jones was invested with the command of the *Ranger*, a new ship built for the service, and sailed Nov. 1, stopped in France to confer with the American commissioners, and then made a cruise upon the n. coast of England, seized the fort of Whitehaven, spiked its guns, burned some of the shipping, and kept England and Scotland in constant alarm. He conceived the project of capturing the earl of Selkirk on his fine estate near Kirkcudbright, in order to compel England to adopt a general system of exchange of prisoners, but this failed on account of the absence of the earl. His crew, however, stole the family plate, which Jones bought of them and restored. During this cruise on the English coast he captured the *Drake*, a superior vessel sent out to take him, and took her into Brest with 200 prisoners. He was cordially received by the American commissioners, and after much delay was appointed to the command of the ship *Duras*, changing the name to *Bon Homme Richard*. In 1779 he set out with a squadron of 5 vessels for the coast of Scotland, causing more terror among the inhabitants than before. He threatened to burn every ship in the harbor, but a strong wind drove him out to sea. Turning his course southward, he fell in with a British fleet of 41 sail, off Flamborough head, homeward bound from the Baltic, convoyed by two powerful men-of-war, the *Serapis* and the *Countess of Scarborough*. After a desperate and bloody battle of three hours the *Serapis* was captured, and the *Bon Homme Richard* was so damaged that it went to the bottom two days afterwards. For this splendid victory he was, on his arrival in Paris, presented by Louis XVI. with a gold-mounted sword bearing a flattering inscription, was invested with the cross of the order of military merit, and greatly honored by the government, the court, and the citizens. On his return to America congress voted him a splendid gold medal, and passed a resolution commending his "zeal, prudence, and intrepidity." He received also a very complimentary letter from gen. Washington. At the conclusion of peace Jones went to Paris as American agent for prize-money. In 1787 he entered the Russian service with the title of rear-admiral, and performed valuable services against the Turks; but on account of the jealousies and intrigues of the Russian officers he resigned, though strongly urged by Catherine to remain. He returned to France, and died of the dropsy. He was not, as has been said, a prey to want and neglect, but had the attendance of the queen's physician, was cheered by the presence of several kind friends, and honored with a public funeral by the national assembly. See Lives by Sherbourne (1825); Mackenzie (1841); W. G. Simms (1845); James Hamilton (1848), and J. C. Abbott (1875); also an article in *Blackwood's Magazine* for Oct. 1887, and J. K. Laughton's *Studies in Naval History* (1887). Alexandre Dumas has made the exploits of Jones the basis of a novel.

JONES, JOHN PERCIVAL, b. Herefordshire, England, 1830; came to the United States in infancy; educated in Cleveland, O.; became a miner in California; removed to Nevada, 1867, and engaged in mining; was elected U. S. senator in 1873, 1879, 1885, 1890, and 1897. He was the most conspicuous leader in the silver movement during the presidential campaign of 1896.

JONES, JOHN WINTER, b. Lambeth, England, June 16, 1805; educated at St. Paul's school; studied law and became connected with the civil service in 1837. In 1856 he was placed in charge of the printed books at the British museum, and, on the retirement of Panizzi in 1866, became the principal librarian. He contributed to the *New Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*, besides editing several valuable works of early travels. He d. 1881.

JONES, JOSEPH STEVENS, 1811-77; d. Boston. He was an actor in early life, and was owner and manager at different times of several theaters in Boston. He graduated from

the Harvard medical school, 1843, and was city physician for several years. He wrote a great number of plays; among them, *Solon Shingle*, *Eugene Aram*, *The Mask of the Huguenots*, *Zofara*, *Paul Revere*, and *The Silver Spoon*.

JONES, NOBLE WIMBERLY, 1724-1805; b. near London; son of Dr. Noble Jones; while he was young his father settled in Georgia. At an early age he held a military commission, and in 1761 was a member of the assembly. He took an active part in the war of the American revolution; was speaker of the first Georgia legislature; was a delegate to the second congress of the colonies in 1775; lost a son at the capture of Savannah in 1778; was taken prisoner at the fall of Charleston in 1780, and carried to St. Augustine; exchanged in 1781, and again sent to congress. He was president of the convention held for the revision of the state constitution in 1795.

JONES, OWEN, 1809-74; b. Wales; was articled to an English architect, with whom he studied ornamentation, and afterwards spent four years in European travel. In 1834 he passed some time in Granada, where he made studies for his great work on the Alhambra. This publication was commenced in 1836 under the personal supervision of Mr. Jones, the manipulation of the stones employed in its vivid and accurate colored illustration, requiring great care and the nicest adaptation. The work appeared in 1842, after Mr. Jones had made a second visit to Granada, in a superb folio volume of richly-colored plates, under the title of *Plans, Elevations, Sections, and Details of the Alhambra*, etc., accompanied by a complete translation of the Arabic inscriptions and a historical notice of the kings of Granada, by Señor Pascual de Gayangos. The Messrs. Longman & Co., and other houses of London, having undertaken the publication of many costly works in chromatic printing, Mr. Jones's name was connected with most of them. He published in 1842 *Designs for Mosaic and Tessellated Pavements*; with Henry Noel Humphreys, in 1847-50, *Illuminated Books of the Middle Ages*; and *The Grammar of Ornament*, 1856; as to the last of which the London *Athenæum* said in 1857 that it was "beautiful enough to be the horn-book of angels." Besides his labors in authorship, Mr. Jones was practically engaged in London in the ornamentation and decoration of buildings. He directed the decoration of the Egyptian, Greek, Roman, and Alhambra courts of the Crystal palace at Sydenham; and also erected St. James's hall, Piccadilly.

JONES, ROGER, 1789-1852; b. Westmoreland co., Va.; distinguished in the war with Great Britain in 1813; appointed second lieut. marine corps; was rapidly promoted for bravery; brevetted colonel in 1824; in 1825 appointed adj.-gen. of the army, which post he held until his death.

JONES, SAMUEL PORTER; "the Mountain Evangelist." As a lawyer, his professional life was ruined by his passion for drink, but after his father's death in 1872 he confessed to being converted and at once began preaching in the Methodist Episcopal Church. His success from the first was remarkable and he preached during the early years of his ministry as many as 800 sermons a year, many of which have been published as *Sam Jones's Sermons* (1885), *Sam Jones's Own Book*, etc.

JONES, THOMAS AP CATESBY, 1789-1858; of Welsh descent; b. Va.; entered the navy, 1805; was lieutenant in 1812; commodore in 1820; captain in 1829. From 1808 to 1812 he was in the gulf of Mexico, engaged in suppressing piracy, smuggling, and the slave trade. The British naval expedition against New Orleans having entered lake Borgne with 40 boats, he attempted with a small flotilla to intercept it, but was wounded and compelled to surrender. In 1842 he commanded the Pacific squadron, and having, from erroneous information as to war existing between the United States and Mexico, taken possession of Monterey, he was, for his indiscretion, temporarily suspended from service.

JONES, WILLIAM, OF NAYLAND, 1726-1800; b. Northamptonshire, Eng.; educated at the Charterhouse and University college, Oxford; ordained priest, 1749; became successively curate of Finedon and Wadsohoe, vicar of Bethersden, rector of Pluckley, Paston, and Hollingbourn, and perpetual curate of Nayland. In 1780 he was elected fellow of the royal society of London. He adopted, while at Oxford, the philosophy of Hutchinson, and subsequently advocated it with great erudition and ingenuity. "He was a man of vast learning, an able theologian, and a proficient in music. "He had," says bishop Horsley, "the talent of writing upon the deepest subjects for the plainest understanding." He wrote with vigor against the principles disseminated during the French revolution and illustrated by it. His most important works are *A Full Answer to Bishop Clayton's Essay on Spirit*; *Catholic Doctrine of the Trinity proved from Scripture*; *Course of Lectures on the Figurative Language of the Holy Scriptures*; *The Scholar armed against the Errors of the Times*; *Memoirs of the Life, Studies, and Writings of George Horne*; *Physiological Disquisitions*; *Art of Music*. He published also two political treatises against the French revolution, entitled *A Letter from Thomas Bull to his Brother John*. He wrote treatises on music and composed anthems and founded the *British Critic* (1793). A complete collection of his works was published in 12 vols. in 1801.

JONES, Sir WILLIAM, was b. in London, Sept. 28, 1746, and was sent to Harrow in 1753, where he soon eclipsed all his fellows, particularly in classical knowledge. In 1764 he was entered at University college, Oxford, where he was enabled to gratify that desire for a knowledge of the oriental languages which had shown itself during the last two years of his residence at Harrow. In 1765 he left Oxford, to become tutor to the eldest son of earl Spencer, with whom he remained five years. In 1770 he published, at the request of the king of Denmark, a *Life of Nadir Shah*, translated into French from the Persian; in the following year, a *Persian Grammar*, republished some years ago, with corrections and additions, by the late prof. Lee; and in 1774 his *Commentaries on Asiatic Poetry*, republished by Eichhorn at Leipsic in 1776. In 1780 he completed a translation of seven Arabic poems, known as the *Moallakat*, which obtain their collective name from being "suspended" in the temple at Mecca; wrote an essay *On the Legal Mode of Suppressing Riots*; and another, entitled *Essay on the Law of Bailments*, and two or three odes. In Mar., 1783, Jones obtained a judgeship in the supreme court of judicature in Bengal, and landed at Calcutta in September. He at once set about the acquisition and promulgation of the knowledge of oriental languages, literature, and customs. He established the royal Asiatic society, "for investigating the history, antiquities, arts, sciences, and literature of Asia," of which he was the first president. To the volumes of the *Asiatic Researches*, sir William contributed largely. Besides these, he wrote and published a story in verse, called *The Enchanted Fruit, or the Hindu Wife*; and a translation of an ancient Indian drama, called *Sakuntala, or the Fatal Ring*. A translation by him of the *Ordinances of Manu* (q.v.) appeared in 1794. He was busily employed on a digest of the Hindu and Mohammedan laws, when he was attacked with an inflammation of the liver, which terminated fatally on April 27, 1794. Jones was one of the first linguists and oriental scholars that this country has produced. The East India company erected a monument to his memory in St. Paul's cathedral, and a statue in Bengal. A complete edition of his works in 6 vols. 4to was published by lady Jones in 1799; and another appeared, in 13 vols. 8vo, in 1807, with a life of the author by lord Teignmouth.

JONESBORO, BATTLE OF, Aug. 31, 1864. While Sherman was besieging Atlanta, he sent a force under Howard to take the railroad near Jonesboro, 20 m. distant, with the view of compelling the evacuation of Atlanta. Hardee was dispatched by Hood, the confederate commander, to prevent this. An attack was made by Hardee on Howard's intrenchments, lasting two hours, when the enemy withdrew, with a loss as reported by Hood of 1400 killed and wounded, the union army suffering much less. Atlanta, as anticipated, was evacuated Sept. 1.

JONESIA, a genus of trees of the natural order *leguminosæ*, sub-order *casalpinieæ*, having a two-leaved calyx, a funnel-shaped, 4-fid corolla, seven stamens attached to a ring which springs from the tube of the corolla, a scimitar-shaped pod. The leaves are abruptly pinnate. The asoca of Sanskrit poetry (*J. asoca*) is one of the loveliest trees of the east. Its orange and crimson flowers grow in graceful racemes. Indian poetry abounds in its praises.

JONESVILLE: a magisterial dist., Lee co., Va. Pop. '90, 4731.

JÖNKÖPING, a län or province in Sweden, bounded n. by Mariestad, lake Wetter, and Linköping, e. by Kalmar, s. by Wexio, w. by Halstad and Wenersberg; 4275 sq. m.; pop. '90, 193,704. Much of it is rocky and mountainous; other parts are fertile and well cultivated, producing grain, potatoes, hemp, flax, and buckwheat. It abounds in minerals, especially iron, which is worked to a considerable extent. Has manufactures of matches, linens, woolens, leather, paper, carpets and tobacco.

JÖNKÖPING, a t. of Sweden, and one of the most beautiful and finely situated in the country, is capital of the län of the same name, and stands at the southern extremity of lake Wetter, and is backed on the s. and w. by pine-clad hills. It is a maritime and trading town, and contains an arsenal and a factory for arms. Pop. '90, 19,682.

JONQUIL (Fr. *jonquille*, from Lat. *juncus*, a rush), a name given to certain species of *Narcissus* (q.v.) with rush-like leaves. The COMMON JONQUIL (*N. jonquilla*), a native of the s. of Europe, is one of the most common bulbous-rooted plants in our flower-borders. It has from two to six yellow flowers at the summit of its scape (leafless stem). The SWEET-SCENTED JONQUIL (*N. odoratus*), also a native of the s. of Europe, is another species very generally cultivated. Perfumed waters are made from jonquil flowers.

JONSON, BEN, or BENJAMIN, an English dramatist, was b., according to the most reliable accounts, at Westminster, though one authority says Warwickshire, in 1574. The Scottish poet Drummond of Hawthornden states that Jonson told him his grandfather was a Scotchman of Annandale, who settled in Carlisle, and his father a clergyman, who died before Ben was born. The latter received his education at Westminster school, where he had for his preceptor the illustrious Camden. Our knowledge of his career from this point until the period when he became famous as an author is very obscure. It is said that his mother took a second husband, a bricklayer (but this is doubtful), and that Ben was forced very unwillingly to assist his stepfather. The story of his residence (for a few months) at St. John's college, Cambridge, may be an authentic tradition, but it really rests on no better evidence than the present of some books now in the library of that college with his name inscribed on them. If he went thither at all

he was soon forced to return home for want of means; but his antipathy to the trade of a bricklayer was so great that he finally ran off, and served as a soldier in the Low Countries for some time. After coming back to England he tried the profession of an actor, but did not succeed, whereupon he started as a writer for the stage. Even in this capacity he did not rapidly acquire a reputation. The first piece that procured him a name was *Every Man in his Humor* (1598), which was soon followed by *The Case is Altered*, which was acted in 1599. At this time Jonson received earnest money for his share in the writing of a tragedy entitled *Robert II. King of Scots*, but this year was more important for the production of *Every Man out of his Humor*; a play which afterwards had the distinction of being played before Queen Elizabeth. In 1604, at the Globe theatre, there was presented *Sejanus*, the first of Jonson's tragedies, Shakespeare himself having a share in the performance. Jonson during this period, when his dramatic powers were at their height, likewise produced the tragedy of *Catiline*—which was not a success—and the comedies of *Volpone*, or *The Fox* (acted in 1605), *Epicoene*, or *The Silent Woman* (1609), the *Alchemist* (1610), *Bartholomew Fair* (1614), and *The Devil is an Ass* (1616). These are comedies full of rich, dry, carefully elaborated "humor," in this as well as in plot being closely imitative of Aristophanes, Terence, and Plautus. In 1618 Jonson took a journey on foot through Scotland, visiting for some time the Scottish poet Drummond of Hawthornden, whose *Conversations* describe his guest as "a great lover and praiser of himself, a contemner and scorner of others." At the accession of the Stuarts, Jonson's genius expressed itself in a new vein, the *Masques*, written for the courts of James and Charles, disclosing a unique gracefulness and lightness. On account of the adulation so delicately expressed in these songs, for many years Jonson was in receipt of a pension from these monarchs, but his careless and profuse habits involved him constantly in difficulties, and he died in poverty Aug. 6, 1637. Jonson's writings are not much relished now, and never were, even in his own day. There is an air of pedantry about his happiest efforts that spoils their effect. Yet, on the other hand, he possesses a rude force, and a humor which, if heavy and saturnine, is also genuine and pungent. Occasionally, too, his lyrics show a lightness and delicacy almost inexplicable, considering the ordinary and cumbrous movement of his faculties. The influence which he exercised over the wits of his time is a proof of the general strength and talent of the man. Shakespeare alone was reckoned his match in those wit-combats held at the Mermaid tavern. He was an immense drinker, and his potations do not seem to have improved either his temper or his constitution. The best edition of his works is that by Gifford, accompanied by a biographical memoir (Lond. 9 vols., 1816; new ed., with introd. and appendices by lieut.-col. F. Cunningham, 1875, Bickers & Son). Both of these editions contain the interesting *Conversations with Drummond* which with the *Jonsonus Virbius* gives most valuable contemporary views of the poet's accomplishments. Consult also Barry Cornwall's edition of the plays, in one vol. (1838). For the best criticism of the poet see Dryden's preface to *An Evening's Love, or The Mock Astrologer*.

JONSSON, FINN, a historian of Iceland, 1704-89; b. Hitardal; educated at the university of Copenhagen; was appointed bishop of Skalholt in 1754. Of his numerous works in Latin and Icelandic the most valuable is *Historia Ecclesiastica Islandica*, 4 vols.

JOODPOOR, or **MARWAR**. See **JOUDPORE**.

JOPLIN, city in Jasper co., Mo.; on the Missouri Pacific and other railroads; 155 miles s. of Kansas City. It is an agricultural and lead and zinc mining region; is principally engaged in mining, smelting, and the manufacture of white lead; and has electric lights, Holly waterworks, and several banks and newspapers. Pop. '90, 9943.

JOP'PA, the name given in the Greek of the New Testament to a t. called in Hebrew *Yafa*; modern, *Yafa* or *Jaffa*, i.e., beauty. It is situated on the sea-coast of Syria, about 33 m. n.w. of Jerusalem, and, according to Stanley, still deserves its name. Joppa is a place of great antiquity. Here, according to the classical myth, it was that Andromeda was chained to the rock, and exposed to the sea-monster; a story that has been supposed to shadow out, in an obscure way, the early intercourse between Greece and Syria. In sacred history it appears as the port of Jerusalem in the time of David and Solomon, and the place to which the cedars of Lebanon were floated from Tyre for the building of the temple. It was at Joppa that the apostle Peter saw the vision which corrected his Jewish prejudices concerning the Gentiles and the spirit of Christianity. In the reign of Constantine the great Joppa was made a bishop's see, but it attained its highest prosperity in the times of the crusades, when it became the principal landing-place of the warriors of Christendom. In 1799 it was stormed by the French under Bonaparte, and here was perpetrated his shameful massacre of Turkish prisoners. In 1832 Mohammed Ali made himself master of it; but the Turks, with the assistance of the British and Austrians, took it from him again in 1840. In 1888 the imports of Jaffa were valued at \$1,250,000; the exports (chiefly soap, cereals, and oranges) at \$1,000,000. Pop. about 16,000.

JORDAENS, JAKOB, a celebrated Dutch painter, was b. at Antwerp in 1594, and d. in 1678. His works are exceedingly numerous, and are to be found in most European collections. They are marked by great truthfulness and vigor of portraiture, and are richly but rather glaringly colored. Their chief defects are a want of taste and elegance in design. Among his best known works are the "Merry-making," the "Satyr and Man blowing Cold and Hot," "Pan and Syrinx," and "Saturn devouring his Children."

JORDAN, the principal river of Palestine, the bed of which forms a great valley, stretching from n. to s. in the eastern part of the country. The Jordan, deriving its head-waters partly from the eastern branches of the Lebanon mountains, and partly from Mt. Hermon, flows s., and after a course of 150 m., having passed through the small lake of El Huleh (the waters of Merom) and the lake of Tiberias (sea of Galilee), it falls into the northern extremity of the Dead sea (q.v.). The bed of the river varies much in breadth, and its banks are in some places flat; in others, steep. Where it enters the Dead sea it is 180 yards broad, and 3 ft. deep; but a little way further up it is only 80 yards broad, and 7 ft. deep. From the lake of Tiberias to the Dead sea the Jordan is crossed by no bridge, although in two or three places there are ruins of bridges. Above the lake of Tiberias is a bridge called Jacob's bridge, over which the road from Damascus to the sea-coast passes. In a number of places the Jordan is fordable; in some, even when the river is in flood. The course of the Jordan was explored by lieut. Molyneux, an English officer, in Aug., 1847, during the dry season; and by lieut. Lynch, with an expedition sent out by the United States government in April, 1848, when the river was in flood. A few miles from the foot of Mt. Hermon are three great fountains. One, the largest, issues from two openings in a bowl-shaped hill called Tell-el-kadi, the hill of the judge, near ancient Dan; one springs from crevices in the rocks and from among ruins that choke the mouth of a cave near Bania or Cæsarea Philippi; and one, the smallest and most remote, flows out near Hasbeiya. These are the main sources of the Jordan, which, uniting their waters, flow into and through lake Huleh. The valley of the Jordan is a part of that remarkable sunken chasm which stretches from the foot of the ridge known as the Anti-Lebanon nearly to the sea of Akabah. The sea of Tiberias, or lake of Galilee, through which the river runs, is 650 ft., and the Dead sea into which it empties is 1312 ft. below the level of the Mediterranean. Within this valley is a lower valley through which the Jordan runs in a course so tortuous that its length is about three times that of the valley. Except the herbage, shrubs or trees, and sometimes the jungle of cane, tamarisk, or willow along the river banks, most of the valley is a desert, and near the Dead sea is covered with a nitrous crust. Navigation is scarcely possible owing to rapids, the average descent between the sea of Tiberias and the Dead sea being 10 ft. to a mile; above the lake of Tiberias the fall is 300 ft. in 12 miles. The precipitous ridges which inclose the valley rise in some places on the w. to 3,000 ft., and on the e. to 5,000 ft. above the bed of the river.

JORDAN, CAMILLE, 1771-1821; b. Lyons; took an active part in politics during the French revolution; opposed a republican government, and was prominent in the insurrection of Lyons. After the fall of that city, Oct. 9, 1793, he was proscribed by the Directory, and fled to Switzerland and London. Returning to Lyons in 1796 he was chosen in 1797 to the council of five hundred, where he advocated the principles of religious liberty, and after the revolution of Sept. 4 went to Germany. In 1800 he was recalled, and opposed the measures of Bonaparte, exposing the frauds in the election of 1802 in a pamphlet, *Vrai Sens du Vote National sur le Consulat à Vie*. During Bonaparte's administration he lived in retirement, devoted to literature, until the accession of Louis XVIII. He was elected in 1816 to the chamber of deputies. At first he sided with them, but disapproving of their measures opposed them.

JORDAN, CHARLES ÉTIENNE, 1700-45; b. Berlin, of French parentage; studied at Magdeburg and Geneva; appointed minister of the French Reformed church of Potzlow in 1725. On the death of his wife he resigned in 1732, and traveled for some years in Holland and France; was with the Prussian crown-prince as his literary assistant in his exile, and appointed by him privy-councilor on his accession as Frederick II. His *Histoire d'un Voyage littéraire en France, Angleterre, et Hollande*, and his *Correspondance avec Frédéric II.*, are interesting.

JORDAN, DAVID STARR, educator and scientist, b. Gainesville, N. Y., 1851; graduated at Cornell Univ., 1872, professor in Lombard University, 1873, and lecturer in the Harvard School of Geology, 1875. He studied under Agassiz in 1873. From 1879-1885 he was professor in the Indiana State University, and from 1885-1891, president of that institution. In April, 1891, he was elected president of Leland Stanford university, Palo Alto, Cal. Dr. Jordan is the author of more than 250 books and pamphlets upon ichthyology and kindred subjects. In 1896 he was appointed president of the U. S. Bering Sea commission.

JORDAN, DOROTHY, or DORA, 1762-1816; b. near Waterford, Ireland; made her début as an actress in Dublin at the age of 16 under the name of Miss Francis, as Phebe in *As You Like It*; afterwards under the name of Mrs. Jordan she acted for three years at the York theater. In 1785 she appeared in London at Drury Lane; becoming very popular in comedy and musical farce. Her ten children by the duke of Clarence, afterwards William IV., are known by the name of Fitz-Clarence. The connection being suddenly broken off by the duke in 1811, she went to France, where in 1816 she died in obscurity and poverty. It is thought by many that she did not die at the time and place stated, but lived for seven years afterwards in England under a different name. A monument to her memory, by Chantrey, was erected by William IV. after his accession.

JORDAN, WILHELM, b. Insterburg, Prussia, in 1819; graduated at the university of Königsberg in 1842, and in that year published his first volume of poetry. In 1848

he was a member of the Berlin national assembly, and was afterwards engaged in naval affairs. He wrote tragedies and comedies, and in his *Nibelunge* tried to rejuvenate the ancient Germanic poetry.

JÖRG, JOSEPH EDMUND, b. Bavaria. Dec. 23, 1819; studied law at Munich; became connected with the bureau of archives in 1847; in 1852 was editor of the *Historisch-Politische Blätter*; in 1865 a member of the second Bavarian chamber. He is an ultra-montane Roman Catholic. He published *Geschichte des grossen Bauern Kriegs*; *Geschichte des Protestantismus in seiner neuesten Entwicklung*, 2 vols.; *Geschichte der Social-Politischen Partien in Deutschland*.

JORGENSEN, JORGEN, a Danish adventurer, who, in the beginning of the present century, made a descent on the island of Iceland, and reigned there as protector for about six weeks, was the son of a watchmaker in Copenhagen, and was born in that city in 1779. On June 21, 1809, having previously visited the island in a ship in which he held the position of interpreter, Jorgensen arrived at Reikiavik in the *Margaret and Ann*, an armed merchantman from London, carrying 10 or 12 guns. A few days after he surrounded the house of the governor, took him prisoner, and informed the townspeople that he should hold Iceland in possession for England, "until such time as the English fleet should relieve him." He then issued several proclamations, announcing "that relations with Great Britain should be set on a firm footing, and Iceland be placed under her protection." He also organized a "government office," confiscating all Danish property, with whatever else he could lay hands on, *to the state chest*, and subjecting the inhabitants to all the miseries of an unscrupulous despotism. On Aug. 9, however, his brief reign was brought to a close by the arrival of a British man-of-war, the commander of which, hearing of the piratical invasion of Jorgensen, immediately seized upon and imprisoned him, restoring at the same time the previous condition of affairs. Jorgensen was carried to England, but he does not seem to have been visited by the punishment he so fully merited. He afterwards lived in London for some years, was convicted of robbery in 1820, and transported to Botany Bay in 1825. He d. in 1830.

JORIS, DAVID, 1501-56; b. Bruges, Belgium, the leader of an Anabaptist sect known by the name of Jorists or Davidists. Early showing a fondness for the art of glass painting, he was apprenticed to a glass painter, and soon displayed great aptitude in the work. To perfect himself in the art he visited Belgium, France, and England. Returning to Holland he married, and in 1524 settled at Delft, practicing his profession; but in 1528 he began to display unusual religious zeal against Romanism, and, while a procession was passing in Delft, he stopped the priests, accused them of deceiving the people by false teachings, and reproached them for worshiping images and pictures. He was arrested, imprisoned, and tried, and banished out of the country for three years. Abandoning the common principles of the reformation, he became an adherent of Anabaptist views. At first he did not identify himself with that sect on account of their disorderly conduct, and their doctrine of using the sword to establish their authority; but in 1534 he fully joined them by rebaptism. He was consecrated as bishop of Delft by Dammas, Ubbo, and others. He showed great zeal in behalf of the Anabaptists; his influence was very great and his followers numerous. The Anabaptist leaders, jealous of his success, openly disavowed him. But at the convocation of Anabaptists in 1536, Joris fearlessly declared himself a divinely appointed leader, and soon afterward issued a pamphlet calling all parties to a peaceful union. The leaders were still more provoked, and most of the Anabaptists forsook him. Those who adhered to him took the name of Jorists or Davidists. He professed to have visions and revelations, and interpreted the persecutions to which his followers were subjected as proofs of the divine favor. At Delft, Haarlem, Amsterdam, Rotterdam, Leyden, and other cities, many suffered death for their adherence to him. His own mother died on the scaffold, a martyr to the doctrines which her son was propagating. Joris left Holland, and fled to the landgrave of Hesse, who refused him an asylum unless he came as a Lutheran. Suddenly in Basle, Switzerland, appeared in 1544 a man by the name of John of Bruges. He was a man of wealth, a communicant in the reformed church, and had come to reside there with his family. He was highly esteemed for his wealth and his virtues, and died peacefully with his family in 1556. This was David Joris. His son-in-law, Nicholas Blesdyek, a reformed preacher, but an avaricious and unprincipled man, after his death denounced him as guilty of the most blasphemous errors. The clergy and university declared his opinions heretical, and his body was dug up and burned. Joris was a man of excessively fervid imagination, and in religion a mystic, believing that he had divine visions, and making religion consist in the exclusion of all external objects from the thoughts, and the cultivation of silence, contemplation, and a peculiar, indescribable state of the soul. He rejected the doctrine of the Trinity, and held strange views concerning Christ. He believed that Joris was to establish internally and externally the eternal kingdom of Christ, which before was the kingdom of Christ only internally. He denied the doctrine of future judgment and the existence of angels. He held, like Manes, that the body only was defiled by sin. Of his 250 books and 1000 letters the most important is the *Book of Miracles*, under the title of *Wonderboek*. A catalogue of his writings and a complete account of his life and work were published by prof. Nippolt of Heidelberg. See DAVIDISTS.

JORNANDES, or **JORDANIS**, a historian of the 6th c., was by birth a Goth, or both of Alan and Gothic descent. He was first a notary, but afterwards adopted the Christian religion, and was made bishop of Crotona, in Italy. He wrote two historical works in the Latin language; the first, *De Regnorum et Temporum Successione*, is a short compendium of the most important events in history from the creation down to 552 A.D.; but the work is only valuable from the accounts in it of several barbarous northern nations. His other work, *De Origine Actuque Seticæ Gentis* (concerning the origin and deeds of the Goths), is a work which has obtained great renown, chiefly from its being our only source of information about the Goths and other barbarian tribes, except when they are casually mentioned by some Greek or Latin historian. The work is, however, full of inaccuracies, both of time, place, and person. There are many editions of both works.

JORTIN, JOHN, D.D., 1698-1770; b. London. His father was a French Protestant of Brittany, having come to England on the revocation of the Edict of Nantes by Louis XIV. The son was educated at the Charterhouse and Jesus college, Cambridge, taking his first degree in 1719; soon became a fellow of the college, and graduated as M.A. in 1722. While at Cambridge he published a small volume of Latin poems entitled *Lusus Poetici*, which are regarded as worthy of a high place among modern Latin verses. He was presented with a living in Cambridgeshire, but after his marriage removed to London, where he became an admired preacher. His sermons at this time, many of which are printed, are distinguished for acuteness of thought and freshness of style. He was rector of Eastwell in Kent and St. Dunstan's-in-the-east; became in 1762 the domestic chaplain of the bishop of London; was presented with the living of Kensington and a prebend in the church of St. Paul's. In 1764 he was made archdeacon of London. He resided at Kensington when he died. His most important works were: *Miscellaneous Observations upon Authors, Ancient and Modern*; *Remarks on Ecclesiastical History*, 5 vols.; *Life of Erasmus*; *Truth of the Christian Religion*; *Sermons*, 4 vols.; *Tracts—Philological, Critical, and Miscellaneous*. He wrote also criticisms on Spenser, Milton, Tillotson, cardinal Pole, Seneca, and others. His works, theological and critical, display great learning and acuteness, and a peculiar terseness of language.

JORUL'LO, a volcanic mountain in the Mexican confederation, situated 150 m. w.s.w. of the city of Mexico, was thrown up, in Sept., 1759, to the height of 1875 ft. from a plain, which itself was 2,890 ft. above the level of the sea; lat. 19° 10' n., long. 101° 2' west. This new creation originally consisted of a series of cones of various sizes.

JOSEFFY, RAPHAEL, b. Pressburg, Hungary, 1852. He received a musical education, and soon distinguished himself as a pianist. He has traveled extensively in Europe and America, and has been everywhere received as a worthy successor to Liszt. He has delicate touch, great facility of execution, and exquisite finish.

JOSEPH, son of Jacob, B.C. 1745-1635 as is conjectured; b. Padan-Aram, Syria. As the favorite of his father he was envied by his brothers, who, angered by his dreams, which predicted his future supremacy, sold him into Egypt. His master, Potiphar, an officer of Pharaoh, made him steward of his house, but, on a false accusation of Potiphar's wife, threw him into prison. The keeper put the whole prison under his control. His interpretation of the dreams of two of Pharaoh's officers having been fulfilled, Pharaoh called upon him to interpret his own strange dream. He did so, predicting seven years of plenty and seven years of famine. Pharaoh gave him authority to do whatever he deemed needful for the safety of the people, and exalted him to be ruler over all the land, second only to the king. In the plentiful years he laid up food in storehouses, and in the years of famine sold it to the people, taking first their money, then their cattle. When these were exhausted they offered their bodies and their lands. So Joseph bought for Pharaoh all the land except that of the priests. He then gave them seed, requiring only that one-fifth of the increase should be paid to the king. The adjacent countries sent to Egypt for grain; the sons of Jacob came also. Joseph forgave their ill treatment of him, and not only supplied them with food, but sent for his father and all the households of his brothers, and gave them houses in the best of the land of Egypt. When dying he took an oath of the descendants of Jacob, saying, "God will surely visit you, and ye shall carry up my bones from hence," which they did about 144 years later, in the exodus under Moses. Joseph's character was one of great tenderness and moral firmness, with high executive capacity. His is one of the brightest names in history.

JOSEPH, the foster-father of Jesus; a descendant of David king of Israel. He was espoused to Mary, afterwards the mother of Jesus, and when he hesitated as to taking her in marriage, an angel appeared in a dream announcing that the child to be born of her was the Son of God. When Cæsar Augustus decreed that all the world should be taxed, he went with Mary to Bethlehem, where Jesus was born, and was present when the shepherds, sent by an angel, came thither to see the holy child. When Herod sought to destroy the child after the visit of the wise men from the east, Joseph was warned again in a dream by an angel to flee into Egypt with the young child and his mother, which he did. After the death of Herod the angel of the Lord again appeared to him in a dream in Egypt, directing their return to the land of Israel. Subsequently, fearing danger to the child from Archelaus, his course was directed in a dream toward Nazareth of Galilee. He was by trade a carpenter.

JOSEPH I., Emperor of Germany, the eldest son of Leopold I., was b. at Vienna, July 26, 1678, was crowned king of Hungary in 1689, and king of Rome in 1690, became emperor in 1705, and died in 1711. The influence of the prince of Salm, who had the charge of his education, and his subsequent connection with prince Eugene, led him to embrace opinions much more liberal than those which have generally prevailed in his family, and he granted privileges to the Protestants of Hungary and Bohemia which had been refused by his predecessors. He also concluded a treaty in 1707 with Charles XII. of Sweden, by which he granted religious liberty to the Protestants of Silesia, and restored to them over 200 churches which had been taken from them by the Jesuits. He was fond of courtly ceremonial, but mild and affable, and sought to improve the condition of the peasantry in his dominions by relieving them from some of the oppressions to which they were subject. He eagerly and successfully prosecuted, in alliance with Britain, the war of the Spanish succession against France.

JOSEPH II., Emperor of Germany, son of Francis I. and Maria Theresa (q. v.), was b. Mar. 13, 1741, at a time when his mother's fortunes were in their lowest state of depression. He early gave proof of excellent abilities. After the peace of Hubertsburg, he was elected king of Rome, and after the death of his father (Aug. 18, 1765) emperor of Germany. Maria Theresa also associated him with herself in the government of the Austrian states; but for some time his actual share in it amounted to little more than the chief command of the army. On her death in 1780 he inherited all her dignities and power. He was ambitious of increase of territory, and although he failed in his object of adding Bavaria to the Austrian dominions, which he thought to consolidate by obtaining it in exchange for the Low Countries, yet he was successful in acquiring Galicia, Lodomeria, and the county of Zips, at the first partition of Poland, in 1772; and he appropriated, in 1780, great part of the bishoprics of Passau and Salzburg. He was a zealous reformer, having imbibed, like Frederick the Great, the principles of the philosophy which prevailed in that age, but he attempted his reforms too rashly, and too much by the exercise of mere authority, and was compelled to restore many things again to their former condition; the hostility of the nobles and clergy, whose power and privileges he sought to reduce, producing rebellions in various parts of his dominions. The clergy in particular regarded him with detestation. He had early shown a dislike to them, which caused no little vexation to his mother; and as soon as he found himself in full possession of the government of Austria, he proceeded to declare himself independent of the pope, and to prohibit the publication of any new papal bulls in his dominions without his *placet regium*. The continued publication of the bulls *Unigenitus* (q. v.) and *In cœna Domini* (q. v.) was also prohibited. Besides this he suppressed no fewer than 700 convents, reduced the number of the regular clergy from 63,000 to 27,000, prohibited papal dispensations as to marriage, and on Oct. 15, 1781, published the celebrated *Edict of Toleration*, by which he allowed the free exercise of their religion to the Protestants and not-united Greeks in his dominions. Pope Pius VI. thought to check this course by a personal interview with the emperor, and for that purpose made a visit to Vienna in 1782; and although he was quite unsuccessful in his object, he carried away with him the conviction that the people were utterly unprepared for the reforms which their sovereign sought to accomplish, a conviction the correctness of which the event abundantly proved. Joseph II. engaged in a war with Turkey in 1788, in which he was unsuccessful; and the vexation caused by this, and by the revolts in his own dominions, and the necessity under which he felt himself of revoking many of the edicts by which he had sought to promote the welfare of his people, hastened his death, which took place on Feb. 20, 1790. He founded many valuable institutions, and did much to promote the progress of arts, manufactures, and commerce in Austria.

JOSEPH, King of Naples. See BONAPARTE, JOSEPH.

JOSEPH, FATHER (François Leclerc du Tremblay), 1577-1638; the private secretary and confidant of cardinal Richelieu; was originally a soldier, but left the army and became a Capuchin friar. So great was his influence with the cardinal, and so well recognized his power, that he was known by the sobriquet of "his gray eminence," in contradistinction to the title of Richelieu. This fact has given rise to the choice of a subject by the celebrated painter Gérôme, whose work, "Son Eminence Gris," is well known to connoisseurs. The religious zeal of father Joseph actuated his entire official life; and conversion and the dissemination of the principles of the church, even though with fire and sword, were the objects most dear to him. In pursuance of these objects he sent missionaries to India, and even to England and Canada, while he sought earnestly to organize a crusade against the followers of Mohammed. A priest of ascetic habits, but of fiery enthusiasm, father Joseph was also a statesman of broad views and comprehensive knowledge, and one of the shrewdest and most able diplomatists of his time. So highly was he esteemed for this remarkable combination of valuable qualities—at a period when the church and politics were inextricably mingled in all civilized countries—that the pope was induced by Louis XIII., to promise him a cardinal's hat; but this honor was not actually conferred upon him, being prevented by his death. It is asserted that an important manuscript by father Joseph is deposited in the national library of Paris, supposed to be the history of the reign of Louis XIII.

JOSEPH OF ARIMATHEA, a rich and devout Israelite, a native of Arimathea, a city of Judea, thought to be Ramah of the Old Testament, and by many identified as the modern Ramlah. From the gospels we gather that he was a member of the Jewish grand council or Sanhedrim. Though not consenting to the judgment of his colleagues, he appeared either not to have had sufficient courage, or not to have found a hopeful occasion, to protest against their conspiracy for the death of Jesus. At any rate we know that through fear he did not openly profess himself a disciple of Christ. But, like the centurion, he was convinced by what he saw at the crucifixion that Jesus was the Son of God, and on the evening of that day, when the triumph of the priests and rulers seemed complete, he "went in boldly unto Pilate, and begged the body of Jesus." Having gained permission, he, with Nicodemus, embalmed and entombed it. There is a tradition, interesting but quite unsupported, that Joseph was one of the 70 disciples and preached the gospel in Great Britain.

JOSEPHINE, a co. of s.w. Oregon, bordering on California, bounded n. by the Rogue river; watered by the Rogue and Illinois rivers; 1605 sq.m.; pop. '90, 4878. It is diversified by mountains, valleys, and forests, and has a soil partly fertile. Gold mines and copper ore are found. Co. seat, Grants Pass.

JOSÉPHINE, MARIE ROSE, empress of the French, was b. June 23, 1763, in the island of Martinique, where her father, Tascher de la Pagerie, was capt. of the port at St. Pierre. She had only an indifferent colonial education; but her qualities of mind and heart, even more than her beauty, won universal regard. When about 15 years of age she came to France, and soon after married the viscount Alexandre Beauharnais; of which marriage were born Eugene, viceroy of Italy, and Hortense, queen of Holland, and mother of the emperor Napoleon III. Josephine's husband having been executed during the reign of terror, she herself just escaped through the events of 9th Thermidor (July 27, 1794). She was married, Mar. 9, 1796, to Napoleon Bonaparte, accompanied him in some of his campaigns, and exercised a great influence in restraining him from measures of violence and severity. At Malmaison, and afterwards at the Luxembourg and the Tuileries, she attracted round her the most brilliant society of France, and contributed not a little to the increase of her husband's power. She regarded his exaltation to the throne, however, with a presentiment of evil; and from the day of her becoming empress, seemed to dread that political motives might lead him to seek the dissolution of a marriage which had proved unfruitful. After scenes of the most painful kind this took place. The marriage was dissolved by law on Dec. 16, 1809. Josephine retained the title of empress, corresponded with Bonaparte, and if the allied sovereigns had permitted would have rejoined him after his fall. She lived near Evreux, and died, after a short illness, on May 29, 1814. Compare *Histoire de l'Impératrice Joséphine* (2 vols. Paris, 1859), by M. J. Aubenas.

JOSEPHUS. FLAVIUS, a celebrated Jewish historian, was b. at Jerusalem, 37 A.D. He was of both royal and sacerdotal lineage, being descended, on the mother's side, from the line of Asmonean princes, while his father, Matthias, officiated as a priest in the first of the twenty-four courses. The careful education he received developed his brilliant faculties at an unusually early period, and his acquirements both in Hebrew and Greek literature—the two principal branches of his studies—soon drew public attention upon him. Having successively attended the lectures at the paramount religious schools of his time—"sects," as he inaccurately terms them—he withdrew into the desert, to a man whom he calls Banos, and who is conjectured to have been either a follower of John the Baptist or an Essene. Three years later he returned to Jerusalem, and henceforth belonged to the body of the "Pharisees," which, in fact, comprised the bulk of the people. So great was the regard for his abilities that at the age of only 26 years he was chosen delegate to Nero. When the Jews rose in their last and fatal insurrection against the Romans, Josephus was appointed governor of Galilee. Here he displayed the greatest valor and prudence; but the advance of the Roman general Vespasian (67 A.D.) made resistance hopeless. The city of Jotapata, into which Josephus had thrown himself, was taken after a desperate resistance of 47 days. Along with some others he concealed himself in a cavern, but his hiding-place was discovered, and being brought before Vespasian, he would have been sent to Nero, had he not—according to his own account, for Josephus is his own and his sole biographer—promised that his captor would yet become emperor of Rome. Nevertheless, he was kept in a sort of easy imprisonment for about three years. Josephus was present in the Roman army at the siege of Jerusalem by Titus; and after the fall of the city (70 A.D.), was instrumental in saving the lives of some of his relatives. After this he appears to have resided at Rome, and to have devoted himself to literary studies. The exact period of his death is not ascertained. All we know is that he survived Agrippa II., who died 97 A.D. He was thrice married, and had children by his second and third wives. His works are: *History of the Jewish War*, in 7 books, written both in Hebrew and Greek (the Hebrew version is no longer extant); *Jewish Antiquities*, in 20 books, containing the history of his countrymen from the earliest times down to the end of the reign of Nero (the fictitious Hebrew *Josippon*, which for a long time was identified with Josephus's *Antiquities*, dates from the 10th c. A.D.); a treatise on the *Antiquity of the Jews*, against Apion, in 2 vols., valuable chiefly for its extracts from old historical writers; and an

Autobiography (37–90 A.D.), in one book, which may be considered supplementary to the *Antiquities*. The other works attributed to him are not believed to be genuine.

The peculiar character of Josephus is not difficult to describe. He was, in the main, honest and veracious; he had a sincere liking for his countrymen, and rather more pride and enthusiasm in the old national history than he could well justify; but the hopelessness of attempting to withstand the enormous power of the Romans, and an aversion to martyrdom, caused him to side with the enemy—perhaps in the faint hope of being thus of some use to the national cause. The influence of Greek philosophy and learning is visible in all his writings, and, as far as biblical history is concerned, infused into it a tone of “rationalism.” He speaks of Moses as a human rather than a divinely inspired law-giver; he doubts the miracle in the crossing of the Red sea; the swallowing of Jonah by the whale; and, generally speaking, whatever is calculated to teach that there was a special miraculous Providence at work on behalf of the chosen people. His style is easy and elegant, and Josephus has often been called the Greek Livy. The *editio princeps* of the Greek text appeared at Basel (Froben) in 1544. Since then the most important editions (with notes) are those of Hudson (Oxford, 1720), Havercamp (Amst. 1726), Oberthür (Leip. 1782–85), Richter (Leip. 1825–27), and Dindorf (Paris, 1845). Bekker-Naber (Leip. 1888–94), *Kritische Ausgabe von Niese* (Berl. 1885–92). See also Bärwald, *J. in Galiläa* (Bresl. 1877); Böttger, *Topographisch-historisches Lexicon zu den Schriften des J.* (Leip. 1879); Bloch, *Die Quellen des J. in seiner Archäologie* (1879); Olitzki, *Flavius, J. und die Halacha* (Leip. 1886); Krenkel, *J. und Lucas* (1894). Josephus has been frequently translated; the three best known versions in English are by L'Estrange (Lond. 1702), Whiston (Lond. 1737), and Shilleto (Lond. 1888–89). Consult also Schürer's article *Josephus* in Herzog-Plitt's *Real-Encycl.* vol. 7 (1880).

JOSHUA (Heb. *Yehoshua*, “Jehovah helps”), the name of the celebrated Hebrew warrior under whose leadership the land of Canaan was conquered. He was the son of Nun, of the tribe of Ephraim, and was born in Egypt. Before the Israelites had reached Sinai he was chosen by Moses to command the troops that fought against Amalek; and shortly before the death of the great lawgiver, he was publicly invested by the latter with the whole civil and military government of the Israelites. The vigorous and, on the whole, successful manner in which he pursued the conquest of Canaan, and distributed the land among the tribes, is minutely described in the book which bears his name. He died at the age of 110, and was buried at Timnath-Serah, in Ephraim. The so-called book of Joshua, in its present form, containing an account of the conquest and division of the “Land of Promise,” was neither written by him nor by any of his contemporaries; but the compiler has certainly made copious use, especially in the earlier chapters, of documents drawn up during the period of the conquest. Such passages as that relative to the harlot, Rahab—“and she dwelleth in Israel unto this day” (vi. 25)—demonstrate their own antiquity; but on the other hand, such passages as the narrative of the capture of Hebron (of which there are several), which did not take place till after the death of Joshua; the frequency of the expression “unto this day,” in connections that forbid us to suppose the interval a brief one; the allusion to Judah and Israel as distinct (xi. 21); the lateness of many of the grammatical forms, etc., clearly indicate the gradual growth of the book under successive editors, the last of whom is placed by Masius, Spinoza, Hasse, etc., after the exile, and by Ewald in the time of Manasseh; while Keil and others place the book in the time of Saul. A Samaritan book of Joshua (*Chronicon Samaritanum*), containing a chronological narrative of events from the death of Moses down to the time of the Roman emperor Hadrian, compiled from Arabic and Hebrew sources, about 1300 A.D., is extant in Arabic, and was first edited at Leyden in 1848, by Juynboll, along with a Latin version. It differs very considerably from the canonical book of Joshua.

JOSHUA, BOOK OF (see **JOSHUA**), consists mainly of records made at the time of the events related, by a person or persons fully conversant with them, and under the direction of the great leader whose name the book bears. The accounts of the crossing over the river Jordan, of the memorial erected, of the battles, victories, punishments, treaties, are given with a definite fullness possible only for eye-witnesses, actors, and leaders in the scenes described. The division of the land by lot, and the grant of cities to the priests and Levites, by the people out of their inheritance, were made from written descriptions previously prepared and recorded in a book by surveyors expressly charged with the work. The covenant into which the people entered to serve the Lord was recorded by Joshua at the time it was made. These various accounts comprise the chief portions of the book. Besides these there are a few particulars, not affecting its integrity, that were added at a later day. These are: (1) a line added to the statement that Joshua saved Rahab with all her property and family, “and she dwelleth in Israel until this day;” (2) a sentence added to the description of Judah's lot, “as for the Jebusites—the inhabitants of Jerusalem—the children of Judah could not drive them out; but the Jebusites dwell with the children of Judah, at Jerusalem, unto this day;” (3) the accounts added at the close concerning Joshua's death and burial; the fidelity of Israel to their covenant all the days of the elders who outlived him, and had known the works of the Lord; and the death of Eleazar the priest. The land of Palestine has been examined by many persons with the book of Joshua in their hands. Among them may be mentioned Ritter,

Robinson, Stanley, and Thomson. Such men say that the book of Joshua bears the same relation to the conquest of Palestine that the Domesday Book of England bears to the Norman conquest. The book being received as genuine is a proof of the conquest of the land; the land being examined is a proof of the accuracy of the book. This book of Joshua is full of strange names, according to the divisions of the whole land, in the mountains, valleys, plains, springs, the wilderness, and the s. country; and when they whose ears have been trained to the work of listening for the ancient names go seeking for information from place to place, while the inhabitants hold their peace, or tell only absurd legends, it is scarcely a figure of speech to say that "the stones cry out" in attestation of the book.

JOSIAH (Heb. *Yoshiyahu*, "Jehovah will help"), one of the kings of Judah, was the son of Amon and Jedidah, and succeeded his father (641 B.C.) at the age of 8 years. He was apparently brought up under the care of the priesthood, early manifested a pious disposition, and became a determined religious reformer, purging Judah and Jerusalem from idolatry. In like manner, it seems, he marched through the land of Israel. This statement has naturally excited much surprise. For more than a hundred years the kingdom of Israel had been a part of the Assyrian empire; its people were, for the most part, carried into exile and their place supplied by heathen colonists. It was in the reign of Josiah that Hilkiah the high priest found the "book of the Torah"—by which some understand Deuteronomy, others Exodus, and others, again, the whole Pentateuch—while the workmen were repairing the temple. Josiah does not appear to have heard of its existence before; at least, the words of it strike him as something novel, and excite the profoundest emotions in his breast. In commemoration of the discovery the king celebrated the feast of the passover with a splendor never before equaled. After this he continued his work of extirpating every trace of idolatry. Wizards, conjurers, "all the abominations" that could be "spied in the land," were "put away." In these efforts the monarch seems to have spent the greater part of his reign. He met his death at Megiddo, in the valley of Esdraelon, when attempting to check the advance of Pharaoh-Necho against the Assyrians. (Compare *Herod.* II. 159.) Josiah was the last of the good kings of Judah. In his days prophesied Jeremiah and Zephaniah.

JOSIKA, MIKLÓS (NICHOLAS), Baron, a very remarkable Hungarian novelist, was born of a distinguished family, Sept. 28, 1796, at Torda, in Transylvania. In his youth he served for some time in the Austrian army, but resigned his commission in 1818, married a wealthy Hungarian heiress, and for many years devoted himself to agriculture and study. His first works appeared in 1834 under the title of *Irány and Vázlatok*, and were exceedingly popular. From that period till the revolution in 1848 he wrote about 60 volumes of novels, all of which were published at Pesth. The most important are *Az utolsó Bátorý* (The Last Bátorý, 3 vols. 1840); *Zrínyi a Költő* (The poet Zrínyi, 4 vols. 1843); *A Csehek Magyar országban* (The Bohemians in Hungary, 4 vols. 1845); and *Josika István* (Stephen Josika—one of the author's ancestors—5 vols. 1847). Involved in the Hungarian revolution, he was obliged to abandon his native country, and afterwards resided at Brussels, where he continued his literary labors. In 1864 he removed to Dresden, where he died in 1865. Among his productions written in exile are *Egy Magyar Család a forradalom Alatt* (A Hungarian Family during the Revolution); *The Maillly Family*; and *Esther* (Esther). Josika is a thoroughly natural novelist, and drew his materials almost wholly from the history of his own land. He has been called the Walter Scott of Hungary. See his *Memoirs* (1865).

JOSIPPON, BOOK OF, a celebrated Hebrew chronicle, supposed to have been written by Joseph-ben-Gorion. From A.D. 950 to our own time it was quoted as a genuine work of Josephus. But from late critical inquiry it is believed to be a production of the middle ages. The author was probably a Jew who lived about the 9th or 10th century. Steinschneider believes the author to have been a native of northern Italy, and considers the chronicle the "Hebrew edition of the Latin Hegesippus." The Jewish historian and critic Grätz holds that it is simply a translation of an Arabic book of Maccabees, entitled *History of the Maccabees of Joseph-ben-Gorion*. The chronicle consists of six books. Beginning with Adam it explains the genealogical table in Gen. xi., recounts the history of Rome, Babylon, Cyrus, the fall of Babylon; then resuming the history of the Jews, describes the times of Daniel, Zerubbabel, Esther, etc.; gives an account of Alexander the great and his successors; of the translation of the Old Testament into Greek; of the Maccabees, the Herodians, and the last war ending with the destruction of the temple by Titus. This work was first printed in Mantua in 1476, and other editions appeared afterwards in different places. It has been translated into Arabic, Latin, German, and English.

JOSQUIN, DES PRÉS, or DEPRÉS, 1450–1531; b. Hainaut, Belgium. He was a pupil of the celebrated Johann Ockenheim for several years in Paris. Many Italian writers claim him as a native of Italy, which may be accounted for by his having lived there, and because of the frequent addition to his name of *Pratensis* or *Del Prato*, from a town in Tuscany. He was a singer in the pontifical chapel of Sixtus IV. Leaving Italy he was appointed *Maitre de Chapelle* to Louis XII., for whom he composed much music. The king having promised him a benefice, and having failed to grant it, Josquin wrote

a motet beginning *Memor esto verbi tui*, which having no effect, he wrote another, commencing *Portio mea non est in terra viventium*, when Louis bestowed the benefice, and Josquin composed a third, expressing his gratitude, beginning *Bonitatem fecisti cum servo tuo, Domine*. Josquin was a voluminous composer. Many of his works are in the British museum. He is worthily considered the greatest composer before Palestrina, and "he may," says Dr. Burney, "be justly called the father of modern harmony." He was buried in the church of St. Gudule.

JOSS, **JOSS-STICK**, **JOSS-HOUSE**. When the Portuguese Jesuit missionaries taught the Canton Chinese to pronounce the name of God (Deus or Deos), the word in Chinese mouths became "Joss," and the Chinese used this word to answer questions or give information concerning their deities, temples, and sticks of incense. Hence the strange term for deity in "pidgin" Chinese.

JOSELYN, **JOHN**, b. Kent, Eng.; sailed for America and reached Boston in 1638; came again in 1663, returning to England in 1671. In 1672 he published in London *New England's Rarities Discovered*; in 1674, *An Account of two Voyages to New England*; *Chronological Observations of America from the Year of the World to the Year of Christ*.

JOST, **ISAAK MARKUS**, an eminent Jewish scholar of Germany, b. at Bernburg in 1793, d. 1860. His principal works are *Geschichte der Israeliten* (History of the Israelites, 9 vols., Berl. 1820-29, to which was added a tenth during 1846-49, entitled *Neuere Geschichte der Israeliten von 1815-45*); *Allgemeine Geschichte des Jüd. Volkes* (Universal History of the Jewish People, 2 vols., Berl. 1831-32); a Translation (into German) of the Mishna, with text and commentary (6 vols. Berl. 1832-34); *Gesch. des Judenthums*, etc. (3 vols., Leipsic, 1857-59). He also edited a journal entitled *Israelitische Annalen* (Fkf. 1839-41). Besides being a savant he was a patriot, and warmly interested himself in behalf of the social and political liberties of his countrymen.

JOTA ARAGONESA, **LA**, a national dance of northern Spain. It is a species of waltz - in 3-time. Camille Saint-Saëns has made a transcription of the melody for the orchestra, op. 64, which has been arranged by the composer for the pianoforte and violin, and for the pianforte for four hands. Glinka also wrote a Capriccio brillante for orchestra on the theme.

JO'TUNS, or **JÆTTEN**, divinities in the Scandinavian mythology, which personified various elements in the principle of evil. Their stature and strength were gigantic, but their intelligence was inferior to that of human beings, by whom in conflict they were invariably defeated. Such intelligence as they possessed was supposed to be the expression of their extreme malignity, which made them inimical to humanity, and equally so to the gods of the Valhalla. They appeared, in fact, as mythical exponents of the malign forces of nature, between which and human authority there must ever be active war.

JOUBERT, **BARTHÉLEMY-CATHERINE**, 1769-99; b. France; educated for the bar, but entered the army, and was second in command to Napoleon in the war in Italy. Enlisting in 1791, Joubert was promoted in 1795 to a major-generalship. He commanded the French army in Holland, but resigned in 1799 and went to Paris. He was reappointed to command, and replaced Moreau in Italy, where he gained slight advantages against the combined Russian and Austrian forces, but was defeated by Suwarrow at Novi, where he fell mortally wounded. So highly was he regarded by the French directory that it was generally believed that he would have been given the supreme command in place of Napoleon, had he lived.

JOUDPORE, or **JODHPORE**, a city in Rajpootana, Hindustan, capital of a protected state of the same name; lat. 26° 19' n., long. 73° 8' e. Pop. '91, 61,849. Besides several magnificent tanks, the place is remarkable for its elaborately constructed and deep wells. The state of JOUDPORE, or MARWAR, is the most populous of the principalities of Rajpootana.

JOUFFROY D'ABBANS, **CLAUDE FRANÇOIS DOROTHÉE**, Marquis de, 1751-1832; b. Paris; disputed with Fulton the honor of first having applied steam to navigation. Witnessing the operation of a fire-engine, he believed that steam could be used for vessels on water. He made his first attempt with a small propeller on the Doubs in 1776, but the experiment was a failure. In 1783 he made another experiment on the Saône, with more success; but for want of pecuniary means and support, he failed to prosecute it. The government refusing him a patent, he went to England. Returning to France he became acquainted with Fulton, who admitted the merit of the experiments. He received permission in 1816 to form a company, and put his first steamer, called *Charles Philippe*, on the Seine; but the attempt was unsuccessful. He withdrew to the Hôtel des Invalides, and died there of cholera. His claim was acknowledged by Arago, and in 1840 by the French academy. Jouffroy published *Les Bâteaux-à-Vapeur*, and wrote for the academy *Memoires sur les Pompes à Feu*.

JOUFFROY, **THEODORE SIMON**, a French philosopher, was b. July 7, 1796, at Pontets, a village of the Jura, early devoted himself to the study of philosophy, and became a teacher of it, and in 1833 a professor in the collège de France. His bad health compelled him to resign his professorship in 1837, and he died Feb. 4, 1842. His works consist chiefly of studies of the Scottish philosophy, and he published translations of the works of Reid and some of those of Dugald Stewart with notes and introductions.

Of his original works, the most valuable is *Mélanges Philosophiques* (1833). He was also known as a political writer, and in 1824 took part in establishing the newspaper *Le Globe*. He was for some time a member of the chamber of deputies, and was a follower of Guizot.

JOUGS, JUGGS, or JOGGS, the name given in Scotland to a form of pillory which was used also in Holland, and probably in other countries. The jougs were nothing more than an iron ring or collar, fastened by a chain of two or three links to a pillar or wall in some public place, such as a market cross, a market tron or weighing-post, a prison door, a church door, a churchyard gate, a churchyard tree, a tree beneath whose branches courts were held, and the like. The ring or collar opened by a hinge or joint, so as to inclose the culprit's neck, when it was secured by a loop or staple, and a padlock. The jougs were employed as a punishment as well for ecclesiastical as for civil offenses. They may be traced as far back as the 16th c., and although they have not been in use for the last hundred years, they may still be found hanging at a few country churches. The jougs obviously take their name from a widely-spread root, which appears in the Sans. *yuj*, the Gr. *zugon*, the Lat. *jugum*, the Ital. *giogo*, the Fr. *joug*, the Ger. *joch*, the Ang.-Sax. *iocc*, and the Eng. *yoke*. The branks (q.v.) were occasionally hung on the same pillar with the jougs.

JOULE, JAMES PRESCOTT, physicist, b. at Salford, England, 24 Dec. 1818, d. near Manchester, Sept. 11, 1889. Although largely self-educated in science, at the age of nineteen he published in the *Annals of Electricity* a description of an electro-magnetic engine which he had himself invented. Further investigation as to the amount of heat evolved from electricity led him to gain, along with Jacobi of St. Petersburg, important results concerning the motive power of the magnetic forces.

These results were embodied in Joule's law, and for this and other services to science, Dr. Joule received the Copley and other medals and numerous honors from the leading universities and scientific societies throughout the world.

JOURDAN, ANTOINE JACQUES LOUIS, 1788-1848; b. Paris; was a surgeon in the army and in military hospitals, and took the degree of M.D. in Paris in 1819. He published *Traité complet des Maladies Vénériennes*, 2 vols.; *Pharmacopée Universelle*, 2 vols.; *Dictionnaire Raisonné, Etymologique, Synonymique, et Polyglotte, des Termes usités dans les Sciences*, 2 vols. His translations from German, Italian, Latin, and English medical works are numerous.

JOURDAN, JEAN BAPTISTE, Comte, a French marshal; b. April 29, 1762, at Limoges, where his father was a surgeon. He early entered the army, embraced with great zeal the cause of the revolution, and soon rose to the rank of a general of division. In Sept. 1793, he obtained the command of the army of the north, and Oct. 16 gained an important victory at Wattignies. In 1795 he was less successful in his campaigns; while in 1796 he pushed his way far into Germany, was driven back by the archduke Charles at Amberg and at Würzburg, and this discomfiture led to his resignation of his command. In 1799 the directory intrusted him with the command of the army of the Danube; but he was defeated by the archduke Charles at Ostrach. Although he opposed the *coup d'état* of 18th Brumaire, the first consul employed him, in 1800, in the reorganization and administration of Piedmont; and on the establishment of the empire, in 1804, he was made a marshal and a member of the council of state. He accompanied king Joseph to Naples, and afterwards to Spain, and in his service he was actively employed as a general. He offered his services to Napoleon after his return from Elba. Louis XVIII. made him a count in 1815. In 1819 he was made a peer of France; but his republican principles led him to enter heartily into the revolution of 1830. He lived and died poor. His death took place Nov. 23, 1833.

JOURNALISM. See NEWSPAPER, AMERICAN JOURNALISM.

JOURNALISM, COLLEGE, embracing those periodicals edited and published by the undergraduates in colleges and other educational institutions. College journalism is peculiar to America. The students in the English universities have, from time to time, attempted to establish similar publications, the most notable of which, *The Snob*, was edited by Thackeray while at Cambridge in 1829. Other sporadic efforts in the direction of college journalism have rarely lasted longer than the college life of their original projectors. *The Oxford and Cambridge Undergraduates' Journal* is little more than an official calendar, and is in no sense a college paper as we understand the term. In America, the first college periodical was the *Gazette*, published in Dartmouth college in the year 1800. Daniel Webster, then an alumnus of some years' standing, was among its early contributors. The *Yale Literary Cabinet* was published in 1806 by the senior class of that year, and this was followed by the *Harvard Lyceum* in 1812. The oldest now in existence is the *Yale Literary Magazine*, which dates from 1836. There is hardly a college of any size in the country which does not boast a literary monthly or quarterly, generally conducted by a board of editors elected from the senior class, and devoted to the publication of essays, serious poems, and more or less successful attempts at "higher literature." But these magazines as well as the annuals which are published by the junior classes in many of the colleges are entirely distinct from the college paper, the most recent and flourishing development of this peculiar phase of journalistic endeavor.

The typical college paper is a weekly or bi-weekly, while two or three of the larger colleges support dailies. The *Yale News* and *The Cornell Sun* are fair examples of these.

The *Princetonian* is published tri-weekly. Among the most prosperous college weeklies are the *Harvard Advocate*, *The Yale Courant*, *The Columbia Spectator*, *The Trinity Tablet*, *The Williams Athenæum*, *The Cornell Era* and the *Brunonian*. The peculiar system of management which keeps the college paper alive year after year also involves a periodical fluctuation in the literary value of the publication. Each year, as a certain proportion of the board of editors graduate or go into a higher class, an equal number of new classmen are elected to fill their places. By this means it so happens that the publication is kept going, and the general tone and policy of the paper is preserved, while the literary tone is raised or lowered as the new men are [more or less clever than their predecessors.

A number of the most successful among our younger literary men have served their apprenticeship on the editorial boards of college papers, and each year they are coming more and more to be recognized as valuable training schools for professional journalism. It is true that the college editor learns a great deal that he has to unlearn when he takes a place on the daily paper, but he has at the same time gained considerable experience that is valuable to him. The college paper, as it is now conducted, gives to the student a considerable experience in practical journalism, affords an agreeable and profitable recreation, and gives to the patrons and friends of education an insight into the actual life of the college—a thing not to be gained from the annual official catalogues. It advertises in a dignified way the instructions represented, submits college sentiments, motives, projects and deeds to the test of deliberation and thoughtful perusal and is, generally speaking, a power in the college for good. There are now in the United States and Canada, according to the best newspaper directories, 232 undergraduate publications.

JOURNALISM, COMIC AND SATIRICAL, devoted to satire, humor and the art of caricature. While there have been sporadic flashes of wit, humor and the lighter view of thought in various periodicals since the earliest newspapers, the first avowedly comic publication that made any impress on the history of journalism was London *Punch*, which was founded in 1841. In its pages Tom Hood, Henry S. Leigh, S. S. Calverly, Frederick Locker, Frederick Burnand, and almost all of the lighter writers of the day together with Leech, Cruikshank, Doyle, Tenniel, Du Maurier and other illustrators whose names have been famous in the art of caricature, found a channel for their peculiar genius. For a long time *Punch* held the field in comparatively undisputed supremacy. Hosts of imitators sprang up and died, and it was argued that in America at least, the people had no time for avowedly comic periodicals. The daily papers almost without exception, furnished columns of humor and it was said that the American preferred to take his jokes in small doses with his breakfast each morning, rather than have it administered in a solid mass once a week. Some of the most brilliant literary men of the past generation tried to establish humorous papers in New York City, and the results were always financially disastrous. But within the past ten years the tide of public favor has taken a different turn, and now there is hardly a city of any importance in the country which has not one or more papers devoted to humorous literature and art. The improvements in engraving processes are, no doubt, largely responsible for this sudden growth of comic and satirical journalism, and the rapid increase of our leisure class has furnished a large clientèle. Education, too, has had much to do with it. To the boor the practical joke, involving physical action, most readily appeals to his sense of humor. He will laugh at a fellow falling down stairs and fail to see the delicate humor of a *bon mot* in *Life*. Some of the best writers and artists have turned their attention to humorous journalism, and a good deal of the matter appearing in our comic papers can fairly be ranked as literature. Politics have always and in every land, furnished a broad field for the pen of the satirical writer and the crayon of the caricaturist. In America this field is being worked to its utmost limit. The colors of the lithographer have been called into use and in political campaigns a pointed cartoon has often proved a most potent argument.

Among the best known English comic papers after *Punch*, are *Judy*, *Fun*, *Pick-me-up*, *Ally Sloper's Half Holiday*, now in existence and financially successful. Among the long list of failures the *Owl*, the *Hornet*, the *Tomahawk* and *Vanity Fair* are names associated with men distinguished in literature. The most successful comic papers in Germany are *Fleigende Blätter* and *Kladderadatsch*; in France are the *Petit Journal pour Rire*, *La Vie Parisienne*, and the *Journal Amusant*. American satirical and humorous papers—*Yankee Notions*, *Nick Naz, Pick*, the *Picayune*, the *Lantern*, *Young America*, *Vanity Fair*, *Momus*, *Mrs. Grundy*, *Punchinello*, *Yankee Do*, *Budget of Fun*, *Uncle Sam*, *Wit and Wisdom* (all now discontinued); the *Wasp* (in San Francisco); *Die Vehme and Puck* (Germ., St. Louis); *American Punch* (Boston, Mass.); *Puck* (New York); *Judge* (New York); *Texas Siftings* (New York); *Life* (New York).

Spain, Italy, Austria, Mexico and several of the South American Republics have comic papers possessing more or less merit, the humor being, as a general rule, of a broader character, and the pictures coarser in drawing and rather grotesque than humorous. In the United States comic journalism is steadily growing in popularity and influence. The "ready print" or as it is technically known "patent inside" system has been introduced by the proprietors of *Life*; and local papers devoted to society matters and humor, on the general lines of *Life*, have sprung up all over the country and are meeting with varying success.

JOURNALISM, ILLUSTRATED. The growth of illustrated journalism has been so rapid during the past ten years and so many valuable improvements have been made in engraving, photo-etching and printing processes that with these improvements it has come to be realized that art in journalism is only in its formative stage. Inventions are being brought forward every week which are designed solely for the purpose of facilitating or bettering the production of illustrated periodicals. A few years ago the wood cut was the only means employed for illustrating daily and weekly publications. At first the artist was obliged to draw the picture on the box-wood block, in reverse, before it was given into the hands of the engraver. This process was necessarily slow and anything in the way of fine work was out of the question except at the cost of much time, and money. The system of photographing the drawing on the wood block was a great step in advance and the photo-etching on metal plates followed soon after. The number and variety of processes have multiplied so rapidly that it would be impossible to recount them here or to attempt any accurate description of the processes themselves. Photo-engraving is one of the oldest and for some purposes the most desirable, though the slowest process. By this method the picture is photographed from a pen and ink or crayon drawing on a gelatine plate. The dark lines are hardened by the action of sunlight and the soft parts washed out with acids, forming a relief plate from which a plaster cast is taken, which in time serves as a mould for an electrotype. Its great advantage lies in the fact that it is cheaper and more rapid than wood engraving and capable of producing, for ordinary purposes, almost as good results. With favorable weather it requires about thirty-six hours to make a photo-engraving from a pen and ink or crayon drawing. This is manifestly out of the question for newspaper work.

Zinc etching, and what is known as the "chalk process" are the two methods in use in newspaper offices. The chalk process consists simply in scratching the picture upon a steel plate which has been covered with a preparation of chalk to a depth of about one-sixteenth of an inch. From this incised plate which forms the mould, a relief plate of type metal is cast. A rapid artist can produce a finished engraving suitable for newspaper illustration in about one hour and fifteen minutes. The objection to the chalk process is that as the chalk offers a certain resistance to the tool of the artist, it is impossible to produce the free outlines of pen and ink or pencil work. In zinc etching, the artist makes the drawing about twice the size of the intended cut. It is then reduced by photography and the photograph is transferred to a zinc plate. The dark portions of the gelatine film have been hardened by the action of light, leaving the whites soft and easily washed away. A film of greasy lithographic ink is then passed over the dark lines thus left in relief, and the plate is etched or eaten out with a solution of nitric acid, the greasy ink protecting the lines. A picture can be drawn and completed by this process in about an hour. It must be remembered in speaking of newspaper illustrations that the artist is still hampered by the limitations of rapid presswork, poor paper and cheap ink. The vast difference in this point alone between newspaper and magazine or weekly paper illustration can be best appreciated by comparison. The average newspaper is printed on paper weighing about forty pounds to the ream, and costing about five cents a pound; ink ranging in cost from six to twelve cents a pound is used, and it is rushed through the cylinder presses at the rate of seventy-five or eighty thousand an hour. The better class of illustrated periodicals on the other hand are printed on calendered paper weighing one hundred pounds to the ream and costing about ten cents a pound; the ink used ranges in price from seventy-five cents to two dollars per pound, and the presswork rarely exceeds nine hundred copies an hour. Certain processes of photo-chemical engraving known as the "half tone" processes have lately been introduced for use in high class publications, which give absolute direct reproductions of photographs and wash drawings. These plates can only be used with good ink or fine paper and a moderate speed of presswork. There is no doubt that illustrated journalism is on the increase rather than the decline. It was for a long time in the daily papers regarded as savoring of sensationalism, but with the improvement in the quality of work it is daily becoming more popular. The past history of illustrated journalism can be rapidly rehearsed.

The first illustrated journal approaching the character of those of the present day was the *Penny Magazine*, published in England by the Society for the Diffusion of Useful Knowledge, in 1833, and which reached a large circulation. In 1841 *Punch* was started, and the following year Messrs. Ingram and Cook founded the *Illustrated London News*, which was followed in 1843 by *L'Illustration*, published in Paris, and the *Illustrirte Zeitung* in Leipsic. The American illustrated press began with the *Illustrated American News*, New York, 1851; which was followed by the *Illustrated News*, New York, 1853. In 1855 the *Illustrated Times* was started in London, and in the same year Frank Leslie founded his *Illustrated Newspaper* in New York, which was soon followed by a number of similar publications whose line has continued with varying fortunes ever since. *Harper's Weekly* began publication in 1857; *Le Monde Illustré* in Paris, in the same year; *La Ilustracion Española y Americana*, in Madrid, 1856; *Illustrated News of the World*, in Paris, 1858; *Ueber Land und Meer*, in Stuttgart, the same year; and from that period onward, illustrated journals appeared in Copenhagen, Montreal, Birmingham, Vienna, Milan, Melbourne, and other cities in Europe and America. The first successful illustrated newspaper published in America was the *Illustrated News*, issued in 1853 by

P. T. Barnum and Messrs. Beach Bros. The art department of this paper was in charge of Frank Leslie, who applied many novel and ingenious devices to the saving of time and increasing the facility with which the work of printing illustrations was accomplished. These included, among other improvements, the use of the cylinder-press with inking table attachment; and the method of bolting blocks of wood together after engraving, thus enabling the distribution of full-page or double-page work among a number of engravers as soon as the drawing had been put on block. The establishment of the *New York Daily Graphic* in 1873 gave encouraging evidence of the possibility of applying the principle of illustrated journalism to the necessities of a daily newspaper. This was accomplished by means of a process in art which has been kept a secret from the general public, though the method is simply a particular form of lithography.

JOUSTS, exercises of arms and horsemanship, performed in the middle ages by knights and nobles. In the joust the combatants engaged one another singly, each against his antagonist, and not in a troop, as in the tournament (q.v.).

JOATEL, HENRI, b. Rouen in 1651; a French explorer; was in the army when young, and joined La Salle's exploring expedition to the mouth of the Mississippi in 1684. He was placed in command of the fort in Texas, and also in St. Louis, and was with La Salle in his last expedition, in 1687, when he was assassinated. With La Salle's brother, nephew, and three others he went to Canada, thence to France in 1688. His *Journal Historique du Dernier Voyage que feu M. de la Salle fit dans le Golfe de Mexique* was published in 1713.

JOVE. See JUPITER.

JOVELLA'NOS, GASPAR MELCHOR DE, 1744-1811; b. Gijou, Asturia, of an ancient and noble Spanish family; studied at the universities of Oviedo, Ávila, and Alcalá; was appointed immediately on leaving college, in 1767, judge of the criminal court of Seville; was made in 1778 chief judge of the king's court at Madrid. Here he became acquainted with Campomanes and other prominent literati of Spain, and was a member of several scientific societies. He formed the acquaintance also of Cabanis, a French adventurer, who, through court intrigue, was thrown into prison, and Jovellanos was banished under the pretext of exploring the natural resources of the Asturias. He improved his retirement in forming plans for developing the internal resources of the country, and founded the *Instituto Asturiano* for improving agriculture, working the mines, and promoting social and educational reform in Asturia. To this he devoted a large part of his official income. Cabanis being restored to the favor of Godoy, the prime minister, Jovellanos was recalled and made home-secretary of state under Godoy, who, however, soon again expelled him. Returning to Gijou he gave himself to the interests of the *Instituto Asturiano*. But in about two and a half years he was again arrested, and sent, in 1801, a prisoner to the island of Majorca, where he was kept closely for seven years, first in a Carthusian convent, afterwards in the castle of Belver. He spent his time here in study, commenced a *Flora Balearica*, and collected materials for a history of the island. On the French invasion he was recalled, and when Joseph Bonaparte became king he was offered the portfolio of the interior. Declining it he joined the patriotic party, was chosen a member of the central junta, and helped to reorganize the cortes. On the dissolution of the junta, Jovellanos retired to Gijou, whence, on the occupation of the town by the French, he escaped to Vega. Feared and hated by his enemies on account of his great influence, he perished by assassination. Jovellanos was the author of numerous compositions in prose and verse. Of the latter the most prominent are the tragedy of *El Pelago*; *Pan y Toros*; the comedy of *El Delincuente homado*; a translation of the first book of *Paradise Lost*; and a collection of miscellaneous pieces. But he was distinguished chiefly as a political economist.

JOVIA'NUS, FLAVIUS CLAUDIUS, b. A.D. 332; the son of Veronianus, a distinguished gen. under Constantius; of a noble Moesian family. He was capt. of the life-guards of the emperor Julian, attending him in his disastrous campaign against the Persians. Julian having fallen in battle, Jovian was proclaimed, A.D. 363, by the army, his successor. His first task was to save his army, harassed by the Persians, and suffering greatly for want of provisions. He reached the Tigris in safety, but found it impossible to cross, exposed to attack from the Persian force. Sapor proposed terms of peace, to which, though ignominious, Jovian was compelled to yield. The terms were that the Romans should surrender their conquests w. of the Tigris, together with the fortress of Nisibis, and many other strongholds in Mesopotamia, and should bind themselves not to aid the Armenians, with whom the Persians were then at war. His troops being in great distress he submitted to the harsh terms, and marched westward towards his kingdom. He surrendered Nisibis to the Persians, the inhabitants removing to Amida, which became the chief Roman town in Mesopotamia. On his arrival at Antioch he proclaimed himself a Christian; and rescinded the edicts of Julian against the Christians, but granting protection to such as remained pagans. He upheld the Nicene, or orthodox creed, against the Arians, and restored the bishops who had suffered at their hands. Athanasius, who visited him at Antioch, he reinstated in the see of Alexandria, from which he had been driven by the Arians. Acknowledged by the various provinces, he set out from Antioch for Constantinople, stopping at Tarsus to pay funeral honors to Julian's remains. Continuing his journey in unusually severe cold, of which several of his attendants died, he reached Ancyra, where he assumed consular dignity; and a

few days after came to Dadastana in Galatia. The next morning, Feb. 17, 364 A.D., he was found dead in his bed. Some attribute his death to suffocation from the fumes of a charcoal fire in his room; others, with more probability, to the dagger or poison of an assassin. He was 33 years of age and had reigned 7 months. Valentinian was proclaimed emperor by the army.

JOVINIAN, an Italian of the 4th c.; one of the opponents of monachism, which was strenuously advocated by the early fathers. But while opposing those who practiced celibacy and the maceration of the body by fasting, he himself remained single and lived like other monks, so that even his enemies admit that his life was blameless. He held also that Mary, after the birth of Jesus, ceased to be a virgin, that the blessedness of heaven does not depend on the merit of good works, that a Christian cannot sin willfully, but will resist and overcome the devil. He advocated his opinions first at Milan, but Ambrose forbidding their propagation, he went to Rome. He and those who followed him were condemned and excommunicated in a council held at Milan in 390, as the authors of a "new heresy and of blasphemy," and forever excluded from the church. Pope Symlicus confirmed the sentence, and the emperor Honorius enacted laws against the Jovinians. Their leader was banished to the lonely island of Boa, off the coast of Illyria, where he died before 406. But his opinions spread everywhere, and it was said that several nuns in Rome married. Augustine came forth in defense of the orthodox principles and practices of the ascetics, endeavoring by argument to reconcile them with reason and Scripture. Jerome followed in the same defense. But notwithstanding the attacks of the three great doctors, Ambrose, Augustine, and Jerome, the heresy, as it was called, spread, and was accepted in different parts of Christendom. Neander ranks the influence of Jovinian next to that of Luther.

JOVIUS, **PAULUS** (or **Giovio**), 1483-1552; b. at Como, of a noble family; a distinguished historical and biographical Italian writer. His name is properly Paolo Giovio, but he is better known by the Latinized form. He studied in the universities of Padua and Pavia for the medical profession, which he soon abandoned for literature. He applied himself to the Latin classics for the purpose of forming a good style. Soon after the election of Leo X. he went to Rome, was introduced to the pope, who, on reading some of Giovio's compositions, declared that, "after Titus Livius there was no writer more elegant or more eloquent," and thenceforth was his patron. He accompanied Cardinal Giulio de Medici on important missions to different countries, and when his patron became Pope Clement VII. he bestowed on him the bishopric of Nocera. Remaining in the capital he intrusted the charge of his see to his deputy. Giovio was present at the famous conference of Bologna in 1530 between the emperor Charles V. and the pope, when the emperor gave him the details of his expedition against the Algerine pirates, for the history which he was then writing. Paul III. did not regard Giovio with favor. That pope was zealous concerning church discipline, while Giovio was latitudinarian, if not an infidel or atheist, and the satirical poets accused him of all kinds of licentiousness. Withdrawing from the papal court he retired to his native Como, built a delightful villa, which he fancied to be like one of Pliny's villas, collected a museum, and made a picture-gallery of the distinguished men of his own and other ages. But the quiet of country life was irksome, and he visited the various courts of Italy, where his humorous conversation and genial *bonhomie* made him a welcome guest. In one of his visits to Florence he was seized with a violent attack of the gout, of which he died. He was buried in the church of St. Lorenzo, where a statue was raised to his memory. He died rich. His principal works were: *Historia sui Temporis*, 2 vols.; *Illustrium virorum vite*; *Libellus de Piscibus Romanis*; *Commentario delle Cose dei Turchi*; *Dialogo delle Impresse*; *Lettere Volgare*. The last is a collection of his letters published after his death, written in a style of jovial humor, and containing much literary and historical information concerning that age. Most of his historical works are untrustworthy, as he was disposed to favor his friends and patrons, and was too careless or indolent to verify his statements.

JOWETT, **BENJAMIN**, b. in London, 1817; educated at St. Paul's School; elected to a scholarship at Balliol College, Oxford, in 1835, and to a fellowship in 1838; was tutor in 1842, and ordained the same year; in 1854 was a member of the commission to consider the mode of admission by examination to the civil service, of which Macaulay was chairman; elected Regius Professor of Greek in the university in 1855; in 1870 was elected master of Balliol College. He published a *Commentary on the Epistles of Paul to the Thessalonians, Galatians, and Romans*, and contributed to the *Essays and Reviews* an article "On the Inspiration of the Scriptures," which being considered heretical, he was tried but acquitted. His chief work is *The Dialogues of Plato translated into English, with Analyses and Introductions*, 5 vols. He was elected vice-chancellor of the University of Edinburgh in 1882. D. 1893.—See *The Life and Letters of Benjamin Jowett* (1897).

JOWF, or **D'JOWF**, a province of Arabia, a dependency of Jebel Shomer, between 29° and 30° n. lat., and 39° and 41° e. long.; 700 sq. m.; pop. 40,000. It is an oasis, well watered, fertile, and has a temperate climate. The date-palm is largely cultivated, but the peach, apricot, fig, and grape grow in abundance, and are of superior flavor. Various cereals and leguminous plants also are grown. The gardens of the Jowf are

noted in that part of the e. for their fertility and beauty. They are irrigated by running streams. The inhabitants are of a superior class. The principal towns are Jowf and Sekakah.

JOY, CHARLES ARAD, PH.D., b. N. Y., 1823: was educated at Union college; graduated at Harvard law school. Later he attended the universities of Berlin and Göttingen, receiving his degree at the latter institution. In 1853 he was in Paris attending lectures at the Sorbonne, but returned to the United States the same year to accept the chair of chemistry in Union college. In 1857 he became professor of chemistry in Columbia college, New York, and remained there until 1879. He was editor of the *Scientific American*, and of the *Journal of Applied Chemistry*; contributed largely to Appletons' *New American Cyclopædia*; and prepared articles on scientific subjects for many of the periodicals of the day. He died in 1891.

JOY, JAMES F., b. N. H., 1810; educated at Dartmouth college, and settled in Detroit, Mich., 1836, where he practiced law. He became interested in railroad enterprises, and was prominent in the organization of the Chicago, Burlington and Quincy railroad, which was effected under that title in 1856. In 1866 he was president of the Michigan Central railroad, and held that position until as late as 1871. The St. Mary's Falls ship-canal was constructed by a company which he organized.

JOYCE, ISAAC WILSON, D.D., b. Ohio, 1836, of Irish ancestry; removed to Indiana about 1849; entered the n. w. Indiana conference, 1859; ordained deacon, 1861; elder, 1863; presiding elder 4 years. In 1880 represented his conference in general conference, and in that of the M. E. church of Canada; became pastor of St. Paul's (M. E.), Cincinnati; in 1883, of Trinity church of that city; in 1886 returned to St. Paul's; elected bishop, 1888.

JUAB, a co. of central Utah; 3828 sq. m.; pop. '90, 5,582. Much of it is mountainous, Mt. Nebo, the loftiest peak, being 11,680 ft. high. The staple is maize. But a small part is adapted to agriculture. Co. seat, Nephi.

JUAN, DON. See DON JUAN.

JUAN, DON, D'AUSTRIA. See JOHN OF AUSTRIA.

JU'AN FERNAN'DEZ, called also MAS-A-TIERRA, a rocky island in the Pacific ocean, about 400 m. off Valparaiso, on the coast of Chili, to which it belongs. Lat. 33° 40' s., long. about 79° west. It is 18 m. long, 6 m. broad, and is for the most part covered with high rocky peaks, the highest of which, Yungu, is about 4,000 ft. above sea-level. There are also numerous and fertile valleys, which yield oats, turnips, apples, strawberries, melons, peaches, figs, grapes, sandal-wood, and other varieties of timber. Numbers of wild goats wander on the cliffs. In 1872 there were only about a dozen Chilians living on the island; and they were dependent on Valparaiso for a supply of most of the necessaries of life. Here Alexander Selkirk, a buccaneer, whose native place was the Scotch fishing-village of Largo, lived in solitude for four years (1704-8). His story is supposed to have suggested the *Robinson Crusoe* of Defoe.

JUAN Y SANTACR'LIA, JORGE, 1712-74; b. Orihuela, Valencia; was sent in 1733 on a small vessel to explore the coast of America. In 1735 he was appointed vice-admiral by Philip V., and accompanied Ulloa's expedition to South America for the purpose of measuring a degree of the meridian at the equator. The expedition was assisted by La Condamine and Bouguer of the French academy. Ulloa and Juan remained in Peru several years, and the results of their observations were published in 5 folio volumes. Juan wrote the scientific account of the expedition, and he and Ulloa together published a treatise on the Spanish-Portuguese meridian boundary line. Juan was an able officer of the Spanish navy, and also wrote works on nautical science.

JUAREZ, BENITO, 1806-72; pres. Mexican republic; b. at Ixtlan of Indian parents; became a lawyer; gov. of Oaxaca, 1848-52; exiled during Santa Anna's dictatorship; elected to the new congress, 1856; pres. of supreme court 1856. On the overthrow of the liberal pres., Comonfort (1858), J. established himself at Vera Cruz, where he set up a provisional government, styling himself constitutional pres., and issuing decrees for the confiscation of the property of the church, the institution of civil marriage, etc., in accordance with the reforms carried by Comonfort in 1857. Meanwhile, Miramon, who had superseded Zuloaga (Jan., 1859), prepared to take the field against his rival. His movements were, however, delayed by a counter-rising of Juarists in Mexico; and before he again advanced J. had secured recognition from the United States by conceding the protectorate (refused to them by Miramon) over the proposed transit routes in the n. and in the isthmus of Tehuantepec. Early in 1860 Miramon besieged Vera Cruz, but his army suffered from want of supplies, his transports were intercepted by the United States ship-of-war *Saratoga*, and after a few weeks he was compelled to retire with loss. Juarez now assumed the offensive. At San Miguelito Miramon was totally defeated by Ortega, and fled to Europe. His rival entered Mexico (Jan., 1861), caused himself in March to be formally elected president for four years, and proceeded to execute the decrees against the clergy with great severity. But the finances of Mexico were now in a state of disorder, which even the wholesale confiscation of church lands could not remedy. In July, 1861, the government decreed suspension of payment for two years of the

indemnities due to England and France, and formally secured by the hypothecation of the customs dues. This act, coming at the end of a long series of outrages (mainly the work of Miramon and his faction), led to the intervention of the allied powers, and the occupation of Vera Cruz by England, France, and Spain. But it soon appeared that the French aimed at more than a simple redress of grievances. The appearance of the clerical chiefs Miramon and Almonte in their camp, and the extravagant demands of M. de Soligny, rendered any arrangement impossible. The failure of the negotiations at Soledad (Feb., 1862) was followed by the conference of Orizaba (April 9), in which England and Spain formally withdrew. France now threw off the mask, and Juárez appealed to the country, proclaiming a guerrilla war, and concluding a loan of 25,000,000 dollars with the American minister, Corwyn. The victory of Zaragoza at Puebla (May 5, 1862) raised the hopes of the Mexicans; but fresh troops arrived from France. Puebla fell (May 18, 1863), after a gallant resistance. Mexico and San Luis de Potosí followed, and in 1864 the republican government was removed to Monterey. The arrival of Maximilian in May was succeeded by further losses from battle and desertion. In Aug. Juárez sent his family to New Orleans, but "le petit Indien" himself still held on, although forced back on Chihuahua, and thence a year after across the frontier. His four years of office had also expired, and Maximilian availed himself of these events to issue the fatal decree of Oct., 1865, in which he declared the republic extinct *de jure et de facto*, and sentenced to death all Juarist leaders taken in arms. Juárez proclaimed in answer that he held office until the expulsion of the invaders rendered a fresh election practicable. By this time the complete pacification of the southern states enabled the Washington cabinet (which had persistently recognized Juárez) to interfere effectually on his behalf. Under diplomatic pressure (1866) Napoleon withdrew his troops, and the positions evacuated by the French were immediately occupied by the republicans. The unhappy Maximilian made a final stand in Querétaro, but was betrayed by López, and shot (June 19, 1867) by order of court-martial—an ungenerous but not unjustifiable act of reprisal which Juárez, it is said, would have been unable to prevent. Mexico and Vera Cruz were reoccupied shortly after, and the triumph of the liberals was consummated by the re-election of Juárez to the presidency (Aug., 1867), after a ten years' struggle, in which he had successfully maintained the constitution of 1857, under which he took office, against domestic treason and foreign intervention. He was re-elected president in Oct., 1871, and held office till he died, July 18, 1872. Juárez, as governor of Oaxaca, was universally esteemed, and his honesty as a reformer has been attested by the British chargé d'affaires (Mr. Matthew's report, 1861), and by all the leading men in the United States.

JUARROS, DOMINGO, d. about 1820; b. Guatemala. He was an ecclesiastic, and author of an important work on Central America, entitled *Compendio de la Historia de la Ciudad de Guatemala*, in 6 books.

JUBA I., d. 46 B.C., son of Hiempsal, king of Numidia, ascended the throne on his father's death, and, having quarreled with Cæsar, supported Pompey in the struggle between these two. He defeated and destroyed the army of Curio, Cæsar's lieutenant, in a fierce engagement near Utica; but was himself defeated at Thapsus, by Bocchus, king of Mauritania, and after fleeing from the battle-field destroyed his own life. The kingdom of Juba was made a Roman province after his death, and the historian Sallust was appointed its first governor. It was afterwards restored to Juba II., by Octavius, in exchange for other territory. The character of Juba in the under-plot of Addison's tragedy of *Cato* is founded on that of Juba I.

JUBÆA, a genus of palms of the same tribe with the cocoa-nut. *J. spectabilis* is a palm of 30 or 40 ft. high, with a wide-spreading crown of pinnate leaves; a native of Chili, where it is called *coquito*. The Chilians cut off the crown, and collect the sap, which flows freely for several months, a fresh slice of the top of the stem being cut off every morning. A good tree will yield ninety gallons of sap, which being boiled down to a syrup of the consistence of treacle, receives the name of *miel de palma* (palm-honey), and is an important article of the domestic economy of the country. The *Jubæa* is, in fact, the Jaggery (q.v.) palm of Chili.

JUBBULPORE, a t. of British India, in the territory of Saugor and Nerbudda, near the Nerbudda river, 200 m. s.w. of Allahabad, an important station on the East India railroad. Pop. '91, 84,481. It is 1458 ft. above the sea, whence a road leads over the Vindhya mountains, through Belhari, to Panna in Bundelcund. It has wide and straight streets, an industrial school, and a military establishment. It is perhaps the most important railway station in India. The English here defeated, Dec. 19, 1817, 5,000 Mahratta troops of the rajah of Nagpore.

JUBILEE, THE YEAR OF (Heb. *Yobel*), a peculiar institution among the Hebrews (Leviticus xxv.), by which, every fiftieth (*not* forty-ninth) year, the land that in the interval had passed out of the possession of those to whom it originally belonged was restored to them, and all who had been reduced to poverty, and obliged to hire themselves out as servants, were released from their bondage; no less were (Jos. Ant. iii. 12. 3) all debts remitted. The jubilee forms, as it were, an exalted sabbatical year (q.v.), and the land was completely to be left to itself in the former as in the latter. The design

of this institution was chiefly the restoration of the equilibrium in the families and tribes. It was to prevent the growth of an oligarchy of landowners, and the total impoverishment of some families; as well as to increase the fertility of the soil and the growth of the population. It was proclaimed at the end of the harvest-time, like the sabbatical year, on the tenth day of the seventh month—the day of atonement—by the yobel (a kind of horn), hence also its name. There is no trace in the whole history of the Hebrews down to the Babylonian exile that the jubilee had ever been observed after the return, however, it appears to have been rigorously kept, like the sabbatical year, for some time at least; but, from its general impracticability, it must soon have fallen into disuse. When the sabbatical year was *de facto* repealed by Hillel's *prosbol* (a legal document entitling the creditor to claim his debt during this period), mention is no longer made of the yobel. The speculations of modern critics on the *possibility* of the yobel, and on the date of its inauguration, cannot prevail against the undeniable fact that it has been kept, and also that it is much more in harmony than the primitive theocratic character of the Mosaic institutions—according to which all the land was held as a kind of loan from Jehovah, who alone had an absolute right over it—than with those of any later period, to which it otherwise would have to be referred.

JUBILEE, or **JUBILEE YEAR**, an institution of the Roman Catholic church, the name of which is borrowed from that of the Jewish jubilee. The Catholic jubilee is of two kinds—"ordinary" and "extraordinary." The ordinary jubilee is that which is celebrated at stated intervals, the length of which has varied at different times. Its origin is traced to pope Boniface VIII., who issued, for the year 1300, a bull granting a plenary indulgence to all pilgrim-visitors of Rome during that year, on condition of their penitently confessing their sins and visiting the church of St. Peter and St. Paul, fifteen times if strangers, and thirty times if residents of the city. The invitation was accepted with marvelous enthusiasm. Innumerable troops of pilgrims from every part of the church flocked to Rome. Giovanni Villani, a contemporary chronicler, states that the constant number of pilgrims in Rome, not reckoning those who were on the road going or returning, during the entire year, never fell below 200,000. As instituted by Boniface, the jubilee was to have been held every hundredth year. Clement VI., in obedience to an earnest request from the people of Rome, abridged the time to fifty years. His jubilee accordingly took place in 1350, and was even more numerously attended than that of Boniface; the average number of pilgrims, until the heats of summer suspended their frequency, being, according to Matthew Villani, no fewer than 1,000,000! The term of interval was still further abridged by Urban VI., and again by Paul II., who, in 1470, ordered that thenceforth each twenty-fifth year should be held as jubilee—an arrangement which has continued ever since to regulate the ordinary jubilee. Paul II. extended still more, in another way, the spiritual advantages of the jubilee, by dispensing with the personal pilgrimage to Rome, and granting the indulgence to all who should visit any church in their own country designated for the purpose, and should, if their means permitted, contribute a sum towards the expenses of the holy wars. The substitution by Leo X. of the fund for building St. Peter's church for that of the holy war, and the abusive and scandalous proceedings of many of those appointed to preach the indulgence (*q.v.*), were among the proximate causes of the reformation. In later jubilee years the pilgrimages to Rome gradually diminished in frequency, the indulgence being, for the most part, obtained by the performance of the prescribed works at home; but the observance itself has been punctually maintained at each recurring period, with the single exception of the year 1800, in which, owing to the vacancy of the holy see, and the troubles of the times, it was not held.

The term Jubilee is used in modern times to designate the celebration of a fiftieth anniversary, e.g., the jubilee of the accession of George III. to the throne of England, held in 1809; that of Queen Victoria, in 1887; and of Pope Leo XIII. in 1888. It is also used for festivals generally—as, the musical festivals known as "Peace Jubilees," held in Boston, Massachusetts, in 1869 and again in 1872.

JUBILEES, BOOK OF, an apocryphal work, much used in the ancient church. The original Hebrew and the Greek translation were lost, but an Ethiopic version has been discovered in Abyssinia. It is called the jubilees, because it divides the biblical history of which it treats, from the creation of the world to the entrance of the Israelites into Canaan, into 50 jubilees of 49 years each, comprising 2,450 years, describing carefully every event according to the jubilee—Sabbatic year, or year in which it happened. It was designed as a commentary on the books of Genesis and Exodus, arranging minutely the chronology of the biblical history, solving difficulties found in the narratives of those books, giving more fully what was only hinted at in the sacred history, and expatiating upon the various religious observances. The author of the book is unknown, but many circumstances indicate that he was a Jew. All critics agree that it was written in Hebrew, translated into Greek, and that the Ethiopic was made from the Greek. Dillman gave a German translation from the Ethiopic, through which it has become known to Europeans. He divided the work into 50 chapters. Its exact date is not known, but critics have fixed it either in the first c. before Christ or about the birth of Christ. It is considered important to the interpretation of the Bible, and to the history of Jewish belief before the Christian era. The Greek version was made at a very early period of the

Christian era, was soon lost in the western church, but existed long after in the eastern. From the 11th or 12th c. it entirely disappeared. In 1844 Dr. Krapff found in the Abyssinian church an Ethiopic translation of the Greek, a manuscript copy of which was presented to the Tübingen university. It is considered as canonical by the Abyssinian church.

JUCH, EMMA, a distinguished vocalist, who was born in Vienna, Austria, July 4, 1861. Her parents were musical, and with them she came to the United States when only three years old. Her talent soon manifested itself, and she was placed under the instruction of Madame Murio-Celli, a prominent teacher in New York City. In 1872 she went to London, where she remained eight years, studying and singing, and making there her first appearance in opera in *Mignon*. On her return to America she spent two or three years traveling about the country, giving concerts, and was everywhere received with great favor. In 1884, when the American Opera Company was organized under the auspices of Theodore Thomas (q.v.) and Mrs. F. B. Thurber, she became the leading soprano. Subsequently she organized an opera company of her own. Marguerite in *Faust*, Elsa in *Lohengrin*, Senta in *The Flying Dutchman*, Crysa in *Nero*, and Eurydice in *Orpheus and Eurydice*, are some of her leading rôles.

JU'DAH (Heb. *Yehuda*, "the bepraised one") was the fourth son of Jacob and Leah, and founder of the greatest and most numerous of the 12 tribes. In the march through the wilderness it had the post of honor—the van—assigned to it; and tradition narrates that its standard was a lion's whelp, with the words: "Arise, O Lord, and let thine enemies be scattered!" After the conquest of Canaan its territories stretched from the Dead sea on the e. to the Mediterranean on the w. (though the Philistines long held possession of the fertile district w. of the mountains of Judah), and from Jerusalem (excluding that city) on the n. to the land of the Amalekites on the south. The capital of the tribe was Hebron.

JUDAH, surnamed **HAK-KADOSH**, the holy; about 135–192; b. at Tiberias; son of Simon, of the tribe of Benjamin; a descendant of Hillel I. While a youth he was admitted to the Sanhedrin on account of his extraordinary knowledge of Jewish law, and on his father's death was made its president. He was called rabbi, and held in the highest veneration by the Jews. He was honored chiefly as the compiler of the Mishna. His last days were spent at Sapphoris. He is mentioned as the friend of the emperor Marcus Aurelius.

JUDAH BEN SAMUEL, surnamed **HA LEVI** (Arab. **ABUL-HASSAN**), b. Castile, in 11th or 12th c.; a Spanish rabbi, highly distinguished as a physician, theologian, and poet. His chief work, the *Kuzari*, in Arabic, contains discourses on religion between a king of the Khazars and a Jewish rabbi. It was translated into Hebrew, Latin, Spanish, and German. His Hebrew sacred songs have been translated into German. In the 12th c. he made a pilgrimage to Jerusalem, but nothing afterwards was heard of him. According to tradition he was assassinated by a Mussulman in Palestine.

JUDAIZERS. See **EBIONITES**.

JUDAS ISCARIOT, so called to distinguish him from the other apostle, Judas or Jude, who was also named Lebbeus and Thaddeus. Of his early life nothing is known, though it is supposed that he lived in Kerioth, a village in Judea, and that his name, Iscariot, means of *Kerioth*. He became a disciple of Jesus, afterwards an apostle, and finally his betrayer. While associating with Jesus and the eleven it appears that he acted as treasurer of the little company. Whether Jesus committed that work to him, or the other disciples left it to him, or he sought the office for himself, does not appear. We learn that on one occasion when a woman broke an alabaster box of costly ointment, and anointed the feet of Jesus therewith, Judas Iscariot said, "Why was not this ointment sold for three hundred pence and given to the poor?" Upon which the historian John makes this comment, "This he said, not that he cared for the poor, but because he was a thief and had the bag, and bare (that is, took and bore away) what was put therein." Very soon after this incident we find that when the conspiracy was laid to put Jesus to death, Judas agreed to betray Jesus to the chief priests for thirty pieces of silver. From that time he sought opportunity to betray him to them in the absence of the multitude, for they feared the people, many of whom were in sympathy with Jesus. Such an opportunity was soon presented. It was the time of the annual feast of the passover. Jesus with his company of twelve had partaken of the feast, and were about to withdraw to a garden where they often resorted for quiet and seclusion, but Judas left them and went out, and having received of the chief priests and elders a band of men and officers provided with weapons and lanterns, he led them in the darkness to the spot well known to him, where Jesus had just been engaged in prayer. Judas had given a sign to his band, saying, "Whomsoever I shall kiss, that same is he: hold him fast;" and as Jesus came out to meet them, saying, "Whom seek ye?" Judas said, "Hail, master," and drew near to kiss him. Jesus replied, "Judas, betrayest thou the Son of man with a kiss?" During the trial which followed, when Judas saw that Jesus was condemned by the chief priests and delivered to Pontius Pilate, the Roman governor, he repented and brought again to the priests and elders the pieces of silver which he had received for his crime, saying, "I have sinned in that I have betrayed the innocent blood." Perhaps the matter had gone further than he anticipated, and he may have hoped to awaken in

them some of the sense of wrong-doing which he was beginning to feel, and so to effect a stay of proceedings. They answered, "What is that to us? see thou to that;" and he cast down the pieces of silver in the temple and went and hanged himself. An additional circumstance is related in the Acts of the Apostles concerning the end of this miserable man. The money which he returned, the priests decided, must not be put into the treasury, being the price of blood; so they used it for the purchase of the potter's field outside the city walls as a burial place for the poor and for strangers. Peter by a figure says that Judas purchased the field with the *reward of iniquity*. This was doubtless the place in which Judas met his terrible death, and which for that reason and also as being the price of the blood of Jesus, was called *Aceldama*. This character, moving like a dismal shadow in the luminous circle of Christ's companionship, has drawn much study. Different views have been set forth as to his motives. Theories of partial excuse for him have not been wanting. It has been suggested even that he was acting in warm friendship towards his master; that, impatient with Christ's seemingly hesitating measures in asserting his rights and establishing his kingdom, Judas resolved to force a crisis of attack in which Christ would find himself compelled to resort to his supernatural power to discomfit his foes—Judas not doubting that Christ would easily overwhelm the opposers, and in the natural reaction of the popular feeling against the plotting priests, would find the whole nation at his feet acclaiming him king. Could this theory be maintained from the recorded facts there would seem to be no crime that could not be made a virtue. Doubtless, there was in this betrayal the usual mixture of motives which is common in human action, and the blinded judgment which pertains to wrong-doing; but Jesus calls this traitor "the son of perdition."

JUDAS MACCABEUS, third son of Mattathias, succeeded the latter as leader of the celebrated revolt of the Maccabees, B.C. 166; defeated the Syrian armies and conquered Lysias and Gorgias, who opposed him with powerful forces. Establishing himself in Jerusalem he dethroned the idols, and restored the Hebrew worship, which had been expelled by Antiochus the Syrian. The struggle for supremacy was renewed by Antiochus Eupator, and although Judas defeated the Syrian armies in many engagements, he was himself finally beaten, and killed, B.C. 160.

JUDAS'S TREE (*Cercis*), a genus of trees of the natural order *leguminosæ*, sub-order *cæsalpinieæ*. The common Judas's tree (*C. siliquastrum*) is a native of the s. of Europe and of the warmer temperate parts of Asia. It has almost orbicular, very obtuse leaves. The flowers, which are rose-colored, appear before the leaves. There is a legend that Judas hanged himself on a tree of this kind. The American Judas's tree (*C. canadensis*) is very similar, but has acuminate leaves. The flower-buds of both species are frequently pickled in vinegar. The wood of both species is very beautiful, veined with black, and takes an excellent polish.

JUDD, GARRETT PARMLEE, 1803-73; b. N. Y.; studied medicine, and in 1825 went to the Hawaiian islands as missionary physician of the American board. His connection with the mission was severed in 1842, and he became adviser and interpreter of Kamehameha III. He organized a ministry for the king and was his minister of finance, discharging his functions with ability and success.

JUDD, NORMAN BUEL, b. N. Y., 1815; studied law; admitted to the bar in 1836; practiced with success in Chicago. He engaged in politics and held many important offices in the state of Illinois. He was U. S. minister to Prussia, 1861-65; member of congress, 1867-71; and afterwards a railroad president. He d. 1878.

JUDD, ORANGE, b. N. Y., 1822; educated at Wesleyan university, Middletown, Conn.; was a teacher and lecturer, and in 1853 became editor of the *American Agriculturist*. He afterwards established a business in agricultural books, and for a number of years edited the agricultural department of the *New York Times*. In 1880 he was appointed, by the president, Indian commissioner. He was a recognized authority on subjects connected with agriculture. He d. in 1892.

JUDD, SYLVESTER, 1813-53; b. Mass.; graduated at Yale in 1836; changed his religious opinions soon after leaving college; entered the Cambridge divinity school, and in 1840 became pastor of a Unitarian church in Augusta, Me., where he remained till his death. He was the author of the very popular romance, *Margaret*, of the poem *Philo*, and a volume of discourses on the *Church*.

JUDE, or **JUDAS**, surnamed **THADDEUS**, or **LEBBEUS**, one of the 12 apostles. He is called in the English Bible the brother of James, the translators having inserted the word *brother*, and the generally received opinion is that they are right. But most of the eminent critical authorities render the words "Judas the son of James." The name of Jude occurs but once in the gospel narrative, in the question put to Christ (John xiv. 22) According to tradition he is connected with the founding of the church at Edessa. The Syrian tradition speaks of his living at Edessa, of his going to Assyria, and being martyred in Phenicia; while Nicophorus says that he died a natural death in Edessa. He is commemorated in the western church on Oct. 8.

JUDEA. See **PALESTINE**.

JUDE, EPISTLE OF, THE, the author of which speaks of himself as Jude, the brother of James, is not found in the oldest Syrian version of the New Testament, and in the

time of Eusebius was ranked among the books which, though received by the majority, were doubted by some. Clement of Alexandria cited it under Jude's name, as the production of a prophetic mind; Origen spoke of it as being full of heavenly grace; Tertullian quoted it as Jude's work; in Jerome's day it was received among the Christian Scriptures as of divine authority, and it is found in the principal ancient catalogues of the New Testament books. The doubts spoken of concerning its canonical authority were owing partly to its brevity, which rendered it less likely to attract attention and secure a rapid circulation; and partly to its containing two statements which are not fully supported by any other known authority. The first has reference to a contention between Michael the archangel and Satan about the body of Moses; and the second attributes to Enoch, the 7th from Adam, a prophecy concerning the final coming of the Lord. Some suppose that these statements were taken from apocryphal books, and are therefore evidence that the writer of the epistle was not an inspired man. To this others reply that there is no evidence of any such quotations having been made, but that, from whatever source the statements were derived, all that the maintenance of Jude's inspiration requires is that they were true. On the question of their truth it has been said: (1) They have not been proved to be false. (2) Among the statements contained in ancient Jewish books of various sorts many were doubtless true. (3) That the promise given to the apostles of guidance into all truth necessary to make them unerring witnesses for God and Christ would save them from historical errors, as easily and fully as from errors of doctrine and opinion to which they were constantly exposed. (4) That the deportment attributed to Michael, appropriate even to an archangel, is supported also by Peter's affirmation concerning angels in general, and that the prophecy ascribed to Enoch is consistent with the analogy of Scripture truth.

The design of the epistle the writer himself clearly gives, saying that when thinking earnestly about writing to Christians, he perceived the absolute necessity of exhorting them to defend the truth, and to shun the errors of false and artful teachers who were striving to deceive the churches, turning the grace of God into an argument for a sinful life, and denying both God and Christ. To show that all such and their followers would be condemned, he reminds Christians that even those who had been delivered from Egypt were afterwards destroyed because of their unbelief, and that the angels who sinned were reserved to the same judgment as that which would come on the guilty cities of the plain. In like manner, he declares, would dreadful judgments be inflicted on those who were corrupting the faith and practice of the churches. He then exhorts all true Christians to remember that the coming of just such ungodly, evil, and hypocritical men had been foretold by the apostles of Christ; that they should not therefore be either surprised or disheartened, but on the contrary should for themselves be steadfast in the faith, secure in the love of God, and confident that through the mercy of Christ they would attain to eternal life; and for others should be at once compassionate towards the weak, and bold to snatch from destruction those that were ready to fall. The epistle closes with an acknowledgment of God's power to save, and an ascription to him of glory and praise.

JUDGE is the generic descriptive name given to those who are invested with the power of judging and deciding causes in the highest courts of common law. In Great Britain—though it is otherwise in America—it is not usual to designate the highest class of judges by the epithet of judge, and British lawyers never do so. Thus, instead of saying Judge Blackstone, Judge Pollock, Judge Eldon, the proper description is—Mr. Justice Blackstone, Chief Baron Pollock, Lord Chancellor Eldon, etc., according to the particular court in which they presided. In Scotland the usual prefix to the name judge is lord; and the judges there, on their appointment, often assume new titles in addition to the prefix "lord." In England the judges of the superior courts are only called lords while they sit in court, and are so addressed by counsel, but not elsewhere. The practice has long been for the crown to confer the honor of knighthood on all the judges of the superior courts of law and equity in England, but not in Ireland or Scotland. All the superior judges are appointed by the crown, and since 12 and 13 Will. III. c. 2, have held their offices during good behavior; since 1 Geo. III. c. 23, they have also continued to hold their appointments notwithstanding the demise of the crown. They can only be removed from their office on the address of both houses of parliament. They are all, except the master of the rolls, disqualified from sitting in the house of commons. Judges have no privileges over other persons in respect of their obeying the law, except that the common-law judges in England have the privilege of suing and being sued in their own court, though not of judging in their own cases.

The term judge has also been appropriated as the proper descriptive title of the judges of the county courts established in England in 1846.—*Judge ordinary*, in English law, is the descriptive title of one judge only—viz., the judge of the divorce and probate court. In Scotland the phrase is often applied to all judges, superior and inferior, whenever they have a fixed and determinate jurisdiction, in contradistinction to commissioners, who have an occasional and temporary judicial authority delegated to them. In the United States of America any public officer lawfully sitting by virtue of his commission, to hear and decide cases brought before him, is called a judge. The presiding officer of a court consisting of several judges is generally called chief-justice.

In regard to tenure, method of appointment, and duties of judges in the United States, see JUDICIARY. A judge is debarred from sitting on a case in which he has an interest, nor can he be a witness in a case tried before him. As a matter of fact, a judge is not debarred, save by professional etiquette and tradition, from presiding over a case in which he has been counsel. So long as a judge does not overstep his jurisdiction he is not liable, either civilly or criminally, for acts performed in the course of his judicial duties, though those acts be erroneous or corrupt; but in the latter case he may be removed by impeachment.

JUDGE-ADVOCATE, the title of an official attached to military commissions, or courts-martial, whose duties are analogous to those of prosecuting attorneys in civil courts; but whose functions, in relation to military law, are also similar to those of a district attorney, or corporation counsel, in being of an advisory character. The appointment of judge-advocates for special courts rests in the authority which appoints the court, whether that be the president, the secretary of war, or the general of the army. But there is also in the U. S. army a corps of four judge-advocates, with the rank of major, who are under the general direction of the judge-advocate-general, and who can be detailed on courts-martial or military commissions, but are usually stationed at the head-quarters of the military departments, where they act as legal advisers to the department commander, and may be appointed by them to court-martial duty. The official duties of a judge-advocate during a trial by court-martial or military commission, or examination by a court of inquiry, are as follows: preparation of the case for the prosecution, procuring of witnesses, administering the oath, opening the case for the prosecution with the necessary argument, questioning the witnesses, and submitting the case to the court. But besides these duties the judge-advocate has still another—seemingly anomalous in this connection—that of protecting the witness from improper or leading questions, and to that extent also acting as counsel for the accused. In the English military service the duties of the judge-advocate have been so far modified that he does not act as prosecutor, but solely in his advisory capacity in connection with the court, and as the recorder of its proceedings.

JUDGE-ADVOCATE-GENERAL, in the United States military service, the chief of the bureau of military justice at Washington, with the rank of brig.gen. To him the proceedings of all courts-martial, courts of inquiry, and military commissions are forwarded for revision and record. In England the judge-advocate-general is the final legal authority for the army, and the adviser of the crown in cases where any action of the sovereign is required. His power is supreme as to reviewing the proceedings of courts-martial, etc.

JUDGES, *Book of* (Heb. *Shoftim*), a canonical book of the Old Testament, recording the achievements of those heroes who, at different periods in the early history of the Hebrews, before the consolidation of the government under a monarchy, from Joshua to Samuel, arose to deliver their countrymen from the oppressions of neighboring nations, but only three of whom, Deborah, Eli, and Samuel, were *judges* in our sense of the word. The contents of the book have given rise to much criticism. It cannot be said to be a *history*, properly speaking. The events recorded in it do not follow each other chronologically, nor is there any other order to be perceived in their arrangement. It is rather a collection of detached historical traditions from the time of the Hebrew republic—probably redacted in the commencement of the reign of David—from ancient poems and popular sagas. It exhibits (whether with a royalistic tendency, as has been supposed by some, or in order to point the moral that however deeply sunk a people—emphatically *the people*—might be in slavery or idolatry, or both, God would always send them a deliverer from either at the right time) the lawless and ungodly state of Israel during the greater part of this period, and the evil consequences their intimate connection with the idolatrous nations around them brought upon them. The book naturally falls into two portions—the first up to chapter xvi., containing the heroic deeds of the single “judges”; the second, from chapter xvii., the two accounts of the idol of Micah, and of the crime of Benjamin. The space of time over which the book extends has of old been hotly contested: that it comprises no less than 300 years (cf. xi. 26) is, however, almost the only point on which we can feel certain, since there is no doubt that many of the events recorded in the book did not follow upon one another, but fell in the same period, a circumstance which chronologers generally have failed to take into account. The book itself differs considerably from the other historical books of the Bible by its simplicity and originality. That most of the heroic adventures related contain—sometimes, perhaps, under a highly poetical guise—true historical facts, has been doubted by a very small number of critics. Ancient traditions make Samuel the author, or rather redactor, of the book, and there is certainly little to be said against, and much for, this supposition. Compare Ewald, Wette, Rosenmüller, Studer, Keil, etc. See JEWS.

JUDGES OF ISRAEL, a name given to those who at intervals directed the affairs of the Israelites during the four and a half centuries which elapsed from the death of Joshua to the reign of Saul. Their names were Othniel, Ehud, Shamgar, Deborah, Barak, Gideon, Abimelech, Tola, Jair, Jephthah, Ibzan, Elon, Abdon, Samson, Eli, Samuel. They were called *shophetim*, from a word denoting both to judge in the usual

sense, and to rule or govern, a name appropriate because judging and ruling are intimately connected in the east. They were then not merely those who determined litigated questions, but persons appointed to perform various duties, which are to be ascertained from the history. It is common to consider their chief function as that of delivering Israel from foreign oppression. But all did not thus begin their career. Eli and Samuel were not military men. Deborah judged Israel before she went to war against Jabin; and whether Jair, Ibzan, Elon, and Abdon had a military command is unknown. Moreover, the nation in general had much more prosperity than adversity in the time of the judges, the whole period of foreign oppression being only 111 years—less than a fourth part of their dominion. It is true that many of these judges arose during the time of foreign oppression, and to military exploits was often due their appointment as judges; but, in general, the appointment depended on the exigencies of the times, requiring gifts or influence adequate for deciding questions between tribe and tribe, administering public affairs, and acting as the head of the people in their intercourse with their neighbors and oppressors. The judges then were faithful men who acted for the most part as agents of the divine will, regents of the invisible king of the chosen people. "They were," says Jahn, "not merely the deliverers of the state from a foreign yoke, but destroyers of idolatry, foes of pagan vices, promoters of the knowledge of God, of religion and of morality; restorers of theocracy in the minds of the Hebrews, and powerful instruments of divine providence in the promotion of the great design of preserving the Hebrew constitution, and by that means of rescuing the true religion from destruction." In nearly every case recorded the judges were appointed by the free choice of the people. The only cases of direct divine appointment are those of Gideon and Samson. The office was for life, but not hereditary, and the judge had no power to appoint a successor. Their authority was limited by the Hebrew law, and in doubtful cases they were required to consult the divine king through the priest. In great emergencies they convened a general assembly of the rulers, over which they presided, and in which they exerted a great influence. They could not levy taxes or appoint officers. Their authority was over only those tribes that elected or acknowledged them. They received no income, bore no external marks of dignity, were simple in their style of life, free from avarice, patriotic. Regarding themselves as the officers of God they in most instances strove to bring their countrymen to acknowledge his authority as that of their invisible king.

JUDGMENT, is a term expressing not only the decision or conclusion of a court in the matter of a trial at law, but also, in certain instances, conveying therewith the order thereupon, as in cases where it awards damages upon the verdict of a jury, or in the instance of what is known as a judgment debtor. Judgment *by default* is rendered in case of the non-appearance of the defendant in court to plead his cause, either personally or by counsel; and in such cases execution is issued for recovery of damages, or, if the suit be for debt, for the amount of indebtedness with costs, without further notice to the one adjudicated against. Confession of judgment is made on the withdrawal of the defendant's plea, when judgment is entered for the plaintiff; of *nolle prosequi*, when the plaintiff, after appearance in court, retires from the prosecution; judgment of *non suit* (from *non sequitur*, it does not follow) is given when the plaintiff fails to appear; judgment in error may either affirm a previous judgment, recall it on account of an error in fact, or reverse it because of an error in law; and interlocutory judgments are given during the progress of an action without concluding it, as in declaring the right of the plaintiff, without awarding damages, or judgment for the plaintiff on a plea of abatement, when it decides that the cause must proceed, and requires the defendant to improve his plea. A final judgment is one which ends the action, as a judgment for the defendant at any time, or for the plaintiff after verdict. But a judgment of *non suit* does not bar the plaintiff from beginning another suit upon the same cause of action.

JUDGMENT. This familiar word of every-day discourse has a technical meaning in logic, to which corresponds its acceptance as the name of a faculty of the mind. A "judgment," in logic, is an affirmation of some kind or other, as, "snow is white," "man is mortal." The contrast to it is a mere notion, as white, mountain, mortality. In a judgment, two notions must always enter, but this is not the whole; there must be some declaration coupling the two together, a function performed in all cases by a verb. A complete meaning, as expressed in a grammatical sentence, is a judgment. Other designations for the same thing are, proposition, assertion, prediction.

The intellectual faculty called judgment has reference to the logical force of the word, and means the power of forming judgments, and by implication, the further power of determining them to be true or false. This last function is perhaps what is most prominently implied in the faculty, as commonly understood.

The intellectual power of judging, when probed to its deepest foundations in the mind, resolves itself into one of two things—the discrimination of difference, or the perception of agreement in the midst of difference (see **INTELLECT**). A judge in a court of law finds that a case comes under, or does not come under, a certain statute; which finding constitutes his decision. A scientific man decides a theory to be true by a certain extent of coincidence with observed fact. An artist approves or disapproves a work of art by its agreeing or disagreeing with his standard, or those previous productions that have settled his conception of excellence in that species.

JUDGMENT, FINAL (in theology), is a point on which various theories have been held. One is that of the common school of rationalists denying a general judgment or a final judicial period, and asserting that men in this life are under a moral government, whereby, in the future world, rewards will come to the good and punishments to the wicked. Another view is that the last judgment is a process now in progress, and even continuous through all history; the history of the world being a continuous manifestation of God is therein necessarily a continuous judging of the world. The Messianic period being in the Old Testament spoken of as the "last day," the "last time," the "end of days," the "end of the world," the Jews believed that at the coming of the Messiah the heathen would be punished, and the chosen people exalted. The view of the pre-millenarians is, that to judge is to reign; and that the last judgment will begin when the personal reign of Christ upon earth begins. Another theory is that the day of judgment is a protracted future dispensation, commencing with the second advent of Christ, and continuing through the thousand years of his personal reign upon earth. The theory of Swedenborg is that the spiritual history of mankind is divided into dispensations of divine truth, i. e., into a succession of churches, and that a final judgment takes place in the spiritual world at the close of each dispensation. According to him there have been several "final" judgments; first, at the flood, to close the Adamic or antediluvian dispensation; second, at the Red sea and through the ten plagues, to close the Noatic dispensation; third, at the coming of our Lord, to close the Mosaic dispensation; fourth, at the time of the reformation, or a little after, in 1759, to close the dispensation of the first Christian church. The doctrine held in common by Protestants, Romanists, and the Greek church is that the final judgment is an event at the end of the world, when the eternal state of men and angels, good and bad, will be determined and publicly manifested; that the rule will be the light enjoyed, either from nature and conscience or from these with the law and gospel contained in the Scriptures; that the ground or matter of judgment will be, not professions, or relations, or reputation, but the "deeds done in the body," and these deeds not as external, but as man's vital, spiritual acts—"the secrets of the heart," in other words, real character; that the time will be at the second coming of Christ, and at the general resurrection; that the place (as some think) will be in the air, because the judge will come in the clouds of heaven, when the living saints will be changed, the dead saints raised, and both caught up to meet the Lord in the air; or (as others think) the place will be the new earth to which the glorified will descend with Christ. Holy Scripture, while plainly and repeatedly announcing the final judgment and establishing the principles of its process, seems to be silent on the details of time, place, and circumstances—revealing only that it will be the world's great natural, historical, and moral consummation under the ultimate manifestation of Christ in his divine humanity, and accompanying the resurrection of the dead.

JUDIC, ANNA DAMIENS, b. Semur, France, 1850; at an early age was employed as a shop-girl in Paris, but impelled by passion for the stage, entered the *Conservatoire*, and made her debut at the *Gymnase*, 1867, in a minor part. Her reputation was of speedy growth and was increased by a successful visit to Belgium, 1871. At the *Bouffes Parisiennes* which she joined, 1872, she soon became the leading attraction; she has also been well received in London, Brussels, and St. Petersburg.

JUDICIAL SEPARATION, in American law, is the separation of two married persons by order of the court of divorce. Married persons may, if they please, mutually agree to live separate, and they may enter into a deed of separation for that purpose, which to some extent is recognized as valid by courts of equity. This is called voluntary separation. But, in the eye of the law, two married persons living apart are still married, and retain the status of married persons, and must sue and be sued in all respects the same as if they were still cohabiting. And a deed of separation is always revocable by the parties, though to some extent binding on each, if the other do not consent to renew the cohabitation. But when the parties have not mutually consented to separate, one of them can compel a judicial separation for certain grounds of misconduct. Thus, either party may apply on the ground of adultery or cruelty, or desertion without cause for two years and upwards. The kind of cruelty which has been held a ground of judicial separation is difficult of definition.

The consequences of a judicial separation are as follow: The parties, not being divorced, cannot marry again; but there is no longer the duty of cohabiting. Part of the decree may consist of an award of a certain income to the wife after separation, and the court may make orders as to the custody and maintenance of children. But, irrespective of this, the wife becomes, to all intents and purposes as regards her future property, in the same position as if she were unmarried. On the other hand, the husband is no longer responsible for maintaining his wife, except so far as he may have been ordered to pay her alimony, and he is not liable for her future debts.

Judicial Separation, or limited divorce, can be obtained in this country for causes varying in the different states. In some states incompatibility of disposition of the parties has been held a sufficient ground for such a divorce. But in the older and more conservative states the policy of the English law has been substantially adopted. While the specific cases are numerous it is difficult to give a general statement of the precise acts which will be considered as furnishing a ground for judicial separation. Perhaps the most that may be said is, that such unprovoked conduct on the part of

husband or wife as renders it impossible for the other to preserve the dignity of his or her position and is inconsistent with the welfare of the children of the family, especially if detrimental to health, will be good ground for such a separation.

JUDICIARY IN THE UNITED STATES. In other countries the judicial is more or less complicated with the legislative function; but in the United States the three departments of government, legislative, executive, and judicial, are scrupulously separated from each other. The house of lords, unlike the American senate, was until recently both a legislative and judicial body, and even now some of its members are judges. The lord chancellor, the highest judicial officer of the kingdom, exercises various powers of a political rather than a judicial character; and the master of the rolls is eligible to a seat in parliament. This investiture of the same person with both judicial and legislative functions has its roots in early Saxon and Norman practices, not yet wholly outgrown. Judges of United States courts can neither serve in congress, fill the presidential chair, nor exercise any political power except that of individual voters.

The judicial power of the United States is vested by the constitution in a supreme court and such inferior courts as congress may from time to time establish. The supreme court consists of a chief-justice and eight associate judges, appointed by the president with the consent of the senate, holding office during good behavior, and receiving for their services a compensation which shall not be diminished during their continuance in office. They have the privilege (if they have been commissioned not less than 10 years) of resigning at the age of 70, and drawing their salaries through life. "The judicial power shall extend to all cases in law and equity arising under this constitution, the laws of the United States, or treaties made or which shall be made under their authority; to all cases affecting ambassadors, or other public ministers, and consuls; to all cases of admiralty and maritime jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more states; between a state and a citizen of another state; between citizens of different states; between citizens of the same state claiming lands under grants of different states; and between a state, or the citizens thereof, and foreign states, citizens, or subjects. In all cases affecting ambassadors or other public ministers, and consuls, and those in which a state shall be party, the supreme court shall have original jurisdiction. In all the other cases before mentioned the supreme court shall have appellate jurisdiction both as to law and as to fact, with such exceptions and under such regulations as congress shall make." (U. S. Constitution, art. 3, secs. 1, 2.) The supreme court has appellate jurisdiction over cases from the circuit courts where the matter in controversy has a value of over \$1000. By the act of 1789, c. 20, sec. 9, the United States is divided into judicial districts, and in each district a district court is established consisting of one judge resident in the district. These courts have both civil and criminal jurisdiction. In their civil jurisdiction they have the powers of a court of admiralty, and also certain extraordinary powers conferred by statute. Their jurisdiction extends over cases of salvage, seizures, prize causes, torts committed on the high seas or within ebb and flow of tide, and maritime contracts. By an act of congress passed in 1845, the district courts were given jurisdiction over contracts and torts in regard to vessels plying between ports in different states on the lakes. The extraordinary jurisdiction of the district courts extends over captures made within the waters of the United States; seizures under the U. S. laws of import, navigation, or trade; suits brought by or against a consul or vice-consul; suits brought by an alien for a tort in violation of laws or treaties of the United States, and over cases in bankruptcy. The criminal jurisdiction of the district courts is concurrent with that of the circuit courts over non-capital offenses against the United States. These districts compose nine circuits, for each of which a circuit court is established, consisting of one of the justices of the supreme court and a circuit judge or a district judge. The circuit courts have original jurisdiction in civil suits "at common law or in equity, where the matter in dispute exceeds in value \$500, exclusive of costs, and the United States are plaintiffs or petitioners, or an alien is a party, or the suit is between a citizen of the state where the suit is brought and a citizen of another state." They have original jurisdiction in cases arising from violation of the copyright or patent laws. The circuit courts have appellate jurisdiction by writs of error to the district courts or appeals from the latter. Other courts of the United States are the territorial courts established in each territory, and consisting of a chief-justice and two associate justices holding office for four years; and the court of claims, consisting of a chief-justice and four associates, with jurisdiction to pass upon all claims resting upon an act of congress, or a department rule, or contract with the United States. There is also a federal court of claims, created by a statute of 1855, and consisting of a chief-justice and four judges appointed by the president. It has jurisdiction over claims arising from contracts made or implied with the government of the United States, and all claims then may be referred to it by either house of congress. In March, 1891, congress instituted in each circuit a "circuit court of appeals," consisting of three judges. These are drawn from the justices of the supreme court, the circuit judges, or, if necessary, from the district judges, and from nine additional circuit judges, whom the act empowers the president to appoint. These courts have appellate jurisdiction, and are courts of record.

In the several states of the United States the judiciary is either appointed by the executive, or, more commonly, elected by the legislature or directly by the people.

The organization of the judiciary is different in the different states, and does not permit of general description here. In the older states the judges were for a long time generally nominated by the governor and confirmed by the senate, holding office during good behavior. To this, however, there was at least one exception; in Vermont, from a very early day, the judges were chosen annually by the legislature; now they are chosen in the same way biennially, the legislature meeting but once in two years. This method of appointment, which at the time of its adoption was contrary to the received traditions, and therefore regarded with distrust as likely to impair the dignity and independence of the judiciary, is admitted to have worked well. As a general rule, the judges have been the men best fitted for judicial station, and the courts have accordingly maintained a very high character. Nor have the judges been changed more frequently there than in states where they have been appointed in the old way and for longer terms. Of late years, in many states, the practice of electing judges for longer or shorter terms by popular suffrage has been adopted. In some cities of the largest class it has happened that incompetent and even corrupt men have secured election to the bench. But it is equally true that, under the old system of appointment, unfit men have attained judicial station as the reward of party service.

In this country it is the universal rule that a judge is not liable to a civil action for acts done in the performance of his legal duties; but for any high crime or misdemeanor he may be impeached. Though the powers to be exercised by any branch of government, national or state, in this country, are carefully defined in the written constitutions, still the interpretation of those constitutions gives rise to very important and delicate questions, which, under our system, are authoritatively settled by the courts of final resort. This power of interpreting the fundamental law is of the highest importance. It is the confirmed habit of the American people to regard as conclusive and binding for the time being the decisions of the judiciary upon questions of constitutional interpretation. Yet such decisions are always liable to review and reversal by the courts themselves. A striking example of this is furnished in the celebrated "Dred Scott" case, wherein it was decided by the supreme court of the United States that negroes were not citizens, and therefore that they might be constitutionally held in slavery; but that decision has no force or authority in the same court as now constituted, and has been effectually, though not formally, reversed.

JUDICIUM POPULI (*judgment of the people*). In the early Roman days a custom prevailed of submitting to the people dissensions between public officers, accusations against them, etc., as matters of public interest. It is supposed that the *judicia publica* of later days were evolved out of this custom. We know that in ancient Greece and Rome the people were the judges, and it was only because all were not willing to serve in such a capacity that lots were drawn. The earliest evidence which we possess on this subject points to the fact that actions brought by private individuals in defense of their private rights, and resting on special laws, were adjudged by special magistrates, while subjects of public interest (*judicia popularia*) were decided by the popular voice in the popular assembly. In due time the increase of statute laws caused the submission of large numbers of cases to private tribunals, and the *judicia populi* were replaced by the *judicia publica*. The legends of early Rome assert that the kings presided in person over the popular tribunals; but as early as B.C. 508 we find magistrates appointed, called *quæstores* or *quæstores rerum capitalium*, who, although at first chosen for special cases, were soon endowed with permanent judicial functions (*quæstores perpetui*). After B.C. 149 the prætor became president of the popular assembly. Additional prætors became necessary from time to time until the full number of 9 was reached in the reign of Sulla, each with jurisdiction over a particular class of offenses. This was the foundation of the criminal courts. The accuser might be any citizen cognizant of the facts, but the *judices* (judges) were chosen by lot. Verdicts were given by ballot and were called *leges*, and supposed to be binding in all similar cases of offense, though they were not always followed. Many contests arose as to the designation of the *judices*; 350 names were ordered by the *lex Calpurnia* to be inscribed on tablets, and from these the judges were selected by lot. From 104 B.C. no one who had been tribune, quæstor, or triumvir, no senator or near relation of a senator, no non-resident, and no one under 30 or over 60 years of age, was eligible for judicial office. It was the prætor's office to choose 450 *judices* each term, who were drawn in each separate case individually by lot. The *lex Plautia*, B.C. 89, allowed the *judices* to be of any class, but the *lex Aurelia*, B.C. 70, limited them to three classes—senators, equites, and *tribuni ærarii*. In Augustus's reign the ordinary number of judges in each case was seventy.

JUDITH, the heroine of an apocryphal and fictitious book (probably of the 2d c. B.C.; Movers, Ewald, etc.) called by her name, is represented as a beautiful Jewess of Bethulia, who perils her life and chastity in the tent of Holofernes, gen. of Nebuchadnezzar, in order to save her native town, by the assassination of the Assyrian commander. This she achieves, and escapes with the head of Holofernes to Bethulia. Her townsmen are inspired with a sudden enthusiasm, rush out upon the enemy, and completely defeat them. The tale is not mentioned by Josephus; and has, from an early period, been held to be an allegory; but it seems more probable that it is a

legend founded on some real fact. It has frequently furnished poets and painters with subjects.

JUDSON, ADONIRAM, D.D., 1788-1850; b. Mass.; graduated at Brown university, 1807; at Andover theological seminary, 1810. Reading Buchanan's *Star in the East* while in the seminary, he was inspired with missionary zeal, and in behalf of five other students and himself he addressed a letter to the General Association of Massachusetts (Congregational), expressing their wish to labor among the heathen, and asking advice. This resulted in the formation of the American board of commissioners for foreign missions. Mr. Judson was sent to confer with the London missionary society and ask their aid. On the voyage he was captured by a French privateer, and thrown into prison at Bayonne, but when released prosecuted his errand. After his return he, with Messrs. Newell, Nott, Hall, and Rice, were appointed by the American board as missionaries to India or Burmah. Mr. Judson married Miss Ann Hasseltine. He was ordained Feb. 6, 1812, and Feb. 19 they sailed for Calcutta. Arriving, they were ordered by the East India government to return home in the vessel which brought them; and, though this demand was modified, they were required to leave soon. Mr. and Mrs. Judson having changed their views in regard to baptism, were immersed by Dr. Ward of Calcutta. This, with other results, awakened among the Baptists of America new interest in missions, and led to the formation of the American Baptist missionary union. Mr. and Mrs. Judson went to the isle of France, afterwards to Madras, with the design of reaching Penang, but, being thwarted in their wishes, took passage for Rangoon. Here, alone and without assured means of future support, they entered upon the study of the language. The care of the mission was assumed by the Baptist union. Within a few years they gathered a church of 18 members, and many natives were impressed by their lives of helpful kindness and their Christian instructions. The government, however, had given some tokens of disapproval. Dr. Price, a physician, having joined the mission, was sent for by the king to come to Ava, the capital, and Dr. Judson removed thither to act as his interpreter. War breaking out between the East India company and Burmah, the foreign residents at Ava endured great perils and hardships. Dr. Judson was arrested at his dwelling, bound with chains, thrown into the death-prison, and subjected to cruel indignities and barbarities. By entreaties and presents his wife sometimes obtained the privilege of ministering to him in the prison, without which he must have died from hunger and suffering. After nearly two years he was released, in Feb., 1826, on the demand of gen. sir Archibald Campbell. He commenced a new mission in Amherst, but an embassy being sent thence to negotiate a treaty which it was hoped would secure religious toleration, his services as interpreter were again required in Ava. During his absence his wife died, worn out by protracted toils and exposures, and by successive attacks of malignant fever. In 1827 he removed to Maulmein, where he found Mr. and Mrs. Wade had arrived before him. Here he erected a *zayat* on a public thoroughfare, where he spent most of his time, preaching or reading the Scriptures to every one who came to him. Mr. Wade did the same in another part of the city. Much light went forth from these centers. A church was formed. The converts were sometimes tested by severe opposition. Dr. Judson took several trips into the interior of the country, and shared in the remarkably interesting work among the Karens. In 1834 he married Mrs. Boardman, who had been a most earnest laborer, both as associated with Mr. Boardman and after his death. In 1839 Dr. Judson was disabled from speaking and threatened with serious pulmonary disease. He took a short voyage, and another in 1841 on account of sickness of the whole family, and in 1845, as the only prospect of life for Mrs. Judson, they all embarked for America. Mrs. Judson died off St. Helena, and her remains were interred on the island. Dr. Judson was received on his arrival in America by Christians of every name with great warmth of affection and esteem. While seeking some one to write a memoir of Mrs. Judson he met Miss Chubbuck, a writer well known in America under the name of "Fanny Forester," to whom he committed the undertaking. The acquaintance formed while this work was in progress led Dr. Judson to ask Miss Chubbuck to go with him to Burmah. They were married, and in 1847 we find them in Rangoon. Here he gave himself partly to the preparation of a dictionary, for which his accurate knowledge of the language qualified him, and to which he had often been urged, and partly to Christian teaching. In 1850, his health having declined almost beyond the possibility of recovery, he was carried in a litter on board ship, in the hope that, as before, a voyage would benefit him. Mrs. Judson was unable to take the voyage with her husband. Mr. Ranney, the mission printer, and a faithful Bengalee servant, accompanied him. He revived a little after going out to sea, but was soon much worse. Still he said, "I feel too much life in me to believe that I shall die at present." But his work was near its end. He died, and his body was committed to the ocean, April 12, 1850, scarcely three days out of sight of the mountains of Burmah. Numerous converts, a corps of trained native assistants, the translation of the Bible and other valuable books into Burmese, and a large Burmese and English dictionary nearly completed, are some of the direct fruits of his 37 years of missionary service.

JUDSON, ANN HASSELTINE, 1789-1826; b. Mass.; educated at Bradford academy, where she developed superior mental endowments, and a decided religious charac-

ter. In 1812 she married Rev. Dr. Adoniram Judson, whom she accompanied to Burmah, became an efficient missionary at Rangoon, and shared with great fortitude his trials and sufferings. In 1821 her health failing, she embarked for America, stopping awhile in England. While at home her history of the Burman mission, commenced in London, was published, and an edition published in England. With health partially restored she returned to Burmah in June, 1823, and a new mission was commenced in Ava. War breaking out between Burmah and England, Dr. Judson having been captured, fettered, and committed to the death-prison, she was confined in her own house under guard of ten ruffianly men, deprived of her furniture, and most of her articles of property. On the third day, being released, she began to devise means for her husband's liberation. She followed him from prison to prison, ministering to his wants, trying to soften the hearts of his keepers, to mitigate his sufferings, interceding with government officials or with members of the royal family. For a year and a half she thus exerted herself, walking miles in feeble health, in the darkness of the night, or under a noon-day sun, with a babe of three months in her arms. By her untiring entreaties, the offer of large presents, and finally the demand of sir Archibald Campbell, Dr. Judson's liberation was effected. In the midst of her efforts she was attacked with malignant fever, and her life was despaired of. After regaining their freedom a new mission was commenced at Amherst. Dr. Judson immediately left for Ava as one of an embassy sent to negotiate a new treaty, and in his absence a remittent fever attacked her, already enfeebled by sufferings and disease, and after 18 days ended in her death. She was a woman of earnest piety, self-sacrificing devotion, vigorous intellect, indomitable perseverance, and unaffected dignity and refinement.

JUDSON, EDWARD, D.D., b. at Maulmain, British Burmah, 1844; a son of the missionary Adoniram J. He graduated in 1865 at Brown univ., and in 1868 was called to a professorship of languages in Madison univ., Hamilton, N. Y. In 1875 he was ordained to a very successful pastorate of the Baptist church at Orange, N. J., from which he withdrew after a few years to organize pastoral and other Christian work on a large scale in the lower part of New York, which culminated in the erection of the Judson Memorial building on Washington Square.

JUDSON, EMILY CHUBBUCK, 1817-54; b. N. Y.; was well educated; taught a seminary for girls at Utica, and sailed for Burmah as the third wife (1846) of Dr. Adoniram Judson. She was a popular writer, contributing articles of poetry and prose under the pseudonym of "Fanny Forester" to the New York *Weekly Mirror*, the *Knickerbocker*, and the *American Baptist Magazine*. She wrote also Sunday-school books. Dr. Judson having died, she returned in 1851 to the United States in impaired health, and devoted herself mainly to the revision of the memoirs of her husband by president Wayland. Her essays, sketches, and poems in the *Mirror* were collected under the title of *Alderbrook*, and her domestic poems under that of *Olio*. Her other works in prose were *The Kathayan Slave*, and *Memoir of Mrs. Sarah B. Judson*. Some of her best poems were composed in Burmah.

JUDSON, SARAH HALL (BOARDMAN), 1803-45; b. N. H.; married in 1825 the Rev. George Dana Boardman, and embarked July 16 for Calcutta. In consequence of the war in Burmah they remained in Calcutta until 1827, when they embarked for Burmah, and commenced a mission at Maulmain, which became the chief seat of Baptist missions in Burmah. From this they were transferred in 1828 to Tavoy, among the Karens, where in two years he died. She continued her missionary work, making tours in the Karen wilderness, "through wild mountain passes, over swollen streams and deceitful marshes, and among the craggy rocks, and tangled shrubs of the jungle." Sitting in the zayat, hundreds gathered around her, and she instructed them through an interpreter. In 1834 she was married to Dr. Adoniram Judson. She translated part of *Pilgrim's Progress*, several tracts, and a hymn-book into Burmese, and before a mission was established among the Peguans, she learned their language, and superintended the translation of the New Testament and the principal Burmese tracts into the Peguan tongue. She also contributed valuable articles to the Burmese newspapers. Her health having failed, she sailed for America with Dr. Judson in 1845, and died on shipboard in the port of St. Helena, and was buried on the island.

JUGGERNAUT, JAGGERNAUT, or JAGGERNAUT PURI, or PURI, is the name of a t. in Orissa (85° 52' long., and 19° 48' lat.), celebrated as one of the chief places of pilgrimage in India. It owes its reputation to a temple erected there in honor of Vishnu, and containing an idol of this Hindu god, called *Juggernaut* (commonly *Juggernaut*), a corruption of the Sanscrit word *Jagannātha*, i.e., lord of the world. According to a legend related in the Ayeen Akbery, a king desirous of founding a city sent a learned Brahman to pitch upon a proper spot. The Brahman, after a long search, arrived upon the banks of the sea, and there saw a crow diving into the water, and, having washed its body, making obeisance to the sea. Understanding the language of the birds, he learned from the crow that, if he remained there a short time, he would comprehend the wonders of this land. The king, apprised of this occurrence, built on the spot where the crow had appeared a large city and a place of worship. The rajah one night heard in a dream a voice saying: "On a certain day, cast thine eyes on the sea-shore, when there will arise out of the water a piece of wood 52 in. long and 1½ cubits broad; this is the true form of the deity; take it up, and keep it hidden in thine house seven days; and in whatever

shape it shall then appear, place it in the temple, and worship it." It happened as the rajah had dreamed, and the image called by him Jagannātha became the object of worship of all ranks of people, and performed many miracles. According to another legend, the image arising from the water was an avatāra or incarnation of Vishnu; it was fashioned by Viswakarman, the architect of the gods, into a fourfold idol, which represented the supreme deity, and the temple itself was erected over it, and inaugurated by the god Brahmā and his divine court. The present temple was finished in 1198 A.D. That devotees committed suicide by throwing themselves under the wheels of the car in which Jagannātha is drawn on the yearly festival, is, it would appear, a calumny of English writers. Hunter, *Imperial Gazetteer of India* (1881), says: "I have carefully examined the whole evidence on the subject from 1580, when Abul Fazl wrote, through a long series of travelers, down to the police reports of 1870. I came to the same conclusion which H. H. Wilson had arrived at from different sources, that self immolation was entirely opposed to the worship of Jagannāth, and that deaths at the car festival were almost always accidental."

JUGGLERS (Fr. *jongleurs*), a term now almost synonymous with conjurer, and applied to persons who perform tricks of legerdemain, originally designated the professional musicians who attended the troubadours and trouvères of Provence and the north of France, either singing their poems, or, if they sung them themselves, accompanying them with an instrument, which was reckoned beneath the dignity of the poet himself. The word is derived from the mediæval Latin *joculator*; in Provençal, *joglar*, *joglador*; in old French, *jonglere* or *jongléor*; in modern French, *jongleur*. These musicians soon began to be also kept in the service of kings and princes, whence they received the name of *menestrels* or *minstrels* (Lat. *minister*, a servant). The profession was at this time an honorable one, and good endowments were devoted to the maintenance of minstrels; and when the art of the minstrel ceased to be exclusively employed for the entertainment of courts, those of this profession formed a separate guild in some towns, as in Paris. But it gradually lost respectability. Rope-dancers, and all who sought to gratify the populace by sleight of hand or feats of agility, were designated by the name *jongleur*, until it became restricted to its present acceptance.—The ancient Romans had their conjurers or wonder-workers (*præstigiatores*), their throwers of knives (*ventilatores*), and their players with balls and rings (*pilarii*). But the greatest proficient in everything of this kind are the Hindu jugglers, who have long been celebrated for the performance of feats which were quite inexplicable to the uninformed. Probably the most comprehensive exhibition of these feats in recent times occurred during the visit of Albert Edward, prince of Wales, to India in 1875-76, when the most expert Indian jugglers exhibited their skill before him. Both the Chinese and the Japanese are skilled jugglers, though with these people there is less of the absolutely mysterious, and more that is the result of agility and practice in their feats, than among the Hindus. The tricks of swallowing fire, expelling marvelous lengths of ribbon from the mouth, sword-swallowing, ball-catching, plate-spinning, and practice with fans are performed equally well by the jugglers of most of the oriental nations. The celebrated "basket" feat, and the trick of causing almost instantaneous vegetation, the seed being planted, and the tree growing to maturity, budding, blossoming, and coming to fruit, under the eye of the spectator, are juggling efforts which are peculiar to the Hindus. The jugglers of civilization, such as Houdin, the fakir of Ava, professor Anderson, signor Blitz, Heller, Herrmann, and others, have gained their reputation mainly by skill in *legerdemain*, and by adroit concealment of the means and appliances used, either through the employment of confederates, or by machinery. The "mysterious disappearance," the "box trick," the "aerial suspension," and the "second sight" trick, are accomplished by such means. The term juggler originated in the name of the instrument performed upon by the *jongleur*, this being a sort of hurdy-gurdy. The performer accompanied troupes of wandering minstrels, and the better to add to his own attractiveness, acquainted himself with certain tricks, acrobatic exercises, and other amusing conceits. It occurred that these latter features became the most popular portion of the performance, and the distinct specialty arose. The value of science to the modern juggler and conjurer is unquestioned; yet the most extraordinary and altogether inexplicable tricks are performed with the least mechanism. Chemistry and optics have played a large part in modern magic, as has also automatic machinery; witness "Pepper's ghost," and the "Psycho" of Mr. Maskelyne in London. See **MAGIC**.

JUGLANS and **JUGLANDACEÆ**. See **WALNUT**.

JUGULAR VEINS (Lat., *jugulum*), are two veins on each side of the neck, that convey the blood from the head to the heart. The external jugular vein is located just underneath the skin, and conveys the blood from the external portions of the head and neck, while the internal jugular vein is deeper, and very near the carotid artery, and conveys the blood from the internal portions of the skull. See **CIRCULATION**.

JUGUR'THA, King of Numidia, son of Mastanabal, who was a natural son of Masinissa, was carefully educated along with Adherbal and Hiempsal, the sons of his uncle, Micipsa, who succeeded Masinissa on the throne. After Micipsa's death Jugurtha soon caused Hiempsal to be murdered (118 B.C.), and Adherbal fled to Rome. Jugurtha succeeded in bribing very many of the Roman senate, and obtained a decision in his

favor, freeing him from the charge of the murder of Hiempsal, and assigning him a larger share of the kingdom than was given to Adherbal (117 B.C.). But Jugurtha soon invaded Adherbal's dominions; and, notwithstanding injunctions by the Romans to the contrary, besieged him in the town of Cirta (112 B.C.), and caused him and the Romans who were captured with him to be put to death with horrible tortures. Hereupon, war was declared against Jugurtha by the Roman people; but, by bribing the generals, Jugurtha contrived for years to baffle the Roman power. At last the consul, Q. Cæcilius Metellus, proving inaccessible to bribes, defeated him in 109 and 108 B.C., so that he was compelled to flee to the Mauritanian king, Bocchus. Marius, who succeeded Metellus in the command, carried on the war against Jugurtha and Bocchus, till at last Bocchus delivered up Jugurtha to the Romans, who exhibited him at Rome in the triumph of Marius (104 B.C.), and then threw him into prison to die of hunger. Jugurtha has obtained greater prominence in history than he deserves, on account of Sallust's history of the Roman campaigns against him.

JU'JUBE, *Zizyphus*, a genus of spiny and deciduous shrubs and small trees of the natural order *Rhamnaceæ*. The species are pretty numerous. The COMMON JUJUBE (*Z. vulgaris*) of the south of Europe, Syria, etc., is a low tree, which produces a fruit resembling an olive in shape and size, red, or sometimes yellow when ripe. The fruit is dried as a sweetmeat, and forms an article of commerce. *Syrup of jujubes* is used in coughs, fevers, &c.; but the *jujube paste* or *pâte de jujube*, of the shops of Britain is made of gum-arabic and sugar, without any of the dried jelly of this fruit. The jujube of India (*Z. jujuba*) is a similar small tree, with round or oblong fruit, sometimes of the size of a hen's egg.—A Chinese species of jujube (*Z. nitida*) has a very pleasant yellow fruit about an inch long; and other species not much inferior are found in Africa, South America, and other warm countries.—The LOTUS (*Z. Lotus*), a shrub two or three feet high, a native of Persia, the north of Africa, etc., produces in great abundance a fruit about as large as a sloe, and with a large stone, but having a sweet farinaceous pulp, which the natives of some parts of Africa make into cakes resembling gingerbread. A kind of wine is sometimes made from it.—*Z. Spina Christi*, another native of the countries near the Mediterranean, is sometimes said to be the plant from the branches of which our Savior's crown of thorns was made, and is therefore called CHRIST'S THORN and JEWS' THORN, names which, for the same reason, are also given to *Paliurus aculeatus*. The fruit is about the size of a sloe, oblong, and pleasantly acidulous.

JUJUY', a province of the Argentine Republic; 35,844 sq. m.; pop. '93, 60,000. It is bounded by Bolivia on the n. and w.; and on the e. and on the s. by Salta. An elevated plain comprises all the n.w. portion, which is a continuation of the great Bolivian tableland, terminating in a mountain chain, the peaks of which are covered with snow, and rise to the height of 14,000 feet. On the east side of the range the surface slopes gradually towards the Chaco plains, interspersed by a few inconsiderable mountains. This district is very fortunate in water supply, being fertilized by several rivers, the principal being the Rio Grande, which effects a junction with the Bermejo s. of Oran. The puna, or elevated plain, has two large lakes, Toro and Casabindo; the latter furnishes an immense quantity of salt; asphalt, gold, silver, gypsum, quicksilver, and petroleum are plentiful in the district; the vegetation is luxuriant, and it abounds in timber; wheat, maize, and sugar are largely cultivated.

JUJUY', a t. of the Argentine Confederation, South America, on a river and in a province of the same name, about 180 m. n. of Tucuman. It is said to be a place of some trade, being on the main route from Salta across the mountains into Bolivia. Pop. '90, 5000.

JUKES. The name (pseudonym) adopted by the prison association of the state of New York to signify a family whose history displayed an exceptional condition in its relation to crime, pauperism, and disease, illustrating heredity. The family indicated descended from a woman commonly described as "Margaret, the mother of criminals," and originated in the interior of the state of New York, in what would appear to have been a positive crime-center, from which the ramifications of this family line spread in all directions. The attention of the N. Y. prison association having been directed towards this remarkable case, a careful examination and analysis of the family record resulted in tracing it to the sixth generation, with definite conclusions as to the processes by which crime and pauperism are perpetuated, such as had never before been reached in any known instance. The facts in the case of the family under consideration showed that the aggregate number of descendants reached 1200 persons; of whom 709 were traced, and the incidents of their career tabulated. Of these, 280 received public charity and 76 were punished for crime, while a majority of all were offenders against virtue, and a large proportion diseased. An ingenious calculation sets forth a loss of a million and a quarter dollars to the commonwealth in 75 years through the mode of living and offenses of this family. In 1877 a report of this remarkable case was made to the prison association of N. Y. by R. L. Dugdale, which was published.

JUKES, ANDREW, an English preacher, who is known as a studious and thoughtful theological writer; author of *Principles of Prophetic Interpretation*, 1841; *The Way which some Persons call Heresy*, 1847; *Law of the Offerings in Leviticus*, 1847; *Characteristic Differences of the Four Gospels*, 1853.

JUKES, JOSEPH BEETE, 1811-69, b. England; educated at Cambridge, and entered upon a course of practical investigation into geological science. He was geological surveyor of Newfoundland in 1839, and was appointed in 1842 naturalist of the surveying expedition of H. M. S. *Fly*, engaged in the examination of the e. coast of Australia. In 1846 he was employed in the geological survey of Great Britain, and contributed to the official report special memoirs on certain districts. He was director of the geological survey of Ireland in 1850, and afterwards professor of geology in the royal Dublin society and the royal college of Dublin. Prof. Jukes wrote the article "Geology" for the *Encyclopædia Britannica*, 8th ed., and several important works on the same subject.

JULEP (French, from the Arabic), syrup of roses and water, a sweet drink. In medicine an acidulous, mucilaginous or demulcent drink, designed to soothe a patient. In the United States, a beverage compounded of brandy, whisky or some other spirituous liquor, and sugar, crushed ice and sprigs of mint. Called also *Mint-julep*.

JULIA, the only child of the Roman emperor Augustus, was his daughter by his second wife, Scribonia, and was b. 39 B.C. She was only a few days old when her mother was divorced. She was educated with great strictness; was distinguished for her beauty, talents, accomplishments, and agreeable manners; she was married at a very early age, 25 B.C., to her cousin, Marcus Claudius Marcellus, the sister's son of Augustus. After his death she was again married, when little more than 17 years of age, to Marcus Vipsanius Agrippa, to whom she bore three sons and two daughters. He dying, 12 B.C., Julia was given in marriage, 11 B.C., to Tiberius, his mother, Livia, the step-mother of Julia, persuading Augustus to this, in order to secure the succession of Tiberius to the throne. The marriage was an unhappy one, and the conduct of Julia far from irreproachable; but Livia's hatred induced her to make exaggerated accusations to Augustus, and she so wrought upon his mind that he astonished all Rome by suddenly declaring, 2 B.C., that his daughter had so far forgotten herself as to be guilty of the most shameless adulteries, making even the forum the scene of her nightly vice. In this charge there seems to have been too much truth; but it is doubtful if there was any truth in the allegation further made that Julia and her paramours had entered into a conspiracy against the life of the emperor. Julia was banished to the isle of Pandataria (now Ventotiene), near Naples, and a number of persons of high rank were put to death or banished for their alleged participation in her guilt. From Pandataria, whither her mother, Scribonia, accompanied her, she was removed to Rhegium (now Reggio), where she was allowed by Tiberius to remain, destitute even of common comforts, till her death, 14 A.D. Her son Agrippa, was put to death by Tiberius in 14 A.D., shortly before the death of his mother. Her other sons died in early age. Her daughters survived her. The elder, Julia, died, 28 A.D., in the isle of Trimetum, on the coast of Apulia, whither she had been banished by Augustus 20 years before for adultery. The younger, the virtuous Agrippina (q.v.), died in 33 A.D., in Pandataria, to which she had been banished by Tiberius.

JULIAN, surnamed the *Apostate*, on account of his renunciation of Christianity; Roman emperor 361-363 A.D., was b. at Constantinople Nov. 17, 331, and was the son of Julius Constantius, the brother of Constantine the great. His proper name was Flavius Claudius Julianus. He and his brother Gallus, who were too young to be dangerous, were spared when Constantius II., son of Constantine, massacred the rest of the imperial family. They were, however, removed to a castle in Cappadocia, where they were subjected to a system of rigorous espionage. Julian's life was very miserable, and the monkish education which he received produced no other result than a strong detestation of the religion professed by his tormentors. He was fond of literature and speculation, and he instinctively turned away from the rude asceticism, gloomy piety, and barbarous janglings of *Homoousians* and *Homoiousians*, to the cheerfulness, refinement, and pure intellectual meditateness of the old Greek philosophers. Some of his teachers appear to have been (secretly) pagans, for the sudden change in the state religion brought about by Constantine had necessitated a great deal of hypocrisy, especially among scholars and government officials. At the age of 20 Julian was at heart a disbeliever in the divine origin of Christianity. On the death of his brother Gallus he was removed by Constantius to Milan, but was subsequently allowed to go to Athens, the home of Greek learning, where he gave himself up to philosophical pursuits, and enjoyed that cultivated society which he so highly relished. The emperor—though still jealous and suspicious—now conferred on him the title of Caesar, and sent him to Gaul to protect it from the incursions of the Germans. Julian defeated the Alemanni at Strasburg (357 A.D.), and compelled the Franks to make peace. His internal administration in Gaul was mild and judicious. His popularity, in consequence, became very great, and when Constantius ordered him to set out for the east, Julian's soldiers rose in insurrection and proclaimed their favorite emperor, who most reluctantly acceded to their demands. The death of Constantius at Mopsoerene, in Cilicia, Nov. 3, 361 A.D., removed the only obstacle out of his way; and on Dec. 11 he made a triumphal entrance into Constantinople. He now publicly avowed himself a pagan, but surprised both Christians and pagans by his edict of toleration. Yet he was not absolutely impartial, for he chose most of his officers from the professed followers of the

old religion, and compelled the Christians to contribute to the restoration of the heathen temples. In 362 A.D. he made great preparations at Antioch, in the hope of bringing the war with the Persians to a successful termination; and in the following year advanced to Ctesiphon and across the Tigris, but want of provisions and treachery necessitated his retreat. He was followed and attacked by the enemy, who were repeatedly repulsed, but in one of the engagements he was mortally wounded by an arrow, and died June 26, 363.—Julian was both a great monarch and a great man. His rule, compared with that of many of the so-called Christian emperors, was just, liberal, and humane; and though only 32 years of age when he perished, he had composed a great number of orations, letters, satires, and even poems (collected and published by Spanheim in 1696). Among his lost works are his *Refutation of the Christian Religion*, and memoirs of his German campaigns and his diary. Julian appears to have been more attached to philosophy than religion.—See Neander, *Ueber den Kaiser Julian*; Strauss, *Der Romantiker auf den Throne der Cäsaren*; Rendell, *The Emperor Julian* (Lond. 1879); Centerwall, *Julianus affällingen* (1884); also the works of Mangold, Semisch, and Rode (1877).

JULIAN, OR JULIANUS, CESARINI, 1398-1444; b. Rome; descendant of a noble Italian family, and one of the most illustrious in the church of Rome in the middle ages; educated at the university of Perugia, and appointed to a professorship at Padua. The dissensions and disorders in the Roman church in the 15th c. required men of great decision and energy, and pope Martin V., recognizing the eminent talents of the young Julian, summoned him to his aid, and appointed him apostolic prothonotary. As the companion and assistant of cardinal Bremda he was sent to Bohemia to bring back the Hussites to allegiance to the church. The mission failed, but for his great services he was made in 1426 cardinal of Sante Angelo. He was sent to represent the pope at a diet in Nuremberg and at the council of Constance at Basle. It was determined to extirpate the Hussites, and before the meeting of the council of Constance, Julian put himself at the head of an army of crusaders, whom he in vain endeavored to fire with religious zeal and patriotic devotion against the Hussites. Repairing to the council of Basle he was made its president, and exerted himself to win back the Hussites by peaceful measures. He relied with confidence on the influence of the council. Eugenius the pope was determined to abrogate its decision, but Julian was opposed to this, and defended the independence of the council and its superiority over the pontiff. But while seeking reform within the church, and contending for the supremacy of the council over the pope, he faithfully adhered to the pontificate, defending the cause of the pope against the attacks of many leaders of the church. Finding the council unwilling to meet his views, he changed his course and became a firm adherent of Eugenius. The council now found itself at variance with its able president, and the church threatened with a great schism. In 1437 a bull was issued ordering a synod at Ferrara to consider the question of uniting the eastern and western churches. Julian, resigning the presidency, left Basle and hastened to Ferrara. The sudden change of Julian from an opponent to a friend of Eugenius has led some to doubt his sincerity. But it can be easily accounted for by his earnest desire for the union of the eastern and western churches and the healing of schisms. He has, however, been charged with duplicity towards the prelates of the eastern church in the council of Florence, to which place the assembly was removed from Ferrara. For his services to the papacy Eugenius made him bishop of Frascati, and in 1440 appointed him legate to Hungary. He was killed in a war with the Saracens.

JULIAN, GEORGE WASHINGTON, b. Indiana, 1817, and though receiving only a common school education became a teacher, and afterwards studied law and was admitted to the bar. He entered politics, and became a member of the state legislature of Indiana in 1845, and a member of congress four years later. He adopted free-soil principles, and was on the presidential ticket headed by John P. Hale in 1852. He was one of the founders of the republican party, was again in congress from 1861 to 1869, and became an ardent advocate of female suffrage. In 1872 he joined the Greeley (liberal republican) movement, and in 1885 was appointed surveyor-general of New Mexico. He published *The Life of Joshua R. Giddings* (1892).

JULIAN CALENDAR. See CALENDAR.

JULIAN CROSS, or CROSS OF ST. JULIAN, a cross crosslet placed saltire-ways.

JULIAN EPOCH. See CHRONOLOGY.

JULIAN YEAR. See YEAR.

JÜLICH, or in the French form of the name, JULIERS, a t. of Rhenish Prussia, 16 m. n.e. from Aix-la-Chapelle, on the Roer. Jülich is situated in a fertile plain, but surrounded by marshes, which make it very unhealthy. It is said to be of Roman origin, and was strongly fortified till 1860, when the fortifications were demolished. The principal branch of industry is the manufacture of leather. Pop. '90, 4,869. —Jülich was long the capital of an independent duchy; and Jülich and Berg (q.v.) were united as possessions of the same family. On the death of the duke of Jülich, in 1609, began a dispute as to the succession, which was not settled till 1666, when a decision was given in favor of the house of Pfalz-Neuburg—the elector of Brandenburg obtaining Cleves

and some of the other territories formerly united with Jülich and Berg. The Pfalz-Neuburg family becoming extinct in 1742, Jülich passed to the Pfalz-Salzbach branch, afterwards electors of Bavaria. By the peace of Luneville it was annexed to France as part of the dep. of Roer; and in 1814 was assigned to Prussia by the congress of Vienna.

JULIEN, STANISLAS-AIGNAN, the first Chinese scholar of his age in Europe, was b. at Orleans, in France, Sep. 20, 1799, and in 1823 became a pupil of Abel Rémusat, who had recently been appointed to deliver a course of lectures on Chinese. In less than a year, he had made himself master of the principal difficulties of the language, and actually executed (in Latin) a translation of the great Chinese philosopher, Mencius, which was published at the expense of the Asiatic society of Paris, and pronounced faultless. From that time, his labors were chiefly directed to the languages and literature of the far east. Ancient and modern Chinese, Mantchu, Sanskrit, the Mongolian tongues, were familiar to him, although, at the same time, he is said to have known almost all the European languages. His translations (into French) embrace the most important works in all departments of Chinese literature. He has given specimens of the Chinese drama in his *Hoei-lan-ki* (The Circle of Chalk, 1832) and his *Tchao-chi-kou eul* (The Chinese Orphan, 1834); of Chinese romances, by his *White and Blue; or, the Two Snake Fairies* (1834), and several other pieces in *Salmigondis* and the *Constitutionnel*. Julien was also the first who succeeded in translating Chinese poetry well—the constant use of allegory and allusion to facts not known to Europeans rendering it nearly unintelligible. But more valuable still than those purely literary productions are his translations of the great works that enable us to understand the religion and philosophy of the Chinese, such as the *Book of Rewards and Punishments* (1835), in which are contained the doctrines of Tao-see; the *Book of the Way and of Virtue* (1841) by Lao-tsze, written in the 6th c. B.C., and forming the oldest and most illustrious monument of Chinese philosophy; and above all, the history of the *Life and Travels of Hiouen-Tsang* (1852), a work of immense importance for the earlier history and geography of India and the knowledge of Buddhism. But not content with these brilliant labors, Julien sought to instruct us concerning the industry and arts of the Chinese, in a variety of treatises, of which we may mention his *Summary of the Principal Chinese Treatises upon the Culture of Mulberry Trees and Silk-worms* (1837), and his *Treatise on the Art of Manufacturing Porcelain* (1856). In 1869, he published the first part of the *Syntax of the Chinese Language*. On the death of Rémusat, he became his successor at the collège de France, and in 1855 president of the college. He was also conservator of the Bibliothèque Impériale, and was specially charged with the oversight of the Chinese department. He died in Feb. 1873.

JULIUS, the name of three popes, of whom the second and third deserve to be noticed.—Julius I., d. Rome, 352; was chosen pope 337, and supported Athanasius in his controversy with the Arians, even to the extent of causing his approval by a council summoned in 342, while he addressed a letter in his defense to the church of Alexandria. The eastern bishops antagonized the pope as to this action, and not being able to come to an agreement with him, excommunicated him.—Julius II., originally cardinal Della Rovere, a nephew of Sixtus IV., was born at Albizzola, near Savona. He was vehemently opposed during his cardinalate to the designs of Alexander VI. for the aggrandizement of his family, and one of his earliest measures on his election to the pontificate, in 1503, was to resume possession of the duchy of the Romagna, which had been bestowed upon Cæsar Borgia. Julius was himself beyond all suspicion of nepotism or selfish designs of aggrandizement; but his public career during his pontificate was almost entirely devoted to political and military enterprises for the complete re-establishment of the papal sovereignty in its ancient territory—Bologna, Ferrara, etc.—and for the extinction of foreign domination and foreign influence in Italy. In pursuing his designs for the purpose of compelling from the republic of Venice the restitution of the papal provinces on the Adriatic, Julius not only entered into the league of Cambray with the emperor Maximilian and Louis XII. of France, but had recourse to spiritual arms, by placing the republic under the ban of the church; and on the submission of Venice, apprehending the ambitious designs of Louis, he withdrew from the league, and entered into an opposite alliance, the “holy league,” to which Spain, Germany, and Switzerland were parties. Hence arose his bitter quarrel with Louis XII., in which the latter attempted, but ineffectually, to enlist the sympathies of the church against the pope. The council of Pisa, which was convened under Louis’s influence, was an utter failure; and the opposing council, fifth of the Lateran, assembled by Julius, but not brought to a close during his lifetime, completely frustrated the designs of Louis. It is alleged that, in his hatred of France, Julius was desirous of drawing even the Turks into the league; but this allegation is negatived by his entire career, one of the main features of which was a design for a holy war, in which he himself should take the command. As an ecclesiastical ruler Julius has little to recommend him in the eyes of churchmen. As a political sovereign he is described by Ranke as “a noble soul, full of lofty plans for the glory and weal of Italy;” and some consider him, with all his defects, as one of the noblest characters of that age in Italy. He was a liberal and judicious patron of art, and a friend of the rising literature of the time. He died Feb. 12, 1513.—Julius III., a native of Monte San

Savino, near Arezzo, was known before his elevation to the pontificate as cardinal del Monte. He was one of the four legates of the pope under whom the council of Trent was opened; and after his election to the papacy in 1550, he himself reopened (in 1551) that council, which had been suspended for upwards of two years. He is connected with English history as having sent cardinal Pole to organize with Mary the reunion of the kingdom with Rome; but his general government of the church is marked by no very striking events, and his private character is sullied by the taint of nepotism. He died Mar. 23, 1555.

JULIUS, NIKOLAUS HEINRICH, 1783-1862; b. Germany; studied and practiced medicine, but devoted himself to investigations of the management of the prisons of different countries. For this purpose he traveled in Europe and in the United States, and wrote and edited a number of works on prison reform, etc., including *Die Amerikanischen Verbesserungssysteme*; *Nordamerikas Sittliche Zustände*; and edited the *Jahrbuch der Straf und Besserungsanstalten*; and the *Magazin der Ausländischen Literatur der Gesammten Heilkunde*. He also made a German translation of Ticknor's *History of Spanish Literature*.

JULLIEN, ADOLPHE; French composer; b. June 1, 1845; was educated at the Lycée Charlemagne. He has been for some time co-editor of the *Revue et Gazette Musicale*. Among his many writings, the following are noteworthy: *La Musique et les Philosophes au XVIII. Siècle* (1873); *Weber à Paris*, 1877; *La Cour et l'Opéra sous Louis XVI.* (1878); *Goethe et la Musique* (1880); *Richard Wagner, sa vie et ses œuvres* (1886); *Musiciens d'aujourd'hui* (1891).

JULLIEN, LOUIS GEORGES, 1812-60; a French musician. He directed promenade concerts in London for many years, and wrote an opera for Covent Garden theater, called *Pietro il Grande*. He visited the United States with a large orchestra in 1853, and gave popular concerts in the chief cities.

JUL LUNDER, a city of the Punjab, stands in the doab of the same name between the Sutlej and the Beas, in lat. $31^{\circ} 20' \text{ n.}$, and long. $15^{\circ} 37' \text{ e.}$ The soil of the neighborhood is very productive; and the place, though fallen from its former greatness, has still (1891) 66,202 inhabitants.—Jullunder, also spelt *Jallandar*, gives name to an administrative district of 1333 sq. m. area (pop. 907,584), and to a division of 12,181 sq. m. area (pop. '91, 4,217,670).

JULUS, or **IULUS**, a genus of *myriapoda* (q.v.), of the order *chilognatha*. The whole of this order was included in the Linnæan genus *julus*, and it is still the family *julidae* of many naturalists. The genus *julus*, as now restricted, contains many species, some of which are British. They are sometimes called SNAKE MILLIPEDES and GALLY-WORMS. They resemble centipedes in form; but their feet are more numerous—some having 120 pair—and are so weak that the animal seems to glide along on its belly, the feet moving like a wavy fringe on each side. The body is nearly cylindrical, not flattened. On any alarm the animal rolls itself up in a coil. The *juli* have no poison-fangs, like centipedes. They inhabit moist and dark places, and feed chiefly on decaying vegetable substances, sometimes also on decaying animal substances.

JULY, the 7th month of the year in our calendar, 5th in the Roman calendar, where it was called Quintilis (the 5th). Originally it contained 36 days, but was reduced by Romulus to 31, by Numa to 30, but was restored to 31 days by Julius Cæsar, in honor of whom it was named *July* (Lat. *Julius*), on account of his birth having happened on the 12th of this month. It was called *Maed-monath*, or mead-month, and *litha-aeftera*, or after-mild-month, by the Anglo-Saxons.

JUMBUSER, a t. of British India, presidency of Bombay, is situated in the district of Broach, and 22 m. n.w. of the town of that name. Pop. 12,100, who are principally employed in the cotton, grain, and coarse cloth trade.

JUMIL LA, a handsome t. of Spain, in the modern province of Murcia, is situated in a delightful valley 37 m. n. of the city of that name. Pop. '87, 14,334, who manufacture fire-arms, earthenware, and tiles.

JUMNA, the principal feeder of the Ganges, is perhaps the only Indian river of the first-class which has its course wholly in Hindustan—the Indus, Sutlej, Ganges, and Brahmaputra all rising in Thibet. Its source, at a height of 10,849 ft. above the sea, is in lat. 31° n. and long. $78^{\circ} 32' \text{ e.}$, at the s.w. base of the Jumnotri peaks; and, after flowing 875 m. chiefly in a s.e. direction, it joins the Ganges at Allahabad. After its first 100 m., during which it receives many affluents, of which the Touse is the largest, it enters the plain of Hindustan in lat. $30^{\circ} 20' \text{ n.}$ and long. $77^{\circ} 38' \text{ e.}$, having still an altitude of 1276 ft. above the sea. Below this point it is joined by many considerable streams: the Chumbul, the Sind, the Betwa, and the Cane on the right; and the Hindon, the Seengoor, and the Rind on the left. All the way downwards the Jumna is generally shallow, and, excepting as to descending rafts, unfit for navigation. By artificial means, however, its waters have been rendered doubly available both for commerce and for agriculture. From either bank a canal has been drawn at once for the use of inland craft and for the purposes of irrigation. The one on the right side, begun in 1356, leaves the main channel a short distance below the point of its emerging from the moun-

lains; while the one on the left side, commenced in 1824, takes its departure a little further down, near the village of Fyzabad. Both of them rejoin the parent stream at Delhi. Historically and politically the Jumna occupies a more prominent position than the Ganges itself above their junction. The former was necessarily the first to cross the path of every invader from the n.w.; and hence on it were built both Agra and Delhi, the two capitals of the Mussulman conquerors of India.

JUMNOTRI, hot springs near the source of the Jumna, in lat. $30^{\circ} 59'$ n. and long. $78^{\circ} 35'$ e., 10,849 ft. above the sea. Their temperature is 104.7° F., nearly that of boiling water at their elevation. They are overhung by three connected mountains known as the Jumnotri peaks, whose altitudes respectively are 21,155, 20,916, and 20,122 feet.

JUMPERS, a name given to those who believed that religious worship should be accompanied with leaping and dancing and other bodily agitations. They are said to have originated in the congregations of Whitefield in the western part of Wales about 1760, and to have had followers among the Quakers and Irvingites. They are called also Barkers, because they accompany the leaping and dancing with groans and incoherent utterance. Discouraged in England they emigrated to the United States, where, in Pennsylvania, Ohio, and the extreme west they have some adherents. Evans, in his *Sketch of the Denominations of the Christian World*, gives an account of their exercises, which he witnessed.

JUMPING HARE, *Pedetes or helamys capensis*, a south African rodent, *spring haas* of the Dutch colonists, generally placed near the jerboas in systems of zoology, but very considerably differing from them. The head much resembles that of a hare, although the ears are shorter; the form of the body is also like that of a hare, but the hind-legs are very long and strong, like those of a kangaroo, and the toes both of fore and hind feet are armed with great claws. Its powers of leaping are extraordinary; it clears 20 or 30 ft. at a bound. Night is its time of activity, and it makes mischievous inroads on fields and gardens. Its flesh is eaten.

JUNAGARH, a t. of Hindustan, chief town of native state of same name, possessed by an independent native chief, now one of the British allies. In 1808 he and other chiefs agreed with the Bombay government to oppose piracy, and allow free commerce with British vessels on the payment of the stipulated duties. This chief, styled the nawaub of Junagarh, has a territory containing a population of 387,500.

JUNCEÆ, or **JUNCA'CEÆ**, a natural order of endogenous plants, herbaceous, generally perennial, with creeping root-stock; narrow, often fistular leaves; regular flowers; the perianth 6-partite; the stamens six; the fruit a 3-valved capsule. This order is nearly allied to *Liliaceæ*, notwithstanding very great difference of aspect, for rushes (*juncus*) are the best-known examples of it. The species, about 200 in number, are mostly natives of cold and temperate climates.

JUNCTION CITY, city and co. seat of Geary co. Kan.; on the Kansas river and the Missouri, Kansas, and Texas and the Union Pacific railroads; 71 miles w. of Topeka. It is in an agricultural region, and contains a public park, public library, waterworks, electric light and street railroad plants, foundry and machine shop, churches, and daily and weekly newspapers. Fort Riley, a large U. S. military post, with school for cavalry and light artillery, is near the city. Pop. '90, 4,502.

JUNE, the sixth month of the year in our calendar, but the fourth among the Romans. It consisted originally of 26 days, to which four were added by Romulus, one taken away by Numa, and the month again lengthened to 30 days by Julius Cæsar, since whose time no variation has taken place. The Anglo-Saxons called this month *sear-monath*, or dry-month, and *midsummer-monath*.

JUNEAU, a co. of s. central Wisconsin, bounded e. by the Wisconsin river; watered by the Lemonweir, Yellow, and Baraboo rivers; intersected by the Chicago, Milwaukee and St. Paul railroad; 800 sq. m.; pop. '90, 17,121. The surface is uneven and extensively covered with forests of pine, sugar-maple, and other trees. The soil is fertile. The staple products are wheat, maize, hay, hops, and lumber. Co. seat, Mauston.

JUNE BERRY, *Amelanchier Canadensis*, a shrub, indigenous to Canada and the United States, which is largely cultivated for its fruit, a berry of rich purple color, sweet in flavor, and of the size of a currant. The characteristics of the shrub are similar to those of the apple and pear, but it is found in many varieties, which offer considerable differences. It varies in height from 3 or 4 to 30 ft., and bears different names in different parts of the country, being known as the shad-bush, the service-berry, and the mountain whortleberry.

It is cultivated in ornamental gardening, as it bears a white flower in abundance.

JUNG, JOACHIM, 1587-1657, b. Germany; a distinguished naturalist and writer on scientific subjects. He was professor of mathematics at Giessen and Rostock, practicing also as a physician. His writings were voluminous, but a number of them were destroyed by fire. A collection was made of those extant by Albrecht in 1747, and published as *Opuscula Physica Botanica*. While he studied and wrote upon philosophy, mathematics, mineralogy, and invertebrates, he was specially noted for his knowledge and ability as a

botanist, and is said to have antedated Linnæus in devising the binomial nomenclature for plants. As a philosopher he ranked among the first of his age, being rated by Leibnitz with Copernicus, Galileo, and Descartes.

JUNG, JOHANN HEINRICH, generally called **JUNG STILLING**, an author, the events of whose life and whose gifts of imagination render him worthy of notice, although at one time his merits were greatly over-estimated. He was born of poor parents at Grund, in Nassau, Sept. 12, 1740, and after trying various occupations became a student of medicine at Strasburg, where he lived in intimacy with Goethe, who conceived a great liking for him, on account of his simple, pure, affectionate nature; settled as a medical practitioner at Elberfeld, and distinguished himself as an operator for cataract. He is said to have improved the eyesight of more than 2,000 persons. Jung subsequently held professorships at Marburg and Heidelberg. He died at Carlsruhe, April 2, 1817. His first publication was an autobiography, *H. Stilling's Jugend, Jünglingsjahre, Wander-schaft, Lehrjahre, Häusliches Leben und Alter* (3 vols., Berlin, 1777-78), which attracted much attention, and was followed by other publications from time to time, continuing the history of the author's career. In religion, Jung represents a class by no means uncommon in Germany—viz., the *pietistic rationalists*, men who put little stress upon the (written) word of God, but are full of veneration (often degenerating, however, into a mere sentimental enthusiasm) for the spiritual truths of Christianity. Jung's collected works were published (1838) at Stuttgart in 14 volumes.

JUNGERMANNIA, a Linnæan genus of cryptogamous plants, containing a great number of species, which some modern botanists have divided into many genera, and some have even formed into an order, *Jungermanniaceæ*, although it is more generally regarded as constituting a sub-order of *hepaticæ* (q.v.). The distinctive characters of the sub-order are that the *spore-cases* open by four valves, and that the *spores* are mixed with *elaters*. The species much resemble mosses in appearance. Many are natives of Britain, some of them very common in moist places. The tropical species are very numerous, and some of them are to be found even on the young shoots and leaves of plants. See illus., *MOSES, ETC.*, vol. X.

JUNG FRAU (the Maiden), one of the highest mountains of the Bernese Alps, rises on the boundary-line between the cantons of Bern and Valais, and attains a height of 13,720 feet. It received its name either from the unsullied purity and dazzling brightness of the snow by which it is covered, or from the fact that no traveler had ever reached its highest point. Its summit was reached first by two Swiss gentlemen, named Meyer, in 1811, and since by Agassiz, prof. Forbes, and many others.

JUNGHUHN, FRANZ WILHELM, 1812-64; commenced his professional career as a surgeon in the Prussian army; afterwards joined the French forces in Algeria, and finally settled in one of the Dutch colonies in Java. In the latter country he made valuable researches into the geological, geographical, and botanical resources of the land, and his published works upon the subject are highly prized. He visited Europe in 1849, but returned to Batavia, where he died. His principal works are: *Java; seine Gestalt, Pflanzendecke und innere Bauart; Die Battaländer in Sumatra; Landschaftsansichten von Java*; and an unfinished description of the plants and fossils of Java, *Pflanze Junghuhniana*.

JUNGLE, a term now fully adopted into the English language, but of Bengalese origin, and employed to designate those thickets of trees, shrubs, and reeds which abound in many parts of India, and particularly in the unhealthy tract called Terai or Tarayani, along the southern base of the Himalaya, and in the Sunderbunds (q.v.) at the mouth of the Ganges. The jungles are often impassable, from the thick growth of underwood, tall grasses, and climbing plants. The soil is generally swampy, and fever and other diseases abound. Tigers and other beasts of prey, elephants, boars, deer, and other quadrupeds are found in great numbers in these thickets, with gigantic snakes and multitudes of monkeys. The jungle flora and fauna are very peculiar, and the moisture and heat carry a tropical vegetation beyond its usual limits northward to the lower valleys of the Himalaya.

JUNGLE FEVER. A species of illness contracted amongst the jungles of India, of an intermittent nature, often assuming a typhoid form. Extreme prostration accompanies it, and one rarely recovers from it except by leaving the country, and escaping from the miasma which causes it. Its attacks are generally confined to foreigners.

JUNGLE-FOWL, the name given by the Australian colonists to a bird (*megapodius tumulus*), which has also been called the **MEGAPODE**, totally different from the jungle-fowl of India. See **FOWL**. It belongs to the family *megapodiæ*. All the species are large birds, with short wings and tail, and of slow, heavy flight. They are remarkable for the thickness of their legs (*tarsi*), and their long and thick toes; and for their habit of heaping up mounds of earth, decayed leaves, etc., in which they lay their eggs, which are hatched by the heat produced by fermentation. The Australian jungle-fowl makes heaps sometimes 15 ft. high, and 60 ft. in circumference at the base, under the shade of thick trees or shrubs, where the heat of the sun may not evaporate the moisture. In these heaps it makes holes of several feet in depth, in which to deposit its eggs. How the young birds emerge is not yet known, nor if they are assisted by the parent birds.

The mounds of the jungle-fowl were at first supposed to be sepulchral tumuli. The jungle-fowl is mostly of a brownish color. Its size is rather less than that of the common domestic fowl. The propensity to heap up earth is very early manifested by young birds.

JUNGLEY GAU, *Bos Sylhetanus*, a species of ox, inhabiting Sylhet and other mountainous parts of the n.e. of India. It is nearly allied to the gayal (q.v.) and to the common ox, and has more the appearance of some of the European domesticated breeds of ox than any of the other wild oxen of Asia. The jungley gau, although in a wild state it is only to be seen in places remote from the habitations of man, and flees from the encroachments of cultivation, is easily domesticated.

JUNGMAN, JOZEF JAKOB, 1773-1847; b. Bohemia; educated at the university of Prague; was teacher at the gymnasium of Leitmeritz, 1799-1815; professor at Prague, 1815-45. His earliest work was a translation into Bohemian of Milton's *Paradise Lost*. He published in 1825 a history of the Bohemian language and literature, and in 1835 a complete Bohemian-German dictionary.

JUNIATA, a co. of s. central Pennsylvania, watered by the Juniata river, and traversed by the Pennsylvania railroad; 410 sq. m.; pop. '90, 16,655. The surface is mountainous, a large part covered with forests, and the valleys are very fertile. The staples are wheat, oats, maize, potatoes, and hay. The county contains slate, sandstone, and limestone. The chief articles of manufacture are farming implements and carriages, and there are several tanneries, flour and saw-mills. Co. seat, Mifflintown.

JUNIATA RIVER, in central Pennsylvania; rising near Altoona. It is formed by the Franktown branch and the Little Juniata, which unite at Petersburg. It runs s.e. through Huntingdon co. and n.e. through Mifflin co., and enters the Susquehanna river at Duncannon, 14 m. above Harrisburg. Including the Franktown branch it is 150 m. long, and has through nearly its whole course some of the most grand and picturesque scenery of the state. It breaks through or crosses several mountain-ridges, and waters several valleys. The Pennsylvania railroad follows its windings from its source to its mouth, crossing it several times.

JUNIPER, *Juniperus*, a genus of trees and shrubs of the natural order *coniferae*, sub-order *cupressineae*, having unisexual flowers, the male and female generally on separate plants, and the fruit a fleshy *galbule* (popularly a *berry*), containing three small nuts. The species are all evergreen, and have small, narrow, rigid leaves, which are opposite, or in whorls of three or four, or imbricated in four rows. They are natives chiefly of temperate and cold regions, and are found in Europe, Asia, Africa, and America.—The COMMON JUNIPER (*J. communis*) is found in all parts of Europe and the n. of Asia, and in the northern parts of North America. Only in favorable circumstances does it become a tree of 15, 20, or at most 30 ft. in height, and in general it is only a shrub from 2 to 6 ft. high. The fruit takes two years to ripen; it is round, of a bluish-black color, with a whitish bloom; it is of the size of a small currant, and is produced in great abundance. The little nuts or stones of the fruit have on the shell three glands, which abound, especially before ripening, in an essential oil—*oil of juniper*—present also in the wood, particularly in the young wood. The wood is yellowish-red, brownish in the heart, hard, and fragrant. When of sufficient size it is much valued by turners. It is also used for veneering. The dry twigs, roots, and berries are used for fumigation. The berries have a strong and peculiar flavor. They are much used for flavoring gin, which derives its name from them (see GIN). They also enter into several medicinal preparations, being stimulant, sudorific, and diuretic. The bark of juniper may be made into ropes, and in some parts of the highlands of Scotland the roots are woven into the coarse baskets which are used for potatoes, peats, etc.—Oil of juniper is lighter than water; specific gravity, 0.839. It is limpid and nearly colorless. It is obtained by distilling the unripe fruit, or the twigs, with water. The medicinal properties of juniper depend on it; six drops are a dose.—SPANISH JUNIPER (*J. oxycedrus*) grows in arid situations in the countries around the Mediterranean sea. Its fruit is about the size of a hazel-nut, and from its fruit and wood is procured an essential oil of disagreeable odor, called *huile de cade* (q.v.), which is used in veterinary practice, particularly as a cure for scab in sheep.—VIRGINIAN JUNIPER (*J. Virginiana*), the RED CEDAR of North America, is an evergreen tree, often 30 to 50 ft. high, of conical form, with horizontal branches and very small leaves; a native of North America, from lake Champlain to the gulf of Mexico. It grows in sandy or rocky places. It is often planted in pleasure-grounds in Europe, and succeeds well in Britain. The berries are small and bright blue. The heart-wood is of a beautiful red color, and is valued by turners, coopers, etc. It is imported into England for making pencils. There are often found on the branches fungous excrescences called *cedar apples*, which have been recommended as a vermifuge.—The BERMUDA CEDAR (*J. Bermudiana*) is a native of the Bermudas, a lofty tree, with very fragrant reddish-brown wood, which is used for furniture, pencil-making, etc., and also for lining cabinets, its flavor preventing the attacks of moths and other insects.—The Himalaya mountains produce several species of juniper, trees of considerable size, beautiful appearance, and valuable wood. The only species of juniper which is a native of Britain is the common juniper, and it is found chiefly in the more mountainous parts.—The SWEDISH JUNIPER of our shrubberies is merely a variety of the common juniper.

JUNIUS, FRANCISCUS, 1589–1677; b. Heidelberg; studied the principles of military engineering, and for a while was in the army; retiring from his profession in 1609 he devoted the remainder of his life to study. He visited England in 1620; was appointed librarian to the earl of Arundel, and held that office for thirty years, during which time he studied the Teutonic languages. His greatest work was his *Glossarium Gothicum*, in five languages, the English portion of which has been issued separately as *Etymologicum Anglicanum*; he also wrote *De Pictura Veterum*, with an English translation by himself, and published an edition of the *Gothic Gospels of Ulfilas*, with a commentary. He visited Germany, 1650, and died in the house of his nephew, Isaac Vossius, at Leyden, leaving his valuable MSS. to the Bodleian library, Oxford.

JUNIUS, LETTERS OF, a famous series of political letters signed "Junius," which appeared in a London newspaper, *The Public Advertiser*, during the last year of the administration of the duke of Grafton and the first two years of that of lord North. They were 44 in number; besides which are to be reckoned as proceeding from the same pen 15 signed Philo-Junius, 62 business-letters (mostly very short) addressed to his publisher, Woodfall, and 10 to Wilkes (privately); and in addition, 113 letters under various signatures. The first of the letters of Junius, published Jan. 21, 1769, treats of the "State of the Nation," and may be said to strike the key-note of all the subsequent correspondence. In it the author singles out several leading members of the ministry, and boldly denounces their inefficiency; and the last of the letters, dated Jan. 21, 1772, closes somewhat suddenly the long indictment against ministers in the same spirit in which it had begun. No sooner did the first Junius appear than the court-party took the alarm. An invisible and dreaded censor was evidently moving among them—one who, though as yet the days of parliamentary reports were still far off, seemed cognizant of all the proceedings of both houses, who not only knew intimately the public career of ministers, but was fully informed regarding the follies and the crimes of their private character. Sir W. Draper, who entered into controversy with this unknown adversary, was in the end overmastered, and reduced to mere humble complaint and confession. The duke of Bedford, lord Mansfield, and chief of all, the duke of Grafton, writhed beneath his lash—the last of these being more indebted for immortality to the splendid sarcasm of Junius than to any measure which it was his fortune to introduce. It cannot, however, be denied that the hatreds of Junius, though springing for the most part from his detestation of injustice, and his contempt for incapacity, were increased and imbibed by party spirit and personal dislike. The style of these letters, though perhaps occasionally somewhat stiff and formal, is of the very highest class. Occasionally rising to the loftiest eloquence, it is always remarkable for closeness of argument, felicity of illustration and allusion, and brilliant epigram. Whoever Junius was, his life depended upon his preserving his *nom de plume*. He had made too many enemies to be safe in acknowledging himself. From the day of the publication of his first letter, however, conjecture has been busy framing theories of the authorship. Burke, lord Shelburn, col. Barré, lord George Sackville, Wilkes, Horne Tooke, Thomas, lord Lyttleton, among others, were supposed in turn to be Junius; but the general opinion now is that sir Philip Francis (q.v.) was the author of these letters. The Franciscan theory is supported by a weight of evidence, which, although entirely circumstantial, is sufficient, Macaulay thinks, "to support a verdict in a civil, nay, in a criminal proceeding." The handwriting of Junius is the handwriting of Francis slightly disguised. Junius, as is evident from his letters, knew the forms of the secretary of state's office, was intimately acquainted with the business of the war office, attended the house of commons in 1770, and took notes of speeches, especially of those of the earl of Chatham; denounced the promotion of Mr. Chamier in the war office as unjust to Mr. Francis, and was bound by some strong tie to the first lord Holland. All these circumstances in the position of Junius correspond exactly with the history of Francis. Good authorities, however, hold that Francis was not Junius; the *Athenæum* (1882) calls the identification "an absurd theory;" and the *Ency. Britannica* (9th ed.) regards the authorship as being as much a mystery as ever. See Chabot and Twisleton's *Handwriting of Junius Professionally Investigated* (1871); also *Junius*, by Woodfall (1850); and Macaulay's *Essays* (Warren Hastings).

JUNK, a Chinese vessel, often of large dimensions. It has a high fore-castle and poop, and ordinarily three masts. Junks, although clumsy vessels, incapable of much seamanship or speed, have proved themselves seaworthy on voyages extending even to America and Europe. The junk of Japan is considerably superior to that in use in China.

Junk, in the British navy, is a familiar term for the salt meat supplied to vessels for long voyages—the name being probably derived from the fact that it becomes as hard and tough as old rope, pieces of which are officially styled *junk*.

JUNKER PARTY. See **POLITICAL PARTIES, GERMAN.**

JUNKER, WILHELM, African explorer, b. in Moscow, Russia, Apr. 18, 1840; d. at St. Petersburg, Feb. 13, 1892. Born of German parents, he was educated at Göttingen, and here took the degree of M.D. in 1865. He journeyed first to Iceland in 1869; to Tunis 1873–4; in 1875–8 was in the equatorial province and on the head waters of the Welle; and finally in 1879–86 in the basins of the Welle and the Bahr-el-Shazal. His explorations were made from motives purely scientific, and his geographical results were remarkably complete. In his dealings with the natives he never used weapons. For the results of his work consult Petermann's *Mittheilungen* (1879–91).

JUNKIN, GEORGE, D.D., LL.D., 1790-1868; b. Penn.; graduated at Jefferson college, Penn., and was for many years pastor of churches at Milton and McEwensville, Penn.; was successively president of Lafayette college, Miami university, and Washington college, Va. (now Washington and Lee university), which last position he relinquished at the beginning of the civil war on account of his union sentiments. His vigor and efficiency were shown in his work as founder and first president of Lafayette college (q.v.), supplying the money for salaries and current expenses for nine years.

JUNKSEYLON, or **SALANG'**, an island in the bay of Bengal, lies in lat. 7° 46' n. and long. 98° 18' e., near the w. coast of the peninsula of Malacca. It belongs to Siam, and trades chiefly with the British settlements of Malacca, Penang, and Singapore. It yields large quantities of tin. Pop. 12,000.

JU'NO and **HE'RA**, the Roman and Greek names of the queen of heaven and wife of the supreme divinity. The two conceptions have unfortunately been confounded, and hence their essential dissimilarity has been lost sight of—a dissimilarity, it may be remarked, as great as that which existed between the Roman and Greek character. We shall endeavor to distinguish between the two conceptions.

HE'RA (meaning "mistress"), the Greek goddess, was the daughter of Kronos and Rhea. She was the sister of Zeus, and afterwards became his wife. Her jealousy is proverbial, and was unfortunately too well founded, for Zeus was the reverse of a faithful husband. In the Homeric poems she appears, on the whole, as an obstinate, quarrelsome shrew, whose temper is a source of frequent discord between herself and her lord, whom, however, she greatly fears. She is represented as often spitefully favoring persons who were the objects of the displeasure of Zeus, and has to be punished for her disagreeable ways. Zeus scolds and even beats her; and on one occasion we read of his having tied her hands and hung her up in the clouds. But she is, nevertheless, a female of majestic beauty, the grandest of the Olympian dames. As the only wedded goddess in the Greek mythology she naturally presided over marriage and at the birth of children. She rode in a chariot drawn by two horses; and in her famous temple at Mt. Eubœa her statue, made of gold and ivory, bore a crown, symbolic of her queenly dignity. Her favorite residences were Argos, Sparta, and Mycenæ; but she had sanctuaries in many parts of Greece. The Greek artists loved to represent her as a majestic woman of middle age, possessing a maternal dignity of mien, with beautiful forehead, large eyes, and venerable expression. Homer repeatedly calls her "the venerable, ox-eyed Hera."

JUNO (the name is from the same root as Jupiter), the Roman goddess, was the queen of heaven, and, under the name of *Regina*, was worshiped in Italy at an early period. She bore the same relation to women that Jupiter did to men. Like the Greek Hera she took a special interest in marriage, whence her name of *Juga* or *Jugalis* (the yoke-maker); but she was also a kind of female providence, protecting the sex from the cradle to the grave. Her epithets, *Virginalis* (the goddess "of virgins"), and *Matrona* ("of mothers"), indicate this. It is a very significant feature of the Roman character that Juno was also believed to be the guardian of the national finances, watching over her people like a thrifty mother and housewife. A temple, containing the mint, was erected to her on the Capitoline as Juno *Moneta* (the money-coiner). She was, besides, the goddess of chastity, and prostitutes were forbidden to touch her altars. She had a multitude of other surnames, which we cannot afford space to enumerate. Her great festival was called the *matronalia*, and was celebrated Mar. 1. Her month (June) was considered the most propitious for fruitful marriages; and even yet, after eighteen centuries of Christianity, this old Roman faith lingers superstitiously in the popular mind. See *illus.*, **MYTHOLOGY**, vol. X.

JUNOT, **ANDOCHE**, duke of Abrantès, and marshal of France, was b. Oct. 23, 1771, as Bussy-le-Grand, in Côte-d'Or, entered the army as a volunteer in 1792, and distinguished himself in the early wars of the republic. Napoleon's attention was first drawn to him during the siege of Toulon; accompanying Napoleon to Italy as aide-de-camp at the battle of Millesimo he so distinguished himself that he was chosen to carry the captured colors back to Paris. In 1798 he followed Napoleon to Egypt, was there created gen. of brigade, and particularly distinguished himself at Nazareth, where, at the head of 300 cavalry, he put to flight 10,000 Turks, after a conflict of fourteen hours' duration. In 1807 he was appointed to the command of the army of Portugal. His army, after undergoing dreadful privations, reached Lisbon, and Junot, with the greatest expedition, made himself master of all the strong places in the kingdom, and reorganized his army. For his brilliant conduct at this time he was created duke of Abrantès, and appointed governor of Portugal; but being defeated by Wellington at Vimieira he concluded a convention at Cintra, returned to France, and subsequently served in Germany, Spain, Portugal, and Russia. In 1812 he was disgraced by Napoleon for a supposed want of energy, and sent to govern Illyria. This along with other causes produced mental derangement. He was taken to his father's house at Montbard, near Dijon, and two hours after his arrival precipitated himself from a window (July 22, 1813), and fractured his thigh-bone.

Amputation was performed, but Junot frantically tore off the bandages, and died some days afterwards.

JUNOT, LAURE, Duchess of Abrantes, 1784-1838; b. France, of a family named Permon; married Gen. Junot in 1800. She was a leader among the beautiful and witty women of the court of Napoleon I., her *salon* being frequented by the most prominent personages in political and social life in Paris. After the fall of Napoleon she devoted herself to historical writing, and published successively *Mémoires sur Napoléon*; *Mémoires sur la Restauration*; and *Souvenirs d'une Ambassade en Portugal*. Despite the interest created by these works their author fell into misfortune, and died in a charitable institution in Paris. Her life was notable, however, for the boundless extravagance of her habits, and to this fact must be attributed mainly its unfortunate conclusion.

JUNTA, i. e., an association, the name given in Spain to a body of persons combined for any political or civil object. The term was formerly applied more exclusively to assemblies of representatives of the people meeting without authority of the sovereign, but has been extended to those of the most strictly legal character.

JUPATI PALM, *Raphia tædiger*, a palm which grows on rich alluvial, tide-flooded lands near the mouth of the Amazon. The stem is seldom more than 6 or 8 ft. high; but the leaves are often 50 or 60 ft. long, rise vertically from the summit of the stem, and bend out on every side in graceful curves, forming a magnificent plume. The leaves are perhaps the largest in the vegetable kingdom; they are pinnate, the leaflets about 4 ft. long. The leaf-stalks, which are often 12 or 15 ft. long below the first leaflets, and 4 or 5 in. in diameter, perfectly straight and cylindrical, are almost like birds' quills in strength and lightness; when dried, of a soft substance, with a thin, hard, glossy outer covering. They are used for various purposes, as for laths, window-blinds, etc. The interior part is soft enough to be used instead of cork.

JUPITER, or **JUPITER**, in Roman mythology was the greatest of the gods. The name is a modification of *Diōvis pater*, or *Diēspiter* (*Diōvis* or *Dies* = *divum*, heaven), i. e., the Father of Heaven, or the Heavenly Father. As such, Jupiter had all power over the phenomena of the skies; hence his numerous epithets, such as *pluvius* (the rain-giver), *tonans* (the thunderer), *fulminator* (the lightning-hurler), *serenator* (the weather-clearer). But he possessed still higher and diviner attributes. The future was spread out clearly before his all-seeing eye; the destinies of men were in his hands, and events were but the expression of his omnipotent will. But he was not careless of mankind. He revealed himself in a variety of ways to them, and taught men to interpret these mystic and symbolic revelations. Wonderful appearances in the sky or unwonted circumstances happening on the earth were the *media* of his communications; hence his surname *Prodigialis* (the sender of prodigies). As the national god of the Roman people, he went with them into battle (like the Jehovah of the Hebrews), fought for them, procured them victory, and, generally speaking, was their protector at home and abroad. This conception of Jupiter is shown in such names as *imperator* (the ruler), *victor* (the conqueror), *stator* (the stayer or stander-by). The strong sense of morality which marked the old Romans also found its expression in their view of the character of the best and greatest (*optimus maximus*) of their gods. Jupiter was the guardian of law, justice, and virtue; oaths and all solemn engagements were made as to him ("in the sight of God," as we say). He had temples erected to him at Rome under all his different names; but the principal one was that on the capitol, whence he had the title of *Capitolinus*, and where, with beautiful significance, the statues of *Fides* (Faithfulness) and *Victoria* (Victory) were placed beside his own. When consuls or other magistrates entered on the duties of their office, or when the army was about to open a campaign, or a general returned victorious from war, sacrifices were solemnly offered to Jupiter, and his favor invoked. When the Romans began to know the religion and literature of Greece, they foolishly sought to identify their own noble, majestic, and gravely upright Jupiter with the lustful and immoral *Zeus* of the Greeks. Hence have originated much confusion. See *ILLUS.* See *ILLUS.*, MYTHOLOGY, vol. X.

JUPITER, is far the largest planet in our solar system, having a mass in excess of all the other members by nearly three-fifths. Its orbit is about five and a half times as far from the sun as that of the earth, or at a mean distance of 475,692,000 m., and its eccentricity is considerable, the planet's greatest and least distances from the solar center being 498,639,000 and 452,475,000 m. respectively. The planet's mean distance from the earth, when in opposition, is about 361,000,000 m., and it moves around the sun in 11 of our years and $314\frac{2}{3}$ days, so that the interval between its returns to opposition has a mean value of 398,867 days, and its orbit is inclined to the ecliptic about $1^{\circ} 18' 40.3''$. The mean diameter is about 85,000 m., with a polar compression of about $\frac{1}{8}$, according to measurements by Mr. Main, thus exceeding the earth in volume a little over 1233 times. One of the distinguishing features of the planet is the belts, or stratified changeable bands crossing the disk in a generally parallel direction with the plane of the orbit. The number of these belts varies, there sometimes being only one, while at times the whole disk is covered; but there are usually three prominent bands or zones. Months will sometimes pass without any remarkable change in their appearance, when suddenly considerable alterations will take place in a few hours. The first observer of these

bands was Huygens who published an account of them in 1659, with his discovery of similar bands on Mars, and of the rings of Saturn. Cassini afterwards made extended observations upon these bands, and also upon matters relating to the planet. There are also certain spots observable upon Jupiter's disk, the first one being discovered by Hooke in 1664, and which he observed to travel from e. to w. in the course of two hours over a space about equal to half the diameter of the planet. Cassini afterwards, at the Paris observatory, assigned a nearly correct rate of motion, by which he was enabled to determine very nearly the diurnal rotation of the planet, 9h. 56m. Airy, late astronomer royal of England, made an estimate of 9h. 55m. 25s., and Maedler another, which is regarded as the most correct, partly because of the number of observations which were made a basis of calculation. His estimate is 9h. 55m. 26.6s. The observations of Cassini, subsequent to 1666, indicated that the spots, besides rotating with the planet, have a certain degree of motion on its surface, and the elder Herschel established the correctness of these observations. These spots have at times been regarded as being permanent, and the one discovered by Hooke has sometimes been called the "old spot"; but they are now regarded as changeable and the effect of cyclonic disturbances in a deep atmosphere, or beneath it, and as having somewhat the nature of sun spots; and the phenomena of the belts are also thought to be connected with causes resembling those in the solar atmosphere, or gaseous envelope. In March, 1885, 9 large, brilliant white spots were seen in the equatorial region. These preserved their configuration unchanged for a week, and from them the American astronomer, Hough, estimated the diurnal rotation at 9h. 55m. 37.4s. See *illus.*, **SUN AND SOLAR SYSTEM**, vol. XIV.

The inclination of Jupiter's equator to the ecliptic is $3^{\circ} 5' 30''$, which would fix the changes of the seasons within narrow limits, were the planet existing under other circumstances resembling those of the earth; but as the temperature of Jupiter is above redness (how far above is not known), the sun's rays, at its immense distance—five and a half times that of the earth, can hardly be taken as an element of its surface heat. Jupiter has five satellites or moons. The first moon has a mass compared to that of the planet of .0000173281, and revolves in an orbit having no sensible eccentricity at a mean distance of 6.04853 times the planet's equatorial radius, in 1d. 18h. 28m., earth time. The second moon has a mass compared to that of the planet of .0000232355, and revolves in a similarly non-eccentric orbit at a mean distance of 9.62347 times the planet's equatorial radius, in 3d. 13h. 14m., earth time. The third moon's mass is comparatively .0000884972; it revolves in an orbit of small but variable eccentricity at a mean distance of 15.35024 times the planet's equatorial radius, in 7d. 3h. 43m., earth time. The fourth moon's mass has a comparative value of .0000426591, revolving in an orbit of greater eccentricity than the third, at a mean distance of 26.9983591 times the planet's equatorial radius, in 16d. 16h. 32m., earth time. From the micrometric observations of Struve at the Dorpat observatory, the following are the estimated diameters of these satellites. In the order above given, first, 2,429 m.; second, 2,180; third, 3,561; and the fourth, 3,046. Their densities must, therefore, differ, the second having nearly double the density of the first, and considerably more than that of the third. Indeed, the density of the first satellite is only about one-fifth of that of the earth, and less than one-fifth more than water. The density of the second is only about two and one-fifth times that of water, but they all have a density greater than that of the planet, which is a little less than one-fourth of that of the earth. On account of the slight inclination of Jupiter's equator to the ecliptic, and the fact that the planes of the satellites' orbits vary but little from the plane of the equator, all of them except the first (which sometimes escapes), suffer an eclipse at every revolution. The mean duration of the eclipses are respectively $2\frac{1}{4}$, $2\frac{1}{2}$, $3\frac{1}{4}$, and $4\frac{1}{4}$ hours. The eclipses of Jupiter's satellites have an interesting reference to the subject of the velocity of light, which was first estimated by means of observations on these occultations by the Danish astronomer Roemer (q.v). See **PLANETS; SOLAR SYSTEM**. Jupiter's fifth moon was discovered in 1892.

JUPITER AMMON. See **AMMON**.

JUPITER SERA'PIS, TEMPLE OF. The ruins of this temple at Puzzuoli, near Naples, afford a remarkable instance of the changes which have taken and are taking place on the relative position of the land and water on the earth. Only three of the original forty-six pillars exist. They rise out of the water, the pavement of the temple being at present submerged; but they bear evidence that they have been at one time submerged to half their height, which is 42 ft. The base of the pillars as high as 12 ft. is quite smooth; for the next 9 ft. they are penetrated by a boring shell, which is still active in the neighboring rocks. The water must have covered this portion of the pillars, and while the mollusks were busy, the lower 12 ft. must have been protected from their ravages by being buried in mud. The changes of level have been so gradual that the pillars have not been moved from their original position.

JUPON, or **JUST-AU-CORPS**, a surcoat. The name jupon is chiefly applied to the short, tight form of that military garment in use in the 14th century.

JU'RA, a range of mountains, of a peculiar limestone formation, known as the Jura limestone, extending from the angle formed by the Rhone and the Ain, in a northeasterly direction (with a gradually declining elevation), for more than 450 m., to the upper part of the course of the Maine. The Rhine, breaking through it between Schaffhausen and Basel, divides it into two parts, the Swiss or French, and the German Jura. The loftiest peaks are Reculet de Toiry, Grand Colombier, Credoz, Dôle (which com-

mands a splendid view of Mont Blanc), and Mont d'Or, all of which are between 5,000 and 6,000 ft. in height. The Swiss Jura consists of a number of parallel chains with long deep valleys between, and over it roads have been carried with great difficulty; but the German Jura is more broken up by cross valleys.

JURA, one of the Inner Hebrides, lying off the coast of the mainland of Argyle, and having the island of Islay on the s.w. It is 27 m. long, and about 5 m. in average breadth. A ridge of bleak and rugged mountains traverses the whole length of the island, and rises in the *Paps of Jura*, in the s., to an elevation of 2,566 feet. The w. coast is deeply indented by loch Tarbert, which nearly divides the island in two. The western shores are savage and rugged; the eastern are pleasing in appearance, presenting green slopes and a belt of plain. At the northern extremity of Jura, and between it and Scarba, is the whirlpool of Corrievrekin (q.v.). About 600 acres are under cultivation. Oats, barley, potatoes, and flax are produced; and black cattle are reared for export. Pop. '91, 691.

JURA, a frontier department in the e. of France, is bounded on the s. by the department of Ain, and on the e. by Switzerland. Area, 1928 sq. m. The vine occupies more than 4 per cent. of the surface, but the production of wine is less than that of many of the other departments. Pop. '96, 266,143. Of its surface, two-thirds are covered by the Jura mountains; the remainder is a low plain about 7 m. wide skirting the western border. Chief rivers—the Ain, the Doubs, and the Loue. The soil on the mountains is thin and stony, but yields abundant grass, upon which great numbers of horses and cattle are fed from June to Oct.; on the plain the soil is rich, but wheat covers less than one-tenth of the surface. The wines of Arbois, of Poligny, of Étoile, and of Salins, have some reputation. The mineral wealth of the department is considerable; the working of rock-salt is one of the chief branches of manufacturing industry. Cheese is extensively made, and there is a good trade in timber. The department is divided into the four arrondissements, Lons-le-Saunier, Poligny, Saint-Claude, and Dôle. Capital, Lons-le-Saunier.

JURASSIC GROUP, the name given by continental geologists to the oolitic series, because the chain of the Jura mountains, on the n.w. of Switzerland, is composed of these rocks. See **OOLITE**.

JURE DIVINO, a phrase denoting by divine right, and used in reference to the authority of civil government or of the Christian ministry, or other office or power. Those who hold the *jure divino* view of the ministry, claim that bishops are by divine right the head of the church, and invested with its government; that they are the successors of the apostles, and, as such, inherit apostolic authority; that through them alone as the medium, the Holy Spirit is transmitted to the church. Those prelatists who oppose the *jure divino* view, while they regard the episcopal form of government as in accordance with the will of God and preferable to all others, yet find no reason for this exclusive claim, and believe that non-episcopal ministrations, though irregular, are yet valid. They rest the claims for the ministry not on an unbroken succession, but on the basis of the divinely sanctioned institution of a Christian church, for which a ministry is needed and therefore appointed. The question as to the divine right of kings and civil magistrates has not now its ancient importance. It seems usual to concede theoretically the divine authority of a government actually existing, but to demand that, in the long run of events, it shall authenticate its sacred origin and right by justice; and a persistent failure in this regard is held to indicate its lapse from divine authority, whereupon it is conceived there is in the people a divine right to establish a government which shall be just.

JURIEU, PIERRE, 1637–1713; b. France; the son of a Protestant minister at Mer, and the successor of his father in that office, is chiefly remembered as a bitter and rancorous controversialist. His zeal, and the self-assertion which marked the expression of his views, led him into wordy battles with theologians so prominent as Bayle, Basnage, Grotius, and Bossuet, which were conducted with the greatest acrimony on all sides. He was a voluminous writer, but his published works are now esteemed as little more than curiosities of the period in which he lived. Besides his controversial writings he was the author of *A Treatise on Devotion; Defense of the Morality of the Reformed Church*; and *A History of the Doctrines and Worship of the Jews*. He possessed great learning, and filled the positions of professor of theology and the Hebrew language at Sedan, and that of professor of theology at Rotterdam, where he died.

JURIS CONSULT (Latin). A name given to a person who is sufficiently learned in the law to be consulted on all points; a jurist; a counsellor. In ancient Rome the masters of jurisprudence were appointed *juris consulti* by the emperor and formed a kind of *collegium*, similar to our Supreme Court. These were privileged to give answers to questions submitted to them by the judges, always in writing, and by the highest authority, namely, their license. Consequently the opinions of the *juris consults* carried great weight before a tribunal.

JURISDICTION, in law, means the authority which a court or judge has to entertain a particular case and decide it. The general rule is that if a court which has no jurisdiction to decide a particular case does decide it, the judgment is a mere nullity. Many nice questions often arise on the question of jurisdiction, which are too intricate

to be here stated. When the objection is taken to the jurisdiction in England it is generally called a plea to the jurisdiction. In Scotland it is included among what are called preliminary pleas. J. is divided into original, that possessed by a tribunal over causes which come primarily before it; appellate, upon causes appealed from a lower court; exclusive, possessed by one tribunal only; concurrent, by several tribunals over the same cause; civil, over civil causes; criminal, over criminal causes; assistant, by a court of equity to assist a court of law, etc. A court enforces its jurisdiction by acting upon the person or property of parties within the limits to which its jurisdiction is confined. See CONFLICT OF LAWS.

JURISPRUDENCE is the science of law, which professes to discuss the principles on which legal rights should be protected and enforced; or it may be called the philosophy of law. This subject has been less cultivated in England than in continental countries, or even in Scotland; for in England the habits of the people and also of their lawyers are too practical to admit of spending time in discussing elementary principles which are more or less vague and speculative. In its literal sense the term means merely knowledge of the law, and seems to have been so used in the Roman law, from which it has been borrowed. The word is often used in a popular sense in this country as synonymous with law, and it is also so used in France; but it is also and more correctly used in contradistinction to law, as implying the system or supposed methodical scheme embracing the principles on which positive law is founded. A distinction is sometimes made between general jurisprudence, which investigates the principles common to various systems of positive law, divesting these of their local, partial, and other accidental peculiarities; and particular jurisprudence, which confines itself to the particular laws of England, or France, or Scotland, as an independent system taken by itself. Jurisprudence thus embraces a wide range, as treating of all those duties which are enforced between man and man; and yet it may be safely said that lawyers, though dealing with the results of the science every day of their lives, seldom give any attention to the latent and general principles on which these results are founded. The only writers who have devoted their attention to this speculative side of the law in this country are Bentham, whose various works abound with these discussions, and Mr. Austin, whose *Province of Jurisprudence Determined* is an acute and masterly work on first principles, to whom may be added John Stuart Mill and Mr. H. S. Maine.

Jurisprudence, again, is really a part of practical philosophy, co-ordinate with ethics, politics, political economy, etc. The term is used in two senses; first, as a body of positive law, regulating the relations of individuals and communities, and enforced by tribunals; which may be called practical jurisprudence. This includes all law, local, national, and international, and the methods and procedure of the tribunals which enforce the law. In its second, but more scientific sense, jurisprudence, which in this connection may be called theoretic or speculative jurisprudence, is an inquiry into the cause of law, an investigation of the principles which have influenced communities, in all times, in the enactment of law. This theoretical jurisprudence is usually defined as the science of law; but it is a science which is far from exact, and in which, till recently, our knowledge had made but little progress since antiquity. The Institutes define it as "the knowledge of things human and divine, and the science of the just and the unjust." Part of this definition was borrowed from the Stoics. The second clause of it, which makes justice the basis and principle of law, was accepted as a competent definition through the middle ages by the continental writers upon the civil law; as also in England, where, though the common law had been growing up, the law-writers were men familiar with the civil and canon law. Grotius returns to the same theory in his division of jurisprudence into divine and human; his human law (*jus humanum*) he subdivides into voluntary law and necessary law. Adam Smith made some contributions to the study of jurisprudence, and Jeremy Bentham and Austin rendered valuable service in the classification of legal rights and remedies. The principle which they sought to establish as the basis of law was "the greatest good of the greatest number." A theory deemed more promising by some has been put forward by sir Henry Maine, who has treated the subject in the historical method. From the date we possess in regard to early institutions, he concludes that law is a matter of growth, the result of the needs of the community in which it originated. There may be truth in each of these theories; and probably difficulty would be found in compacting the whole truth into any single brief theory.

JURISPRUDENCE, MEDICAL, the application of medical science to legal cases. Its practice dates to a very early period, particularly among the Jews, Greeks, and Romans, the Greek Hippocrates being the highest authority among the latter. It embraces a far greater circle of knowledge and more extended research in almost all directions than any other branch of human knowledge. The medical expert should not only be well grounded in what is strictly termed medical science, but he should have a fair knowledge of chemistry, to be able to appreciate the bearing of the work of the chemical expert upon the case, and he is called upon to decide many questions of mechanics and other branches of physics. A fair understanding of the principles of criminal law must also be considered proper adjuncts to his strictly medical knowledge. On account of the

great extent of the subject, a few names only will be mentioned of the most distinguished promoters of legal medicine. As a science it is of comparatively modern date, having made little systematic progress until several centuries after the completion of the Justinian code, or until some knowledge of human physiology had become general in the medical profession. The code of Charles V. ordered that in all doubtful cases of suspected infanticide, homicide, and other cases of death by violence, there should be reference to physicians. Ambroise Paré (1517-90) published a treatise upon tardy births, and Fortunatus Fidelis published in 1602 all that was then known in regard to medicine in all its branches. About 20 years afterwards Paulus Bacchias began the publication of his *Medico-Legal Questions*, which were completed about 1650. At this date medical jurisprudence may first be considered as meriting the name of a science. In 1609 Henry IV. of France ordered by a patent the appointment of two surgeons, in every town of sufficient importance, to make examinations in medico-legal cases. The application of the hydrostatic test of Galen (2d c.) had already been revived by Harvey, and was afterwards discussed by Bartholin, Schreyer, Bohn, and others. In 1722 Valentine published his celebrated *Medico-Legal Pandects*, and Albertini between 1725 and 1747 published his great work, entitled *System of Medical Jurisprudence*, which was followed by Tischmeyer's *Institutes of Legal or Forensic Medicine*, which was used by Haller as the basis of his celebrated lectures. Passing over several names of importance, we come to that of Antoine Louis (1723-92), who greatly advanced the science by dissertations and opinions given in the courts, afterwards collected under the title *Causes Célèbres*. In the latter part of the 18th c. Fodéré published his celebrated work on legal medicine and public hygiene, an exhaustive treatise upon the science; and about the same time Dr. Parr published in England his *Elements of Medical Jurisprudence*, which was, however, little more than a compilation from continental authorities. In 1813 Fodéré published a revised edition of his original work, and about the same time Orfila published his great work on general toxicology, the most erudite and useful which had yet appeared, followed by his *Leçons de Médecine Légale*. Then followed the works of Devergie, Capuron, Esquirol, and Marc, and the establishment of the *Annales d'Hygiène publique et de Médecine Légale* in 1829. The standard work is now Hamilton and Godkin's *System of Legal Medicine* (N. Y. 1894 foll.). In Germany contemporary labors of great merit were also performed. The names of more recent authors would fill much space. For the trial of legal cases involving the investigation of medical questions there is required a degree of skill and learning on the part of the lawyer as well as of the judge, and of intelligence on the part of the jury, not demanded in ordinary civil or criminal cases. Every medical expert has witnessed the mismanagement and loss of numbers of cases through want of comprehension on the part, frequently of lawyers, and sometimes of judges and juries. If the lawyer have the knowledge of his particular case well settled in his mind by a course of careful examination and consultation with his medical counsel, and his case be a good one, he will generally be able to make it clear to both judge and jury; and alas! if the case be a bad one, he will be likely to carry it if the opposing counsel be unable to comprehend it. Upon a consideration of the innumerable accidents often involving injuries of an occult nature and occurring under an endless variety of circumstances, and of the various kinds of homicides by all kinds of weapons and by poison; of injuries from violent assaults not resulting in death; and of the variety of cases of mental alienation, it is obvious that the sphere of investigation of the medico-legal expert is vast, and that it will often require the joint labors of several persons. In cases of homicide a question as to whether a certain instrument found near the scene of the tragedy is capable of making the wound found upon the body is extremely likely to arise. Or it may be disputed whether the wound was the cause of death, it having, perhaps, been made after the death, which had resulted from poisoning or drowning or suffocation. Many circumstances, if carefully observed, may shift the weight of evidence from one side to another, and the greatest caution is required in guiding the search to a sound conclusion. In cases of suspected infanticide there is often required the profoundest knowledge of physiology and pathology. A witness may testify to having heard a cry, or to having observed certain signs of life; but it may be within the power of a physician to expose the falsity of such testimony by showing the physical impossibility of its being true, on well-demonstrated physiological principles. A proper examination of the lungs, made with due circumspection, precluding the possibility of tampering or of mistake, is competent to decide the question in regard to respiration, but the examination may be performed so carelessly as to vitiate the evidence of the expert. There are often circumstances under which post-mortem examinations are made which require the most extended observation and experimental knowledge. After a body has been buried a few days, a few weeks, or a few months, certain changes, termed post-mortem, take place, which have been mistakenly ascribed to injuries produced before burial. The utmost care in examination is often required in order that the truth shall be maintained. The medical jurist or expert is often called upon for an opinion in regard to the probable ultimate result of an injury, such, for instance, as has followed a concussion in a railroad car, or a fall of a building. The claimant of damages is producing all the evidence of severe and permanent injury that can possibly be displayed, with how much sincerity it behooves the defense in the suit for damages to show. The medical examiners on both sides must be

men of the keenest perception and of practical and theoretical knowledge, or injustice will be likely to follow, to the unfair advantage of one or the other of the parties.

Charitable institutions are sometimes investigated upon charges of starvation, cruelty, or neglect. Several, or perhaps all, of the children are found in a state of extreme anæmia, and the evidence is very strong that they have been starved. A plea, however, may be put in that from hereditary causes, and previous bad living, their constitutions have been so affected that their present bad condition is the result of this, and not of want of food in the institution. Moreover, an examination of the premises reveals a bad sanitary condition. The ventilation may be found faulty and not remediable by the party accused, or its faults may not have been understood. The soil-pipes may have been defective, and currents of foul air have defiled the healthy currents of life. Prolonged investigation and unbiased judgment is often required for the decision of such cases. Questions concerning the legitimacy of offspring often arise which are so evenly balanced by the learning and research which is brought into the legal arena by the medical experts that it is sometimes scarcely possible for an unprejudiced person to come to a conclusion; but this only shows how great is the importance of precise knowledge. Certain cases of legal medicine which come within the province of professed alienists, or those who make a special study of mental disease, are more or less of an empirical character, and for that reason often require great experience on the part of the expert to enable him to pronounce a well-founded opinion. This part of medical jurisprudence may be regarded as in its infancy, involving, as it does, cases of temporary mental aberration, of the diagnosis of the various kinds of insanity, and the subject of trance, or somnambulism. The medical expert is often required to be an adept in microscopy, as well as a good chemist, in order to be able to make thorough examinations of various kinds of stains which sometimes form the principal subjects of his investigations. The condition of blood stains, brought forward as evidence of guilt, may be such as to lead to the detection of fraud, and of the fastening of the evidence of guilt upon a party who had hitherto escaped suspicion, or against whom there was no evidence. The blood of certain classes of animals can be certainly distinguished from that of others. How far the distinction can be made it is unnecessary here to say; but the blood of birds is so different from that of man and other mammals that its detection is one of the easy problems of microscopy. Blood which has collected in cavities from traumatic extravasation, and that which is consequent upon post-mortem change, under certain circumstances is often the cause of much discussion. The condition of the heart and of the lungs under the various circumstances in which death by suffocation may take place, often presents problems to the medical jurist requiring the greatest circumspection and analytical examination. Authorities may sometimes be found to conflict with each other, or by a variation in the statement of facts may be made to seem to do so, and therefore the most original and well-educated professional attainments are often required to enable judge or jury to reach an intelligent conclusion. The differential diagnosis of the various modes of death, the evidence of which may have been left upon the body; the evidence afforded by the post-mortem condition of various organs, as the brain, the kidneys, the liver, the lungs, the spleen, the heart, the stomach, and the intestinal canal; of the eyes, of the nails, and of the surface of the body, must be matters familiar to the medical expert or witness. The chemist, as a legal expert in cases of poisoning, must be familiar with the various tests and methods of examining poisons; but the physician who may be called in the case should have as thorough a knowledge as possible of the therapeutic and toxic effects of different poisons upon the body, and particularly of the post-mortem appearances which they produce. The failure of the chemist may be supplied by the physician, or, if there be reason to suspect error in the analysis, scientific pathology may come to the aid of justice.

Dead persons found beneath the surface of water often present difficult problems for the medical expert. Was the death caused by drowning? What evidence is offered by the condition of the lungs or the stomach? Do they contain water; and if the evidence be conclusive that they were drowned, was the case one of homicide or of suicide? Is there any wound upon the body which would have caused death had drowning formed no part of the cause? It is possible that a homicide may have been committed with a knife or a pistol or other deadly weapon, and if death had taken place before the body was thrown into the water the evidences of drowning would have been absent. Was death produced by strangulation, and, if so, what other circumstances are there capable of connecting some person with the crime? An intelligent professional examination of the case will often lead to the detection of the criminal when all the more common modes of search will be in vain. Poison may be found in the stomach of the person supposed to be drowned, and evidence may be furnished tending to show that the poison had been administered with either a homicidal or a suicidal intent. Whichever way this evidence tends, may be strengthened or weakened, or overthrown by the extent to which the poison has penetrated to the various organs of the body, taken in connection with all the circumstances. A very brief sketch of an actual case will serve to further illustrate the value of the science of medical jurisprudence. A woman was found dead in her bed. A coroner's jury found that her throat was cut almost from ear to ear, severing the principal blood-vessels and the windpipe. An open razor was found lying under her right arm. No extensive examination was made; the case appeared to

be one of suicide, no doubt seemed to be raised, a verdict was rendered accordingly, and the body was buried. Several months after suspicions were entertained by certain parties against the husband. The body was exhumed, and another coroner's jury returned a verdict of homicide, charging him with the act. He was arrested and brought to trial. The medical counsel for the prosecution contended that it was a case of suffocation and subsequent throat-cutting. Contradictory evidence in regard to the amount of blood which had flowed from the wound was given at the trial. The theory of suffocation required that there should be but little flow of blood, and several witnesses testified that the loss of blood was insignificant. On the other side witnesses testified to the loss of considerable quantities of arterial blood. It was contended on one side that the wound was such in extent and direction that it could have been done only by a homicide, taken in connection with the rather delicate physical condition of the wife. On the contrary, the defense contended that the extent and direction of the cut furnished evidence of suicide, and, moreover, conclusive evidence against homicide, taken in connection with other circumstances, such as the relations of the bed to the room. It was placed with one side against the wall, and it was contended that it would have been impossible for a homicide to make the incision in the neck unless standing at that side of the bed. This presupposed too much forethought and deliberation on the part of the husband. It was contended by the prosecution that the condition of the lungs, found at the second post-mortem inspection, indicated suffocation, or partial suffocation, previous to the cutting of the throat; but the examination of one of the lungs found in the body at the third post-mortem by experts employed by the defense indicated, as was contended by them, that there had been no engorgement or passive congestion, but rather a want of natural quantity of blood at the time of death. The accused was acquitted. If the case had not been defended in the most resolute manner, and the greatest circumspection practiced, it is probable that a contrary verdict would have been rendered. See HOMICIDAL MANIA; INFANTICIDE; INSANITY; LUNACY; and MURDER.

JURY (see JURY TRIAL). An impartial jury is insured by the practice of the right of challenging, and by the method of securing a jury invariably by lot, the choice being additionally guarded by the necessity for each juror to swear to his freedom from any preconceived opinion as to the case on trial, and that he is in possession of no information regarding it, of a nature to influence his decision. Juries are divided into common, grand, special, petit, and struck. A common jury is so entitled to signify that it is drawn in the usual manner. A grand jury has for its duty the examination of evidence against a suspected person with a view to discover if this be sufficient foundation on which to frame an indictment. A petit jury passes finally on all cases that come before it. A special jury and a struck jury are obtained by the parties striking from the panel such a number as shall leave the number required by law. Juries are in all cases to determine from the evidence the facts in dispute in the causes that are brought before them. In the matter of law they are supposed to follow the instructions of the court, but frequently a mixed question of law and fact is raised which must be submitted to and passed upon by a jury. Courts of special session, police magistrates, and justices of the peace are qualified to decide causes without the intervention of a jury. The right of trial by jury is guaranteed by the constitution in all criminal cases except upon impeachment, and in all civil cases where the amount in dispute exceeds the sum of 20 dollars. Jurors, in this country, are commonly selected by the sheriff or other court-officer from among the persons possessing the statutory qualifications.

JURY TRIAL (Fr. *juré*, sworn) is a mode of trial in the United States, by which a few citizens, selected for the purpose, are constituted the judges of the truth of the facts in suits between parties, and compelled to discharge this duty on the sanctity of their oath, but in subordination to a higher judge, who has distinct functions of control. Various theories have been adopted as to the origin and development of this characteristic feature of the administration of justice in England and the U. S. Jury trial does not owe its existence to any positive statute, but has grown up insensibly, and has become inextricably interwoven with the people's habits. It was generally supposed, until recently, that our Anglo-Saxon ancestors had the credit of having nursed the germ of this vigorous plant of liberty; and a cartoon in the new houses of parliament has embodied this popular belief. Recent researches have, however, shown that jury trial, as now known and practiced, did not exist in those times, though it has been the natural development and sequence of other rudimentary forms of trial then prevailing. Indeed, the germ of jury trial is found in human nature itself, and in some phase or other is detected in almost every form of civilization, the essence of it being a reference of disputed facts to the impartial judgment of a few men of average understanding and of nearly the same station in life as the litigants. In ancient Rome a criminal trial was conducted before a presiding judge and a body of *judices*, taken from a particular class, whose duty it was to determine the fact of the guilt or innocence of the accused; but they could exercise the prerogative of mercy, which does not belong to the modern jury. The result of the forms of trial usual with the Anglo-Saxons has been summed up by Mr. Forsyth in his *History of Jury Trial*, and he states these conclusions: Courts were presided over by a reeve, who had no voice in the decision, and the number of persons who sat was usually twelve. The assertions of parties were admitted as conclusive,

when supported by the oaths of a certain number of compurgators. The testimony of the neighborhood was appealed to for the purpose of deciding matters of general concern. Sworn witnesses were appointed in each district, whose duty it was to attest all bargains and transactions, in order that they might be ready to give evidence in case of dispute. Every care was taken that all dealings between man and man should be as open and public as possible. It was by a gradual process of improvement that the precise functions of the jury were defined, and it would be beyond our limits to discuss the details of this progress. It will suffice to describe the institution of jury trial as it now exists, and has for centuries existed with little alteration.

In criminal cases in England and Ireland there are two or three kinds of juries in requisition. In all cases of sudden death, homicide, or murder, the coroner of the district summons a jury of 12 men, who inquire into the circumstances of the death, and if it appear that such death was caused by the criminal misconduct of any person, the jury may find that such person was guilty of murder. This inquisition, or finding, is sufficient, without any other process, to put the alleged criminal on his trial by the petit jury; but one may proceed also against the prisoner in the ordinary manner. In most criminal cases, the grand jury is the medium of accusation. They perform the duty of public accusers; they do not try a prisoner, but the indictments are in the first instance submitted to their consideration, for the purpose of seeing whether there is enough of doubt and suspicion to make it necessary to put the accused on his trial. Accordingly, in every county and borough of England where sessions of the peace or assizes are held for criminal trials, a jury of not less than 12, nor more than 23 men, are summoned to see that there is some foundation for each indictment. The judge first charges them—that is, gives them general directions as to particular crimes, and they hear witnesses for the prosecution only and *ex parte*, finding a true bill, or ignoring the bill, according as they think there is or is not a case worthy of trial against the prisoner. See GRAND JURY. The chief duty, however, as to the trying of prisoners is discharged by the petit jury, which consists of 12 men, who are sworn to try the cause between the crown, as prosecutor, and the prisoner. Previous to this trial, the prisoner is not, as a matter of course, entitled, except in cases of treason, to a copy of the indictment, though in many cases he can indirectly obtain a copy, or at least is generally made acquainted with the particulars of the charge against him. Nor is the prisoner entitled, except in cases of treason, to have a list of the witnesses who are to be brought against him. The first thing is to arraign the prisoner at the bar, and ask him if he pleads guilty or not guilty. If he do not plead guilty, he is then put on his trial. He is not entitled to demand from the court to have a counsel to defend him, though practically there is little difficulty in procuring one. The jury are then sworn. The number of jurors is 12, but a much larger number are summoned, and the prisoner is entitled to challenge those of the jury who, he has good cause to believe, will be hostile to him. He can challenge a certain number of these without giving any reason; but when he exceeds such number, he must state some valid reason. The prisoner is not, however, entitled beforehand, except in cases of treason, to have a list of jurors supplied to him. At the trial the prosecuting counsel begins, and makes a speech to the jury commenting on the case. He then calls his witnesses; and it may be observed that it is a public duty for witnesses to attend, and they can be compelled, subject to fine and imprisonment, to attend and be examined. Each witness is first examined by the prosecuting counsel, then cross-examined by the prisoner or his counsel, and then re-examined by the prosecuting counsel. A witness testifies on his oath, and if he speaks falsely may be prosecuted for perjury. After the prosecutor's case is closed the prisoner or his counsel addresses the jury, and if he has any witnesses, calls them, and they are examined, cross-examined, and re-examined in like manner. If the prisoner calls witnesses the prosecuting counsel has the right of making a speech in reply; and even where the prisoner calls no witnesses, the prosecutor can frequently insist on replying, and thus having the last word. The judge then sums up the evidence by going over it in detail, explaining any points of law that may arise; but he carefully informs the jury that it is for them exclusively to say whether, upon the evidence as laid before them, they think the prisoner was guilty or not guilty. The jury must be unanimous in their finding. If they have a difficulty in agreeing they are locked up a reasonable time, which means generally about 6 hours—though no definite limit is fixed—without food, till they agree. If, after this reasonable time has elapsed, they are unable to agree, they are discharged without a verdict. The consequence is that a new jury are summoned, when the same process is repeated. If they find the prisoner guilty it is for the judge exclusively to pronounce the appropriate sentence, and some discretion is allowed to the judge on that point. But neither the judge nor the jury can pardon the prisoner; it is for the crown alone to do so, and practically the propriety of doing so is left to the home secretary, whose duty it is, if any application, reasonably supported by evidence, is made to the crown, to inquire into it, which he does by examining the matter and consulting the judge. The settled rule is that no new trial can be had in criminal cases, even though some error may have been made by the judge or jury. The only mode of obtaining redress is by petitioning the crown to pardon the prisoner, or commute the sentence, as the case may be; and the home secretary advises the crown as above.

In civil cases the established practice in England and Ireland is for most questions

of disputed fact which are material to the case to be referred to the decision of a jury. It is the only regular mode of solving the dispute which the law provides. The necessity of a jury trial is arrived at after the parties have, by their mutual pleadings, come to an issue—i.e., one party distinctly asserts some fact which the other as distinctly denies, the fact being material to the cause. A jury is then summoned, and the rule is, that all causes of action are tried in the county in which the dispute arose. The jury consists of 12 persons. Juries are either common juries or special juries; the former act compulsorily, but are not paid for their loss of time; the latter also act compulsorily, but they are selected on the ground of their supposed superior intelligence, and they are paid a small sum for their services. In most cases, the plaintiff's counsel begins, and makes a speech to the jury; then calls his witnesses, who are examined, cross-examined, and re-examined on oath; after which, if the defendant's counsel do not intend to call witnesses, the plaintiff's counsel sums up his case, and makes a second speech; but if the defendant's counsel calls witnesses, then he first makes a speech to the jury, next calls his witnesses, and lastly sums up his case in a second speech to the jury, after which the plaintiff's counsel replies; so that it depends on whether the defendant's counsel calls witnesses, whether or not he has the last word with the jury. The judge then sums up the evidence, and the jury must be unanimous in their verdict. If they do not agree after being shut up a reasonable time, they are discharged, as in criminal cases, and a new jury may be summoned. If there was any mistake of the judge, or any mistake and misconduct of the jury, the losing party may, in many cases, obtain leave to have a new trial, which is conducted in the same way before other jurors.

In both criminal and civil cases the functions of the judge and the jury are distinct. The judge has no right to decide the fact, nor the jury to decide the law; but in some cases, the jury cannot be prevented from practically deciding both. Thus, in the case of libel, it was at one time attempted by judges to confine juries to the decision of an unimportant fact; and the practice of lord Mansfield in so restricting the functions of juries was attacked by Junius and others, till finally Mr. Fox's act was passed, which restored the powers of juries in those cases, and made them practically judges of the law also. In other cases, however, the separation of the functions of judge and jury requires very nice discrimination, and none but experienced lawyers and judges can readily recognize these technicalities. In practice, there can be no doubt that juries can with difficulty be controlled in their decisions on all questions affecting personal and political wrongs; and it is especially to their control over the issues of the latter class of cases, often most judiciously exercised, that the great authority and permanent influence of juries are to be traced. One great advantage of jury trial, over and above the essential fairness of the principle on which it is founded, is the experience and knowledge, as well as the love of fair-play, which are thereby acquired by the people who take part in it. On the other hand, it is often complained that in a great majority of cases, whether caused by qualifications of jurors being too low, and the essential obtuseness of uneducated minds, or the capricious and wayward humors which sway them, the result is little else than a lottery, and even indirect bribery is frequently suspected to operate in some of the cases, especially those which unscrupulous attorneys conduct. Probably the chief reason why jury trial has so long stood, and still stands, so high in public favor is, that notwithstanding all its glaring and familiar defects, no other machinery has ever been devised which is not open to similar or greater strictures.

In criminal trials in Scotland prisoners have the advantage of being by law entitled, before the day of trial, to have a copy of the indictment, also a list of the witnesses to be brought forward against them, and likewise a list of the jurors, of whom forty-five are summoned. As regards the order of procedure at a criminal trial, a different practice prevails: the evidence is first given on both sides, and then the prosecutor's counsel addresses the jury, after whom the prisoner's counsel addresses the jury; so that in all cases the prisoner has the last word, and he always knows the whole of the prosecutor's case before he requires to open his own. The judge then sums up the case, as in England. From the forty-five jurors, fifteen are drawn by lot; these constitute the jury, and the verdict of a majority suffices. There is also a verdict of "not proven" allowed to be given, and which is often preferred by the jury in cases where there is little moral doubt, though the legal evidence is insufficient. In England such a verdict is equivalent to, and treated as, a verdict of "not guilty;" and it is so far final in Scotland that the prisoner cannot a second time be put on his trial. The expediency of such a verdict has been objected to, as fixing a stigma on the accused person; but the answer has been made that it is most in conformity with the true result of the inquiry. In Scotland new trials are not allowed in criminal cases; and in case of pardons, the home secretary acts in the same way as he does in England.

As regards trial by jury in civil cases in Scotland the practice was introduced by a statute in 1815, which imported most of the forms then existing in the English practice. As in England, the jury in civil cases consists of 12 persons. Unanimity is not now essential. By a recent statute, 22 and 23 Vict. c. 7, if after being kept 3 hours in deliberation, nine or more of the jury agree on a verdict, such verdict is to be taken as that of the jury; and if, after being inclosed nine hours, the jury, or nine of them, cannot agree, the judge is entitled to discharge them, and generally does so. Moreover,

the judge may allow the jury refreshment after they are locked up to deliberate. These latter modifications on the rigid rule have not been yet adopted in England.

A jury *de medietate lingue* is a jury half composed of foreigners, and it is a privilege which may be demanded by foreigners, when indicted in England for felony or misdemeanor, if so many foreigners are found in the place. See SPECIAL JURY.

JURYMAST, a temporary spar used to replace a mast which has been lost from any cause, and so to enable the vessel to reach some port for more permanent repair.

JUS CIVILA. See LAW, CIVIL OR ROMAN.

JUS DEVOLU'TUM, a phrase formerly used in Scotch ecclesiastical law to denote the right which devolved on the presbytery to present or appoint a minister to a vacant benefice, if the patron did not within six months present a properly qualified person.

JUS GENTIUM, is the law of nations, distinguished as *jus gentium privatum* and *jus gentium publicum*; the former taking cognizance of difference between the laws of different nations as to the same subjects; and the latter of the public relations of different nations with each other. For fuller treatment of this subject, see INTERNATIONAL LAW.

JUSHPORE, a protected state of Chutia Nagpur, Bengal, India, is entirely surrounded by British territory. It covers 1963 sq. m., with about 90,000 inhabitants. Its chief place is a town of the same name. The country, a table-land, is much overrun with jungle, the cleared ground producing grain chiefly, rice, and oil, and the uncleared portions abounding in wild silk.

JUS MARI'TI, a phrase used in Roman law, and adopted in the Scotch law to denote the legal right accruing to a husband *qua* husband over his wife's property. See HUSBAND AND WIFE.

JUS RELICTÆ, in Scotch law, is the right of a widow to a share in the movable or personal property of her deceased husband. This is a vested or absolute right, and cannot be defeated by the husband's will; and hence the movable estate of the married parties is often called in Scotch law the goods in communion, because, on the death of the husband, there is a division of such goods between the widow, the children, and next of kin of the deceased. If the husband has left children, then the goods in communion are divided into three equal parts, one of which belongs to the widow. If, on the other hand, there are no surviving children or grandchildren, then the goods are divided into two equal shares, one of which belongs to the widow. When the husband dies insolvent, the wife cannot claim her *jus relictæ* in preference to the creditors. Though the widow has this right to her *jus relictæ* at common law, yet, if she entered into an antenuptial contract of marriage, by which she accepted an equivalent provision, her right may be defeated, provided the contract expressly stated the one to be in substitution for the other. In England there is no such absolute right of a widow to a share of a husband's goods, unless he died intestate, in which case, but in which only, she gets a similar share of the personal estate by virtue of the statute of distributions. See HUSBAND AND WIFE; SUCCESSION.

JUS REPRESENTATIO'NIS, a phrase adopted by the Scotch from the Roman law, to denote that inheritable succession, and also to a limited extent in movable succession, when one or more of the children of a deceased person have predeceased, the children of such predeceasing children represent their parent, and take his or her share. Thus, if A die, and one of his children, B, had predeceased A, leaving children C, D, E, F, then C, D, E, F collectively take the share of A's property which would have come to B if B had survived A.

JUSSIEU, DE, the name of a family which, for more than a century and a half has numbered among its members some of the first botanists of the age.—ANTOINE DE JUSSEU, who was born at Lyons in 1686, and died at Paris in 1758, was professor at the Jardin du Roi, and the author of various works on botany; amongst others, an *Appendix to Tournefort* (Lyons, 1719). He made several voyages and journeys to foreign countries for the purpose of collecting plants, on which occasions he was accompanied by his younger brother, Bernard, who co-operated with him in all his investigations, and acted as his assistant.—BERNARD DE JUSSIEU, who was born at Lyons in 1699, and died in Paris in 1777, contented himself through life in assisting his brother and nephew, without seeking renown by the publication of his own important observations. Having been named superintendent of the gardens at the Petit-Trianon in 1759, he arranged the plants in accordance with a natural system substantially the same as that which his nephew and pupil, Laurent De Jussieu, subsequently elaborated in a more perfect manner. As Bernard refused to make publicly known the principles on which his mode of arrangement was based, the glory of his labors devolved upon Laurent, who alone possessed the key to this botanical enigma.—LAURENT DE JUSSIEU, who was born at Lyons in 1748, and died at Paris in 1836, was worthy the rich heritage left to him by his learned and disinterested relatives. At the age of 17 he began his botanical studies

under his uncle Bernard, and four years later was nominated demonstrator and assistant to Lemonnier, the professor of botany in the Jardin du Roi. He at once began to reform the arrangement of the gardens and collections of plants under his charge, and to apply to them his own and his uncle's ideas in regard to the natural method. For 30 years he continued to develop his novel views; and when his *Genera Plantarum*, which he began in 1778, was finally completed in 1789, the natural system was finally established as the true basis of botany (see BOTANY). In 1793 Jussieu became professor of botany in the newly-organized Jardin des Plantes, where he continued to teach till 1820, when blindness compelled him to resign his chair to his son Adrien. During his tenure of office he founded the library of the museum, which is one of the best in Europe. His papers in the *Annales du Museum* (from 1804-20), and his articles in the *Dictionnaire des Sciences Naturelles* rank among the most valuable contributions to the literature of botany, and embody all the results of his own investigations.—ADRIEN DE JUSSIEU, his son, was born at Paris, Dec. 23, 1797, and died in the same city, June 29, 1853. From his earliest years he showed himself a worthy representative of the reputation of his family. As a youth, he carried off the first prize in the *Concours*, or annual competition among all the collegiate schools of Paris; and on taking the degree of M.D. in 1824, he presented as his thesis a memoir on the family of the *Euphorbiaceæ*, which attracted the attention of all botanists. His subsequent papers on the *Rutaceæ*, *Meliaceæ*, and *Malpighiaceæ*, fully realized the expectations that had been entertained of him. His embryo of the *Monocotyledons* is a work of great merit, and was to have been followed by a series of papers on similar subjects, when ill health compelled him to relinquish this project. He was also prevented by the same cause from extending his *Cours Élémentaire de Botanique* (1848) into a complete and general treatise. In 1831 he was elected a member of the academy, and, shortly before his death, was nominated to the presidency of that body. Jussieu contributed many valuable papers to the *Annales du Museum*, the *Comptes Rendus*, and the *Dictionnaire Universel d'Histoire Naturelle*; but the services which he rendered to science were not due only to his writings, for his influence as a lecturer was of even higher importance, and has been manifested by the number of able botanists of all nations who have owed their training to him.

JUSSIEU, LAURENT PIERRE DE, b. France, 1792; nephew of Antoine; was a writer of educational books and works of fiction, whose writings were popular and passed through many editions; and for one of which, *Œuvres Posthumes de Simon de Nantua*, he received the Monthyon prize. From 1839-42 he was a member of the chamber of deputies. He d. 1866.

JUSTE MILIEU, a French term, signifying the *just mean*, or, according to the common expression, the *golden mean*. After the revolution of 1830 this term acquired a political signification, and came into very frequent use, because of the declaration of the organs of Louis Philippe that the *juste milieu* was the only principle of government which could secure the welfare of France.

JUSTE, THEODORE, b. Brussels, 1818; a writer of considerable note. He was secretary to the board of education in Belgium, and did very much to promote liberal views upon the subject of instruction. His principal publications are: *Histoire Élémentaire et populaire de la Belgique*; *Histoire de la révolution Belge de 1790*; *Précis de l'histoire des moyen Ages*; *Les Pays Bas sous Philippe*; *Charles Quint et Margaret d'Autriche*; *Les Pays Bas au XVIème Siècle*; *La Soulèvement de la Hollande en 1813*, et la *fondation du Royaume des Pays Bas*; and *Notes historiques et biographiques*. He died 1888.

JUSTICE, one of the cardinal virtues of the ancients, and the name for a principal department of social and moral duty in all ages. Practically, justice is considered to be clear and definite; but theoretically, there have been great disputes as to its ultimate analysis and the source of its binding quality. It has been maintained very generally that both the perception of what is just and unjust, and the powerful sentiment in favor of the one, and in opposition to the other, are instincts of our nature, or make a part of that comprehensive instinct termed conscience, or the moral sense. On the other hand, it has been held that utility, in other words, the general interests of mankind at large, is what determines justice, and that the sentiment enforcing it grows out of a regard to those interests.

The supposed instinctive origin of the sense of justice is encumbered with all the objections that attend the hypothesis of innate notions generally, so powerfully set forth by Locke in his *Essay on the Understanding* (see ETHICS). But neither is the other view free from serious difficulties, of which the greatest is the universally felt contrast between the just and the expedient, or the simply useful. We are frequently called upon to sacrifice expediency to justice, which would seem to imply an obligation higher than the interests of mankind. *Fiat justitia ruat cælum*—"Let justice be done, although the universe should collapse." Whence arises this paramount obligation?

If we inquire into the nature of justice by examining the particulars coming under it, we find such instances as the following: It is unjust to deprive a man of his personal liberty, his property, or any other thing belonging to him by law; justice, therefore, requires us to respect each one's *equal rights*. Sometimes, however, we call the law itself unjust, in which case we sympathize even with disobedience to it. It is then sup-

posed that there is some higher law that should have preference—as, for example, the moral law. Thus, it is conceived by most men at the present day to be unjust to hold our fellow-creatures in slavery. Again, it is considered unjust to *break faith* with any one; in other words, promises and engagements must be fulfilled in order to do justice. It is unjust to show partiality in cases where all are equally entitled to favors. *Impartiality* in public tribunals is of the very essence of justice. Nearly the same idea is expressed by the notion of *equality*. In all these cases there are some definite individuals—one or more—that are considered to be possessed of a *right*, and to be wronged if that right is not fulfilled. Herein lies the difference between justice and benevolence or generosity, this last being the mere overflowing of our disinterested fellow-feeling, which no one can claim as a right, and for whose neglect we are not punished.

These particulars, which are among the most marked instances of the property in question, do not suggest any qualities present in all just actions, and absent in the opposite, excepting the existence of a so-called right on the part of somebody, and also the sentiment which demands the punishment of those that violate those rights. We are no nearer the solution of the original question, which is, why should these rights be either determined or enforced on any other ground than expediency, or the well-being of mankind? It is admitted on all hands that the just and the expedient concur in the long run, but yet people demur to making expediency the test of justice. Probably there is something peculiar in the application of the term “expediency,” which is the cause of the apparent paradox whereby the two qualities are made the same, and yet not the same.

This is really the case. Of the social regulations that affect the well-being of mankind, there are two widely different classes. In the first place, there are the interests of *SECURITY*, or those requisites without which human society could not be maintained. Respect for liberty, life, and property, and the performance of engagements, are essential to the very existence of human beings in society; if these cannot be enforced, if offenders in these points were to escape with impunity, disorganization and ruin would be the inevitable consequences. The strength of the sentiment that injustice calls forth is therefore not a matter of surprise; *existence* is at stake, and whatever be the force of our impulse of self-preservation, and our desire of the preservation of our fellow-beings, the same will be the measure of our repugnance to the acts that endanger both the one and the other. Compare these interests with another class of things; also for the good of society, as, for example, the promotion of trade, manufactures, or science, all which are very advantageous to mankind, but not absolutely essential to our existence. They at most express the difference between two grades of happiness, not the difference between existence and annihilation. The contrast between the just and the expedient may now be apparent; both relate to the welfare of mankind; but the one is concerned with *being*, the other with *well-being*, to use a favorite distinction of Oliver Cromwell's. The one is so immeasurably superior in point of urgency to the other, as to account for the very different degrees of our attachment to the two interests. The superior claims of justice to generosity flow from the same considerations; in fact, the argument is an identical one. We can live without generosity, or with some very small share of it; a thoroughly selfish community, if not also very short-sighted as well, might exist; but a community where justice was nowhere observed, could not exist. Still, the grounds of justice are and can be no other than general utility. “If,” says Mr. John Stuart Mill, “that expression does not seem to convey a sufficient feeling of the strength of the obligation, nor to account for the peculiar energy of the sentiment, it is because of the extraordinarily important and impressive kind of utility which is concerned. The interest involved is that of security, to every one's feelings, the most vital of all interests. All other earthly benefits are needed by one person, not needed by another; and many of them can, if necessary, be cheerfully foregone, or replaced by something else; but security no human being can possibly do without; on it we depend for all our immunity from evil, and for the whole value of all, every good beyond the passing moment, since nothing but the gratification of the instant could be of any worth to us, if we could be deprived of everything the next instant by whoever was momentarily stronger than ourselves. Now, this most indispensable of all necessities, after physical nutriment, cannot be had unless the machinery for providing it is kept uninterruptedly in active play. Our notion, therefore, of the claim we have on our fellow-creatures to join in making safe for us the very groundwork of our existence, gathers feelings around it so much more intense than those concerned in any of the more common cases of utility, that the difference in degree becomes a real difference in kind. The claim assumes that character of absoluteness, that apparent infinity, and incommensurability with all other considerations, which constitute the distinction between right and wrong, and that of ordinary expediency and in expediency. The feelings concerned are so powerful, and we count so positively on finding a responsive feeling in others (all being alike interested), that *ought* and *should* grow into *must*, and recognized indispensability becomes a moral necessity, analogous to physical, and often not inferior to it in binding force.”—*On Utilitarianism*.”

If there were such a thing as intuitive, eternal, and immutable justice, independent of all the concerns of this world, and paramount over the highest interests of mankind, it ought to be something clear and unambiguous, the same in all ages and nations, being revealed to the human mind without any reference to men's outward circumstances.

But, not to repeat the arguments that refute this notion as respects morality in general (see ETHICS), it may easily be seen that as to justice in particular there is a very great disagreement among mankind in everything except the first essentials of social security—namely, the respect for legal rights, the keeping faith, and the like. These things men in all ages have recognized as a part of justice; but in the things less essential to the common safety of mankind, where notions of just and unjust are still admitted and pleaded, there is anything but unanimity of opinion; nay, what is considered just in one country and time, is considered unjust in other countries or other times. *Primo-geniture* is one example; slavery is another.

JUSTICE, LORD CHIEF, the title given in England to the chief judge of the queen's bench division of the high court of justice; formerly given also to the chief judge of the common pleas. He of the queen's bench was, however, always lord chief-justice of England; and on him were conferred, in 1831, the powers of the lord chief-justice of common pleas, that division of the court being abolished.

JUSTICE-CLERK, LORD, a high judicial officer in Scotland, being the second highest judge in point of rank, and in the absence of the lord justice-general, the presiding judge of the court of justiciary. His usual duty is to sit as chief of one of the divisions of the inner house called the second division of the court of session (q.v.). The office in its origin was, as its name imports, of a more humble character.

JUSTICE-GENERAL, LORD, the highest judge in Scotland, also called the lord president of the court of session. Formerly the office of justice-general was a sinecure, and not a judicial office, but the title is now, since 1831, associated with that of the lord president.

JUSTICE OF THE PEACE, in England, is a person appointed by commission of the crown, or by act of parliament or charter, to exercise certain judicial authority in a county or borough. The person who practically appoints to the office is the lord chancellor, who in his discretion may include in the commission certain persons who must have an estate of £100 a year, clear of all rents and charges; or if he has no estate in possession, but is entitled to the reversion thereof, if it be of the rent of £300 a year. All persons having the above qualification may be appointed justices of the peace; but practicing attorneys or solicitors are not eligible for counties in which they practice. The office of justice of the peace is entirely gratuitous, for they receive neither salary nor fees, and hence the justices are often called the "great unpaid." But in modern practice it has been found necessary to deviate from this rule, and to appoint in all the cities and many large towns certain paid justices called stipendiary magistrates at a fixed salary, who discharge the duties of justices, which are necessarily onerous and important. In the city of London and certain other places the mayor and certain corporators are constituted by charter justices of the peace by virtue of their office.

The institution of justices of the peace is very ancient. Previous to 1327 there were conservators of the peace in every county chosen by the freeholders out of the principal men of the county to preform similar duties, but by a statute of Edward III., a change took place in the practice, and ever since the election of justices has been taken from the people, and exercised by the crown. At first, however, they were still called merely conservators or keepers of the peace and were not dignified with their present title. Gradually, the office grew more and more important, in consequence of many statutes adding to their duties and jurisdiction, until, in the thirtieth year of the reign of Elizabeth, the form of commission was revised, and was settled nearly in the form which is now used. The commission is in the name of the sovereign, addressed to certain persons by name, and directing them "to keep our peace in our county of —, and to keep all ordinances and statutes for the good of the peace, and for the good rule and government of the people, and to chastise and punish all persons that offend against the said ordinances." The commission then assigns them to inquire "by the oath of good and lawful men of all manner of felonies, poisonings, enchantments, sorceries, arts, magic, trespasses, forestallings, regratings, engrossings, and extortions whatsoever, and of all crimes and offenses," etc. Formerly it was usual to select the most eminent to be of the *quorum*, a name derived from the first word of the clause *quorum aliquem vestrum* A, B, C, D, etc., *unum esse volumus*, and one of these must always be present.

Although the institution of justices of the peace, like many of our institutions is derived from England, the method employed for their creation differs in the United States from that adopted in the former country, and also differs in different states. In some instances they are appointed by the executive, in others elected by the people. Their powers and duties also vary in the different states, but in most they have jurisdiction in minor cases, either civil or criminal. The extent and nature of their powers are usually defined by statute. The distinctive value of this class of magistrates is found in their power to prevent breaches of the peace, and to examine persons charged with the commission of crime or misdemeanor and hold to bail to answer in the upper court, or in default of bail to commit them to jail. In this latter particular their functions are somewhat analogous to those of a grand jury.

JUSTICES, LORDS. From the times of the Norman and Plantagenet kings it has been the occasional practice in England for the sovereign to appoint one or more persons

called lords justices to act as his substitutes in the supreme government during his absence from the kingdom. Subsequent to the revolution these appointments have been made by letters-patent under the great seal, and the authority of parliament has sometimes been required in confirmation of their powers. On five occasions such appointment was made by William III. when going abroad, though while his queen was alive he delegated his authority to her during his absence. The statute 12 and 13 Will. III., settling the succession on the house of Hanover, provided "that no person who shall hereafter come to the crown shall go out of the dominions of England, Scotland, or Ireland, without consent of parliament;" but this clause was repealed by 1 Geo. I. c. 2, and the first sovereign of the house of Hanover, during five of his absences in Germany, made an appointment of lords justices. George IV., on his visit to Hanover, delegated his authority to 19 guardians, of whom the duke of York, heir-presumptive, was one. On none of the absences of her present majesty from her kingdom has there been any delegation of the royal authority; and on one of these occasions, lord chancellor Lyndhurst stated in the house of lords that the law officers regarded it unnecessary in point of law to appoint lords justices, in which opinion he concurred. In case of the sovereign's minority, a regency has generally been resorted to. The powers of lords justices have been usually limited in the matter of pardoning and reprieving criminals, summons or prorogation of parliament, the disposal of public moneys in the treasury, and of church preferment in the gift of the crown. The lords justices appointed under the commissions of 1719 and 1729 could continue the existing parliament by short prerogations, till otherwise directed under the royal sign-manual—the other acts here specified could not be exercised without the special signification of the royal pleasure, except when necessary for the public service. The power to create peers has only once been delegated, by Charles I. in 1644; and lord Herbert, afterwards earl of Glamorgan, in whose favor the right was exercised, was, after the restoration, compelled to resign by the house of lords.

Lords justices have sometimes been appointed to carry on the government of Ireland in place of a viceroy; in modern times, this has only been done during occasional absences of the lord-lieutenant.

JUSTICES' CLERK, an officer, generally a solicitor, appointed by justices of the peace in England to assist them in their duties. Owing to the justices themselves not being trained lawyers, and yet being called upon to administer many branches of the law, and construe acts of parliament, all of which require much skill, the justices' clerk is a person of much local influence, and in practical effect guides and controls the justices under the form of advice. He is, properly speaking, not a public officer, but in the nature of a servant of the justices. By various statutes, he is entitled to receive fees in connection with the business transacted by the justices.

JUSTICIARY COURT, the highest criminal court in Scotland. Its judges are seven of the judges of the court of sessions—viz., the lords president, justice-clerk, and five others appointed by patent. The quorum of the high court consists of three judges. It sits usually in Edinburgh.

JUSTIFYABLE HOMICIDE is the killing of a human creature without incurring legal guilt, as where a man is duly sentenced to be hanged; where one, in self-defense, necessarily kills another to preserve his own life, etc.

JUSTIFICATION, in law, the technical expression for the defense in actions for libel or slander in which the defendant admits the making of the libel but avers that the facts stated are true. If a J. is proven it is a complete defense in a civil action, though not in a criminal action, the maxim in such case being "the greater the truth, the greater the libel." The theory of this is that the repetition of the assertion is calculated to excite the anger of the plaintiff and provoke a breach of the peace. See **LIBEL**.

JUSTIFICATION, one of the most common terms of technical theology. In Protestant theology it expresses an act of divine favor whereby a sinner is absolved from the penalty of his sins and accepted as righteous, not on account of anything in himself, but on account of the righteousness of Christ imputed to him. According to this view it is a purely forensic act—the act of a judge sitting in the forum, or place of judgment, and acquitting the condemned by an exercise of clemency, in consideration of the merits of another, who has paid the penalty which was justly his due. In this forensic sense of the word the apostle is understood by Protestants to speak (Rom. iii. 26) of God as "the justifier of him which believeth in Jesus."

In the doctrinal system of the Roman Catholic church justification is considered not purely as a forensic act, or act of acquittal, but, further, as an infusion of personal righteousness, and as hence equivalent to what Protestants specially call *sanctification*. The distinction between the two things is in Protestant doctrine a cardinal distinction—the one being viewed as an *act*, the other as a *work*; the one proceeding from the divine clemency or grace once for all, the other from the progressive agency of the divine Spirit. A corresponding distinction is likewise found in the Catholic system between the *act of justification* and the *state or condition of habitual justice*.

This doctrine of justification is laid down most plainly in the epistles of St. Paul,

and it has appeared to some as if there were a discrepancy in this respect between these writings and the epistle of St. James. Whereas the one says: "For if Abraham were justified by works, he hath whereof to glory; but not before God. For what saith the Scripture? Abraham believed God, and it was counted unto him for righteousness." The other says: "Was not Abraham our father justified by works? Ye see then that by works a man is justified, and not by faith only." Perhaps the most effectual way of reconciling these statements is to suppose that the apostle Paul is describing the inward reality of justification, which has no dependence upon works, but only upon faith, while St. James is speaking of its outward manifestation—of its reality as evinced in the Christian character and conduct, which necessarily expresses itself in good works, without which, in *this* sense, there can be no justification. Justification, in short, is independent of works in its origin and primary condition. Its origin is the grace of God—its only primary condition, acceptance of this grace, or *faith*. But it is dependent upon works as its essential manifestation. Faith is not passive, but *active*; and a faith which is not active, which is not a spring of earnest Christian activity, is not a true faith. Such a faith cannot justify a man.

JUSTIN, a Roman historian who flourished, in all probability, in the 3d or 4th c., although some assign him an earlier date. His history—which is of great value, from its being our only authority on many important points—is merely a selection of passages from the *Universal History* of Trogus Pompeius, a work now lost.

JUSTINIANUS (JUSTINIAN) I., FLAVIUS ANICIUS, nephew, by the mother's side, of the emperor Justin, was born 483 A.D., in the village of Tauresium, which afterwards grew into the splendid city of Justiniana, and on the site of which the modern Kustendje stands. Although of obscure parentage he shared the success of his maternal uncle, Justin, being invited at an early age to Constantinople, where he received a careful education, and if the reports of his courtly biographers can be accepted, attained to considerable eminence in philosophy, theology, and law, as well as in the more elegant pursuits of poetry, music, and architecture. When his uncle was elevated to the purple, in 518, he appointed Justinianus commander-in-chief of the army of Asia. The tastes of Justinianus, however, inclining him rather to civic pursuits, he declined this appointment, and remained attached to the court of Constantinople. In 521 he was named consul, and during the remaining years of the reign of his uncle he continued to exercise great influence. In 527 the emperor Justin, by the advice of the senate, proclaimed him his partner in the empire. Justin survived the step but a few months, and Justinianus was crowned as sole emperor, along with his wife, the famous Theodora, whom, despite of her more than dubious antecedents as an actress, he had raised to the position of his wife. Justinianus, on his accession, was in his 45th year. His reign, which extends over 38 years, is the most brilliant in the history of the late empire. Although himself without the taste or the capacity for military command, he had the fortune or the skill to select the ablest generals of the last days of Roman military ascendancy. Under the direction of his generals, and especially of the celebrated Narses (q.v.) and Belisarius (q.v.), his reign may be said to have restored the Roman empire, at least in outward appearance, to its ancient limits, and to have reunited the east and west under a single rule. In his first war—that with Persia—he concluded a treaty by which the crisis that had so long threatened was at least warded off; but the rejoicings which celebrated its termination had almost proved fatal, by a domestic revolution, to the authority of Justinianus himself. A conflict of the so-called Blue and Green factions in the circus in 532 was but an outburst of political discontent, which went so far as to elect a rival emperor, Hypatius. Justinianus himself was struck with dismay, and made preparations for flight; but the vigor and determination of Theodora arrested the revolt. Narses, with a relentless hand, repressed the tumults, 30,000 victims having, it is said, fallen in a single day. By the arms of Belisarius the Vandal kingdom of Africa was reannexed to the empire; and the same gen., conjointly with Narses, restored the imperial authority as well in Rome as in northern Italy and a large portion of Spain. One of the most extraordinary, though in the end ineffective, works of the reign of Justinianus was the vast line of fortifications which he constructed, or renewed and strengthened, along the eastern and south-eastern frontier of his empire. These works of defense, and the construction of many public buildings, both in his capital and in other cities of the empire, involved an enormous expenditure, and the fiscal administration of Justinianus, in consequence, pressed heavily on the public resources; but it is admitted to have been ably and uprightly conducted. It is, however, as a legislator that Justinianus has gained renown. Immediately on his accession he set himself to collect all previous legislative enactments which were still in force; and in order to do this thoroughly he first compiled a *code*, which comprised all the constitutions of his predecessors (527-529). See **CODE**. The authoritative commentaries of the jurists were next harmonized, and published under the title *Digesta Pandecta* (529-533). See **PANDECTS**. The code was republished in 534, with the addition of Justinianus's own constitutions. His third great legal undertaking was the composition of a systematic treatise on the laws, for the guidance of students and lawyers. This was published a short time before the *Digest*, under the title of *Institutiones*, i.e., "Institutes." All these works were accomplished under the careful superintendence and direction of Tribonian, and were

written originally in Latin. The later treatises which Justinianus caused to be written were in Greek, and were entitled *Novellæ*, i.e., "New Works."

The character of Justinianus as a ruler contrasts favorably with that of most of the emperors, whether of the earlier or the later empire. His personal virtues were of a class and in a degree seldom united in one of such station, and his public administration, with the single exception of that of ecclesiastical affairs, in which he was an arbitrary and imperious intermeddler, exhibits great ability and just and upright intentions. He died at the age of 83, and in the 38th year of his reign, Nov. 14, 565.

JUSTIN MARTYR. See **JUSTINUS**.

JUSTINUS, surnamed the **MARTYR**, and frequently the **PHILOSOPHER**, a father, and, after Tertullian, the most distinguished apologist of the Christian church, was a native of Flavia Neapolis, a Roman city erected on the site of the ancient Sechem, in Samaria. The date of his birth is variously assigned to the years 89, 113, 114, and 118 A.D. His father Priscus was a heathen, and Justinus was educated in the religion of his father. He became an ardent student of the philosophy of his age, beginning with the school of the Stoics, but finally adhering to that of the Platonists. With the last, as he himself relates, he was in the commencement highly satisfied; but, as he was one day wandering along the sea-shore, he encountered a man of mild and venerable aspect, who created in Justinus's mind a desire for higher knowledge than Plato had reached, referring him to the study of the Jewish prophets, and through them to the great Christian teacher whom they foretold. The result was his conversion to Christianity, at some date between 119 and 140 A.D. After his conversion he retained the garb of a philosopher, but, as a Christian philosopher, he strove by his writings and his instructions to bring others to the truth which he had himself discovered. He is said to have been beheaded about the year 165, in the reign of Marcus Aurelius, because he refused to offer sacrifice to the heathen gods. His death is attributed by the ancients to the enmity and malignant arts of the Cynic philosopher Crescens. The works of Justinus, although not very voluminous, are highly interesting and important. The books ascribed to him with certainty are two *Apologies for the Christians*, the first addressed "to Antoninus Pius," the second "to the senate;" a *Dialogue with Trypho the Jew*, which professes to be the record of an actual discussion held at Ephesus. The *Address to the Greeks* is no longer held to be a genuine work of Justinus. The *Exhortation to the Greeks*, the *Letter to Diognetus*, and a work *On the Monarchy of God*, an argument against the polytheism of paganism, and other works once ascribed to him, are certainly spurious. The first edition of his works is that of Robert Stephens (Paris, 1551). The Benedictine edition of Justinus, by Maran, appeared in 1742; and Otto's—the best—at Jena in 1842–46. See Semisch's monograph (1842) and Aubé's (Par. 1874) on Justinus.

JUSTINUS I., or **JUSTIN THE ELDER**, emperor of the east, was b. in 450 A.D., of barbarian parents, and entered as a private into the emperor's body-guard, of which he rose to be commander. He held this last post till the death of Anastasius I., whom he succeeded on the throne, 518 A.D. Feeling that, from his total want of learning, he was unfitted to direct the internal civil administration, he wisely resigned this duty to the quæstor Proclus, whose administration gave general satisfaction. In 519 he entered into an arrangement with the pope, which resulted in a cessation of hostilities between the Greek and Latin churches. In 523 he resigned to Theodoric, king of Italy, the right—which till this time the eastern emperors had always exercised—of appointing "consuls" in Rome; and the same year he became involved in a war with the king of Persia. Some time before his death in Aug., 527, he associated his nephew Justinian with himself in the government.

JUSTINUS II., or **JUSTIN THE YOUNGER**, emperor of the east, succeeded his uncle Justinian I., in 565 A.D., and espoused Sophia, the niece of the empress Theodora, a beautiful and able, but revengeful woman. His rule was weak and despicable. Through the influence of the empress Narses (q.v.) was dismissed from the exarchy of Ravenna, though at the time Justinus was fully aware that the Longobards were meditating an invasion of Italy. The joy of these savages, on hearing of the disgrace of the one man whom they dreaded, was excessive; and in 568 they burst like an avalanche upon Italy, which from this time was forever lost to the Greek empire. In the midst of a disastrous war with Khosrû, king of Persia, Justinus died Sept. 26, 578, after appointing Tiberius, one of his generals, as his successor. Justinus had been insane from 574, from which time till his death the supreme authority was in the hands of the empress.

JUTE. The jute of commerce is a fiber produced from two species of *tiliaceæ*, the *corchorus olitorius* and *corchorus capsularis*, two plants, alike in qualities, though slightly different in appearance, and sown indiscriminately; the first having round seed-pods and reddish stalk, the latter long seed-pods and bright green stalk. From the fiber which is the cheapest known are produced gunnies, gunny-cloth and cordage, and from the finer qualities carpets, shirting, coat-linings, etc., are made. It is extensively used for mixing with silk, cotton, and woolen fabrics, and also in paper-making, while the leaves are eaten in many places as food.

Although indigenous to the tropics, Bengal being the largest jute-growing country, the plant grows in most climates and on all kinds of soil, rich alluvial lands, and lands

subject to salt-water tidal influences particularly favoring its production. It is an exhausting crop for the soil. The plant, if weeded once, requires no more attention till cutting time. It grows to a height of 12 ft., having a single stalk without branches or leaves till near the top, and will flourish though flooded with 2 ft. of water for a month at a time. In Bengal the plant is cut while in flower, about three months after sowing. Cut close to the ground, stripped of leaves and branches, it is tied in bundles and steeped from 10 to 20 days in water, to loosen the fiber by rotting the outer bark. After steeping, the plant is beaten till the fiber only remains, which is cleaned, dried, and made into "drums" of 70 or 80 lbs. If for exportation, it is pressed into bales of 300 lbs. and upwards. Fine jute has a beautiful glossy golden appearance, and is soft and silky to the touch. Great importance attaches to length and strength of fiber.

The first mention of the word jute is in 1796, in the manuscript commercial index of the court of directors of the East India company. It is the Bengali name used by the natives of Cuttack and Balasore, where the first European manufactories were established in the middle of last century. In 1829 the total export from Calcutta was 20 tons, value £60. In 1833 it had increased sixteenfold, and about 1864-65 the increased demand caused jute cultivation to extend to other districts, the exportation in 1879-80 reaching the enormous amount of 4,626,710 cwts., value, £4,009,491.

England, Bombay, and America originally divided the exports of jute, and up to the time of the civil war North America took the largest share of the gunnies (see GUNNY BAGS). Jute and gunnies are now exported from Bengal largely to France, Australia, and other parts of the world. Jute grown in England is not remunerative. It has been successfully grown in small quantities in America, however.

Gunnies are classed as Nos. 1, 2, and 3. No. 1, thick and close woven, is used for sugar, fine grains such as linseed or rape-seed, and similar products; No. 2, also close woven, but thinner, for rice and the larger grains; No. 3, thick, coarse, and open, is principally suited for the outer covering of double bags. The manufacture of gunny with primitive looms is a common form of convict labor in Bengal. Near the Himalayas, in north-eastern Bengal, the natives wear a fine cloth of their own manufacture, made of jute, or jute and cotton.

Increased demand has lately induced jute production in Burmah, Italy, Queensland, and America, etc.; and a European company has been started to cultivate jute in British Burmah on a large scale. The manufacture, again, is largely carried on in Great Britain, and is the chief industry of Dundee and Belfast. In Bengal jute valued at about a million sterling is annually manufactured, mostly for local consumption, the bulk being turned out by the English mills, of which there are several near Calcutta, employing thousands of hands, the Gauripore and Barnagore mills being the principal. Additional mills on a large scale are being erected, so that it remains to be seen whether the advantages of locality and cheap labor in India, over enterprise, cheap machinery, and established trade at Dundee and Belfast, will cause the present supremacy of the latter places to wane.

A coarse paper has been made for centuries back in Bengal out of jute, by beating the fiber into a pulp with lime, drying it in sheets, sizing with rice starch, and polishing with a stone or shell.

New Zealand flax (*formium tenax*) is a rival fiber. Rhea or China grass (*urtica tenacissimus*), which grows wild in rank luxuriance in the tropics, is so fine and strong as to rival silk, but there is great difficulty in separating the fiber from the wood and bark. The Indian government offer £5,000 for a cheap invention for this purpose; and till this is discovered Bengal jute is likely to maintain its supremacy among the cheap fibers of the world.

JUTE MANUFACTURES. The extensive and daily increasing use of jute as a textile material, has induced us to give a brief notice of its manufacture into fabrics, by way of supplementing what has been already said under the head JUTE. This now gigantic industry has sprung up so rapidly, one might almost say so stealthily, that comparatively few persons are aware of its importance, and many have never even heard of the fiber at all. For some 40 years back the Dundee mill-owners have been gradually employing it more and more to mix with flax, until there is scarcely one of them who does not use it largely, and the majority now use it entirely. Jute is more brittle than flax, and will not spin so fine, nor wear so well; but then it is only about half the price, and when woven is attractive enough in appearance. In India it has been manufactured by the natives into gunny-cloth for centuries.

The jute-plant is very largely cultivated in Bengal, and the fiber is prepared there for exportation by the process of water-retting. Jute of a fine glossy appearance brings the highest price in the market. It is spun by processes similar to those employed for flax, but as it is from 10 to 15 ft. long, it is necessary to cut it into 3-ft. lengths before it can be heckled. The fiber also requires to be saturated with whale-oil and water, so as to soften and render it more elastic, preparatory to spinning. Heckling is the first of the spinning operations, and its object is to remove the coarser portions of the jute, and lay the fibers in parallel order. The heckle is a kind of comb, with sharp-pointed steel teeth, from 1 to 2 in. in length. Formerly the process was done by hand, but now heckling-machines are used. The heckled stricks are next taken to the *spreader*, or first

drawing-frame, where they are spread upon an endless creeping-sheet, so as to supply the jute continuously to another part of the machine, where, by a peculiar arrangement of rollers, it is drawn out, through combs of closely-ranged steel pins, into a continuous ribbon, called a *sliver*. A number—say 14—of these slivers are then taken to another drawing-machine, with steel combs, and drawn out into one. In like manner some 20 of these slivers are again drawn into one. The first sliver from the spreader has thus, so to speak, been drawn out 280 times its original length; and by continuing this doubling and drawing, the fibers become thoroughly parallel and equalized. The sliver from the last drawing-frame is still further drawn out, and at the same time receives a slight twist in the roving-frame. Finally the bobbins of “rove” are taken to the spinning-frame, and spun into yarn upon the “throstle” principle.

Just as in the case of flax, the jute tow from the heckling process is also spun into yarn, in which case it is first carded by means of a “breaker” and “finisher” card, and then *drawn*, *roved*, and *spun*, as above described. Indeed, a great deal of jute, as imported, is treated in this way without being heckled at all.

The larger portion of jute fabrics is woven from yarn of the natural color; but for some purposes it is bleached; and when used for carpets, it is dyed various colors. It bleaches with difficulty, but is easily dyed. Hessian sheetings for packing all kinds of merchandise are most largely produced; but sackings, baggings, osnaburgs, ducks, carpetings, mattings, etc., are largely made as well. It is also intermixed with flax, cotton, and wool for various union fabrics. At Dundee the manufacturers have not yet been able to render the dyes on this material fast; but at Barrow-in-Furness, where it is manufactured on a very considerable scale, a process discovered by M. Julius Lachs by which the fiber is permanently dyed is in successful operation. As a result of this, a finer class of jute goods such as curtains, table-cloths, and dress-pieces are now made, to which the general name of *kalameit* is given.

Jute Manufactures in the United States.—According to the census of 1880 there were only four establishments in the U. S. making a specialty of this manufacture. In 1890 the number had increased to seven. They employed an average of 1212 hands, and the value of their annual product was \$1,120,121. But a number of establishments in other parts of the union manufacture bagging of jute, flax, and hemp, and the total value of J. M. in the U. S. is estimated at about \$5,000,000. The average annual consumption of jute in the U. S. is about 140,000 bales. Experiments made under the auspices of the dept. of agriculture have indeed proved that jute can be successfully raised in the southern states, as for instance in S. C., Fla., Ga., La., and Tex., wherever there is a hot damp climate, moist soil, and a sandy, clay, or alluvial mould. In several cases the yield was as large as 3500 lbs. to the acre. But the cheapness of the foreign article, and the low rate of tariff charges (20 per cent. *ad valorem*) make native competition impracticable. The name American jute has been given to a fibrous family of the mallow tribe which grows wild in Penn. and N. J. It furnishes an excellent fibre and is even thought by experts to be superior to the imported article. Rope, carpet, and paper have been successfully made from it; and its cultivation and manufacture may in time add a new branch to our national industries.

JÜTERBOGK, a small manufacturing t. of Prussia, in the province of Brandenburg, is situated on the Nuthe, 27 m. s. of Potsdam. Here considerable wool and flax markets are held, and wine is produced to some extent. Woollen-cloth manufacturers, spinning, weaving, and dyeing are carried on. Pop. abt. 7000. Near Jüterbogk is the field of Dennewitz, where the Prussians defeated the French under Ney and Oudinot, Sept. 6, 1813.

JUTLAND (Dan. *Jylland*), the only considerable peninsula of Europe that points directly north, forms a portion of the kingdom of Denmark, and used to comprise the province of North Jutland and the duchy of Sleswick (q.v.), which was called by the Danes South Jutland. The province of North Jutland has an area of 9,709 sq.m., and a pop. (1890) of 942,120. See DENMARK. Jutland is said to have been inhabited in the earliest times by the Cimbric (q.v.), and from this circumstance it has received the name of the Cimbric peninsula, or Chersonesus. In historical times we find it inhabited by the Jutes, who took part in the expedition of the Saxons to England. As allies of the Saxons they waged war with Charlemagne, and under the name of Normans (Northmen) frequently desolated the coasts of Germany and France.

JUVENALIS, DECIMUS JUNIUS, the Roman satirist, was b. at the Volscian town of Aquinum. The year of his birth is unknown; but it may be taken for granted that he was a youth in the reign of Nero; that he was come to man's estate, and was writing in that of Domitian (81–96 A.D.); and that he survived into the times of Hadrian (117–38 A.D.). He seems to have enjoyed a competence. He practiced at Rome as an advocate; and there are some reasons for supposing that he visited Egypt. Among his friends were Martial and Statius, and perhaps Quintilian. But nothing is known of his personal history except a few leading facts—among them that he recited some of his satires in public with much applause; and even these facts are not known to us in any detail. His interest for posterity depends altogether on his writings—on his sixteen satires, still surviving, which occupy the very first rank in satirical literature, and are of priceless value as pictures of the Roman life of the empire. Juvenal and Horace

respectively represent the two schools into which satire has always been divided; and from one or other of them every classical satirist of modern Europe derives his descent. As Horace is the satirist of ridicule, so Juvenal is the satirist of indignation. Juvenal is not a man of the world so much as a reformer, and he plays in Roman literature a part corresponding to that of the prophets under the Jewish dispensation. He uses satire not as a branch of comedy, which it was to Horace, but as an engine for attacking the brutalities of tyranny, the corruptions of life and taste, the crimes, the follies, and the frenzies of a degenerate state of society. He has great humor of a scornful, austere, but singularly pungent kind, and many noble flashes of a high moral poetry. We would especially point out that the old *Roman* genius—as distinct from the more cosmopolitan kind of talent formed by Greek culture—is distinctly discernible in Juvenal. He is as national as the English Hogarth, who perhaps gives a better image of his kind and character of faculty than any single English humorist or moralist that we could name. Juvenal has been better translated in our literature than almost any other of the ancients. Dryden's versions of five of his satires are amongst the best things Dryden ever did. Dr. Johnson imitated two of the most famous in his *London* and *Vanity of Human Wishes*; and the version of the whole of them by Gifford is full of power and character. The best modern edition of Juvenal is that of J. E. B. Mayor (1886), while those of Maclean, Simcox, Lewis, and that by Pearson and Strong (1888) are to be commended. The latest English version of Juvenal is that by J. D. Lewis. An edition of the text by A. Weidner was published (Leip.) in 1889, while those of Heinrich and Jahn are well known.

JUVENILE OFFENDERS. The practice of singling out offenders of a tender age from adult offenders, and subjecting them to different punishment and reformatory treatment, has gained ground of late years. In the eye of the law persons are considered capable of committing crime when of the age of seven, and are punishable like other persons. But in England and Ireland, in cases of larceny, whenever a person under the age of 16 is brought before justices, and is convicted, he or she may be committed to the house of correction for three calendar months or less, or, in the discretion of the justices, shall be fined £3 or less; or if a male under 14 years, shall be once privately whipped (with a birch rod, not more than 12 strokes), either instead of or in addition to such imprisonment. The juvenile offender, however, may object to be tried by justices of the peace, and may insist upon being tried by jury, if he prefer it. And in all cases of juveniles under 16 being convicted of offenses, the justice or magistrate may, in addition to the sentence then passed, provided such sentence is not less than 14 days' imprisonment, direct the offender, at its expiration, to be sent to a reformatory school for a period of not less than two years, and not more than five. But the parent or guardian may have the child sent to another reformatory school than the one named by the magistrate, on paying the additional expense, if any. The expense of the conveyance of the offender to the school is paid by the county or borough, but his continued maintenance there must be paid for by the parent or step-parent, if of sufficient ability, such sum, however, not to exceed 5s. per week. Children who have not yet committed crime, but are in a vagrant and neglected state, may also be sent to an industrial school (q.v.). In Scotland there are also statutes with regard to reformatory schools and juvenile offenders similar to what exist in England. History makes it plain that while there can be but little doubt as to the existence of this class under the older forms of civilization, there would not appear to have been any marked effort toward the suppression of the evil until late in the 17th century. The German wars and those of Napoleon, in their enormous production of the condition of orphanage, under circumstances calculated to carry those unfortunates who experienced it into vagabondage and consequent temptation, appear to have first concentrated the ideas of social economists on the subject. Accordingly we find, in the establishment founded at Halle by Herman Fromcke in 1695, the first recorded institution distinctly reformatory for children. This was, in fact, the "ragged school" of the kind established at the beginning of the 18th c. by John Pounds, the cobbler, in England. These individual efforts not only inculcated in the public mind the idea in pursuance of which they were originated, but speedily gave rise to organized effort in the same direction. About 1817 was established the London philanthropic society, which included in its purpose and practice the reformation of juvenile offenders. This organization opened the first English house of refuge for children, which may be considered the prototype of similar institutions in America. The next such establishment to which special importance is given in the history of the subject was founded by Dr. John Henry Wichern, in 1833, at a short distance from Hamburg, in Germany, and was called the *Rauhe Haus*. In all these establishments the reformatory feature had been maintained, associated with education, and with mechanical labor, as in the trades. Contemporary with the early movements in that direction in England were the organized efforts which were made in America, among which that of the society for the reformation of juvenile delinquents in New York, 1823, was the first. This society originated in a movement among the society of Friends, which was made as early as 1818. So important had the subject become in the minds of leading American publicists of the day that Edward Livingston, in his celebrated code of Louisiana, developed his

views with regard to it in impressive language. Out of the New York society grew, by slow stages, the magnificent institution of Randall's island. In Boston a reform school was established in 1826, and one in Philadelphia two years later. The next step in advance was the combination of agricultural pursuits with the reform element, and out of this grew the modern "farm school," as it exists in Massachusetts and other states at the present day. The first farm school was established in Boston about 1837, and 10 years later the first state reform school was organized at Westborough, Mass. It has become the conclusion reached by experience that schools founded and managed under government control are, on the whole, more economically and systematically conducted than those directed by charitable organizations or individuals. In 1837 was founded near the city of Tours, in France, the agricultural colony of Mettray, due to the labors of M. de Metz, who had carefully investigated the reform school systems of Germany and America, and who thereafter devoted his life to the object which had come to possess so much interest for civilized communities. The Mettray school, still flourishing, is an actual village, where live and work a multitude of town children of the lower stratum, in various stages of reform, and all progressive in their lives. The Mettray system, which was really a combination of special features in those of Germany and America, now became the model, and in 1855 was established, in close likeness to it, the industrial school for girls at Lancaster, Mass., which was soon followed at Lancaster, O., by the foundation of a similar school for boys. No account of reformatory institutions of the character of those which we are discussing would be comprehensive without some reference to the Five Points mission and the children's aid society of New York, the former the scene of the labors of Rev. Mr. Pease and his fellow-workers; the latter, which was founded in 1853 by Rev. Charles L. Brace, an enterprise devoted to the removal of poor children from the temptations of the city, and their establishment in country homes. Both these institutions have faithfully fulfilled the intent of their founders, and have done much to ameliorate the condition of those whom they have taken under their charge. See CHILDREN'S AID SOCIETY.

JUVENTAS, the goddess of youth in Roman mythology, whose worship dates back to a very early period, a structure dedicated to her having been erected on the capitol at Rome before the building of the temple of Jupiter in the 6th c. B.C. In 191 B.C. a temple was consecrated to Juventas in the Circus Maximus. Here was kept a register of the names of those liable to military duty.

JUXON, WILLIAM, D.D., 1582-1663; b. Chichester, Eng.; educated at St. John's college, Oxford; vicar of St. Giles's, Oxford, in 1609, and rector of Somerton in 1614. In 1621 he became president of St. John's college, and vice-chancellor in 1626. In 1628 he was made dean of Worcester; in 1633 bishop of Hereford and of London; in 1635 lord high-treasurer. In the civil war he adhered to Charles I., losing his ecclesiastical revenues and a large part of his temporal estate. He attended the king at his trial and execution, was deprived of his bishopric after the death of Charles, and imprisoned for refusing to reveal what the king had intrusted to him. After the restoration he was made archbishop of Canterbury.

JYNTEAH, a district of British India beyond the Brahmaputra, in the presidency of Bengal, formerly a state under a rajah in the British-India province of Siam. The last rajah was deposed in 1835.

K

K, THE eleventh letter of the English alphabet. The Semitic languages had two characters with the same or very similar consonantal power—the one called in Hebrew *Kaph* (hollow of the hand), the other *Koph* (the hind head). Both were at first transplanted into the Greek [κ (*Kappa*) = K, ϣ (old Greek *Koppa*) = Q], and thence into Latin; but in Greek, *Koppa*, or *q*, was early dropped, and in Latin *Kappa*, or *k*, was supplanted by *c* (see ALPHABET and letter C), except in the case of a few words, as *Kalendæ* and *Kæso*. In the languages derived from Latin, accordingly, *k* is used only in writing foreign words. Although unknown to the Anglo-Saxon alphabet, it has in modern English to a considerable extent taken the place of *c* in words of Saxon origin. See C. The character *Koppa*, or *q*, has been retained in modern alphabets, as it was in Latin, only in the combination *qu*. This is clearly a relic of the primitive nature of written characters, when they constituted syllabaries rather than alphabets, each character expressing a consonantal articulation followed by a particular vowel sound; so that there was one character for *ba* and another for *bo*; one for *ka* and another for *ko* or *ku*, as in hieroglyphs. *K* (*q*, or *c* hard) is the sharp mute of the guttural series, *k*, *g*, *ch*, *gh*. See LETTERS. The interchanges of *k* are indicated under C.

KAABA (Arab. "square house"), the name of an oblong stone building within the great mosque of Mecca (q.v.). According to the legend, Adam first worshipped on this spot after his expulsion from Paradise, in a tent sent down from heaven for this pur-

pose. Seth substituted for the tent a structure of clay and stone, which was, however, destroyed by the deluge, but afterwards rebuilt by Abraham and Ishmael. Certain it is that the building existed from time immemorial, and served the Arabs before Mohammed as a place of idolatrous worship, probably to Zohal (Saturn). It is, as it now stands—rebuilt in 1627—35 to 40 ft. high, 18 paces long, 14 broad. Its door, coated with silver, is opened only three times in the year—once for men, once for women, and once for the purpose of cleaning the interior. Next to this door, in the n.e. corner of the edifice, is set the famous lava-like black stone which, since the second year of the Hedjrah (q.v.), has served as kibleh, i.e., as an indicator of the direction towards which all Moslems must turn in their prayers. This stone, which is said to have dropped from paradise together with Adam, is held in extreme veneration, and one of its principal names is "The Right Hand of God on Earth." It was originally of white color, but the sins of mankind have caused it to shed so many silent tears that it has become (externally) quite black. Others explain this change of color by the unnumbered kisses and touches bestowed upon it by the pilgrims, part of whose ceremonies (see HAJJ) consists in compassing the Kaaba seven times, each time either kissing this stone or touching it with the hand and kissing the latter. A smaller stone, to which, however, less veneration is shown, is set in the s.e. corner of the Kaaba. The outside of the Kaaba is annually covered anew with the richest black silks, on which are embroidered sentences from the Koran in gold—a pious contribution first on the part of the caliphs, later of the sultans of Egypt, now of the Turkish emperors. The Kaaba has a double roof, supported by pillars of aloe-wood, and it is said that no bird ever rests upon it. The whole edifice is surrounded by an inclosure of columns, outside which there are found three oratories, or places of devotion, for different sects; also the edifice containing the well Zem-Zem, the cupola of Abbas, and the treasury. All these are further inclosed by a splendid colonnade, surmounted by cupolas, steeples, spires, crescents, all gilded and adorned with lamps, which shed a brilliant luster at night. These surroundings, between which and the Kaaba run seven paved causeways, were first devised by Omar, for the better preservation of the Kaaba itself.

KAAMA, or **CAAMA**, *Antelope caama*, a species of antelope, a native of the s. of Africa, nearly allied to the *bubalus* (q.v.) of the n. of Africa. It is the *harte-beest* of the Dutch colonists of the cape of Good Hope, where it is the most common of all the large antelopes. Its horns are rather short and thick, curved like the sides of a lyre. It inhabits plains and congregates in large herds. Its flesh is very good, more resembling beef than that of almost any other antelope. It is very capable of domestication. See *illus.*, ANTELOPES.

KABBALAH. See CABBALA.

KABUL. See CABUL.

KABYLES, another name for the Berbers (q.v.).

KADESH-BARNEA, anciently on the s. confines of Syria; noted for its wells. Near it Moses brought water from a rock; there Miriam was buried, the Jews were defeated by the Amalekites, and, for their murmuring, were driven back into the desert; and thence Joshua sent spies to examine the promised land. It is located by Dr. Robinson at 'Ain-el-Weebah, on the route from Petra to Hebron, near the s. extremity of the plain of El Ghor (in Hebrew, 'Arabah), which stretches northwards to the shore of the Dead sea. But Dean Stanley places it at Petra, and later investigation seems to point conclusively to 'Ain Qadis, an oasis in the desert of Tir, 45 miles w. of 'Ain-el-Weebah. The arguments in favor of this locality were first presented by Rowlands in 1842, were adopted by Bunsen, Palmer, Alford, Geikie, and many others, and have received confirmatory evidence through the Rev. H. Clay Trumbull's visit to the place in 1881. See Trumbull's *Kadesh-Barnea*, 1883. The principal Scripture references are, Gen. xiv., Deut. i., 44, Num. xiv., Num. xx.

KADI. See CADI.

KADIAK, an island to the s.e. of the peninsula of Alaska (q.v.). It is an irregularly shaped mass of mountains, measuring 75 m. by 50. The chief value of Kadiak consists in its salmon canneries, employing a large number of hands. St. Paul, on its n. coast, has a tolerable harbor and a considerable export trade in furs.

KADIAKS, **KONTAGAS**, or **KOLOSHES**, the first two being the native, and the last the Russian designation of an aboriginal race occupying the northern shore of Alaska. Extending a distance of more than 1500 m. across the peninsula, this family, in its various tribal bands, is also to be found scattered over from 100 to 150 m. of the interior. Altogether, there are said to be 14 tribes, the chief in importance, and who give the general name to the rest, being inhabitants of the island of Kadiak.

KADMONITES, from a Hebrew word meaning "eastern," is recorded in biblical literature as the name of a Canaanite tribe which, in the time of Abraham, occupied the country in the n.e. of Palestine, immediately under Mt. Hermon. This is the accepted definition of the term, which may, however, have had a more general significance, to wit, "the children of the east," or those living beyond the Euphrates.

KADOM, a t. of Russia, in the government of Tambov, and 140 m. n.n.e. of the t. of Tambov, on the river Moshka. The houses are built chiefly of wood, and the principal trade is in honey. Pop., mostly of Tartar descent, abt. 8000.

KAF. See **CAF**

KAFFA, or **KAFA**, a kingdom in e. Africa, s. of Abyssinia, on an elevated table-land, 5,000 ft. above the sea. It is mountainous, with wide valleys, and is drained by numerous water-courses, which unite to form the Goshop, or Gojeb, a large river that rises farther south. Kaffa lies between the lake-region of the head-waters of the Nile and the mountains of the Moon, lat 7° n., long. 36° 30' east. The country is fertile and in some parts well cultivated, the coffee-plant being indigenous, and, as is believed, having derived its name from that of this country. There is a considerable trade in cotton and cotton cloth, and slaves. The natives are of the same family as the Abyssinians, and speak one of the Hamitic group of languages. Capital, Bonga.

KAF'FIR, or **KAFIR**, the name of a great family of the human race inhabiting the s. part of the continent of Africa, classed by Dr. Latham in division B of the variety Atlantidæ, their physical conformation being modified negro, and which also includes the Betjuans (q.v.), Ovampos, Damaras, and other similar tribes living in the region s. of 18° s. latitude, and extending to the boundaries of the Cape Colony. By the term Kaffir, however, the tribes inhabiting the coast-country on the e. side of s.e. Africa are generally understood, and recent events have further narrowed the designation in a popular sense as more particularly applying to the tribes living in the country between the Cape Colony and Natal, those e. of the latter colony, as far n. as Delagoa, being now better known as Zulus or Zulu Kaffirs. General distribution of the Kaffir races: 1. Tribes (Amatabele, Amazulu, etc., n. of Natal; Amampondo, Amaxosa,* etc., in Kaffraria proper) speaking the Zulu language and its dialects, inhabiting the east-coast region; 2. Tribes (Makololo, n., and Bakuku, n.w. of lake Ngami; Bakalihar, etc.) speaking the Sichuana language and its dialects, inhabiting the central region, and known under the general name of Betjuans; 3. Tribes (Ovampos and Damaras) speaking the Ovampo or Otjiherero and its dialects, inhabiting the west-coast region.

History, etc.—The word Kaffir is derived from the Arabic *Kafir*, "an unbeliever," which was applied by the Mohammedan inhabitants of the e. coast to the native tribes living south of them, and adopted by the Portuguese, after their settlements at Melinda and Mozambique, to designate the inhabitants of the vast region lying to the south, and extending to the country of the Hottentots, now the Cape Colony.

The oldest genealogical records of the Kaffir chiefs go back to 1617. In 1688 the old Dutch colonial records first mention the Kaffirs as having at that early period driven the Hottentot aborigines as far south as the Great Fish river; and in 1784 the latter was declared the boundary of the Cape Colony to the east. In 1798 commenced the series of wars between the English and the Kaffirs, and by the year 1811, the latter, after repeated attacks, were driven across the Fish river. In 1819, under the leadership of a false prophet called Makanna, they ventured to attack Graham's Town, but were repulsed with great slaughter. A period of broken peace and ill-kept treaties then succeeded, during which time a considerable European and Hottentot population had been settled along the frontier (1820). In 1828 they were driven out of the Kat river valley, which was filled with Hottentot settlers; then came the great war of 1834–35, which cost upwards of a million sterling, and ended in the Kaffirs being driven to the e. of the Great Kei, and the territory between it and the Great Fish river was taken possession of by sir B. Durban, but immediately restored by the then colonial secretary, lord Glenelg. In 1846, war, which had been long inevitable, again broke out, and the Gaika and Islambe Kaffirs, members of the great Amaxosa tribe, invaded the colony, and overran the whole of the frontier districts as far w. as Uitenhage, and n. to the Stormbergen, inflicting great loss even on the imperial troops on many occasions. Again under sir H. Smith, they were in 1848 driven back, and the country they inhabited once more annexed to the British crown, under the title of British Kaffraria. Unfortunately, however, the influence of the chiefs remained unbroken, and they used it for evil by again invading the colony in 1851—this time not only the Gaika tribes, but the whole of the Amaxosa and Amantembu, besides a numerous body of rebel Hottentots, all well armed and provided with ammunition. Again, after a struggle of many months, the enemy was finally repulsed, and sir H. Smith being relieved by sir H. Pottinger, and he by sir George Grey, the latter, by his wise and astute policy, succeeded in breaking up the power of the chiefs, dispersing the tribes amongst the European settlers, and utterly destroying their strength, in which he was not a little assisted by a terrible famine which about that period fell on the unfortunate people, they having neglected to plant their fields, and having killed nearly all their cattle at the command of a false prophet called Umlangeni, whose influence the deluded chiefs used to urge their people to this last war. In 1877 a new disturbance broke out amongst the Galeka Kaffirs in the Transkei territory, extended to the Gaikas, and was followed by the war with the Zulus. There was sharp fighting between the Kaffirs and the English and colonial forces; and the anxiety created by the war inflicted a serious check on the prosperity of the frontier set-

* The prefix *Ama* signifies tribe or family.

tlements. A well-armed European population now occupies British Kaffraria, and the natives look for justice to local magistrates instead of to their former chiefs. Beyond the Kei river the chiefs still rule, but their power is very much broken.

The Kaffir races are a tall, well-made, and generally handsome people, of a dark brown or bronze color, and hair in short woolly tufts. As we proceed to the n. they gradually become more assimilated to the negro type, until at last the two races seem to blend together. They are brave, and in times of peace kind and hospitable to strangers, affectionate husbands and fathers; and their minds have a peculiarly acute and logical turn, which in their "palavers" with the whites often gave them the best of the argument. They are an honest people, except, perhaps, in the article of cattle. Although their idea of God appears very indistinct, and their feelings of veneration but small, yet they are very superstitious, and dread the influence of wizards and sorcerers. Their huts, which are built by the women, are of a bee-hive shape, composed of wattles stretched with grass, and a collection of them is called a "kraal," a word of Portuguese origin signifying an inclosure. The general rule of the chiefs is patriarchal, they being assisted, however, by a number of "pakati," or councilors, whose advice is generally followed by the chief. Polygamy is allowed, and wives are generally purchased for cattle. The chief has absolute power over the property of his whole tribe, although he seldom exercises it. If any individual accumulates great wealth, an accusation of witchcraft is sure to make him disgorge it. They practice, in common with all other African nations, circumcision and many peculiar rites of purification, many of them analogous to those prescribed in the Mosaic law; but these rites appear, both in Africa and Asia, to have been generally practiced at an earlier period even than the Jews adopted them. The Kaffir criminal code is very simple: a fine, great or small, of cattle pays for almost any offense, and the *lex talionis* is strictly forbidden even in case of murder. Many of their ceremonies and dances are of a very gross and obscene nature, although the Kaffir women, especially after marriage, are very chaste and modest in their deportment, and present in this respect a striking contrast to the Hottentot race. The Kaffirs are strictly a pastoral people, and the men tend their herds exclusively, even to milking them, leaving to the women the labor of cultivating their gardens, building their huts, gathering fuel, etc. They generally wear a blanket; the former robe of softened ox-hide is now very seldom seen. In time of war the Kaffir appears in the field naked and painted with a fiery-red clay. The native arms are assagais and clubs, but the use of fire-arms is now prevalent amongst all the south African tribes. The Kaffir language is considered as a dialect of the Sichuana, which is the original stock of the different tribes of the Kaffir race. It is fine, sonorous, and expressive, with an ingenious and complicated system of grammar. On the Cape frontier many Hottentot and Dutch words have been introduced; and in the Zulu dialect the Wesleyan missionaries and bishop Colenso of Natal have published many excellent works tending to elucidate the philology of South African languages.

The Amafengu, or Fingoes, are the remains of various Zulu tribes, refugees from the wars of Chaka, reduced to slavery by the Amaxosa Kaffirs, and rescued by sir B. Durban in 1835, and settled by him along the e. frontier of the Cape Colony. They are a saving, careful people, and many of them are converted to Christianity. They have always been the firm allies of the British against their hereditary enemies, the Kaffirs, although of the same race and language. The Fingoes are often, from their money-making propensities, called the Jews of the Kaffir race. The Amampondo, Amabaxa, and other tribes living near the Natal frontier, have never warred against the English, although often quarreling amongst themselves; they are gradually declining in numbers, and are not near so fine a race as the frontier Kaffirs.

KAFFIR CORN. See DURRA.

KAFFRARIA, PROPER OR INDEPENDENT. The general designation of Kaffraria was formerly applied to the whole of the coast region of South Africa e. of the Great Fish river, and extending as far n. as Sofala. Then it was limited to a strip between Cape Colony and Natal, and bounded by the Great Kei and Umzimvelu rivers. Since 1875 it is, however, false to speak of this as independent Kaffirland; as Fingoland, the Idutvya Reserve, Tambookieland, and other districts beyond the Kei, are now annexed to Cape Colony. This annexed Transkei territory has a larger area than the really independent portion which occupies the seaboard.

Kaffraria is drained by the Great Kei, the Umzimvoobo or St. John's river, and its fan-like branches, the Tsetse and Tena, which rise in the Quathlamba, the Umzimvelu, Umtata, Umbashee, and several other streams with short courses, which rise in a high escarpment or ridge, forming a sort of buttress to an undulating grassy but woodless plateau, which extends along the foot of the mountains at a height of about 2,500 ft. above the sea. The rivers, especially near the coast, run through deep wooded kloofs, sunk below the level of the surrounding country, and none of them are navigable. The

coast generally is rocky and dangerous, and should not be approached closer than 3 m.; anchorage may be found in one or two shallow bays e. of the St. John's river.

Kaffraria is inhabited by the remains of the Amaxosa and Amamtembu tribes of Kafirs (who, since the annexation of British Kaffraria, have retired across the Kei river), the once powerful tribes of the Amagaleka, Amampondos, and Amabaxa, besides the remains of many broken Zulu tribes, refugees from the wars of Chaka and Dingaan, who have found shelter in that portion of the country that borders on Natal. The total number of natives may be roughly estimated at 300,000; but it is probable in a very few years the whole region will be absorbed into the neighboring colonies of British Kaffraria and Natal, as the population is rapidly decreasing, and the chiefs fast losing their prestige and influence. The paramount chief is Rili, or Creili, of the Amagaleka tribe, who has his principal kraal about 20 m. e. of the Great Kei river.

The soil of Kaffraria is fertile. The natives raise sufficient crops of Indian and Kaffir corn, pumpkins, etc., for their own use. Cotton has been successfully grown in many localities along the coast. Cattle, horses, and goats thrive well, and a considerable trade with the adjacent colonies is carried on in hides, horns, goat-skins, tallow, and wagon-wood. The Wesleyan society have established many well-organized stations, forming convenient halting-places along the lines of road which traverse Kaffraria between the Cape Colony and Natal, and where travelers will be sure to meet a kind reception.

KAFFRARIA, BRITISH, a country of South Africa, lying between the Great Kei and the Umtamvuna rivers; which was wrested from the Kafirs by the Cape Colonists in the war of 1846-47, and was for a time an independent colony, but is now a part of Cape Colony. It has an area of 6,500 sq. m., and is bounded on the n. by a high and picturesque range of mountains called the Amatola (4,000 to 5,000 ft.), a continuation of the Great Winterberg and Katberg ranges in the Cape Colony. It is well watered by the Bashee, Umtata, Umzimvubu, and other minor streams or torrents, generally running in deep and rugged beds, and by the Great Kei, a considerable stream, dividing it from Independent Kaffraria. None of these rivers is navigable.

The physical aspect of British Kaffraria is similar to that of Lower Albany, or the e. coast region of the Cape Colony. Many fertile, well-watered valleys are found amongst the spurs of the Amatola mountains. Behind these mountains are high grassy plateaux, extending to the Kei river, and well adapted both for grazing and agriculture, and many parts are covered with fine forests.

In 1859 British Kaffraria was divided into farms of from 1000 to 3000 acres, which were granted free on certain terms of settlement and defense. The pop. in 1891 was 486,572 (10,312 whites, 470,624 Kafirs, 5636 Hottentots).

The principal town is King William's Town, the head-quarters of the military and seat of government, and containing a pop. of about 2,500 souls. The port of British Kaffraria is East London, at the mouth of the Buffalo river, where there is good anchorage. There are numerous military posts and German villages extending along the line of the Buffalo from the sea to the mountains, and also several mission-stations, Episcopal, Wesleyan, Presbyterian, and German; and the natives are in numerous cases reclaimed from heathenism, and becoming an orderly and civilized population. In 1861, by her majesty's letters-patent, British Kaffraria was declared an independent colony, under a lieutenant-governor, the governor of the Cape being styled high commissioner. Its revenues were derived from quit-rents of the farms granted, and the revenue duties collected at the port of East London, and were about sufficient to pay the expenses of the limited executive. In 1865 British Kaffraria ceased to be an independent colony, and was annexed to Cape Colony.

The larger wild beasts have nearly disappeared, although a few years back the high plains n. of the Amatola, called the Bontebok flat, were the favorite hunting grounds of South African sportsmen. A considerable number of the German legion, sent here after the Crimean war, have received grants of land, and make excellent settlers. Two English and one or two German newspapers are published in King William's Town. A railway traverses British Kaffraria from east London to Queenstown.

KAfirISTAN' (i.e., country of the Kafirs or infidels), a country of Central Asia, on the s. declivity of the Hindu Kush, forming part of the northern basin of the Cabul, in 34° 20' to 36° n. lat. and 69° 40' to 71° 40' e. long.; area, 7,000 sq. miles. The country is divided into narrow valleys by spurs of the Hindu Kush. The inhabitants, whose number is unknown, differ, as the name of the country implies, in creed and origin from the great body of the neighboring tribes; in features and complexion they are allied to a Turco-Tartar stock. This state of isolation is mainly owing to the natural strength of the region, which, though repeatedly invaded, has never yet been subdued. The soil is fertile enough to render external intercourse comparatively unnecessary, yielding, as it does, fruits, from plantains and figs to apples and pears—and feeding large herds of cattle, sheep, and goats. Three entirely distinct languages are spoken, those namely of the Siah Posh, the Uai and the Presun people.

KAFTAN, an article of Turkish dress, like a dressing-gown, in use amongst other oriental nations.

KAGA, an old province on the w. coast of Japan, between parallels 36 and 37 of n. lat., the former seat of the Maëda family of daimios, and one of the richest provinces in the empire. What renders the name a household word in Europe and America is the manufacture of splendid gold and silver inlaid bronzes, and the red and gold pottery. The characteristic decoration in gold and rouge of Kaga-ware is a development of the school of the Eraku artists of Kioto. The ware requires three bakings. Kanazawa in Kaga is the chief city, and Hakusan (white mountain) rises on the s.e. border. Nearly all modern Kaga-ware is decorated in Tokio.

KAGOSHI MA, or **KAGOSIMA**, a t. of Kiushiu, one of the Japanese islands, capital of the feudal territory of prince Satsuma; pop. '93, 55,842. This prince was the sufferer in 1863 of the punishment allotted for the murder of Mr. H. L. Richardson, a Hong-Kong merchant, who was killed on the highway between Yedo and Yokohama by a party headed by the younger brother of Satsuma. For this offense the British bombarded Kagoshima, Aug. 15, 1863, and dismantled most of the forts.

KAH'LENBERG, the name of a hill on the Danube river in Austria, a short distance from Vienna. It is memorable from having been the scene of the arrival of Sobieski to the rescue of Vienna, when that city was besieged by the Turks in 1683. It is 1100 ft. above the river, and its summit is made a place of resort by the Viennese, where various amusements are conducted.

KAIAN'IANs, the second of the historic, or sixth including the legendary or prehistoric, dynasties of Persia. The twelfth and last monarch of the previous dynasty, Afrásáb II., had been conquered by Rustam, who placed upon the throne Kai-Kubáb, a descendant of Minúchihr, and thus founded the Kainian dynasty, so named on account of the prefix *Kai* (mighty) attached to the names of the kings, beginning with Kai-Kubad and followed by Kai-Káus (Darius the Mede), Kai-Khusrau (Cyrus), Luhrásp, Gashtásp (in whose reign Zoroaster introduced the fire-worship); Bahman, or Ardashir Dirázdest; Dárá I.; Dárá II. (or Darius Codomanus of the Greeks). This dynasty existed 660-334 B. C., ending with the battle of Arbela, in which the last king, Darius, was overthrown by Alexander.

KAIYETEUR FALL, a noble waterfall in British Guiana, which is formed by the waters of the Potaro river plunging from the basin of that stream into the valley of the Essequibo below, a sheer descent of 741 ft., and a sloping cataract thereafter of 88 feet. The breadth of this fall at its beginning, on the edge of the declivity, is 369 ft., and its depth at the same place 15 ft. in the dry season.

KAIN, JOHN JOSEPH, D.D., b. Martinsburg, W. Va., 1841, educated at St. Charles college, Ellicott city, Md., and St. Mary's seminary, Baltimore; ordained priest in the Rom. Cath. church, 1866. For several years he had charge of churches at Harper's Ferry, W. Va., and Winchester, Va.; was consecrated bp. of Wheeling, 1875; made coadjutor to the archbishop of St. Louis, 1891; administrator of the archdiocese, 1893; and full archbishop, 1896.

KAIRA, a large t. in Hindustan in the British collectorate of the same name, within the presidency of Bombay, near the confluence of the two small rivers, Watruk and Seree. It is in lat. 22° 45', long. 72° 44', and 265 m. from the city of Bombay. It is surrounded by a wall with bastions. The streets are narrow and irregular, but the houses are high and well built, with sloping tiled roofs, and the gables and verandahs ornamented with carved woodwork. The district was ceded to the East India company by the Gaekwar and has an area of 1561 sq. m., with a pop. of 782,733.

KAIRWAN, a decayed t. of Northern Africa, in the state of Tunis, is situated 30 m. s.w. of Susa, with which it is connected by rail, in a treeless, marshy plain. It is surrounded by a brick wall, surmounted by towers. It contains about 80 ecclesiastical structures, of which the Okbah mosque, one of the most sacred of Islam, is considered one of the four gates of Paradise. Pop. 20-30,000.

KAISER, the German title of emperor. It was derived from that of Cæsar, permitted by Diocletian to be used by the governing prince of Dalmatia, Croatia, and the line of the Danube, who was heir-presumptive to the imperial throne. The term was employed by the German emperors of the Middle Ages, and later by the emperors of Austria. In 1871 it was assumed by William I. of Prussia, on his being crowned emperor of Germany.

KAISERSLAUTERN, or **LAUTERN**, a thriving t. of Rhenish Bavaria, is pleasantly situated on the Lauter, 31 m. s.w. of Worms. Pop. '71, 17,867; '85, 31,452; '90, 37,047.

KAISERSWERTH, a t. in Prussia, 5 m. from Düsseldorf: pop. '90, 2,379. It is situated in the province of the Rhine and on the river Rhine; and is chiefly important for the house of deaconesses established by Theodor Fliedner (q.v.) in 1836.

KAISER WILHELM'S LAND. The German portion of Papua (q.v.).

KAKAPO, or OWL PARROT (*Strigops habroptilus*), a remarkable bird, a native of New

Zealand, belonging to the parrot family (*psittacidae*), but of very owl-like appearance, and, like the owls, nocturnal, or nearly so, concealing itself in holes during the day, except in very gloomy weather. The kakapo takes possession of a hole, where one exists, among stones or the roots of trees, but seems also to have the power of making a burrow for itself. Dogs take it in its hole, although it makes some resistance; but, after a little experience, they learn how to deal with it. It is also pursued and taken by dogs when running on the ground. The flesh of the kakapo is more pleasant and delicate than that of any other parrot. This interesting bird has almost disappeared from the northern island of New Zealand, and is much more rare in the middle island than it was not many years ago. It will probably soon be extinct, unless means are adopted for its protection. It is the only known bird having large wings which does not use them for flight.

KAKODYLE. See CACODYLE.

KALAFAT, a walled t. of Roumania, in the s.w. part of Wallachia; pop. 2,995. It is on the left bank of the Danube, which here forms the Bulgarian boundary, and is directly opposite Widin, and 155 m. from Bucharest. It is very strongly fortified, and has frequently been an important strategic point in the Turkish wars. The Russians lost here 10,000 men in an engagement with the Turks in 1829; and in 1854 severe engagements took place in the same vicinity. In April, 1877, war was declared between Russia and Turkey, and Kalafat was occupied by Cossacks. Early in May the Roumanians held Kalafat, and the Turks shelled the town from the fortress of Widin, thus beginning the war between Turkey and Roumania. By June 3 the lines from Galatz to Kalafat were held by 240,000 Russians and 60,000 Roumanians.

KALAKAU'A, DAVID, king of the Hawaiians; b. Honolulu, Nov. 16, 1836; descended from Keawe, an ancient king of the islands; received an English education with prince Lunailo and fifteen other hereditary chiefs in the royal school at Honolulu. In 1860 he visited California. On the death of Lunailo, who appointed no successor, Kalakaua was elected king in 1874 by the legislature, over Emma, queen dowager and relict of Kamehameha IV. The partisans of Emma, on hearing the result, broke into the court-house and attacked the legislature which had elected her rival. Assistance being asked from the English and American ships in port, the rioters were dispersed, and Kalakaua was crowned the seventh king of the Hawaiians. In 1889 he published *Legends and Myths of Hawaii*. He died in San Francisco in 1891, while on a short visit to this country to arrange a treaty of reciprocity.

KALAMA, city and co. seat of Cowlitz co., Wash.; on the Columbia river and the Northern Pacific railroad; 40 miles n. of Portland, Or. It is principally engaged in lumbering, fishing, farming, and fish-packing. Pop. '90, 325.

KALAMATA, or CALAMATA, a sea-port of Greece, capital of Messenia, near the head of the gulf of Koron; pop. '89, 10,696. The outer harbor has a depth at entrance of 24 feet, and inside of 14 feet. An inner harbor is under construction. It is the seat of the bishop of Messenia. It is supposed to be the site of Pheræ, prominent in the time of the Trojan war. In the period of the crusades it was the most important town of Peloponnesus, was annexed to Venice, but in the 18th c. came into possession of the Turks.

KALAMAZOO, a co. in s. Michigan, organized 1830; has a soil of great agricultural value. The Kalamazoo river flows through the county near its center, and the country is dotted with burr-oak plains or openings; pop. in '70, 32,054; in '90, 39,273; area, 576 sq. miles. The soil is composed of a brown loam, with a strong admixture of clay; this is also found where the prairies border the Kalamazoo river. These prairies are covered with wild flowers of many varieties. Much attention is given to the raising of live-stock. All products abound that are found in the middle states. From 40 to 80 bushels of corn to the acre are produced, and the average of wheat is placed at 25 bushels. Ledges of sandstone occur in the southern portion; also fine timber growing on the bottom-lands by the Kalamazoo and a number of smaller streams. Lines of railway cross the county in every direction. Among the industries are the manufacture of furniture, pumps, carriages, musical instruments, and agricultural implements. There are mills run by steam and water power, foundries, and machine shops. Co. seat, Kalamazoo.

KALAMAZOO, city and co. seat of Kalamazoo co., Mich.; on the Kalamazoo river and the Chicago, Kalamazoo, and Saginaw, the Grand Rapids and Indiana, the Lake Shore and Michigan Southern, and the Michigan Central railroads; 47 miles s. of Grand Rapids. It contains Kalamazoo college (Bap.), Michigan female seminary, Parsons business college, Queen City and Borgess hospital, State asylum for the insane, Wilbur home and school for the feeble-minded, orphans' home, public library, ladies' library association, Y. M. C. A., Y. W. C. A., and Bronson park. There are electric lights and street railroads, city waterworks supplied by artesian wells, national and state banks, more than 30 churches, and daily, weekly, and monthly periodicals. The principal industries are celery growing and the manufacture of wagons and carriages, boilers and engines, paper, caskets and coffins, playing cards, patent medicines, etc. Pop. '90, 17,853.

KALAMAZOO' RIVER, or **KEKALAMAZOO** (an Indian word signifying a boiling pot), is a river in s. Michigan. It is clear and narrow, and very rapid^d and rising in the center of s. Michigan, flows westward through four counties over a bed of pebbles, limestone, or sand, emptying into lake Michigan 41 m. n. of the St. Joseph river, and 29 m. s. of Grand river. It is 200 m. long but only 90 m. in a direct line from source to mouth. At its mouth, which is an excellent harbor for vessels of 100 tons burden, it is 400 ft. in width, and from 10 to 15 ft. deep. There are four considerable towns on its banks, Marshall, Battle Creek, Kalamazoo, and Allegan; the latter, 38 m. from its mouth, is a depot for lumber; and up to this point the river is navigable at all seasons. On the banks are found the *mounds* that puzzle antiquarians. Thick forests grow along its borders, which in Allegan co. furnish excellent pine timber; in Kalamazoo and Calhoun counties it flows mostly through oak-openings. It supplies excellent mill-sites for manufacturing purposes.

KAL'BĒ, or **CALBE**, a t. of Prussian Saxony, in the government of Magdeburg, is situated 18 m. s. of the town of that name, on the left bank of the Saale. Spinning and weaving, with manufactures of paper, wool and cloth, are here carried on. Pop. '90, 9069.

KALE, or **BORECOLE** (Ger. *Kohl*), a cultivated variety of *brassica oleracea*, differing from cabbage in the open heads of leaves, which are used for culinary purposes as *greens*, and also as food for cattle. There are many sub-varieties, of which some are of a green and others of a reddish-brown or purplish color; some have the leaves comparatively plain, and others have them very much waved or curled, some also fringed or lacinated. Most of the kinds are biennial, like the cabbage, but some may be reckoned perennial, as the *Milan kale* (*chou de Milan*), and are frequently propagated by cuttings. The kind called *German greens* is one of the most delicate, and is very much cultivated in Britain, chiefly as a winter vegetable. The more the leaves are curled the more it is esteemed. The mode of its cultivation nearly agrees with that of cabbage.

KALE, SEA. See **SEA KALE**.

KALEIDOSCOPE (from Gr. *kalos*, beautiful, *eidos*, image, and *skopeo*, I see), an optical instrument invented by sir David Brewster in 1817. It consists of a tube, through whose length pass two mirrors or reflecting planes, which are hinged together along one edge, and make with each other an angle which is an aliquot part of 180°, whilst the one end is fitted up with an eyeglass, and the other is closed by two glasses, at a small distance from each other, between which are placed little fragments of glass or other variously colored objects. The eye looking into the tube now perceives these objects multiplied as many times as the angle which the reflecting planes make with each other is contained in the whole circumference of a circle, and always symmetrically disposed; and the slightest shaking of the instrument produces new figures. There are various modifications of the kaleidoscope, by some of which its power is much increased; and it is not only a pleasing toy, but of great use to pattern-drawers and others, to whom it supplies endless varieties of figures.

KALENDAR. See **CALENDAR**.

KALENDS. See **CALENDS**.

KALENDS, GREEK. See **GREEK KALENDS**.

KALER'GIS, **DEMETRIUS**, 1803-67; b. Candia; educated at St. Petersburg; distinguished himself in the war of Grecian independence, and was taken prisoner by the Turks. He was very active in the revolution of 1843-45, was general and adjutant of king Otho, and was for some time minister of war. In 1861 he was sent as ambassador to Paris.

KALEWALA. See **FINNISH LITERATURE**.

KALGAN, or **CHANG KIAKAU**, a populous Chinese city, 110 m. from Peking in a north-westerly direction, on the Sangho river, and on the line of the great wall. It comprises both a Tartar and a Chinese quarter, and is strongly fortified. Occupying a position on the high road to Kiachta, in Siberia, it is the seat of a trade which formerly amounted to \$8,000,000 per annum, but which has declined since 1860, owing to the extension of trade privileges to the entire frontier. Pop. about 70,000.

KALGUEF, or **KOLGUEV**, an island of Russia, in the Arctic ocean, 240 m. in circumference; belongs to the government of Archangel, and is situated 115 m. e. of the northern extremity of the peninsula of Kanin. It is the resort of innumerable flocks of wild-fowl, especially eider-ducks, geese, and swans, which are caught in great numbers by the fowlers who visit the island every summer.

KĀLIDĀSA, the greatest dramatist and one of the most celebrated poets of India. He is known to the literary public of Europe especially through his drama *Sākuntala*, which, first introduced to the notice of the western world by sir William Jones (1789), created so great a sensation throughout Europe that the early success obtained by Sanskrit studies in England and Germany may be considered due to this masterpiece of Sanskrit literature. Another drama of the same poet, and next in renown to *Sākuntala*,

is the *Vikramorvas'ī*, or the Hero and the Nymph. Besides these works, Hindu tradition ascribes to his authorship a third drama and several poems, which no European critic will believe could ever have sprung from a mind like that of Kālidāsa. Prof. Lassen, in the *Indische Alterthumskunde*, passes the following judgment on this poet: "Kālidāsa may be considered as the brightest star in the firmament of Hindu artificial poetry. He deserves this praise on account of the mastery with which he wields the language, and on account of the consummate tact with which he imparts to it a more simple or more artificial form, according to the requirements of the subject treated by him, without falling into the artificial diction of later poets, or overstepping the limits of good taste; on account of the variety of his creations, his ingenious conceptions, and his happy choice of subjects; and not less on account of the complete manner in which he attains his poetical ends, the beauty of his narrative, the delicacy of his sentiment, and the fertility of his imagination." Dr. Bhāo Dāji, in a learned and ingenious essay "On the Sanskrit Poet, Kālidāsa" (*Journal of the Bombay Branch of the Royal As. Soc.*, Oct., 1860), has endeavored to identify Vikramāditya, the contemporary of Kālidāsa, with Harsha Vikramāditya, and that the great poet would therefore have lived in the middle of the 6th c. of the Christian era.

KALIHARI DESERT. The Kalihari is a vast central and nearly uninhabited tract of country lying between Great Namaqualand and the Betjuana country, in South Africa, extending from the northern banks of the Gariep or Orange river to the latitude of 21° s., or the verge of the Ngami region, a distance of nearly 600 m., with an average breadth of about 350 m., and presenting some curious physical features quite distinct from other desert regions of the globe. It is a wholly riverless, sandy, but in many places well wooded region on which rain seldom falls, intersected by dry water-courses, with a substratum of a tuffaceous limestone, and to all appearance formerly the bed of an immense lake. Livingstone considers it remarkable for little water and considerable vegetation, and therefore very different from the karroos of the Cape Colony, which have neither water nor vegetation except after heavy rains, and from the bare and sandy deserts of North Africa and Arabia. No mountains or elevations of any considerable height are found in the Kalihari, the general level of which may be considered as 3,000 ft. above the sea. The few springs or "sucking-places" which here and there are found are generally carefully concealed by the Bakillhari, a miserable wandering race of Betjuana Bushmen, who roam through the desert in quest of game, of the skins of which they make the fur robes called "carosses." The Kalihari has been crossed by C. J. Andersson and others, near its outskirts; but of its central parts very little is known. After heavy rains immense herds of elephants, rhinoceroses, and giraffes are found in its dense thickets, and feed on the succulent wild melons called "kengwe" which then abound there. In the n. part are immense forests of thorn-trees. Coal, copper, and gold are found.

KALISCH, DAVID, 1820-72, a German farce and song writer of ability, and founder of the *Kladderadatsch*, a humorous and satirical paper, published in Berlin, since 1848. His plays are very popular in Germany, and a collection of his songs has been published separately under the title *Berliner Leierkasten*.

KALISCH, ISIDOR, Jewish clergyman and lecturer, b. in Prussia Nov. 15, 1816; was educated at Berlin, Breslau, and Prague. In 1849 he came to the U. S., and in 1850 became pastor of a Jewish congregation in Cleveland where he labored in the interest of reformed Judaism. His controversies with Rev. Isaac Leeser are prominent in Jewish literature. He has written many important books.

KALISPELS, or **PENDS D'OREILLES**, a tribe of Indians inhabiting portions of British America, Idaho, Washington, and Montana. The Kalispels appear to have been peculiarly the subject of the characteristic treatment afforded the Indians by the American government, in being forced to submit to breaches of treaty stipulations, and to exasperating changes of habitat under U. S. executive direction. Formerly a wretched race of creatures, illy-fed and half-clad, their condition was essentially improved through the influence of the missions established among them about 1840 by father De Smet. Always peaceable, though brave and aggressive when molested, they became industrious, and cultivated their lands intelligently and with success. But the obligations which were entered into by the U. S. government in the treaty of 1855 were never honestly fulfilled, and the various bands were from time to time removed from their reservations, where they had cultivated lands and raised large numbers of cattle, horses, and hogs, and were driven to less eligible districts, and forced to begin life anew. In Montana there are said to be only 57 members of this tribe; in Washington there are (1890) 200. The tribe receives its name from the valley of Kalispel, e. of the Cascade mountains, where they have some time resided.

KALISZ, a Russian government, or district, in Poland, bordering on Prussia; 4,392 sq. m.; pop. '91, 881,798. Capital, Kalisz.

KALISZ, a t. of Poland, on the Prosna, in the government of the same name, 149 m. w.s.w. of the city of Warsaw. It is one of the oldest Polish towns, and was formerly the capital of a palatinate. Pop. '90, 20,060, who carry on an extensive trade. The adjoining country is the best cultivated in the kingdom. Two famous battles were

fought here—the first between the Poles and Russians and the Swedes in 1706; the other between the Russians and Saxons in 1813.

KALIYUGA, in Hindu chronology, the fourth or last of the periods contained in a mahāyuga or great yuga (q.v.). It may be compared to the iron age of classical mythology. It consists, according to native imagination, of 432,000 solar-sidereal years, and begins 3,101 years before the Christian era. The relation of the four yugas being marked by a successive physical and moral decrement of created beings, the kaliyuga is the worst of all. "In the kri'ta (or first) age," Manu says, "the (genius of) truth and right (in the form of a bull) stands firm on his four feet, nor does any advantage accrue to men from iniquity. But in the following ages, by reason of unjust gains, he is deprived successively of one foot; and even just emoluments, through the prevalence of theft, falsehood, and fraud, are gradually diminished by one foot (i.e., by a fourth part)." The estimate in which this kaliyuga, our present age, is held by the modern Hindus may be gathered from one of their most celebrated Purāṇas, the Padma-Purāṇa. In the last chapter of the Kri'yāyogasāra of this Purāṇa the following account is given of it: "In the kaliyuga (the genus of) right will have but one foot; every one will delight in evil. The four castes will be devoted to wickedness, and deprived of the nourishment which is fit for them. The Brahmans will neglect the Vedas, hanker after presents, be lustful and cruel. They will despise the scriptures, gamble, steal, and desire intercourse with widows. . . . For the sake of a livelihood, some Brahmans will become arrant rogues. . . . The Sūdras will endeavor to lead the life of the Brahmans; and out of friendship people will bear false witness; . . . they will injure the wives of others, and their speech will be that of falsehood. Greedy of the wealth of others, they will entertain a guest according to the behest of the scriptures, but afterwards kill him out of covetousness; they are indeed worthy of hell. The twice-born (i. e., the first three castes) will live upon debts, sell the produce of cows, and even their daughters. In this yuga men will be under the sway of women, and women will be excessively fickle. . . . In the kaliyuga, the earth will bear but little corn; the clouds will shed but little rain, and that, too, out of season. The cows will feed on ordure.

KALKASKA, a co. in s. Michigan, which embraces the head-waters of the Manistee river, the natural outlet to lake Michigan for the pine-timber section; 580 sq.m.; pop. '90, 5160. It is one of the five counties that constitute the Grand Traverse region. It is covered with a dense growth of hard-wood timber, and the soil is productive to a remarkable degree. Its forests, furnishing materials for building purposes, offer strong inducements to the settler. The streams abound in brook trout. Co. seat, Kalkaska.

KALLOCH, ISAAC S., b. Rockland, Me., 1832, was ordained as a Baptist minister, went to Boston at the age of 27 yrs., and became pastor of the Tremont Temple Bapt. society. He attracted large congregations by the plainness and boldness of his language in the pulpit. He resigned, 1857, and established himself as a stock raiser in Lawrence, Kan.; became a zealous lay preacher, 1876, and soon afterward removed to Cal., where he threw himself into politics and was elected mayor of San Francisco by the Workingmen's Party, 1879. During the canvass he was shot and badly wounded by Charles De Young, editor of the *San Francisco Chronicle*, who in turn was shot and killed by Kalloch's son. He d. in 1887.

KALM, PETER, 1715-79; b. in Sweden; educated at the universities of Abo and Upsala; was a botanist of distinction and reputation. He was a friend of Linnæus, who recommended him to the Swedish government, which, in 1748, dispatched him to North America for the purpose of making investigations in natural history. He remained abroad during three years, and on his return to Sweden published an account of his travels, which was translated into English and published in London, 1772. He became professor of botany, at Abo, was a member of the Swedish academy of sciences, and author of a number of scientific works. The genus *kalmia*, a native North America evergreen, was named in honor of Prof. Kalm.

KALMAR, a t. and sea-port on the s.e. coast of Sweden, capital of the province of the same name, is situated on the Kalmar sound, opposite the island of Oland, and about 200 m. s.s.w. of Stockholm. It has a good harbor, a handsome cathedral, and a large and beautiful castle, in which, July 12, 1397, the treaty called the "Union of Kalmar," which settled the succession to the three northern kingdoms upon queen Margaret of Denmark and her heirs forever, was agreed to by the deputies of the three kingdoms. The union, nevertheless, lasted only till the death of Margaret (see DENMARK, *History*). The commerce of the town is considerable, and manufactures of sugar and matches are carried on. Pop. '90, 11,772.

KAL MIA, a genus of plants of the natural order *ericeæ*, consisting of evergreen shrubs, mostly about 2 or 3 ft. high, natives of North America, with red, pink, or white flowers, generally in corymbs. The flowers are very delicate and beautiful, and the corolla is in the shape of a wide and shallow bell. Some of the species are frequent ornaments of gardens in Britain. They delight in a peat-soil. *K. latifolia*, the mountain laurel or calico bush of North America, occupies large tracts on the Alleghany mountains. It grows to the height of 10 ft., and the wood is very hard. It is narcotic and dangerous; the leaves are poisonous to many animals, and the honey of the flowers possesses nox-

ious properties. A decoction of the leaves has been used with advantage in cutaneous diseases.

KAL MUCKS, or, as they call themselves, the Derben-Ueirat (the four relatives), and also designated by the name of Eleutes and Khalimik (apostates), are the most numerous and celebrated of the Mongol nations. They are divided into four tribes, the first of which, the *Khoskôts* (warriors), number nearly 60,000 families, and inhabit the country round the Koko-nur, which they consider the native country of the race. One portion of this tribe migrated to the banks of the Irtsch, and became subsequently incorporated with the second tribe, the Dzûngars; another portion migrated to the banks of the Volga, in the 17th c., and is found at the present day in the government of Astrakhan. The second tribe are the *Dzûngars*, who give the name to a large territory (Dzûngaria) in the w. of Chinese Tartary; at the present day they number about 20,000 families. The third tribe are the *Derbets* or *Tchoros*, who deserted Dzûngaria, and finally, to the number of 15,000 families, removed a few years ago to the plains of the Ili and the Don, where they are being rapidly incorporated with the Don Cossacks. The fourth great tribe of the Kalmucks are the *Torgots*, who, about 1660, separated from the Dzûngars, and settled in the plains of the Volga, whence they were called the *Kalmucks of the Volga*; but finding the Russian rule too severe, the majority returned to Dzûngaria.

No Mongol or Turkish race presents such characteristic traits as the Kalmucks; indeed, they answer exactly to the description given of them by Jornandes 13 centuries ago, when, under the name of Huns, they devastated southern Europe. The Kalmuck is short in stature, with broad shoulders and a large head; has small, black eyes, always appearing to be half shut, and slanting downwards towards the nose, which is flat, with wide nostrils; the hair is black, coarse, and straight, and the complexion deeply swarthy. The Kalmuck is considered to be the original type of the Mongol and Manchû races, and his ugliness is the index of the purity of his descent. They are a nomad, predatory, and warlike race, and pass the greater part of their lives in the saddle. Their usual food is barley-flour soaked with water, and their drink is the "koumiss" (made from fermented mare's milk). Most of the Kalmucks are Buddhists, but a few have adopted Mohammedanism or Christianity. See *ILLUS.*, *ASIA*, vol. I.; *JAKUTS*, *ETC.*, vol. VIII.

KALNOKY, GUSTAV, Count, b. Lettowitz Moravia, 1832. He entered the army when very young, and resigned with the grade of col. to enter the diplomatic service, 1850. He was appointed ambassador to Copenhagen, 1874, and to St. Petersburg, 1880; and was minister of foreign affairs, 1881-95.

KALONG, a name originally Javanese, and belonging to one or more species of frugivorous bats (q.v.) inhabiting Java, but now frequently applied to all the frugivorous bats, the family *pteropidae*, or at least to all the species of the genus *pteropus*. The *pteropidae* are all large bats, and some of them are the largest of all the *cheiroptera*. They are called *roussette* by French naturalists, and often, popularly, flying fox by Europeans in the east. They are found in the East Indies, Japan, Australia, Africa, and South America. There are many species. Their food consists chiefly of soft fruits, as bananas, figs, etc. The Javanese *kalong* (*pteropus Javanicus*) measures about 5½ ft. in expanse of wing. The head and body are more than a foot long. It is gregarious, and during the day great numbers may be seen hanging by their hinder claws, motionless and silent, on the branches of trees which they have selected for their abode. The body is covered with fur of a reddish-brown color. This and the other true *pteropi* have no tail, and a smaller number of vertebræ—24 in all—than any other mammalia. Some of the *pteropidae* have a very short tail. The flesh of some of them is eaten, and one, inhabiting the Moluccas and Isles of Sunda, has been called the eatable *kalong* (*P. edulis*). It is said to be white and delicate. Some of the species are migratory.

KALPA, in Hindu chronology, a day and night of Brahmâ, which, according to some, is a period of 4,320,000,000 solar-sidereal years, or years of mortals, measuring the duration of the world, and as many, the interval of its annihilation. The Bhavishya-Purân'a admits of an infinity of kalpas; other Purânas enumerate thirty. A great kalpa comprises not a day, but a life of Brahmâ.—In Vedic literature kalpa is a Vedânga.

KALPA-SÛTRA is, in Vedic literature, the name of those Sanskrit works which treat of the ceremonial referring to the performance of a Vedic sacrifice. See *VEDA*.—In Jaina literature it is the name of the most sacred religious work of the Jainas. See *JAINAS*. It is chiefly occupied with the legendary history of Mahavira, the last of their 24 deified saints, or Tirthankaras, but contains also an account of other 4 saints of the same class. The name of the author was Bhadra Bâhu, and the work was composed, as Stevenson assumes, in the year 411 of the Christian era; but the conjecture of another writer places it 632 after Christ. It is held in so high respect with the Jainas that "of the 8 days in the middle of the rains which are devoted to the reading of those works esteemed peculiarly sacred, no less than 5 are allotted to the Kalpa-Sûtra." Stevenson, *The Kalpa-Sûtra and Nava Tatva* (Lond. 1848).

KALSOMINE, or **CALCIMINE**, a composition of zinc-white and glue sizing mixed with water, in which, by adding coloring matter, any color desired may be produced.

The process of kalsomining is very difficult, even for skilled painters. It requires great nicety in the preparation of the surface, care in compounding the mixture, and skill in applying it. For ceilings, mix $\frac{1}{2}$ lb. of glue with 15 lbs. zinc; for walls, 1 lb. of glue with 15 lbs. of zinc. Paris white is sometimes used as a substitute for kalsomine.

KALU'GA, a government of Russia, lies immediately s.e. of that of Smolensk. Area, 11,942 sq. m.; pop. '90, 1,242,900. The surface is flat; the soil stony, sandy, and only moderately fertile. Almost half of the province is under forest. It is watered by numerous rivers, the chief of which is the Oka. The principal occupation of the inhabitants is the cultivation of hemp. Industries are rapidly developing, and a considerable trade in iron, paper, leather, glass and chemicals. Colored cloths for the China trade are also made. The government of Kaluga is divided into 11 districts.

KALUGA, chief t. of the government of the same name, is situated on the right bank of the Oka, 149 m. s.w. of Moscow. From the 14th to the 18th c. its stronghold was a great protection against the invasions of the Lithuanians, the Tartars of the great horde, and especially against the Crimean Tartars. Situated in the center of the empire and on a navigable river, it carries on an extensive corn-trade, the corn being sent down the Oka to Nijni-Novgorod, and thence up the Volga, the Volga canals, and the Neva, to St. Petersburg and the Baltic ports. A considerable trade in furs, cottons, and glass has sprung up. There are several leather and other factories in the town. Pop. '89, 40,489. Kaluga has for many years been a place of banishment for political offenders; and used to be the residence of Schamyl, the Circassian chief.

KAMA, a navigable river of European Russia, the principal affluent of the Volga, rises in the government of Viatka, and after a s.w. course of 1100 m., joins the Volga in the government of Kasan, 50 m. above the town of that name. Its chief tributaries are the Viatka, the Tchoussovaia, and the Bielaia. This river is navigable 40 m. below its source, and the navigation commences in the beginning of May. The annual value of the goods conveyed on the Kama is estimated at \$40,000,000. The river abounds in fish, especially salmon.

KĀMA, or KĀMADEVA, the Hindu god of love, and one of the most pleasing creations of Hindu fiction. In Sanskrit poetry, especially that of a later period, he is the favorite theme of descriptions and allusions, and mythology exalts his power so much that it allows even the god Brahmā to succumb to it. According to some Purāṇas he was originally a son of Brahmā; according to others, a son of *Dharma* (the genius of virtue), by *Sraddhā* (the genius of faith), herself a daughter of *Dakṣa*, who was one of the mind-born sons of Brahmā. The god Śiva being on one occasion greatly incensed at Kāma, reduced him to ashes; but ultimately, moved by the affliction of Rati (voluptuousness), the wife of Kāma, he promised her that her husband should be reborn as a son of *Kṛishna*. The god Kṛishna, accordingly, having married Rukmini, she bore him *Pradyumna*, who was the god of love. But when the infant was six days old it was stolen from the lying-in chamber by the terrible demon S'ambara; for the latter foreknew that Pradyumna, if he lived, would be his destroyer. The boy was thrown into the ocean and swallowed by a large fish. Yet he did not die, for that fish was caught by fishermen and delivered to *Māyāvati*, the mistress of S'ambara's household; and when it was cut open the child was taken from it. Whilst *Māyāvati* wondered who this could be, the divine sage, Nārada, satisfied her curiosity, and counseled her to rear tenderly this offspring of Kṛishna. She acted as he advised her; and when Pradyumna grew up, and learned his own history, he slew the demon S'ambara. *Māyāvati*, however, was later apprised by Kṛishna that she was not the wife of S'ambara, as she had fancied herself to be, but that of Pradyumna—in fact, another form of Rati, who was the wife of Kāma in his prior existence.—Kāma is described or represented as holding in his hands a bow made of sugar-cane and strung with bees, besides five arrows, each tipped with the blossom of a flower which is supposed to conquer one of the senses. His standard is, agreeably to the legend above mentioned, a fabulous fish, called Makara; and he rides on a parrot or sparrow—the symbol of voluptuousness. His epithets are numerous, but easily accounted for from the circumstances named, and from the effects of love on the mind and senses. Thus, he is called *Makaradhvajaja*, "the one who has Makara in his banner;" *Mada*, "the maddener," etc. His wife, as before stated, is *Rati*; she is also called *Kāmakalā*, "a portion of Kāma," or *Prīti*, "affection." His daughter is *Trishā*, "thirst or desire," and his son is *Aniruddha*, "the unrestrained."

KAMBALU'. See CAMBA'LUC.

KAMEE'LA, or KAMALA, a violently purgative medicine, said to be a specific against tape worm, prepared from a plant of the order *euphorbiaceæ*, the *rotlera tinctoria*. It grows wild in Abyssinia, Australia, eastern China, southern Arabia, and India. This remedy has long been employed by the British soldiers in Hindustan in cases of *tenia*, and with great success.

KAMEHA' MEHA I., called Nui (the great), 1753-1819; the first king of the Hawaiian islands. On the death of his uncle, Kalanio Ku, king of the island Hawaii in 1781, he became head-chief of the western part. In self-defense he waged war, first with the chiefs of his own island, and then with those of the other islands, which resulted in bringing the whole group under his control, and he became king in 1809. He was a man remarkable for mental energy, physical strength, and a noble carriage, but mild, frank, and generous. He built forts and mounted guns upon them. He had soldiers armed with muskets, and drilled after the fashion of Europe. He created a navy, the keel of the first ship having been laid for him by Vancouver in 1792, and before his death he had 20 ships, some of them copper-bottomed. He appreciated the character of Vancouver, whose frequent visits exerted a good influence upon him. Under his reign some of the chiefs became intelligent, conversed well in English, and assumed many of the habits of civilized life. He encouraged agriculture, commerce, and the mechanic arts. He partially abolished the taboo system and human sacrifices. His reign was remarkable for the prevalence of peace, security, and order. He died only a few months before a Christian mission embarked at Boston for the islands. He left two sons and one daughter, his eldest son, Liholiho, by his wife Keopuolani, succeeding him. See *illus.*, *SANDWICH ISLANDS*, vol. XIII.

KAMEHA' MEHA II., called LIHOLIHO IOLANI, second king of the Hawaiian islands, 1797-1825. Kaahumanu, the favorite wife of his father, was his premier, and shared with him the government until her death. He completely abolished taboo and idolatry, and the missionaries, on reaching the islands, received the astounding intelligence that the gods had been burned and the whole system of idolatry destroyed. The king permitted the missionaries who arrived in 1820 to remain at Kailua, and assigned a house belonging to the late king for their temporary residence. In Nov., 1823, he embarked for England and the United States, accompanied by his wife Kamamalu and two chiefs, leaving the government in the hands of Kalaimoku and Kaahumanu, and naming his brother Kauikeaouli as his successor if he should not return. They were well received by the British government, but the king and queen both died without having seen George IV. or his ministers of state. Their remains were taken to the islands in an English frigate. Though of intemperate habits, Liholiho declared his belief in Christianity, attended public worship, and recommended the same to his people. He was a diligent student, decided, and enterprising in character. He was succeeded by his brother Kauikeaouli as Kamehameha III.

KAMEHA' MEHA, III., called KAUIKEAOULI, third king of the Hawaiian islands, 1814-1854. He did not fully assume the royal power until 1833, the kingdom being under the regency of Kaahumanu, the queen dowager of Kamehameha I., and Kalaimoku, and on the death of Kaahumanu, in 1832, Kena'u, the daughter of Kamehameha I., became regent, and afterwards premier of Kamehameha III. In his youth Kamehameha was dissipated, but through the influence of the missionaries under whose instruction he was placed when nine years of age, he became a wise and useful man. Though not always temperate he had excellent points of character, and was beloved by his people. Previous to 1838 the government was a despotism; but in 1840 he gave his people a written constitution, recognizing the three grand divisions of king, legislature, and judges; and under his reign the Christian religion became the established national religion of the Hawaiian islands. Great Britain, France, and the United States acknowledged the independence of his government, and treaties were made with these and other powers. Education, agriculture, and commerce in his reign were prosperous. He was greatly harassed by the efforts of foreign seamen, led by European and American officers, to violate the laws, and of English and French officers to introduce French Roman Catholic priests into the islands. He was called Kamehameha the good.

KAMEHA' MEHA IV., called ALEXANDER LIHOLIHO, fourth king of the Hawaiian islands, 1834-1863; b. Honolulu; the nephew and adopted son of Kamehameha III., who appointed him his heir and successor under the name of Alexander Liholiho. With his brother Lot Kamehameha he visited, in 1850, England, France, and the United States, and in 1854, soon after his return, he ascended the throne. In 1856 he married Emma, the daughter of a native chief and an English woman, and the adopted daughter of Dr. Rooke, an English physician. Excessive grief for the loss of his infant son shortened his days. He was a man of talents, better educated than his predecessors, of prepossessing manners, and loved by the people. He was much interested in the progress of the Reformed Catholic mission, and by his personal solicitation of subscriptions was instrumental in the establishment in 1860 of the Queen's hospital in Honolulu. He translated the Book of Common Prayer into Hawaiian.

KAMEHA' MEHA V., called LOT, fifth king of the Hawaiian islands, brother of Kamehameha IV., and called Lot Kamehameha, 1830-72. He was dissipated in his youth, but reformed before he became king. Like his brother, he was educated and accomplished, and, having acquired experience as minister of the interior and commander of the forces, he was well qualified to administer the government. He refused to take the oath to the constitution of Kamehameha III., considering it too democratic, and proclaimed one more absolute, which, after violent opposition, was accepted. He was a man of strong

will and great courage, but superstitious. Dying unmarried, the direct line of the Kamehamehas ended with him. He named no successor, and Prince Lunailo, a chief of a high family, was appointed king.

KAMEKE. GEORGE ARNOLD CARL VON, b. Prussia, 1817; entered the army in 1834, and in 1850 was promoted to captain. He was sent to Vienna in 1856 as attaché to the Prussian embassy, and remained there two years. In 1858 he was appointed chief of the engineering department, with the rank of lieutenant-col. He was placed in command of a regiment of infantry in 1861, and rose to the position of major-general, and chief of staff, leading the 2d army corps in the war with Austria in 1866. His services were rewarded by a decoration, and in 1867 he was promoted to the office of inspector-general and in the following year to lieutenant-general. On Aug. 6, 1870, during the Franco-Prussian war, he made the direct attack on Saarbrücken in command of the 4th division (part of the 7th army corps), leading the assault in person. By him, also, the movement was undertaken that resulted in the capture of the heights of Spichern; he was summoned from the frontier to Paris, Jan., 1871, and given charge of the engineering operations of the siege. After peace was declared he returned to his former position of inspector-general, and was minister of war in 1873-83. He d. in 1893.

KAMENZ. See CAMENZ.

KAMI, or HAPPY SPIRITS, are in Japanese mythology certain spirits or divinities who founded the first terrestrial dynasty. The Japanese believe that the spirits of human beings survive the body, and receive reward or punishment according to the conduct of this life. If a man's life has been distinguished for piety, patriotism, or good works, they deify him after death as a *Kami*, and thus the number of these deities is indefinite. Some of them preside over the elements and powers of nature. The worship of these demigods or Kami is called *Kami-no-mitsi*, or *the way of the Kami*. They have chapels in all parts of the empire called *mias*, which are always built in picturesque localities, generally among groves of trees, usually upon a hill, natural or artificial, with a massive stone stairway leading to the top. These mias were originally commemorative chapels, erected in honor of Japanese heroes. The prince of the province where the hero was born, or had performed his deeds, had the charge of keeping the chapel in repair; there was no priest to officiate, and no privileged class interposed between the worshiper and the being worshipped.

KAMINETZ-PODOLSK, or PODOLSK, a t. of w. Russia, capital of the government of Podolia, is picturesquely situated near the Austrian frontier, on the hilly banks of the Pakhra, an affluent of the Dniester. Its foundation dates from the earliest times. Pop. '91, 10,919. The most noteworthy buildings are the Gothic cathedral and the Dominican church. The fortifications, which were razed in 1812, have been renewed. Kaminitz-Podolsk was, before the partition of Poland, the strongest bulwark of that country against the Turks.

KAMOURS'KA, a co. in Quebec province, Canada, on the St. Lawrence river, whence it extends to the state of Maine, the range of mountains which form the source of the river De Loup and the Androscoggin being a part of its eastern boundary; 1017 sq. m.; pop. '94, 20,454, chiefly of French descent. Its surface is much broken. It is traversed by the St. Francis, Kamourasca, and Walloostook rivers, and by a division of the Grand Trunk railway. The principal products are oats, rye, barley, wheat, and potatoes. Co. seat, Kamouraska.

KAMPEN, one of the prettiest towns of the Netherlands, in the province of Overijssel, is situated near the mouth of the Ijssel, in the Zuyder Zee. To render the port accessible, it has had to be prolonged by means of jetties from both banks of the river for nearly 2 miles into the Zuyder Zee. Pop. commune, 1,900.

KAMPEN, NIKOLAAS GODFRIED VAN, 1776-1839; b. in Holland; obtained his first literary impressions in a bookstore in which he worked as an apprentice. He studied languages and taught German, and at the age of 30 was professor of the Dutch language, literature and history in the university of Leyden. He also edited the *Leyden Gazette*, and wrote voluminously on many subjects. In 1831 he published *Geschiedenis der Nederlanden buiten Europa*.

KÄMPFER, or KÄMPFER, ENGELBRECHT, 1651-1716; b. Germany; was a medical student at Königsberg, and visited Persia as secretary to the Swedish ambassador. Having received an appointment as surgeon to the Dutch East India company, in its naval service, he accompanied the fleet, to which he was appointed, to the East Indies and Japan. He returned to Europe in 1693, and devoted himself to the preparation of his voluminous notes for a comprehensive history and description of the empire of Japan and the kingdom of Siam. It is a curious fact in literary history that this important work was never published in Dutch, and that from the first edition, published in London in 1727, were made the existing French and German translations.

KAMPTU LICCN, the name given to a kind of floor-cloth, which is said to be made of india rubber and cork; much of it, however, consists of oxidized linseed oil and cork. The cork is reduced to a state resembling very fine sawdust, and kneaded up with the

real caoutchouc, or with the artificial kind made of oxidized linseed oil, the whole being kept very soft by heat. The mass is then made into sheets by passing through cylinder rollers heated with steam. The sheets, when cold, are ready for use, when no ornamental surface is required; but very excellent designs may be painted upon it, the same as upon ordinary floor-cloth. Kamptulicon, notwithstanding the ease with which it is made, is more expensive than the floor-cloth made by painting hempen or linen fabrics; it has however, qualities which render it very valuable for special purposes; its elasticity to the tread not only makes it agreeable to walk on, but it is noiseless, and is consequently well adapted for hospital passages and other positions in which quiet is desirable; it is also impervious to damp, and thereby well suited to damp stone floors. See LINOLEUM.

KAMPTZ, KARL ALBERT CHRISTOPH HEINRICH VON, 1769-1849; b. Germany; studied law at Göttingen, and rose to a high judicial position. For 12 years he was minister of justice of the kingdom of Prussia. He incurred the animosity of the students and of the more liberal Germans engaged in the political movements of the time, and his important work, the *Codex der Gendarmerie*, was publicly burned by the students of Wartburg.

KAMTCHATKA, PENINSULA OF, forms the s.e. extremity of Siberia, from which it stretches southward, extending in lat. between 51° and 62° n., and in long. between 156° 40' and 162° e. It is 725 m. long, and averages 190 m. in breadth. A chain of volcanic mountains traverses the center of the peninsula, and gives rise to the rivers, of which the Kamtchatka is 150 m. in length. There are about 14 volcanoes in the peninsula, the most remarkable of which—the volcano of Klyuchevskaya—is 15,762 ft. high. This mountain now only emits smoke and embers; but in former times eruptions used to take place every seven or eight years. The soil, in general, is stony; but there are many tracts of mountain-slope which are arable. Agriculture, however, is much hindered by untimely frosts, periodical rains, and sometimes by multitudes of mice and rats. The bread required by the inhabitants of the fortresses of Petropavlovsk and Tagil is supplied from Okhotsk. The principal occupations of the inhabitants are fishing and hunting. The most valuable domestic animal is a peculiar kind of dog which never barks. Kamtchatka was annexed to Russia at the end of the 17th c., after the expedition of the Cossack chief Atlasof. Pop. about 7,500, made up of Kamtchadales, Kourdetri, Omototzi, and Russians. The Kamtchadales—the preponderating race of the inhabitants—live mostly in the south. They are small in stature, with a large head, broad face, black hair, small eyes, broad shoulders, and hanging lips and stomach. Formerly they lived in tents made of branches; they now dwell in huts. They have nominally embraced Christianity, but retain much of their savage nature and superstitions. Nijni-Kamtchatsk, the chief town of the government, is situated on the river Kamtchatka. The fort of Petropavlovsk, with a fine harbor covered with ice only during a brief period of the year, is most picturesquely situated, and enjoys a healthful climate. For type of people, see illus., ASIA, vol. I.

KAMYSHIN, a t. of Russia, in the government of Saratov, terminus of railway to Tambov and Baltic ports, on the right bank of the Volga; lat. 50° 5' n. long. 45° 25' e. It possessed, '89, 15,015 inhabitants, who carry on a considerable trade in corn.

KANABEC, a co. in e. Minnesota; 522 sq. m.; pop. '90, 1579. The largest portion of the surface is covered with forests of sugar-maple, pine, etc. The soil produces wheat, oats, and grass. It is drained by the Grindstone and Knife rivers. Co. seat, Mora.

KANADA, also called Kâsyapa, a celebrated Hindoo sage, the founder of the atomistic philosophy.

KANAGA'WA, a t. of Japan, on the railway of Yedo. It is situated on the northern edge of a bight on the western side of the great bay of Yedo, and about 16 miles from that city. Here, in 1854, the treaty between the United States and Japan was consummated; and here was located for a time the official section of the foreign community which, through the manœuvres of the Japanese, has been established, not at Kanagawa, but at Yokohama, on the opposite point of the bay. Kanagawa formerly had a larger foreign trade than any other port of Japan; but owing to the rise of Yokohama, it has declined in importance and population. The chief imports are cotton and woolen goods; the chief exports, silk and tea. In 1872 Kanagawa was first lighted with gas. Pop. '87, 11,897. See YOKOHAMA.

KANARIS, KONSTANTIN, a native of the isle of Ipsara, distinguished for his exploits in the Grecian war of independence, and particularly for the destruction of Turkish vessels by fire-ships. He was master of a small merchant-vessel before the commencement of the war. In 1822 he blew up the Turkish admiral's ship in the strait of Chios, and thus avenged the cruelties which the Turks had perpetrated on the Greeks in that island. In Nov. of the same year he burned the Turkish admiral's ship in the harbor of Tenedos. His native isle of Ipsara having been ravaged, he took revenge, Aug. 17, 1824, by burning a large Turkish frigate and some transport-ships which were carrying troops to Samos, and thereby saved Samos from the calamity which Chios and Ipsara had endured. In 1825 he formed the bold design of burning the Egyptian fleet in the harbor of Alexandria, where it lay ready to carry troops to the Peloponnesus, and it

appears that only an unfavorable wind springing up prevented his success. He was appointed to important commands by the Greek president, Capo D'Istrias, and in 1848 and 1849 was war minister of Greece, and president of the cabinet. He took part in the revolution of 1862, and held office repeatedly under the new king. He died Sept. 14, 1877.

KANAWHA, a co. in West Virginia, formed in 1789 of two counties, Greenbrier and Montgomery; pop. in '90, 42,756, including colored; area, 825 sq. m.; co. seat, Charleston, which is also the capital of the state, 308 m. w. of Richmond. The uplands, and the banks of the Kanawha river (Kanawha, in the Indian dialect, signifying *the river of the woods*), are covered with a dense growth of timber. Fine sandstone is found in extensive ledges, and inexhaustible beds of bituminous coal. Salt is an important article of export; and the water is obtained by boring at a depth of from 300 to 500 ft. below the bed of the Kanawha river. The brine invariably rises to a level with the river. The Elk, Coal, and Pocatalico rivers water wide sections of the county, and the Chesapeake and Ohio railroads cross it. Tobacco is one of the chief staples; other products are: corn, wool, oats, pork, and sweet potatoes. The manufactures include saddlery and harness, woolen goods, cooperage, flour, and lumber.

KANAWHA, GREAT. See GREAT KANAWHA.

KANDAHAR'. See CANDAHAR.

KANDAVU, one of the Fiji Islands (q.v.).

KANDIYO'HI, a co. a little w. of the centre of Minnesota, about 860 sq. m.; pop. '90, 13,997. It has an undulating surface, diversified by forests of oak, elm, etc., and with many small lakes. The soil is of an excellent quality, producing wheat, oats, grass, etc. Co. seat, Willmar.

KANDLER, JOHANN JOACHIM, a German modeler in porcelain, who worked at Meissen. He died in 1776.

KANDY, or **CANDY**, an important t. in Ceylon (q.v.), 7° 20' n. lat., 80° 50' e. long.; pop. '91, 20,400. It was formerly the capital of the king of Kandy's dominions, and the palace of the kings, though now much dilapidated, covers a considerable space, and was formerly a building of great magnificence. The ruined temple and tombs of the kings are objects of much interest to travelers. Kandy is 58 m. from the town of Colombo, and is situated in the midst of a number of steep hills, whose lofty summits are covered with jungle and very unhealthful. The houses are of mud and thatched, excepting those of the chiefs, which are tiled and whitewashed. Three miles away are the botanic gardens of Peradeniya.

KANE, a co. in n.e. Illinois; 540 sq. m.; pop. '90, 65,061. It has an undulating surface and a fertile soil. A considerable portion of the county is prairie. It is intersected by the Chicago and Northwestern, and the Chicago, Burlington and Quincy railroads. Its staple productions are wheat, corn, oats, hay, flax, butter, and pork. It contains the cities of Aurora and Elgin. Co. seat, Geneva.

KANE, a co. in s. Utah, bordering upon Arizona; bounded on the east by the Colorado, 4172 sq. m.; pop. '90, 1685. A considerable portion of its surface is mountainous. The soil produces wheat, corn, and pasturage for sheep. Co. seat, Kanab.

KANE, ELISHA KENT, M.D., a celebrated Arctic explorer, was b. in Philadelphia, United States, Feb. 3, 1820; entered Virginia university in 1836, afterwards studied medicine, and entered the navy as a surgeon, in which capacity he visited China, India, the East Indies, and, under leave of absence, Arabia, Egypt, Greece, and Western Europe. Soon after returning home he was ordered to the w. coast of Africa in May, 1846, but being attacked by fever, was compelled to return in the following April. He was then transferred to the military staff, and served in Mexico. In May, 1850, he commenced his career of Arctic discovery as surgeon, naturalist, and historian to the first Grinnell expedition. In the spring of 1853 he was again sent out, this time as commander of a second Grinnell expedition, in which he achieved important results. These results are fully detailed in his *Second Grinnell Expedition in Search of Sir John Franklin* (2 vols. Philadelphia, 1856). On his return in the autumn of 1855, honors rained upon the fortunate adventurer; he received gold medals from the queen of Great Britain, the royal geographical society of London, the American congress, and the New York legislature; but his health, which had been precarious since 1844, was rapidly failing, and after a visit to London, where he grew rapidly worse, he sailed to Havana, where he died Feb. 16, 1857. His life has been written by W. Elder, M.D. (8vo, Philadelphia, 1857).

KANE, Sir ROBERT, M.D., a celebrated chemist, was b. in Dublin in 1810. He was educated for the medical profession, and in 1832 was received as a member of the royal Irish academy, and in the same year projected the *Dublin Journal of Medical Science*, which at first treated only of chemical and pharmaceutical subjects. In 1840 he received the gold medal of the royal society of London for his researches into the coloring matter

of lichens. From 1844 till 1847 Kane was professor of natural philosophy to the royal Dublin society, and in the last-mentioned year received the Cunningham gold medal of the royal Irish academy for his discoveries in chemistry. In 1846, he originated the museum of industry in Ireland, was appointed its first director, and the same year received from the lord-lieutenant the honor of knighthood. He held for a number of years the office of president of the queen's college, Cork, which he resigned in 1864. His important works are: *Elements of Chemistry* (1841-42, 1849), a work of widely acknowledged merit; *Industrial Resources of Ireland* (1844), being the substance of a lecture delivered in the previous year, and published at the expense of the royal society of Dublin. He d. 1890.

KANGAROO, *Macropus*, a genus of marsupial quadrupeds, of which there are many species, almost all Australian, although a few are found in New Guinea and neighboring islands. The genus, which some naturalists subdivide, is the type of a family of *macropidae*, including also the kangaroo-rats or potoroos (q.v.), which have canine teeth in the upper jaw, whilst the kangaroos have no canine teeth, and in their dentition generally, and in their digestive system, make a nearer approach than any other marsupial quadrupeds to the ruminants; the potoroos, on the other hand, approaching the rodent type. Kangaroos are said sometimes to ruminant. The stomach of kangaroos is large, and is formed of two elongated sacs. They are entirely herbivorous. The *macropidae* are all characterized by great length of the hind legs, whilst the fore legs are small; but the radius allows a complete rotation of the fore-arm, and they make use of the fore feet as organs of prehension, and for many purposes, with great adroitness. The fore feet have five toes, each armed with a strong curved nail; the hind feet have four toes—one very large central toe, with a very large solid nail. The hind feet are very long, through an extraordinary elongation of the metatarsal bones. The tail is very long, thick, strong, and tapering, and is of great use in balancing the animal in its leaps, and also for sustaining the body in its ordinary erect sitting posture, in which it uses the hind legs and the root of the tail as a tripod. In this posture, also, it usually walks by the hind legs alone. The head is in form somewhat like that of a deer; the ears moderately large, and oval; the eyes large and the aspect mild.

The GREAT KANGAROO, *M. giganteus*, is generally about 7½ ft. in length from the nose to the tip of the tail, the tail being rather more than 3 ft. in length, and fully a foot in circumference at the base. The height of the animal is rather more than 50 in. in the erect sitting posture already mentioned, but it sometimes raises itself on its toes to look around it, and its height is then greater than that of a man. The WOOLLY KANGAROO or RED KANGAROO, *M. laniger*, rather exceeds it in size. The great kangaroo was first discovered in Cook's first voyage, June 22, 1770, and until that time it may almost be said that kangaroos were unknown to Europeans, although a New Guinea species (*M. Brunii*) had been described by Le Brun in 1711. It is of a grayish-brown color, the fur moderately long and moderately soft. It is found in many parts of Australia and in Van Diemen's land. It sometimes attains the weight of 160 lbs., or upwards. Its flesh is highly esteemed, and it is much sought after by the colonists, so that it is now rare in regions where it was once abundant. It is not properly gregarious. The kangaroos are all timid animals, making their escape from their pursuers by extraordinary leaps. The great kangaroo often proves too swift for grey-hounds. When driven to bay it sometimes kills a dog by a single stroke of its hind leg, the great nail ripping him open at once. Some of the kangaroos inhabit open plains, some are more generally found in forests, some are frequent on the snowy summits of the highest Australian mountains. They are of very various size; some are not much larger than a rabbit. They are easily tamed; some species have been brought to America, and have bred in zoological collections, but have not yet been properly naturalized.

The exceedingly immature state in which young kangaroos are born, and the manner in which they are nourished, fail to be noticed in the article MARSUPIALIA. Ere they finally desert the pouch of the mother, the young may be seen poking their heads out of it and nibbling the herbage among which she moves. See illus., MARSUPIALIA, vol. IX.

KANGAROO APPLE, a species of *Solanum* (q.v.), (*S. laciniatum*), with a somewhat shrubby succulent stem, smooth pinnatifid or entire leaves and lateral racemes of flowers; a native of Peru, New Zealand, Australia, and Tasmania, in which latter countries its fruit is called kangaroo apple, and is used as food. When unripe, it is acrid, and produces a burning sensation in the throat;

KANGAROO GRASS, *Anthistiria australis*, the most esteemed fodder-grass of Australia. It grows to a height much above that of the fodder-grasses of Britain, affords abundant herbage, and is much relished by cattle. The genus is allied to *Andropogon*, and has clusters of flowers with an involucre. The awns are very long and twisted, both in the kangaroo grass and in a nearly allied species, *A. ciliata*, which is one of the most esteemed fodder-grasses of India.

KANGAROO ISLAND, in south Australia, at the mouth of the gulf of St. Vincent, in lat. 36° s., long. 137° e. Its length from e. to w. is 95 m., and its width generally about 25 m.; 1970 sq. miles. The surface is extensively covered with brushwood, with a

few trees. It has numerous salt lakes. It received its name from the number of kangaroos found there by its discoverer, capt. Flinders.

KANGHOA, or **KANG-WA**, Japanese **KOKWA**, a well-wooded, rocky, and mountainous island off the western coast of Corea, between n. lat. 37° and 38°, and long. e. from Greenwich, 126° and 127°. It is about 20 m. long, and 9 or 10 wide, of an elongated oval shape, having an area of 160 sq. miles. The soil is very fertile, producing rice, tobacco, sorghum, maize, barley, beans, cabbage, chestnuts, etc. This island is scoured on its eastern side by the cold, rapid, and turbulent current of the Han river, the largest in Corea, whose sources are in the high mountains along the e. coast. The city of Kanghoa, with a pop. of about 12,000, in the eastern center of the island, has from ancient times been the refuge of the royal family during foreign invasion or civil war. During the Mongol invasion it was the national capital. Chinese pirates have greatly troubled the inhabitants for centuries. In Oct., 1866, the French naval expedition, under admiral Roze, made rendezvous off the island, and attacked Kanghoa city in force, in revenge for the murder of nine French Jesuit missionaries in Seoul a few months before. The fortifications, consisting mainly of a crenellated wall 15 ft. high, defended by arrows, jingols, and matchlocks, were stormed by scaling parties, the gates broken in with axes, and the place captured after some slaughter. About 80 bronze and iron cannon of small caliber, 6,000 matchlocks, the official archives of the city, large food-supplies, \$32,000 worth of silver, and a valuable library of books were captured; besides large quantities of miscellaneous war material. Flushed by success, a party of 160 marines attempted to capture a fortified monastery a few miles s. of the city, which had been garrisoned by a regiment of native tiger-hunters. Upon the first assault nearly one-fourth of their number were disabled, and a retreat was ordered. The next morning, after one week's stay in Corea, the admiral suddenly gave orders to evacuate the island. The French government did not approve of the expedition, and Bellonet, the French minister who had ordered it, was recalled. The effect of this ill-planned raid was disastrous all over the east, French prestige suffered greatly, and the massacre at Tientsin followed, June 2, 1870. This frightful event was believed to have gained its first impetus from the unfortunate issue of admiral Roze's campaign in Corea. The American expedition sent in 1871 to make a treaty with Corea if possible, and inquire into the affair of the *General Sherman* (see **PING YANG**), arrived off Boiséé (Woody) island May 30. On June 1 the *Palos* and *Monocacy*, with four steam-launches, were dispatched up the river, and while turning a rocky point were fired on by the Coreans. Only one of the Americans was hurt, and the forts were shelled and silenced at once. Eight days later an expedition of chastisement was dispatched against the forts on the Kanghoa side of the river. The force consisted of 759 men, 2 extra-armed gun-boats, and 4 steam-launches. After forty-eight hours' absence from the anchorage, eighteen of which were spent on land, during which five forts were attacked and captured, the Americans returned victorious, having lost three men killed and ten wounded, among the former lieut. McKee, who, like his father in Mexico, lost his life as he entered a fort leading his men. Fifty flags, 481 cannon, and many trophies were captured and the forts dismantled. About 400 Coreans lost their lives. The forts were on the rocky promontories jutting into the river, whose violent current made naval maneuvers extremely difficult. The whole fleet, under rear-admiral John Rodgers, with minister A. A. Low, then returned to Chifu (see report of the U. S. secretary of the navy, 1871). On Sept. 19, 1875, the Japanese gun-boat, *Unyo-kan*, while on her way to Newchang, China, stopped at Kokwa or Kang-hoa island to procure water. Her men were fired on by the Corean garrison, who evidently mistook the Japanese mariners for French or Americans. The Japanese, on the 20th, attacked the fort (Yeso), and without loss to themselves killed 24 of the garrison and took the fort. This event led to the treaty expedition sent later, under Kuroda, by which the two nations have entered into commercial relations.

KANGRAH, an extensive hill fort in the northern part of the Punjab, s.w. of the Himalaya mountains, between the Beyah and the Rauvy rivers. The fortress was taken by Mahmoud of Ghizni, who carried off immense riches; retaken by the rajah of Delhi in 1043, and subsequently, after a long siege, by the emperor Akbar. At the beginning of the present century it belonged to Sansa Chand, who surrendered it to Runjeet Singh. When the English obtained possession of the Punjab the country in the vicinity of Kangrah was chosen for the cultivation of the tea-tree, and there is now an extensive plantation at the base of the Chamba range of hills.

KANIZSA, the name of two towns in Hungary.—Nagy (or Gross) Kanizsa, a market t., and once an important fortress, in the co. of Zala, 120 m. s. of Vienna, with which it is connected by railway. It has several churches, a monastery, town-house, etc. There is a considerable trade in cattle. Pop. '90, 20,619.—Kanizsa Magyar, a market t. in the dist. Zenta, in a fertile district on the Theiss, 15 m. s.s.e. of Szegedin. It has several churches, a synagogue, high school, etc., and a trade in corn and cattle. Pop. '90, 15,494.

KANKA'KEE, a co. in n.e. Illinois, on the Indiana border, and drained by the Kankakee and Iroquois rivers; nearly 680 sq. m.; pop. '90, 28,732. The land is chiefly prairie, interspersed here and there with swamps. It is mainly an agricultural county,

its chief productions being wheat, corn, oats, potatoes, flax, butter, and cheese. Several important railroads pass through it. Co. seat, Kankakee.

KANKAKEE, city and co. seat of Kankakee co., Ill.; on the Kankakee river and the Cleveland, Cincinnati, Chicago and St. Louis, the Illinois Central, and the Indiana, Illinois and Iowa railroads; 56 m. s.w. of Chicago. It contains the Eastern Illinois hospital for the insane, emergency hospital, public library, ladies' library, gas and electric light and electric railroad plants, waterworks supplied from the river, national and private banks, and several churches and newspapers. It is an important trading point for farmers. Pop. '90, 9,025.

KANO, a great manufacturing and mercantile t. and capital of a province of the same name, in the state of Houssa, Central Africa, stands in lat. 12° 2' n. and long. 8° 20' e. The province is estimated to contain 300,000 inhabitants, and from its beauty and wealth has been called the "Garden of Central Africa." The wall which surrounds the town of Kano is 18 m. in circuit. The houses are built of clay, covered for the most part with conical thatched roofs. It is the first town of industrial importance in the Soudan north of the equator and has manufactures of tissues, sandals and leather. Thousands of slaves are exported from here. The pop. is about 35,000.

KANOGE, or **KANOUG**, a t. and district of Hindustan, in the province of Furruckabad. The district lies along the e. side of the Ganges, and has generally a sandy soil, but well cultivated. The town is 2 m. from the Ganges, with which it is connected by a canal. It is of great antiquity, and when taken by Mahmood of Ghizni was one of the most wealthy and populous cities of India. It was the capital of Hindustan at the time of the Mohammedan invasion, when, in 1018, it was captured, but not permanently held by Mahmood. There is now but one street, and there are no important buildings. The adjacent plain is covered with ruined temples and tombs, and broken images under the trees. Among the ruins are found curious remains of antiquity, such as coins inscribed with Sanskrit characters, sometimes with the image of a Hindu deity. The distance of Kanoge from Agra is 110 m.; from Lucknow, 75 m.; from Delhi, 214 m.

KANSAS, the most central state of the union, and the 21st in order of admission; in lat. 37° to 40° n.; long. 94° 40' to 102° w.; bounded on the n. by Nebraska; on the n.e. and e. by Missouri; on the s. by Indian and Oklahoma Territories; on the w. by Colorado; length from e. to w. 410 m.; breadth n. to s. 200 m.; total area, 82,080 sq. m., or 52,531,200 acres; land area, 81,700 sq. m.

HISTORY.—K. was a part of the territory of Louisiana ceded by France to the U. S. in 1803, and originally was bounded on the n. and s. by the 40th and 37th parallels, and on the e. and w. by Missouri and the summit of the Rocky mountains. It is believed that it was visited in 1541 by an army of Spaniards and Indians under Vasquez de Coronado. In 1719 it was partly explored by Frenchmen from Louisiana, and in 1819–20 by a party under Maj. Long of the U. S. army. By the Missouri compromise (q.v.) of 1820, slavery, except in the state of Missouri, was forever prohibited in states n. of lat. 36° 30'.

In 1854, when it was proposed to organize the territories of K. and Nebraska, the supporters of slavery incorporated in the act of organization a proviso declaring that the prohibition of 1820 was "inoperative and void," thus proposing to remove the barrier to the extension of slavery which had been created by congress 34 years previously, and to the maintenance of which, during all that period, both the northern and southern portions of the union had held themselves to be "forever" bound. The plea by which it was sought to justify this act was that "the compromises of 1850," so called, which had been adopted by congress as a "final settlement" of all the differences respecting slavery which then existed, operated as a "virtual" repeal of the Missouri restriction. Before the bill was passed by congress (May, 1854) emigrants from Missouri and Arkansas and from northern states entered K., and the struggle for its possession began. On June 10 a pro-slavery convention announced that slavery already existed in the territory. This stimulated the opponents of slavery, and colonies sent out by the Massachusetts emigrant aid society came in from New England, founding Lawrence (Aug.), Topeka, Ossawatimie, and other towns. On Nov. 29, at an election held for the choice of a territorial delegate to congress, armed bodies of men from Missouri took possession of the polls, and of the 2843 votes cast, 1729 were proved to be illegal. On Mar. 30, 1855, an attempt was made to elect a territorial legislature, and again the polls were taken possession of by armed bodies of men from Missouri, who elected pro-slavery delegates from every district, casting 4908 votes in a total of 6307. Gov. Reeder set aside the returns from six of the districts, and ordered new elections therein, which resulted in the choice of free state delegates, except in Leavenworth, where the Missourians again interfered. The first territorial legislature assembled at Pawnee, July 2, 1855. The pro-slavery party gained a majority in this body, and expelled the members who had been chosen at the second election ordered by the governor. The statutes of Missouri were adopted in the main. Acts were passed making it a capital offense to assist slaves in escaping either to or from the territory, and felony to circulate antislavery publications or to deny the right to hold slaves; also requiring all voters to swear to support the fugitive slave law. A convention met at Topeka, Oct. 23–Nov. 11, located the capital at that place, adopted the boundaries of the Kansas-Nebraska bill, and adopted

County Towns ☉ Railroads

STRUTHERS & CO., ENGRS, N.Y.

a constitution prohibiting slavery after July 4, 1857, but excluding negroes from the state. An election was held Dec. 15, and the constitution was accepted. The pro-slavery party, however, abstained from participation. An election for state officers and a legislature under this constitution was held Jan. 15, 1856, and Charles S. Robinson was chosen governor. The contest between the political parties increased in violence; the free-state leaders were indicted for treason; Gov. Robinson was imprisoned, and on May 21, Lawrence, the headquarters of the antislavery party, was pillaged by a force of Missourians and others. The unjustifiable murder of 5 men by a party led by John Brown, who had come to K. in 1855, was one of the events of that year. The friends of the northern and southern parties continued to aid them by sending money and arms, but emigrants from the north were either driven away or disarmed on reaching the border. On July 4, 1856, the free state legislature met at Topeka, but was dispersed by U. S. troops. On Sept. 7, 1857, a pro-slavery convention adopted the Lecompton constitution (q.v.), and its adoption "with slavery" or "with no slavery" was submitted to the electors, Dec. 21. The constitution was accepted by the pro-slavery party, the free-state men declining to vote, but when again submitted to the people, Jan. 4, 1858, was rejected, and again, Aug. 3, at an election ordered by congress. In 1859, July 5, a constitutional convention met at Wyandotte, and by a vote of 34 to 13 adopted a constitution prohibiting slavery. This was ratified, Oct. 4, by a vote of 10,421 to 5530. On Nov. 8 delegates to congress and members of the territorial legislature were chosen, and on Jan. 29, 1861, K. was admitted to the union. In 1860-61 a continued drought occasioned much suffering. During the civil war eastern K. was exposed to frequent invasions by confederate raiders from Missouri and Arkansas, and on Aug. 23, 1863, Lawrence was burned by guerillas under Col. Quantrell, and 183 persons were killed. The troops furnished to the union army numbered 20,151-2080 col'd. Between 1864 and 1870 massacres by the Indians occurred in several localities, and in 1874 locusts devoured the crops. In 1878-79 a widespread excitement and dissatisfaction among the colored people of the south led to the emigration into K. of 40,000 of their number.

TOPOGRAPHY.—The surface of K. is undulating, with a gentle slope toward the e., where there is a succession of fertile prairies, rich valleys, and grass-covered hills. In the n.w. the altitude above the sea is more than 4000 ft., while it is less than 1000 ft. near the Missouri river. The river bottoms vary in width from one quarter of a mile to 10 m. Back from the bottom-lands are bluffs varying in height from 50 to 300 ft. The state is abundantly watered, the streams generally running e. On the northeastern border the Missouri presents a water front of nearly 150 m. The K. river, formed by the union of the Republican and Smoky Hill Rivers, in Geary co., flows eastward 150 m., and empties into the Missouri near Wyandotte. The Smoky Hill rises in Colorado, and after entering K. receives the Saline and the Solomon—the former about 200 and the latter 300 m. long. The Republican also rises in Colorado, flows across the n.w. corner of K. into Nebraska, and afterwards returns to the state, joining the K. as above mentioned. The Big Blue, which rises in Nebraska, and the Grasshopper are northern tributaries of the K., while the Wakarusa joins it from the south. About two thirds of the state lies s. of the K. and Smoky Hill Rivers. The Osage rises in the e. part of the state, flows s.e. 125 m., and enters Missouri. The Neosho rises near the center of the state, flows s.e., receives the Cottonwood, and enters the Indian territory. The Verdigris, 20 m. farther w., flows nearly parallel with the Neosho, and also enters the Indian Territory. The Arkansas, which rises in Colorado, runs through nearly three fourths of the length of K., in a course so tortuous that its windings in the state have been reckoned at 500 m. With its tributaries, the Walnut, the Little Arkansas, and Cow Creek, it drains the larger portion of southern K. No one of all these interior rivers is navigable.

GEOLOGY AND MINERALOGY.—S. eastern K. belongs to the middle coal measures, the strata varying from 403 to 600 ft. in thickness. The upper carboniferous measures overlap on the n. and the permian on the w., the two covering about one fourth of the state. The coal of e. K. is bituminous, and the veins in the n.e. are thin. Lignite coal of inferior quality is obtained in w. K. The coal-bearing region has an area of 17,000 sq. m. The triassic formation extends through the state, w. of the 101st meridian. The cretaceous (Niobrara) formation, rich in fossils, occupies a large but irregular tract, extending from n.e. to s.w. The drift period is amply represented in the n.w. and s.w. The pliocene and cretaceous fossils of the n.w. and w. include dicotyledonous leaves of many species: cinnamon, such as now grows only in the torrid zone; large sharks and other fish; saurians and amphibians of great size; and marine shells, reptiles, and fishes of species previously unknown. Among the minerals are brown hematite and other iron ores, zinc, lead, alum, sulphur, chalk, hydraulic limestone, magnesian limestone, gypsum, kaolin, fire and brick clays, ochre, lime, manganese, freestone, marble, and moss-agate. There are large deposits of salt, and petroleum and natural gas are obtained in many localities.

ZOOLOGY.—Among mammals are the elk, antelope, deer, black and brown bear, panther, 2 species of wolf, wild-cat, raccoon, opossum, civet, prairie-dog, 4 species of fox, and 3 of hare. Among 300 or more species of birds and wild fowl are the mocking bird, chewink, purple finch, wild turkey, wild goose, grouse, and prairie-chicken. The reptiles, fishes, etc., include the rattlesnake, adder, black snake, horned lizard, sturgeon, garpike, river herring,

eel, paddle-fish, six species of sucker, and six of catfish. Salmon and shad have been introduced.

BOTANY.—A small part only of the state is wooded. The most abundant trees are the white-ash, cottonwood, four species of oak, red and white elm, hickory, black walnut, sycamore, red, sugar, and rock maple, hackberry, mulberry, box-elder, willow, cherry, redbud, and pecan. The osage orange is extensively used for hedges. Among shrubs and flowering plants are the clematis (*Fremontii*), rattleweed, evening primrose, mentzelia, prickly pear, ironweed, larkspur, blazing star, poppy, rosinweed, coneflower, sunflower, hawkweed, bindweed, ground cherry, painted cup, wild sage, greasewood, dayflower, and a species of *astragalus* dangerous to cattle.

CLIMATE AND SOIL.—The climate of K. is very pleasant, the great proportion of fair sunny days being one of its features. In winter the temperature rarely falls below zero; in summer it ranges from 80° to 100°, but the nights are cool, and the air is dry and pure. The winter winds, to which the prairies offer no obstruction, are sometimes very severe, but, on the whole, the climatic conditions are highly favorable to consumptives and those suffering from asthma and other bronchial troubles. At the meteorological bureau of the state university at Lawrence, the maximum temperature averages 82.3; minimum, 28; mean, 52.39; rainfall, 2.89 inches; snow precipitation, 1.67 inches; rainy days, 7; and mean barometer, 29.087. The soil of the state is admirably adapted to agriculture, being rich in the mineral constituents which promote vegetation. The bottom lands are especially fertile, the soil being from 2 to 10 ft. deep. On the uplands it is from 1 ft. to 3 ft. in depth. In the e. half of the state it is a black, sandy loam, intermixed with vegetable mold. In the w. part it is of a lighter color, but deeper than that in the e.

AGRICULTURE.—Agricultural pursuits may be said to occupy the attention of the majority of the people of Kansas, although out of 52,531,200 acres of land, only 18,360,260 are actually under cultivation. The farms are valued at over \$559,000,000 and the products reach a value of over \$80,000,000 annually. The principal crops in their order are corn, wheat, hay, oats, potatoes, rye, barley, the state ranking among the states second in production of hay, third in wheat, and fourth in corn. Upwards of half a million pounds of cotton are produced annually. For encouraging the cultivation of sorghum, the state pays a bounty of two cents per pound on the sugar manufactured from this product. More than \$2,500,000 is invested in the beet sugar industry, which is also of great importance. Many varieties of fruits, such as peaches, pears, apples, plums, cherries, etc., are raised to great advantage in Kansas. The smaller fruits also flourish finely. About 35,000,000 acres are devoted to grazing purposes. The vast extent of rolling prairies covered with nutritious grasses and fed by never-failing springs furnish unequalled facilities for the breeding of superior stock. Kansas City has mammoth stock-yards and packing establishments, whence canned meats are shipped to all parts of the world. In 1890 the wool product amounted to 2,253,240 lbs. The dairy products in 1890 comprised butter, 46,117,076 lbs.; milk, 201,608,099 galls.; cheese, 759,210 lbs. The poultry and eggs are estimated at an annual value of \$2,500,000. The farm and ranch animals number over 5,000,000 head, valued at about \$85,000,000, the state ranking third in cattle and ninth in swine.

MANUFACTURES.—Probably no tract of country of equal extent is better supplied with available water power than Kansas. The streams are fed by living springs, and the slope of the land insures rapid currents, which are maintained even in the driest weather. In 1890 there were 4471 manufacturing establishments, with an aggregate capital of \$43,926,002, which employed 32,843 persons, to whom \$16,328,485 was paid in wages, used materials valued at \$78,845,167, and had an output valued at \$110,219,805. The principal industries, in the order of the value of output, were slaughtering and meat-packing (\$44,696,077), flour and grist milling (\$17,420,475), foundry and machine-shop work (\$2,756,825), manufacture of men's clothing (\$1,126,968), zinc smelting, dairying, bridge building, lumber working, salt making, and brick and tile work. Topeka has lumber and planing mills, marble and stone works, ornamental iron works, foundries, flour and grist mills, cigar, saddlery, carriage and wagon factories. Leavenworth manufactures heavy iron work of all kinds, besides furniture, woolens, carriages and wagons and canned goods. Argentine and Kansas City smelt large quantities of lead, silver and zinc, furnishing one-fifth of all the lead and silver smelted in the United States. Pittsburg is the second zinc-producing city in the country. Lawrence has factories of barbed wire, flour and paper mills. Silk is made from the cocoons at Peabody, Larned and Lincolnville. Salt works are established at Hutchinson, Solomon City and elsewhere. Natural gas is found at Wyandotte, Paola, and Fort Scott.

BANKS.—In 1896 there were 116 national banks in operation, with capital, \$9,812,100, deposits \$15,274,655, and reserve \$5,829,897; and 395 state and private banks, capital \$8,208,492, deposits \$14,895,067, and resources \$25,836,874.

TRANSPORTATION.—There are no commercial canals in the state, and but few of the rivers are navigable. In railroad facilities the state is more fortunate, having about 9,000 miles of road in operation, and ranking fourth in railroad mileage. The large number of great trunk lines converging at Kansas City, Kan., and Kansas City, Mo., place the state in direct communication with nearly every seaport and large city in the country.

RELIGION, EDUCATION, ETC.—The leading denominations are the Methodist Episcopal, Roman Catholic, Baptist (North), Disciples, Presbyterian (North), United Brethren, Congregational, Friends, and Lutheran (General Council). In 1890 the number of church edifices was 2854; organizations, 4920; value of church property, \$7,447,569. The school population in 1895 was 439,200; pupils enrolled, 381,123; teachers, 11,916. There are a State normal school at Emporia; private normal schools and colleges at Fort Scott, Great Bend, McPherson, Maryville, and Salina; colleges exclusively for women at Oswego (Presb.) and Topeka (Prot. Epis.); State university at Lawrence; denominational colleges and universities at Atchison, Baldwin, Dodge City, Emporia, Enterprise, Highland, Holton, Kansas City, Lecompton, Lindsborg, Ottawa, St. Marys, Salina, Sterling, Topeka, and Winfield; the Haskell Indian school at Lawrence; State institution for the deaf and dumb at Olathe; State institution for the blind at Kansas City; State asylum for idiotic and imbecile youth at Winfield; State industrial school for girls at Beloit; and State reform school for boys at North Topeka. Other institutions are the State penitentiary at Lansing, State insane asylums at Topeka and Ossawatimie, and Soldiers' orphans' home at Atchison. In 1896 there were 63 libraries of 1,000 volumes each and upward, with 302,780 bound volumes and 83,569 pamphlets; and 696 periodicals of all kinds.

GOVERNMENT, ETC.—Topeka is the state capital. The governor is elected by the people for two years, with salary of \$3000; the lieutenant-governor for 2 years, salary, \$1,000; the secretary of state, auditor, and attorney-general are elected in the same way, for the same term, each receiving an annual salary of \$2500. The legislature is composed of 40 senators elected for 4 years, and 125 representatives elected for 2 years. Their compensation is fixed at \$3 per day for actual service and mileage. The sessions begin biennially on the second Tuesday of January, and are limited to 50 days. The state election is held on the Tuesday succeeding the first Monday in November. In 1887 municipal suffrage was granted to women. The supreme court, consisting of a chief-justice and 2 associate justices, is elected by the people for the term of 6 years, salary, \$3000 each; the district courts, of one judge each, are elected by the people for 4 years; the probate court of each co., consisting of one judge, is elected for 2 years. Married women may sue and be sued, carry on in their own names any trade or business, and have full control of their earnings. The property of a wife at marriage is not merged with that of her husband, but remains her own. Neither husband nor wife is allowed to bequeath more than half his or her estate away from the other without written consent. Divorces are allowed for abandonment for one year, adultery, impotency, extreme cruelty, drunkenness, gross neglect of duty, and imprisonment in the penitentiary subsequent to marriage. No intoxicating liquors can be manufactured, sold or imported. The legal rate of interest is 6 per cent., but 10 per cent. is allowed by contract. K. has 10 representatives in congress. The electoral votes have been cast as follows: 1864, Lincoln and Johnson, 3; 1868, Grant and Colfax, 3; 1872, Grant and Wilson, 5; 1876, Hayes and Wheeler, 5; 1880, Garfield and Arthur, 5; 1884, Blaine and Logan, 9; 1888, Harrison and Morton, 9; 1892, Weaver and Field, 10; 1896, Bryan and Sewall, 10.

The total state debt, 1896, was \$752,000, of which school funds held \$496,000; equalized property valuation, \$321,846,698; state tax levy, \$1,367,845.

POPULATION.—In 1855, 8501; 1860, 107,206; 1870, 364,399; 1880, 996,096; 1890, 1,427,096. There are 106 cos. For pop. 1890, see census tables, vol. XV. The largest cities, 1890, were Topeka 31,007; Kansas City, 38,316; Wichita, 23,853; Leavenworth, 19,768; Atchison, 13,963; Fort Scott, 11,946; Lawrence, 9997. In rank among the states, in 1890, Kansas ranked eighteenth in population.

See history of K. by Holloway, Tuttle, and Spring (1885).

KANSAS CITY, city and co. seat of Wyandotte co., Kan.; at the junction of the Missouri and Kansas rivers, and on the Kansas City Northwestern, the Missouri Pacific, and the Union Pacific railroads; opposite Kansas City, Mo. The city was chartered in 1886, when the former cities of Armourdale, Kansas City, and Wyandotte, and the town of Armstrong were consolidated under the present name. It contains Kansas City university, the State blind asylum, Bethany and St. Margaret's hospitals, gas and electric lights, electric and cable street railroads, waterworks supplied from the Missouri river, several national and state banks, and public parks. Over 15 bridges cross the Kansas river. The chief industries are slaughtering and beef and pork-packing. The city has several of the largest slaughtering and packing plants in the country, and extensive stock-yards. The interests of Kansas City, Kan., and Kansas City, Mo., in this industry, are mutual, and the plants on each side of the state boundary line, which separates the cities, constitute the second largest live stock and meat-packing place in the United States. There are also large railroad yards and carshops and steam flour mills. Pop. '90, 38,316.

KANSAS CITY, a city in Jackson co., Mo.; at the junction of the Kansas and Missouri rivers; adjoining Kansas City, Kan.; 135 miles w.n.w. of Jefferson City; laid out, 1830; received a city charter, 1853; area, 13 sq. miles. Its rapid growth from a village was due to the extension of the railroad systems of the Western states, and the gradual centering here of all the western trunk lines, putting the city in full touch with each of the states and territories and with Mexico. More than 30 of the most important rail-

roads of the country pass through or have a terminus at the city, among them the Atchison, Topeka and Santa Fe, the Burlington route, the Chicago and Alton, the Chicago Great Western, the Chicago, Milwaukee and St. Paul, the Chicago, Rock Island and Pacific, the Kansas City, Pittsburg and Gulf, the Missouri, Kansas and Texas, the Missouri Pacific, the Union Pacific, and the Wabash. To facilitate this exceptional railroad transit, a number of bridges have been constructed across the river; one, the first one built across the Missouri, is 1,387 feet long, and cost over \$1,000,000, and another is 7,392 feet long. Within the city is a mammoth union depot, used in common by many of the roads. Local and suburban transit is afforded by electric, cable, and elevated roads, and the general transportation facilities are augmented by many river steamboats.

The city is built on a bluff that rises abruptly from the river to a height of 120 feet; is irregularly laid out; has wide streets, built up chiefly with brick; contains Swope, Troost, Washington, Budd, and other parks; and is lighted with gas and electricity. The waterworks plant, owned by the city and constructed at a cost of over \$3,000,000, is supplied from the Missouri river. Among the noteworthy buildings are the U. S. government building and bonded warehouses; city hall; Y. M. C. A. and Y. W. C. A. buildings; Roman Catholic cathedral; First Congregational, Calvary Baptist, and Grace and Trinity (Prot. Epis.) churches; city, German, and All Souls hospitals; public library; Kansas City, Progress, and Commercial clubs' buildings; board of trade building; industrial school for boys; high school; etc. There are several sectarian and non-sectarian colleges and schools; a law college; several medical and dental colleges; a manual training school; and nearly 100 churches; besides many national, State, and savings banks, and daily, weekly, and monthly periodicals.

The manufacturing establishments reported in 1890, numbered 1,478, and had \$14,104,620 capital; employed 14,757 persons, to whom \$9,448,696 was paid in wages; used materials that cost \$16,361,184; and had an output valued at \$31,936,366. The principal interest was slaughtering and meat-packing. The plants are on both sides of the boundary line, and the details of the industry are credited to Kansas City, Kan. (q.v.), excepting those given in aggregates for both cities together; hence the value of the output of this industry alone in Kansas City, Kan., as reported, exceeds that of the entire manufacturing plants of Kansas City, Mo. The two cities, having a close identity of commercial interests, but separate municipal governments, constitute the second largest live-stock and meat-packing place in the country, and also the second largest grain market; but the details of receipts and shipments are not reported separately for each city.

The site of the city, known originally as Kawsmouth, was an Osage Indian village, the starting-place of Pike's overland trip, 1806; was settled by French fur traders, about 1822; incorporated as a town, 1839; was a rendezvous of French expedition, 1842; was conspicuous in the border war, 1861-2; was the starting-place of the first railroad across the plains; and received its first commercial impetus when the Missouri Pacific railroad reached it, 1865. Pop. '90, 132,716, including 13,048 in suburbs afterward declared to have been illegally annexed.

KANSAS, a tribe of Indians of the Dakota family, and a branch of the Osages. On Marquette's map of 1673 they are placed on the Missouri River, beyond the Missouris and Osages. The Jesuits had a mission among them in 1728. In 1815 they were on the Kansas River, at the mouth of the Saline, having been driven away by the Sioux, and numbered 1500. In 1825 they ceded most of their lands to the government, and in 1846 were placed on a reservation on the head-waters of the Neosho. In 1835 the Methodists attempted to convert them. In the Civil War they furnished 80 or 90 soldiers to the union army. In 1862 the Friends established a mission among them with small success. New treaties were made, 1867, 1869; and in 1872 they were removed to the Indian Territory. They now number but a few hundreds.

KANSAS or **KAW RIVER**, is formed by the Solomon and Smoky Hill Rivers, which unite in Saline co., Kan. It flows eastward, and joins the Missouri at Kansas City. Its chief affluents, the Republican and Big Blue Rivers, enter it from the n. It is 300 m. long, has on its banks Topeka, Lawrence and Kansas City, and the Kansas Pacific railroad runs by its side its entire length. It is not navigable to any important extent.

KANSAS, UNIVERSITY OF, a co-educational, non-sectarian institution, at Lawrence, Kan.; organized, 1864; opened, 1866. It has schools of law, pharmacy, art and music, engineering, etc., with museum of natural history, various laboratories, gymnasium, athletic grounds, and electrical engineering plant. The grounds and buildings are valued at upward of \$350,000. In 1896 there were 54 professors and instructors, 895 students in all departments, and nearly 26,000 volumes in the libraries. President, Francis Huntington Snow, PH.D., LL.D.

KANSU, the most n.w. province of China (q.v.).

KANT, IMMANUEL, one of the greatest and most influential metaphysicians of all time, was the son of a saddler, of Scotch descent, and was born at Königsberg, April 22, 1724. He was educated at the university of his native town, and after spending some years as

a private tutor, took his degree at Königsberg in 1755, and began to deliver prelections on logic, metaphysics, natural philosophy, and mathematics. In 1762 he was offered, but declined the chair of poetry, and in 1770 he was appointed professor of logic and metaphysics. He died Feb. 12, 1804. Kant's private life was uneventful, yet curious and almost ludicrous in its mechanical regularity. As Socrates could hardly be induced to go beyond the walls of Athens, so Kant clung with oyster-like tenacity to the city of his birth, never leaving it during the thirty years of his professorship. He remained a bachelor all his life. Kant was a man of unimpeachable veracity and honor, austere, even in his principles of morality, though kindly and courteous in manner, a bold and fearless advocate of political liberty, and a firm believer in human progress. The investigations by which he achieved the reputation of a reformer in philosophy, refer not so much to particular sections or problems of that science, as to its principles and limits. The central point of his system is found in the proposition, that before anything can be determined concerning the *objects* of cognition, the *faculty* of cognition itself, and the *sources of knowledge* lying therein, must be subjected to a critical examination. Locke's psychology, indeed, at an earlier period in European speculation, had shown a similar tendency; but before Kant, no thinker had definitely grasped the conception of a critical philosophy, and Kant himself was led to it not so much by Locke, as by Hume's acute skepticism in regard to the objective validity of our ideas, especially of the very important idea of causality. The Kantian criticism had a twofold aim: first, to separate the necessary and universal in cognition from the merely empirical (i. e., from the knowledge we derive through the senses); second, to determine the limits of cognition.

In regard to the former of these, it is of importance to observe that Kant did not subject the old psychological doctrine of "faculties" to any analysis, but attributed to each of these—viz., to the faculties of sense, understanding, judgment, and reason—certain innate *a priori* forms, conceptions, and functions, which, as constituting the necessary conditions of any experience whatever, possessed, on account of their subjective necessity, a universal subjective validity. Thus, in the sense, as the faculty receptive of external impressions, there must lie, according to Kant, the forms of space and time; in the understanding, as the faculty by which the manifold in appearance is combined in the unity of conception, the categories; in the reason, as the faculty of principles, the ideas of the unconditioned and the absolute; in the judgment, in as far as it is not merely subsumptive, but also reflective, the conception of design or conformity to the purpose in view; finally, in the will or the practical reason, the categorical imperative of the moral law.

In regard to the latter aim of the Kantian criticism—viz., to determine the limits of theoretical knowledge—the efforts of Kant go to show that universal forms, existent *a priori* in the human mind, can afford knowledge only under the condition that the objects which they cognize are presented by experience; while for the determining of what lies beyond the limits of experience, they are merely empty forms, by which something indeed is *thought*, but nothing *known*. Even within the limits of experience itself, we are cognizant, according to Kant, through the forms of the sense and of the understanding, not of things as they are in themselves, but only as they appear; hence the opposition between *noumena* and *phenomena*. But when we try to transcend those limits and to ascertain the intelligible basis of the phenomenal world by the forms of the sense and the categories, the *reason* becomes entangled in an unavoidable dialectic for which there is no objective, but only a critical solution. The objects of this dialectic, the carrying out of which constitutes an essential and leading part of the *Critique of the Pure Reason*, are the soul, the world, and God; and in relation to the cosmological conceptions in particular (viz., of the beginning and end of the world, of the unity or non-unity of the ultimate particles of things, of causality through freedom or through the necessity of nature), the reason is involved in a series of self-contradictions (in the Kantian technology, *antinomies*). The result, according to Kant, of the critical examination of all claims to a knowledge transcending experience in the regions of rational or speculative psychology, cosmology, and theology, is the necessity for abandoning the hope of attaining such. The idea (native to the reason) of the unconditioned is allowed to possess a regulative, not a constitutive value; that is to say, it is a principle necessary for the extension of our inquiries beyond the fixed limits of experience, without, however, yielding us an extended knowledge. So far the philosophy of Kant is purely negative and destructive. Hamilton, Mansel, and others have—in regard to the limits of the knowable—merely reiterated the arguments of the great German, while in regard to the points in which they do differ from him, as, for example, the *nature* of our knowledge, it is a matter of very great doubt if they are as logical and consistent as their predecessor.

But the austere and stoical morality of Kant was something too *positive* to allow him to rest satisfied with merely negative results; hence he sought in the reality of his ethics a compensation for the nihilism of his metaphysics. He maintained the unconditional validity of the moral law, and of the consequences which legitimately flow from it. This validity, however, it should be observed, is simply *moral*, and in no way demonstrates the metaphysical reality of the ideas, which, nevertheless, by a power of its own, it compels us to accept. The reason, as operating in the sphere of ethics, is

called by Kant the practical reason, or the practico-legislative reason. The ideas which the practico-legislative reason postulates are, 1st, the idea of *freedom*; 2d, of immortality, as the necessary condition for an ever-increasing approximation to the fullness of the moral law; and 3d, of the being of God, as the necessary condition of such a regulation of the universe as shall show the order of nature to be the expression of a moral design. Rejecting all the ontological, cosmological, and physico-theological proofs of the existence of God as mere futilities, Kant based his belief in God on the inward necessities of a practical morality. Religion—i. e., the recognition of our duties as divine commands—has, in the system of Kant, the closest dependence on morality; in fact, becomes identical with it. This purely ethical conception of religion led him to a criticism of the positive dogmas of theology from an ethical standpoint, in which are contained most of the elements of theological rationalism. The application of the practical reason, as understood by Kant, to aesthetics and jurisprudence is equally fruitful of important results.—Kant's first work, *Gedanken von der wahren Schätzung der lebendigen Kräfte* (Thoughts on the True Estimation of the Active Powers), was published in 1747. The principal of its successors were, *Die falsche Spitzfindigkeit der vier syllogistischen Figuren* (The False Hair-splitting of the Four Syllogistic Figures, 1762), *Beobachtungen über das Gefühl des Schönen und Erhabenen* (Observations on the Beautiful and Sublime, 1764); *De Mundi Sensibilis et Intelligibilis Forma et Principiis* (On the Form and Principles of the Sensible and Intelligible World, 1770); this is the prelude to his *Kritik der reinen Vernunft* (Critique of the Pure Reason, 1781); *Grundlegung der Metaphysik der Sitten* (Basis of the Metaphysics of Ethics, 1785); *Kritik der praktischen Vernunft* (Critique of the Practical Reason, 1788); *Kritik der Urtheilskraft* (Critique of the Judgment, 1790); and *Religion innerhalb der Grenzen der blossen Vernunft* (Religion within the Limits of Mere Reason, 1793). For an account of the influence of Kant, see GERMAN PHILOSOPHY. See also Caird's *Account of Kant's Philosophy* (1877); Adamson's *On the Philosophy of K.* (1880); Watson's *K. and his English Critics* (1881); Stirling's *Text-book to K.* (1881).

KANTEMIR. See CANTEMIR.

KA'OLIN is the name given by the Chinese to the fine white clay which they use in making their porcelain. It is furnished by the decomposition of a granitic rock, the constituents of which are quartz, mica, and feldspar, the latter having gradually molded, by the joint action of air and water, into this substance. A very similar clay, to which the Chinese name has been given, occurs near St. Austel in Cornwall, and near Limoges in France. In Maryland, Nebraska, and a number of other states of the American union, kaolin is found and the annual consumption in the United States is considerable. All clays are silicates or hydrated silicates of alumina; and these clays, which are much valued by the porcelain makers, may be represented by the formula $Al_2SiO_3 + 2HO$.

KAPELLMEISTER, or CAPELMEISTER (German, Chapel-master), the director of music and choir-trainer in a royal or ducal palace. The chapel-master is generally a composer of music, and the position is regarded as one of much honor and of considerable importance. Palestrina, Handel, Haydn, Mendelssohn, Bach and other celebrated musicians were chapel-masters.

KAPILA, the renowned founder of the Sāṅkhya (q.v.), one of the philosophical systems of the Hindus. Prof. J. E. Hall, in his learned and excellent preface to his edition of the text-book of the Sāṅkhya, the *Sāṅkhya-Pravachana*, says: "By the prevalent suffrage of mythology Kapila is reputed to have been a son of Brahmā; but he is otherwise described as an incarnation of Vishnu. He is also recounted to have been born as the son of Devahūti; and again is identified with one of the Agnis or fires. Lastly, it is affirmed that there have been two Kapilas—the first, an embodiment of Vishnu; the other, the igneous principle in human disguise. It must be acknowledged, in short, that we know nothing satisfactory concerning Kapila; the meager notices of him that are producible being hopelessly involved in uncertainty."

KAPP, FRIEDRICH, b. in Germany, 1824, devoted his earlier years to the study of law; but, having espoused the cause of those who were seeking to establish republican principles on the continent of Europe, he became involved in the revolutionary movement of 1848, and found it necessary to leave the country. He accordingly went to New York, where he joined the republican party in politics, and while he practiced his profession, also interested himself greatly in public affairs. He was chosen one of the republican presidential electors for the important election of 1860, and in that capacity cast his vote for Abraham Lincoln. He was a commissioner of emigration in the city of New York. In 1870 he went to Germany, where he was elected to the reichstag. Kapp wrote a number of works on slavery, and on the relations of Germany and the United States, and lives of baron de Kalb and Gen. Steuben. He d. 1884.

KAPPEL, a village in the canton of Zurich, Switzerland; pop. about 3000; noted chiefly as the place where Zwingli was killed in 1531, in a battle between Protestants and Roman Catholics.

KARA GEORGE. See CZARNY GEORG.

KARAHISSAR'. See AFIUM—KARA-HISSAR.

KARAITES. See JEWISH SECTS.

KARAJAN, THEODOR GEORG, Ritter von, 1810-73; b. Vienna, Austria; doctor of laws, historian and philologist. He was vice-president (1851) of the "Academie der Wissenschaften," becoming president in 1859. He wrote many important philological works, and among miscellaneous pamphlets, one on "J. Hayden in London, 1791 and 1792." Jahn's book on Mozart contains valuable material contributed by Karajan.

KARAJITCH, VUK STEFANOVITCH, 1787-1864; b. Servia; educated at Karlevoitz at the school for dissenters from the Greek church. Being of a delicate constitution, instead of joining the insurgents in their struggle against the Turkish authorities which began in 1804, he acted as secretary to their chiefs, who were ignorant of the art of penmanship. He also served at Belgrade, as secretary of the senate and of Kara-George or Black George, prince of Servia, while he held the power. In 1813, the Serbians being abandoned by Russia, he was compelled, after the treaty of Bucharest establishing the power of the sultan, to fly to Austria, and encouraged by Kopitar, the Slavonic scholar, then holding a position in the imperial library, he undertook the labor of collecting the national ballads, with many of which he had been familiar as a boy. He traveled through Bosnia and Montenegro, seeking among 5,000,000 of Serbian-speaking people for their ancient songs, translations of some of them having been loudly praised by Goethe. Some are of recent origin, celebrating the exploits of the first 10 years of the present century. He was supplied from all sources, even by ferocious Mohammedans of western Turkey, and by Serbian women, who contributed their familiar love-songs. In 1814 he published *Narodne Srpske pjesme*, (Vienna, 4 vols.), selections of which have been translated into English and German, ranking very high among European ballads. He also published a Serb grammar translated into German by Jacob Grimm, and in 1818 a Serbo-German dictionary, basing his system of orthography on the Russian alphabet, and *Danitzza*, a literary almanac. In 1826-34, *Serb Popular Proverbs*, and *Serb Popular Tales*. In 1847, a Serbian translation of the New Testament. In 1849, *Koechejick*; or, *Casket for the Serbian Language and History*, and other works of value in the study of the race. He received the honorary degree of PH.D. from the university of Jena, and a pension from the Russian government. His Serbian countrymen have no family names, and the distinctive surname of Karajitch is the name of the district where his family resided; his appellation of Vuk Stefanovitch signifying Wolf, the son of Stephen.

KARAK, a small rocky island in the Persian gulf in lat. 29° 14' n., long. 50° 20' e.; 15 m. in circumference, and 40 m. n.w. of Bushire; pop. about 3,000. A village on the n. side has 1000 inhabitants, who support themselves by fishing and raising fruits. Vessels find safe anchorage at Karak during the violent gales from the n.w. which prevail in this sea. It has a fertile soil and good water, but is without timber. The Dutch built a fort here in the 18th c., but soon abandoned the island. The English occupied it, 1839-41, and in 1856 the English expedition against Persia landed on the s.e. coast.

KARAKORUM, or MUSTAG MOUNTAINS, called also TSUNG LING, a range of central Asia, separating the province of Cashmere from eastern Toorkistan, and crossing Thibet. It commences in long. 74° 30' e., and extends to about 92° east. It is, in fact, the western part of the Kuenlun mountains, and the name is given also to a pass 18,000 ft. high by which the Karakorum range is crossed from Thibet into Chinese Toorkistan. Depsang peak on this range is 28,278 ft. high, and others are nearly as high. The average height is 25,000 feet. The highest water-shed of Asia is near the Karakorum pass. This range, with which the Kuenlun is often said to be connected, is in fact a distinct branch of the Himalayas. The city of Karakorum was the ancient capital of Mongolia, and for a time of Jenghis Khan. Its site has not been discovered.

KARAMAN, KARAMA'NIA or CARAMANIA, an inland region of Asia Minor, comprising most of the tableland between 36° 50' and 39° 10' n.; 31° and 50° e. Cattle breeding is the chief employment of the inhabitants, who are for the most part nomadic Turks. The town of Karaman (anc. *Laranda*) has a pop. of 7-8,000. Karaman very nearly corresponds in area with the modern vilayet of Konia.

KARAMSIN, NICHOLAS MICHAILOWITSCH, the greatest of Russian historians, was b. Dec. 1, 1765, at Mikhailovka, in the government of Orenburg. His father was an officer of Tartar descent, and placed him in the army, but he soon retired from it, and devoted himself to literary pursuits, and after a tour in Germany, Switzerland, and France, took part in establishing the *Moscow Journal*, and published volumes of tales, poetry, etc. But the work which first gained him a high reputation was his *Letters of a Russian Traveler* (6 vols. Moscow, 1797-1801), a work which exercised an extraordinary influence in the improvement of literary taste in Russia. After some other literary attempts of no great importance, he directed his attention to the history of his country. In 1803 he was appointed imperial historiographer, with a pension of 2,000 rubles, and from this time he labored uninterruptedly at his *History of Russia* (12 vols. Petersb., 1816-29), for the preparation of which he had access to all the national archives. For this work the emperor Alexander, who had read part of it in manuscript, made him a present of 60,000 rubles. It has been translated into other languages. It comes down only to 1611. It is in high repute in Russia, displays much research and judgment, and is, in fact, by far the most valuable work in Russian historical literature. Karamsin died on May 13, 1826.

KARA'SU-BAZAR, a manufacturing t. in the Crimea, 25 m. e.n.e. of Simferopol. It is surrounded by gardens, and contains 4 churches and 24 mosques with minarets. Pop. '89, 13,843, who carry on considerable trade, and manufacture morocco leather and other articles.

KARATCHEF', a t. in the n.w. of the government of Orel, European Russia, on the Snezheti, an affluent of the Dezna, dates from the 12th c., and contains ('80) 11,267 inhabitants, who carry on a large trade in cordage.

KARE'LIA, an ancient province of Sweden, near the gulf of Finland, annexed to the Russian empire by Peter the Great, and now forming portions of the governments of Finland, St. Petersburg, Olonez and Archangel. The original inhabitants were of Finnish origin.

KAREN'GIA, *Pennisetum distichum*, a grass closely allied to the millets, and producing a grain of the same kind. It is a native of central Africa, and is extremely plentiful on the southern borders of the Sahara, supplying in some places the principal part of the food of the inhabitants.

KARENS, or **KARRANS** (wild men), so called because, through oppressions and atrocities of the people among whom they dwelt, they have been driven to occupy jungles and almost inaccessible mountains, shunning other races except as drawn for trade to the towns. They are found in Burmah, Siam, and the southern part of China. They are supposed to have anciently migrated from farther north, and their features and language suggest a Caucasian origin. They are found sometimes as nomads, burning the underbrush in a forest, building three or four huts in the ashes, staying till the resources of the spot are exhausted, then moving elsewhere. Sometimes they are found as husbandmen, raising rice, vegetables, and fruit, and trading in honey, poultry, pigs, rattan, mats, and tusks of the elephant and rhinoceros. They are harmless and industrious, and superior in morals to many more civilized races. The common dress is a sleeveless cotton frock, but they are fond of ornaments. Their houses are of bamboo, raised on strong posts, 6 or 7 ft. from the ground. As a race they are without form of religion or regular priesthood, and till recently without a written language; but through a set of poetic legends they have transmitted from father to son ideas of an overruling God, of the brotherhood of man, and of future reward and punishment. In these songs, which are singularly pure and elevating, are accounts of the creation, of a deluge, of a time when language became confused in consequence of disbelief in God, of the betrayal of a son and daughter of God by Satan in the form of a dragon, which are remarkably like the teachings of the Jewish scriptures. In these songs are also prophetic anticipations of future enlightenment through white strangers, who should come to them by water. When the missionaries sent to Burmah met with these people, and began to tell them of Christ, they were gladly received, and their labors have been attended with success scarcely rivaled in the history of missions. The converts were relentlessly persecuted by the Burmese, but, since southern Burmah fell into the hands of the English, the Karens have been able to build churches and establish schools. There were, 1884, 103 ord. native preachers, 363 unordained, 463 churches, 23,804 members, 1,553 baptisms.

KARGÉ, JOSEPH, 1823-92; b. Posen, Germany; educated at Posen, Breslau, Paris, and Berlin; took part in the Polish struggle for independence, 1849; came to the United States, 1851; served in the union army through the civil war, becoming brev. brig.-gen.; commissioned in the regular army, 1867; resigned, 1870; and thence till his death was professor of continental languages and literature at Princeton college.

KARIKAL' a remnant of the once extensive possessions of France in India, lies on the Coromandel coast, on the estuary of one of the branches of the Kaveri, within the limits of the British district of Tanjore. It contains only 63 sq. m. with 70,526 inhabitants (1891), of whom the great majority are natives. Karikal was ceded to the French by the rajah of Tanjore in 1759. Having subsequently fallen into the hands of the English, it was restored at the general pacification of 1814, on condition that it should neither contain any fortification nor possess any garrison, unless for purposes of police. This tract is of little commercial importance. Karikal is 150 m. to the s. of Madras.

KARKOR, a city e. of the Jordan, in the desert. Its exact location has not been identified, though supposed to have been not far from Succoth and Penuel. Here Zebah and Zalmemna, the Midianitish kings, were routed by Gideon (Judges, viii. 10).

KARMA'THIANS, CARMATHIANS, so-called from Abu Saïd Al-Jenabi, surnamed Al Karmata, a Mohammedan sect which sprang up in the 9th c. A.D., under the caliphate

of Al-Motamed, and which, by a combination of extraordinary circumstances, succeeded in establishing itself for a time, as a political power which threatened to overturn the caliphate itself. What we have said of the particular creed and tendencies of the advanced sect of the Ismailis, under that heading, began first to be fully realized and developed about the middle of the 2d c. of the Hedjrah, through one Abdallah Ibn Maimun; an oculist (kaddah) by profession and a Persian by birth. It was he who first, aided by favorable circumstances, matured a plan which, for the boldness and genius of conception and for the energy and vigor with which it was carried out, has not many parallels in history. Nothing less was contemplated than the union of the Arabic conquerors and the many races they had subjected since Mohammed's death, and the enthronement of what afterwards was called "Pure Reason" as the sole deity to be worshipped. The advanced should be free of all so-called religious fetters, which, as symbols and allegorical actions, should be laid all the heavier on the necks of the less advanced strata of society. The "Believers" and "Conquerors" were to be made missionaries for unbelief and the implements for the destruction of their own empire. Whatever the ultimate plans of Abdallah may have been, there can be no doubt about the astute way in which he set to work for the new faith. With an extraordinary knowledge of the human heart and human weakness, he offered devotion to the believer; liberty, if not license, to the "free in spirit;" philosophy to the "strong-minded"; mystic hopes to the fanatics; miracles to the masses. To the Jews, he offered a Messiah; to the Christians, a Paraclete; to the Moslems, a Mahdi; and to the Persian and Syrian "pagans," a philosophical theology. His practical exertions, and their wonderful results, soon attracted the attention of the authorities. Obligated to flee from place to place, he sought refuge successively in Karaj, in Ispahan, in Ahwaz, in Basra, finally in Salamia, in Syria, where he died, leaving his son Ahmed his successor as chief of the sect of the Ismailis. This Ahmed, warned by the fate of his father, proceeded with greater caution, more especially with regard to the name of the Imam or great Prophet, which he left rather uncertain.

Among the missionaries he sent to Irak there was one named Husein Ahwazi. In the province of Kufa this missionary, according to some of the authorities, met a man named Hamdan Karmat, whom he converted to the new faith, and at his death laid his mission upon Karmat's shoulders, whom he had previously initiated into the whole extent of the faith. According to others, however, it was Husein himself, who from some cause received the name of Karamita or Karmat, a word the meaning of which is rather uncertain—indicating, according to some, a man who, having short feet, makes small steps; according to others, a man who has red eyes, etc.

Whoever Karmat was, he was the fittest man to carry out the original intentions of the founder. He very soon succeeded in gaining the full confidence of his flock, which increased daily, and in making them blind instruments of his will. He introduced, according to some of the authorities, absolute communism, not only of property, but even of wives, among them, and founded one particular colony, consisting of chosen converts, around his own house in Kufa. This residence of his, called the house of refuge, became the center of an immense conspiracy. From this place all the missionaries were sent out, and all the threads of the great movement were directed. Amongst the most noted of those missionaries was one Abu Saïd, who was sent first to southern Persia, and afterwards to Bahrein, in the Persian gulf.

The inhabitants of Bahrein, which had formerly been a province of Persia, were partly Jews, partly Persians, who had capitulated to Mohammed, and had been allowed to retain their own creeds. After the prophet's death, they had at once shaken off the unwelcome yoke, which, however, had again been put upon them by Omar. The interior of the country was inhabited by certain Arabs, highly disaffected against Islam, the innumerable precepts of which they disliked with an intense dislike. No wonder that Abu Saïd made the most marvelous strides in his conversions. In less than two years he had brought over a great part of the people of Bahrein. In 287 Hedjrah, the caliph, sent an army of 10,000 men against Abu Saïd and his followers, but the latter remained victorious, and made the caliph's own general prisoner. He now gained undisputed possession of the whole country, part of which he had only conquered as yet, and having destroyed the old capital Hajar, made Lahsa, his own residence, the capital of the country. While the court of Bagdad was threatened with destruction by this newly-established power on one side, two chiefs of another Karmathian branch appeared, the one in the neighborhood of Kufa, the other in Syria. The first was defeated, captured, and tortured to death; the other was more successful. The governor of Damascus, who marched against him, was beaten most ignominiously. This Karmathian triumph, however, though followed by a few others, was of but short duration. A decisive victory (294 Hedjrah), won by the caliph's general, Wasif, forever put an end to this branch of the Karmathians.

Meanwhile both Karmat and Abu Saïd had become—by what means is matter of great obscurity—faithless to their own creed. We have no certain dates about the death of Karmat. Abu Saïd was killed, together with some of his principal officers, in the bath in his own castle at Lahsa, in 301 Hedjrah, by one of his eunuchs; and four years later his son, Abu Tahir, became his successor, and he has left his name indelibly stamped upon the annals of Islam. In 311 he seized the town of Basra. In the next year he pillaged the caravan which went to Mecca, and ransacked Kufa. In 315 he

once more reappeared in Kufa and in Irak, and gained so decided a victory over the caliph's troops that Bagdad began to tremble before him. In 317 (930 A.D.) the great and decisive blow against Mohammedanism was struck. When the great caravan of pilgrims for the annual pilgrimage had arrived at Mecca, the news suddenly spread that Abu Tahir, the terror of Islam, had appeared at the head of an army in the holy city itself. All attempts to buy him off failed, and a massacre of the most fearful description ensued. With barbarous irony, he asked the victims what had become of the sacred protection of the place. Every one, they had always been told, was safe and inviolable at Mecca. Why was he allowed thus easily to kill them—the race of donkeys? According to some, for 6 days, to others for 11 or 17, the massacre lasted. The numbers killed within the precincts of the temple itself are variously given. The holy places were desecrated, irredeemably almost. But not satisfied with this, Abu Tahir laid hands on the supreme palladium, the black stone itself.

Yet he was apparently mistaken in his calculations. So far from turning the hearts of the faithful from a worship which God did not seem to have defended, the remaining Moslems clung all the more fervently to it. God's decree had certainly permitted all those indignities to be put upon his house, but it was not for them to murmur. The stone gone, they covered the place where it had lain with their kisses. As often as Abu Tahir did not distinctly hinder them by force, the caravans went on their usual annual pilgrimage. In the year 327 the emir of the pilgrimage, Abu Tahir's own personal friend, first succeeded in persuading him to conclude a treaty by which the pilgrimage was allowed again, on payment of five denars for every camel and seven for every horse. Yet the black stone, notwithstanding all efforts on the part of the court of Bagdad, was not returned. Abu Tahir seems altogether to have been a man of extraordinary abilities. Of his valor, with which he also knew how to imbue his followers, the following is told: When he had taken away the black stone and desecrated the holy places, he marched, with 500 horse, upon Bagdad. The caliph Moktader sent 30,000 men, under his best general, to meet him. Having ascertained how small were the rebel's resources, the caliph sent a friendly message to him by the general himself, adjuring him by their previous friendship to desist from his insane attempt, and to make good his escape in time. Whereupon he asked the messenger of how many the caliph's forces consisted. "Thirty thousand," was the answer. "Then go," he said, "and tell your master that he has just sent three men too little." And calling for three of his own men, he commanded one of them to stab himself, the second to throw himself into the Tigris, and the third to jump over a precipice, all of which was instantly done. "You see," he continued, "what my warriors are like, and what numbers mean against such as these." The following night he made a sudden attack upon the enemy, routed them completely, and took the general himself prisoner.

Regarding the special form of belief of the Karmathians, as far as it has been preserved to us, it seems in the beginning—before Ismailism became that mixture of "naturalism," "materialism," of whilom Sabæism, and of Indian incarnations and transmigrations of later days—to have only been a kind of "reformed" Islam. The prophet Karmat, it was held, had brought a new law into the world. By this, many of the Mohammedan tenets are altered, many ancient ceremonies are abrogated, new forms of prayer are introduced, and an entirely new kind of fast is inculcated. Wine is permitted, as well as a few other things prohibited by the Koran. Certain other of the precepts met in this book are turned into mere allegories. Instead of tithes they gave the fifth part of their property to the Imam. Prayer is but the symbol of obedience to their Imam. Fasting is the symbol of silence, or rather of concealment of the religious doctrine from the stranger.

Abu Tahir died almost absolute master of Arabia, Syria, and Irak, in 332 Hedjrah. It was not until seven years later (950 A.D.), under the reign of two of his brothers who had succeeded him, that the black stone was returned to Mecca for an enormous ransom, and fixed there on the seventh pillar of the mosque called Rahmat (God's mercy), in the presence of the emir of the mosque and others, a Spaniard amongst them. Yet the Karmathians were accused of not having returned the stone itself, or, at all events, of having broken it. Forty camels, it was also said, had been unable to carry it away, while a single one had brought it back; one, moreover, that had been lean when it started, and had become fat when it had reached Mecca.

From that time forth, however, the star of the Karmathians began to wane. Little is heard of them of any import till 375, when they were defeated before Kufa—an event which seems to have put an end to their dominion in Irak and Syria. In 378 they were further defeated in battle by Asfar, and their chief lost his life. They retreated to Lahsa, where they fortified themselves; whereupon Asfar marched to Elkatif, took it, and carried away all the baggage, slaves, and animals of the Karmathians of that town, and retired to Basra. This seems to have finally ruined the already weak band of that once formidable power, and nothing further is heard of them in history, although they retained Lahsa down to 430, and later still. Even to this day there exist, according to Palgrave, some disaffected remnants of them at Hasa (the modern name of their whilom center and stronghold), and other tracts of the peninsula; and their antagonism against Mohammedanism, which they have utterly abrogated among themselves, so far from being abated, bids fair to break out anew into open rebellion at the first opportunity.—

KARNAC'. See THEBES.

KARNES, a co. in s. Texas; 735 sq. m.; pop. '90, 3637. The surface for the most part is nearly level. The soil is adapted to pasturage, and furnishes support to large herds of cattle, which are the chief article of export. Co. seat, Karnes City.

KAROO BOKADAM, a harmless fresh-water snake of India, 4 ft. long.

KARR, JEAN BAPTISTE ALPHONSE, a French literary man of considerable eminence, was b. at Paris Nov. 24, 1808. After being educated at home by his father, who was a distinguished pianist, he passed with much distinction through the curriculum of the Collège Bourbon, in which he afterwards, while very young, became a teacher. While employed in this institution, he fell in love, and began to cultivate the muses; and a copy of verses which he sent to the satirical journal, the *Figaro*, formed his introduction to the literary career. His verses were not accepted by the *Figaro*, but its editor asked him to send something in prose, and the result was that he became a regular contributor to the journal. Disappointed in his attachment, he revealed to the world the story of his grief in a novel entitled *Sous les Tilleuls* (1832, 2 vols. 8vo). A youthful desire to astonish, a determination to seem original, made many ignore the real originality of this work; and the curious blending of irony and sentiment, of good sense and nonsense, which form the author's manner, was puzzling to simple people; but the critics declared the book charming; and the public, to whom youthful traits in a novel are never unpleasing, on the whole concurred in the verdict. Encouraged by the success he had met with, Karr soon produced a second novel, which did not diminish his reputation (*Une Heure trop Tard*, 1833); and thereafter, year after year, he produced new works, until he had become a prolific author, and a recognized popular favorite. *Fa Dièze* appeared in 1834; *Vendredi Soir* in 1835; *Le Chemin plus Court* in 1836, the last a work in which he again rehearsed the experiences of his youth—at least, it is popularly believed that in it he told the world his own story. He afterward published *Einerley* (1838); *Geneviève* (1838, 2 vols.); *Clotilde* (1839); *Hortense* (1842); *Am Rauchen* (1842); *Pour ne pas être Treize* and *De Midi à Quatorze Heures* (1842); *Few Bressier* (1845, 2 vols.); *Voyage autour de mon Jardin* (1845, 2 vols.); *La Famille Alain* (1848, 3 vols.); *Histoire de Rose et de Jean Duchemin* (1849); *Les Fées de la Mer* (1850); *Clovis Gosselin* (1851); *Contes et Nouvelles* (1852); *Agathe et Cécile*; *Fort en Thème*; *Soirées de Sainte-Adresse*; *Les Femmes*; *Raoul*; *Lettres écrites de mon Jardin*; *Au Bord de la Mer* (1852–1855); *Promenades hors de mon Jardin* was published in 1857; *La Pénelope Normande* in 1848; *La Pêche en Eau douce et en Eau salée*, the *Dictionnaire du Pêcheur*, in 1860; *Gaîtés Romaines* (1870); *Dieu et le Diable* and *Le Credo du Jardinier* (1875). The publication of a complete edition of his works commenced in 1860. The letters and the sketches which he from time to time wrote from Nice, his place of residence in later years—upon horticulture, and flowers, and fishes—the pleasures of the country and the seaside—still remain among the most delightful and popular of his works.

In 1839 M. Karr became chief editor of the *Figaro*, and in the same year he founded a monthly satirical journal called *Les Guêpes*, which he long conducted with the most brilliant success, gaining for himself a very high reputation as a wit and satirist, but making, as was natural, many enemies, of whom one, a lady, made an attempt upon his life, which happily proved abortive. Several volumes of *Les Guêpes* have been reprinted; so also have been three volumes of sketches, which, under the title of *Bourdonnements*, he began to contribute to the *Siècle* in 1852. M. Karr contributed very largely to periodicals, from which, indeed, many of his works have been republished. At Nice, where he lived for many years, he occupied himself—thriftyly combining the man of business with the enthusiast—with the growth of flowers and fruits; and the most beautiful bouquets sold in Paris were made up of the produce of his garden. Several new varieties of flowers, especially a dahlia, bear his name. He d. in 1890.

KARROO' is the original Hottentot term, now generally adopted into the language of physical geography, for the immense barren tracts of table-lands, about 2,000 ft. above the sea-level, which occupy such a large portion of the surface of the Cape Colony and the region n. of it. The karroos of South Africa are generally composed of shallow beds of the richest clay-soil, resting on a substratum of slaty rock, and only want the fertilizing power of water to render them as productive as any other part of the surface. After heavy rains, luxuriant vegetation quickly springs up, which as quickly perishes; and the different rivers shown on maps as crossing the karroos, are generally little more than dry water-courses, with strings of standing pools in their beds. In the most barren portions the soil is much impregnated with alkaline matter.

The principal karroos of the Cape Colony are found extending in a north-easterly direction, between the Roggeveld and Nieuvelde mountains and the coast ranges, forming a belt of table-land about 350 m. in length, with an average width of 60 m., and only inhabited by the Boers in the winter season, when water and grass are abundant.

Within the last few years, by the introduction of merino sheep, and the construction of dams, land in the karroo is becoming more valuable.

KARS, lately a Turkish stronghold, now a frontier fortress of Russian Armenia, lies about 115 m. s.w. of Tiflis. It is situated on a table-land of upwards of 6,000 ft. in elevation; the climate is therefore rather severe. Pop. '91, 3,941, mostly Armenians, who carry on an active transit trade. In 1828 it was taken from the Turks by the Russians under Paskevitch. Kars was brilliantly defended by the Turks under gen. Williams for six months in 1855. At the beginning of the war of 1877-78, Kars was invested by the Russians, but relieved in July by Mukhtar pasha; besieged again in autumn, it was carried by storm Nov. 18, 1877. Kars, long a bulwark of the Ottoman empire in Asia, was one of the Armenian fortresses the cession of which to Russia was agreed to by the Berlin congress in 1878.

KARSHI (anc. *Nakhsheb*), the second city in size and commercial importance of the khanat of Bokhara, central Asia, is situated on the Shehri Sebz river, 90 m. s.w. of Bokhara city. Karshi is surrounded by cultivated land and numerous gardens. It consists of the city proper and a weakly fortified citadel, has ten caravansaries and a well-supplied bazaar, and is considered likely to be of great importance in the transit-trade organized between Bokhara, Cabul, and India. Karshi is distinguished for the fabrication of knives of various kinds, which are exported to all parts of central Asia, as also to Persia, Arabia, and Turkey, where they realize three or four times the cost price. According to Vámbéry, one kind, with Damascus blades, and handles with gold and silver inlaid, are worked with great taste, and might, both for durability and temper, put to shame the most famous produce of Sheffield and Birmingham. The inhabitants, estimated at about 25,000, are for the most part Usbegs, with a mixture of Tadjiks, Indians, Afghans, and Jews; they are distinguished by their cheerfulness and light-heartedness. The town, the Persian Nezev, was one of the places of residence of Tamerlane.—See Vámbéry's *Travels in Central Asia* (1864).

* **KARSPINSKI'**, FRANCISZEK, 1745-1823; b. Poland; having received his early education under the direction of the Jesuit fathers, lived both in Vienna and Galicia as agent for landed estates. In 1783 he appeared at the court of Stanislaus Augustus, king of Poland, as secretary of prince Adam Czartoryski, in Warsaw. Being averse to the life, either of courts or of a tutor in noble houses, in 1791 he rented two estates in Lithuania for 50 years, and remained there the rest of his life, a great benefactor to his tenants. His poems, which are national, are remarkable for their depth, simplicity, and sweetness. His writings, in 4 vols., were published by Demochowski at Warsaw in 1821; new edition, Leipsic, 1836; and contain, besides songs and idyls, a translation of the Psalms, a tragedy called *Judyta*, and several prose essays. His autobiography is in the hand-book called *Znîcz* at Wilna, 1834.

KARSTEN, HERMANN KARL, b. Prussia, 1817; after completing his studies in Berlin, devoting himself chiefly to botany, undertook a journey through the northern portion of South America, which occupied him, with a brief interval of rest, during 13 years. He made a profound study of the flora of the United States of Colombia, and also of palms, and after his return to Berlin he published *Die Vegetationsorgane der Palmen; Flora Columbiae, and Chemismus der Pflanzencelle*. He was professor of botany at Vienna, 1868-72.

KARSTEN, KARL JOHANN BERNHARD, 1782-1853; b. Germany; studied law at Rostock, but applied himself to medicine, and in 1801 assisted in editing Scheerer's *Universal Journal of Chemistry*. In 1803 he became referendary, and soon after assessor, in the superior mining office in Breslau. In 1806 he went to upper Silesia to take charge of mining, and to furnish the fortress with munitions. He erected the zinc works of Lidognia, in which zinc was first made from cadmia. He gave lectures in Breslau until, in 1819, he was called into the ministry of the interior of Berlin, as private, superior, mining counselor. He wrote *Hand-Book of Metallurgy; Elements of Metallurgy and Metallurgical Science; Metallurgical Travels Through a part of Bavaria and Austria; Sketches of German Mining; Philosophy of Chemistry; Archives of Mining and Metallurgy*, 20 vols.; and, as a continuation of this work, *Archives of Mineralogy, Geognosy, Mining, and Metallurgy*, in 25 vols.

KÂRTTIKEYA, the Hindu Mars, or god of war, a being represented by the Purânîc legends as sprung from Siva, after a most miraculous fashion. The germ of Kârttikeya having fallen into the Ganges, it was on the banks of this river, in a meadow of Sara grass, that the offspring of Siva arose; and as it happened that he was seen by six nymphs, the *Krittikâs* (or Pleiades), the child assumed six faces, to receive nurture from each. Grown up, he fulfilled his mission in killing Târaka, the demon king, whose power, acquired by penances and austerities, threatened the very existence of the gods. He accomplished, besides, other heroic deeds in his battles with the giants, and became the commander-in-chief of the divine armies. Having been brought up by the Krittikâs, he is called *Kârttikeya*, or *Shânmatûra*, the son of six mothers; and from the circumstances adverted to, he bears also the names of *Gângeya*, the son of Gangâ; *Sarabhû*, reared in Sara grass; *Shanmukha*, the god with the six faces, etc. One of his common appellations is *Kumâra*, youthful, since he is generally represented as a fine youth; and

as he is riding on a peacock, he receives sometimes an epithet like *Sikhivāhana*, or "the god whose vehicle is the peacock."

KASAM. See **KAZAN**.

KASANLIK', or **KEZANLIK**, a t. of European Turkey, at the base of the Balkan mountains, 85 m. n.w. of Adrianople, on the Tunja, an affluent of the Maritza. **Kasanlik** was often heard of during the Russo-Turkish war of 1877. Pop. 9,500.

KASBIN, or **KAZVIN**. See **CASBIN**.

KAS'CHAU, a t. of Hungary, is situated in the beautiful valley of the Hernad, surrounded by vine-clad mountains, 40 m. n.w. of Tokay. It contains numerous churches, of which that of St. Elizabeth (built 1342-82), is said to be by far the finest Gothic edifice in Hungary. Silk and woolen goods, and gold, silver, and copper articles are manufactured. Pop., inclusive of suburbs, 30,000. Two battles were fought near Kaschau during the Hungarian revolution, both of which the Austrians gained.

KASHAN', one of the most flourishing towns of Persia, is situated in a well-peopled, well-cultivated district, 3,690 ft. above sea-level, and 120 m. s. of Teheran. The vicinity is celebrated for its fruit, and the town for its extensive manufactures of silk-stuffs, gold brocade, carpets, and copper-wares. It is a large town, and abounds, like all Persian towns, in mosques, bazaars, baths, etc. Pop. 30,000.

KASHGAR'. See **CASHGAR**.

KASHIN', a t. of Russia, in the government of Tver, and 75 m. n.e. of Tver on the Kashinka, a tributary of the Volga. Great part of the town is old and ill built, but it is a place of much activity, rapidly increasing in prosperity and population. Tanning is a principal branch of trade. Candles and linen are largely manufactured. Kashin is celebrated for the extraordinary number of its churches and other ecclesiastical buildings. Pop. '89, 6,833.

KASHMIR'. See **CASHMERE**.

KASKAS'KIA, a river of Illinois, United States, which rises in the eastern part of the state, and, running s.w., falls into the Mississippi at Kaskaskia. It is navigable to Vandalia, 150 miles.

KASKAS'KIA, a precinct in Randolph co., Ill., on the Kaskaskia river. It is the oldest settlement in Illinois, of which it was the capital till 1818. Its founders were Frenchmen, and most of the present inhabitants are of French descent. It has little business. Pop. has declined since '80, 1,212; '90, 862.

KASKAS'KIA INDIANS, a tribe formerly settled in Illinois, whence they were removed by the U. S. government in 1832 to the territory which is now included in Kansas, and in 1867 to a reservation in Indian territory, where the remainder of them, very few in number, still reside. There is a tribal connection between the Kaskaskias and the Peorias and other Illinois Indians. The former are rather more intelligent than is usually the case, and have taken kindly to civilization.

KASSIMOF', a t. in the n.e. of the government of Riazan, European Russia, on the left bank of the Oka, dates from the 12th century. Pop. '89, 15,769. The chief branch of industry is tanning. In the vicinity are several tombstones and other interesting relics of the time of the Mongolian rule.

KASSON, JOHN ADAMS, b. Vt., 1822; graduated in 1842, at the university of Vermont; practiced law at St. Louis; in 1857 removed to Iowa; became assistant postmaster-general in 1861; elected to congress in 1862, '64, '72, and '74; 1877-81 minister to Austria; re-elected to congress 1880 and 1882; minister to Germany, 1884-85.

KASTAMU'NI, a t. of Turkey in Asia, in the n. of Anatolia, is capital of a vilayet of the same name. There is abundant copper in the vicinity. It contains thirty mosques, and about as many public baths; but its industrial products comprise only cotton goods to a small extent, and some copper-wares. Pop. 30-40,000.

KATAH'DIN, or **KTAADN**, the highest mountain in Maine, 5,200 ft. above the sea. It is in Piscataquis co., in a dense wilderness and difficult of access, and the view from the summit is wild and grand.

KATER, HENRY, a mechanist of considerable eminence, was b. at Bristol in 1777, and d. in London, in 1835. At his father's desire, he began the study of the law, but in 1794 relinquished his legal studies, and obtained a commission in the 12th regiment of foot, then stationed in India. During the following year he was actively engaged, under col. Lambton, in the trigonometric survey of India; and on his return, in 1808, became a student in the senior department at Sandhurst, and was shortly afterwards promoted to a company in the 62d regiment.

His contributions to science are chiefly to be found in the *Philosophical Transactions*, to which, between the years 1813 and 1828, he contributed fifteen papers. The most important of these memoirs are those relating to his determination of the length of the seconds' pendulum at the latitude of London; and those which describe his "floating collimator," an instrument for aiding the determination of the horizontal or zenith points.

For the invention of this instrument, he received the gold medal of the royal astronomical society. In addition to these memoirs, he was, conjointly with Dr. Lardner, the author of "A Treatise on Mechanics" in the *Cabinet Cyclopaedia*. Most of the learned societies in Great Britain and on the continent enrolled him among their members. His memoirs on the verification and comparison of the standards of weights and measures of Great Britain and Ireland, induced the emperor of Russia to employ him to construct standards for the weights and measures of that country; and for these labors he received the order of St. Anne, and a diamond snuff-box. He died from an affection of the lungs in the 53d year of his age.

KATIF', a fortified t. in Arabia, on the Persian gulf. It has a trade in pearls from the adjacent fishery. Pop. 6,000.

KATKOFF', MIKHAIL NIKIFOROVITCH, b. in Moscow, 1818. After finishing his studies in Königsberg and Berlin, he was for several years professor in philosophy in Moscow. He relinquished this position in 1856, to devote himself to journalism, in which he acquired an immense influence. He was an extreme defender of imperial absolutism, and was the best known representative of Russian Chauvinism. D. 1887.

KATMANDU', CATMANDOO, or KHATMANDU. See NEPAUL.

KA'TRINE, LOCH, one of the most celebrated of Scottish lakes, is situated near the s. w. border of Perthshire. It is 8 m. in length, and three-quarters of a mile in mean breadth; greatest depth, 78 fathoms; height above the sea, about 370 feet. Its shape is serpentine, and displays great variety of shore and background. Ben Venue and Ben An are on its banks. It contains several islets, one of which, Ellen's isle, is the center of the action of the *Lady of the Lake*. Several of Wordsworth's lyrics also were written on subjects suggested in this locality.

The waters of Loch Katrine are remarkably pure, having only one degree of hardness, and in all, two grains of solid matter to the gallon. The water-supply of the city of Glasgow (q. v.) is drawn from this lake and those connected with it (Vennachar and Achray). The water is conducted first by a tunnel 6,975 ft. long through a mountain, and then by aqueducts, pipes, and tunnels, to the reservoir near the city—a distance of upwards of 25 miles.

KAT RIVER, a branch of the Great Fish river, in the Cape Colony, rising in the Didimaberg, in the valleys of which, in 1828, were settled, under the care of the London mission society, a large body of Hottentots and Bastaards, who occupied the country formerly inhabited by the Kaffer chief Macomo and his people. But in the commencement of the war of 1850, the credulous Hottentot population, believing that the colonists were about to drive them from their farms, threw themselves into the arms of the Kaffir chiefs, and expelling the missionaries, invaded the colony. This led to the breaking up of the settlement as a mission station and exclusive native reserve; and it now forms the division of Stockenstroem, and is inhabited by a rather dense, mixed population of Hottentots, Fingoes, and Europeans. It is one of the best watered, wooded, and fertile districts in the Cape Colony, and includes an area of about 400 sq. miles.

KÁTSENA, a large, but now desolate t. of Central Africa, capital of a province of the same name, subject to the sultan of Sókoto, is situated in a beautiful and salubrious district in lat. 12° 54' n., and long. 7° 25' e. 90 m. n. w. of Kanó. It is surrounded by a wall about 14 m. in circuit, and contained at one time at least 100,000 inhabitants. In 1807 the conquering Fúlbe assailed it, and a war was commenced, which lasted for upwards of seven years. The capture of Kátsena was achieved only through its destruction. It has now a population of 8,000, and Kanó (q. v.) has taken its place as the center of commerce for the country.

KATSU ÁWA, a Japanese statesman, b. about 1820. Of progressive ideas, he became, after witnessing com. Perry's actions and methods in 1854, a strong adherent to the party representing "New Japan." As one of the officers in the tycoon's navy he commanded the steamer that in 1861 carried the Japanese embassy to America. In 1868, through his friendship with Saigo (see SAIGO), he saved Yedo from the torch. At that time the minister of the tycoon, he advised his master to resign, which the latter did. The assassination of Katsu Áwa was three times attempted by disappointed retainers of the tycoon. Retiring with his master to Shidzuoka, Katsu Áwa was recalled by the mikado, and made secretary of the navy and afterward imperial adviser. Katsu Áwa sent his son to the United States to study at the naval academy at Annapolis, from which he graduated.

KATTIMUNDUO', or CUTTIMUNDUO, a substance somewhat resembling gutta-percha. It is the milky juice of the East Indian plant, *euphorbia nerifolia*, and is either obtained as a natural gum, which has oozed through the bark, or by making incisions and collecting the juice which flows. It is much used in India as a cement for knife-handles and for similar purposes, but is not exported to other countries.

KATTYWAR', a term originally applied to one of the ten districts of the peninsula of Guzerat, has gradually been made to extend, as a collective name, to the whole of them. In this larger sense, it stretches in n. lat. from 20° 42' to 23° 10', and in e. long. from 69°

5' to 72° 14', containing 21,000 sq. m., and 1,475,685 inhabitants. This province of India, touching on part of its eastern frontier the district of Ahmedabad, is everywhere else bounded by water—the runn and gulf of Cutch, the Arabian sea, and the gulf of Cambay. Politically, the country is divided among more than 200 chiefs, some of them paying tribute to the Guicowar of Guzerat, and the rest to the British government, but all of them being under the protection of the latter since the year 1820. Between them these petty princes have a revenue of £865,270 sterling, and a force of about 4,000 cavalry and 8,000 infantry. The climate is unhealthy, and the surface is generally undulating. The principal crops are millet, maize, wheat, sugar, and cotton.

KATUNGA, or **EYEO**, a t. of Gando, West Africa, 25 m. from the mouth of a tributary of the Niger, and about 75 m. s.s.w. of Bussa. It is surrounded by a mud wall and a ditch. There is a brisk trade in yams, corn, goats, sheep, fowls, native cloths, etc. Pop. supposed to be about 15,000.

KĀTYĀYANA, a name of great celebrity in the literary history of India. It belongs, in all probability, to several personages renowned for their contributions to the grammatical and ritual literature of the Brahmanical Hindus; but it is met with also amongst the names of the chief disciples of the Buddha, S'ākyamuni.—The most celebrated personage of this name, however, is Kātyāyana, the critic of the great grammarian Pāṇini; and he is most likely the same with the Kātyāyana who wrote the grammatical treatise called the *Prātisākhya* of the white Yajurveda. See **VEDA**. Professor Goldstücker, in his *Pāṇini*, etc., *his Place in Sanskrit Literature* (London, 1861), has shown that he cannot have been a contemporary of Pāṇini, as was generally assumed; and in a paper recently read by him before the Royal Asiatic society (Feb., 1863) he has proved that this Kātyāyana lived at the same time as the great grammarian Patanjali, whose date he had previously fixed between 140 and 120 before the Christian era.

KATYDID, *Platyphylum concavum*, a species of grasshopper (q.v.) of a pale-green color, a native of North America, very plentiful in some parts of the United States, where its peculiar note is always to be heard during the summer, from the evening twilight till the middle of the night. This note is almost like a shrill articulation of the three syllables kat-y-did, following each other in quick succession, after which there is a pause or two or three minutes. The organ of sound is a transparent elastic membrane in a strong oval frame in each of the wing-covers; these membranes, by the overlapping of the wing-covers, can be made to rub against one another, and the sound is produced by the friction.

KATZBACH, a small river in the Prussian province of Silesia, falling into the Oder at Parchwitz. It has become famous in history from the battle fought on its banks on Aug. 26, 1813, between the French troops under marshal Macdonald and the Prussians under Blücher, in which the latter were completely victorious. The French lost in the battle of the Katzbach 5,000 killed, and 18,000 wounded and prisoners, with 103 cannons, two eagles, and 250 ammunition-wagons.

KAUAI, the largest of the Hawaiian islands, in lat. 22° n., long. 159° 30' w.; 527 sq. m.; pop. '90, 11,859. Wailua, the highest peak, near the center, rises about 6,000 feet. West of this is a table-land 3,000 ft. high, of 40 sq. miles. It is separated from Niihau island on the s.w. by Kaulaka passage. The valleys are numerous, and the soil in them is often 10 ft. deep. There are large tracts of arable land. The s.w. portions are dry and sterile. The largest river is the Hanalei, emptying into a harbor of the same name. The principal town is Koloa. This and Nawiliwili have good anchorage. The island gives evidence of volcanic origin. The chief products are sugar and rice, and hides and tallow are exported. Bread-fruits, bananas, and all tropical fruits grow in abundance.

KAUFFMANN, MARIA ANGELICA, 1740-1807; b. at Coire, in Switzerland; died in Rome. A gifted woman of many accomplishments, especially distinguished as a portrait painter. She was daughter of a painter, exhibiting at the age of 12 intellect of a high order and such familiarity with literature, history, and art as to attract marked attention. Her father, fully appreciative of her talents, devoted himself to her education and took her to Italy. Bishop Neoroni of Como, hearing of the rare genius of the child, sent for her, was charmed by her intelligence and beauty, and sat to her for his portrait. It was a success, and at the age of 13 she was already overtaxed with orders. At 20, already celebrated, her father traveled with her to Florence, Parma, Rome, Bologna, Naples, and Venice. At Bologna she executed an etching entitled "The Toilet." At the age of 23 at Rome, she was the friend of Winckelman and Rafael Mengs, both of whom had a high opinion of her skill as an artist. The former sat to her for his portrait, and was enthusiastic in appreciation of her accomplishments. A few years later she was deceived into a marriage with a spurious count Horn, from whom she not long afterwards obtained a divorce. All these years she was engaged on portraits of the eminent men and women of high rank who were attracted by her fame. She accompanied lady Wentworth to England, where she was received with honor in the highest circles, where her beauty, genius, and pure character made her life an ovation. Portraits by her hand were the rage. She joined in the organization of the English royal academy, was one of its original 36 members, held a prominent place in its exhi-

bitions, and was honored with the warm friendship of sir Joshua Reynolds. When a commission of five was appointed to decorate St. Paul's cathedral, she was associated with Reynolds, West, Bray, and Cipriani on that commission. In 1781, after the death of her father, she married signor Antonio Zucchi, a Venetian, and thenceforward resided in Venice and Rome. At Venice she painted one of her historical pieces, "Leonardo Dying in the Arms of Francis I." At Rome she attracted the friendship of Goethe, Herder, and Klopstock; and her last years were crowned with respect and honor. The list of her works is large. Portraiture of the noted beauties of her time in Italy and England was considered her *forte*. Of the grace and high refinement of her style we have a good example in "The Vestalina," of late years widely known by photographs and miniature copies on porcelain. See life, in *Art Journal* (1890).

KAUFMAN, a co. n.e. of the center of Texas, in the valley of Trinity river; 832 sq. m.: pop., 1890, 21,598. It is well timbered, and has a fertile soil, producing cotton, grain, and live-stock. Co. seat, Kaufman.

KAUFMANN, CONSTANTIN PETROVITCH VON; b. Mar. 3, 1818, in the Baltic provinces of Russia. He won distinction first as an engineer, and afterwards served as chief of staff in the Caucasus. Later he served for a time in the war department, and aided in reorganizing the army. In 1865 he was made governor-general of the military division of Wilna, and in 1867 of the newly-formed division of Turkistan. In the latter position he won great distinction by his success in strengthening and extending Russian influence in central Asia. He waged a successful war against Bokhara, and subjugated the khan of Khiva, in 1873, as well as Merv in 1880. He d. 1882.

KAUFMANN, THEODOR; b. Nelsen, 1814; studied painting in Hamburg and Munich; and during the political troubles in Germany in 1847-49, he came to the United States. In the war of the rebellion he served in the army, and afterwards lived in Boston. His chief pictures are: "On to Liberty;" "Gen. Sherman near the Watch-fire;" "A Pacific Railway Train Attacked by Indians."

KAULBACH, WILHELM VON, a celebrated German painter, was b. at Arolsen, in the principality of Waldeck, Oct. 15, 1805, and in his 17th year entered the academy of arts at Düsseldorf, where he soon became one of Cornelius's best pupils. He seemed thoroughly penetrated by the severely ideal and allegorical spirit of that great master, yet even from the first he displayed no lack of individual genius. Among his first important productions (1828-29) were six symbolical figures, the best-known of which is "Apollo among the Muses." To the same period belongs a work of a wholly different and even opposite character, "The Madhouse," conceived and executed in the most vigorously realistic spirit. It added immensely to Kaulbach's reputation, and king Ludwig of Bavaria now employed him to decorate duke Maximilian's palace in Munich. For this he executed, in the strictly antique style, 16 frescos illustrating the fable of Psyche and Cupid. His designs from Klopstock, Goethe, and Wieland, for the same monarch, are also worthy of mention. In 1837 Kaulbach completed his "Battle of the Huns," a picture representing the grand legend of the continued struggle in mid-air of the souls of the Huns and Romans who had fallen before the walls of Rome, which was regarded as the culmination of the new German school. Nevertheless, the realism of which we have spoken still found expression in various works. His patient study of Hogarth is quite visible in his illustrations of Schiller, of Goethe's *Faust*, and *Reineke Fuchs*. In 1846 Kaulbach completed what is probably his *chef-d'œuvre*, the "Destruction of Jerusalem by Titus." It is a marvelous mixture of history and symbolism. In 1849 Kaulbach succeeded Cornelius as director of the Bavarian academy of art. In 1859 he finished his "Battle of Salamis." The *grisaille* cartoon (in oil) of Peter Artries is one of his later and most characteristic works; among his other paintings are "The Tower of Babel," and a series of frescos at Munich. Latterly he painted many portraits. He died April 7, 1874.

KAUNITZ, WENZEL ANTON, Prince von, Count of Rietberg, a great Austrian statesman, born at Vienna in 1711; studied at Vienna, Leipsic, and Leyden; traveled in England, France, and Italy; and being the head of an ancient and honorable family, soon received important political appointments from the emperor Charles VI. He continued to fill important situations under Maria Theresa. He gained great fame as a diplomatist, in 1748, at the congress of Aix-la-Chapelle. He was afterwards Austrian ambassador at the French court; and in 1753 was appointed court and state chancellor, and in 1756 chancellor also for the Netherlands and Italy, and continued for almost 40 years to have the principal direction of Austrian politics. The project of the partition of Poland originated with him. He had so much to do in the management of the political affairs of Europe that he was jocularly called the European coach-driver. He was very vain and confident of his own abilities, so that his highest praise for anything which he thought well done was to say with an oath: "I could not have done it better myself." He was narrow in his political views, regarding exclusively the supposed interests of Austria, but sincere and upright according to his notion of his duty. He took a very active part in the ecclesiastical reforms of Joseph II., so that at Rome he was styled *the heretical minister*. He was a liberal patron of the arts and sciences. He

URBANA

retired from public life on account of old age, when Francis II. ascended the throne, and died June 27, 1794.

KAURI, or KOWRIE, or K. PINE, *Dammara australis*, a species of dammar (q.v.), a native of New Zealand. It is a tree of great size and beauty, and is said sometimes to attain a height of 140 ft. or more, with whorls of branches, the lower of which die off as it becomes old. The timber is white, close-grained, durable, flexible, and very valuable for masts, yards, and planks. It is much used for masts for the British navy, no other being considered equal to them. The Fiji islands, New Hebrides, and Australia produce other species, the timber of all which is sold under the name of *K. pine*, although there are differences of quality. All of them are trees of dark dense foliage, All of them also produce a resin called K. RESIN, or K. GUM, and sometimes Australian copal and Australian dammar, of which large quantities are imported into Britain and North America, chiefly from New Zealand. It is sometimes found in pieces as large as a child's head, of a dull amber color, where forests of these trees have formerly grown, and is obtained by digging. It is also collected from the trees from which it has newly exuded, and is then of a whitish color. It is used for making varnishes, etc.

KAVA. See AVA.

KAVANAGH, JULIA, 1824-77; b. in Ireland; educated in France, but after 1844 resided in London. She was a remarkably graceful and intelligent writer of fiction, her works being devoted mainly to the illustration of home life and domestic traits. She wrote also several biographical sketches, including *French Women of Letters*; *English Women of Letters*; and *Women of Christianity Exemplary for Piety*. Among her works of fiction are *Nathalie*; *Daisy Burns*; *Adèle*; *Grace Lee*; and *Sybil's Second Love*.

KAVANAUGH, HUBBARD HINDE, D.D.; b. Ky., 1802. He joined the Kentucky Methodist Episcopal conference in 1823, and was eminently successful as an itinerant. In 1839 he was superintendent of public instruction in Kentucky, and in 1854 was ordained a bishop of the Methodist church, south. He d. 1884.

KAVI, the ancient sacred language of Java. There are three dialects of the Javanese—the vulgar tongue, the polite dialect, and the ancient or recondite. All of these have words from the Sanskrit, Arabic, and Tehigu, brought in, not by conquest, but by religion and commerce. The largest infusion of these is of Sanskrit. In the common language of Java the proportion of Sanskrit is about 11 in 100, but in the recondite it is about 40 per cent. The introduction of Sanskrit is traced to the immigration of the Brahmans from India about 2,000 years ago, who brought with them also Hindu civilization and religion. Kavi holds the same relation to the Javanese that the Sanskrit does to the language of India. The word *kavi* signifies learned or wise, and is used because in this dialect is the Javanese literature, consisting of poems, histories, romances, etc. In the 15th c. the Kavi language, with Hinduism, was driven from the island to the small island of Bali.

KAYE, JOHN, D.D., 1783-1853; graduated at Cambridge, where he became successively master and regius professor of divinity. Was made bishop of Bristol in 1820, and 7 years later bishop of Lincoln. He made a study of the Greek and Latin fathers, and published *Writings and Opinions of Clement of Alexandria*; *Writings and Opinions of Justin Martyr*; *The Ecclesiastical History of the Second and Third Centuries*, illustrated from the *Writings of Tertullian*; and *Government of the Church during the First Three Centuries*.

KAYE, Sir JOHN WILLIAM, 1814-76; was for several years employed in the military service of the East India company, and wrote a number of works on oriental subjects, including *History of the War in Afghanistan*; *Life and Correspondence of Lord Metcalfe*; *Life of Sir John Malcolm*; *History of the Sepoy War*, etc.

KAZAN, a t. of Russia, capital of the government, and ancient capital of the kingdom of the same name, is situated on the river Kazanka, 4 m. from the n. bank of the Volga, and 200 m. e.s.e. of Nijni-Novgorod. It was founded in 1257 by a Tartar tribe, and after various vicissitudes was made the capital of an independent kingdom, by the khan of the Golden Horde, which flourished in the 15th century. In 1552 the Russians, under Iwan the terrible, carried the town after a bloody siege, and put an end to the existence of the kingdom. Pop. '97, 131,508. Kazan contains a large number of churches, convents, and mosques, and a university attended by 825 students, and having a library of 80,000 vols. The chief manufactures are soap and leather, cotton goods, flour and starch.

KAZAN (in Tartar, *a golden-bottomed kettle*), a government of Russia, near the Weichsel with Vologda on the n.e. and the government of Nijni-Novgorod on the west. Area, 24,601 sq. m. Pop. '91, 2,208,917—mostly Christians, with a number of Moslems, and some idolaters. The soil is for the most part fertile; corn is exported; the climate is rather severe, but healthy. Cattle-breeding is hampered by want of meadow lands; keeping of bees, and fishing are the chief employments of the people. There is an extensive trade in timber, pitch, and wooden dishes.

KAZIMIRZ, a t. of Poland, in the government of Lublin, on the right bank of the Vistula. It was founded in 1350 and formerly carried on a flourishing trade in grain, in

which a number of English commercial houses established here were engaged. Kazimirz contained (1888) 3174 inhabitants, of whom the majority were Jews.

KAZINCZY, FRANZ, 1759-1831; a Hungarian author and editor, whose writings include plays, poems, travel-sketches, and translations from the English, French, and German. He received a college education and studied law, but followed literature as a profession, and by earnest and persistent effort accomplished much towards the restoration of the Magyar language and the abolition of the use of Latin in its place. In 1794, having been concerned in a political conspiracy, he was brought to trial and sentenced to death, but obtained a commutation and was imprisoned for several years. After his liberation in 1801, his life was peacefully occupied in general literary pursuits.

KAZOO is a toy, wind-instrument, resembling a whistle, about four and a half inches long, open at each end, and having seven orifices to allow the passage of the air. These openings do not require fingering, and by simply talking, whistling or singing into it, any tune may be given, or any animal imitated, as a pig, dog, cock, etc.

KEAN, CHARLES JOHN, second son of Edmund, was b. in 1811, and educated at Eton. When his father fell into ill-health he adopted the stage as a profession. He was popular in the provinces and in America before he achieved reputation in London. He married, in 1842, Miss Ellen Tree, and till his death in 1868 they acted together. He became the lessee of the Princess's theater in 1850, and was the director of the royal theatricals. His management at the Princess's theater was distinguished chiefly by the splendid manner in which certain plays were produced. The utmost pains were expended on scenery and dress, and as much care was taken to avoid anachronisms as to secure good acting. *Sardanapalus*, produced in 1853, was perhaps the most striking of these "restorations," as they are called. Kean attempted the parts in which his father shone, but did not succeed in being more than a comparative to the superlative which the elder generation of playgoers remembered. In a lower line of character, and in such pieces as the *Corsican Brothers*; *The Wife's Secret*; and *Louis XI.*, he was more at home than in the world of Shakespeare.

KEAN, EDMUND, was b. in London, Nov. 4, 1787. His father was a stage-carpenter; his mother an actress. From his infancy the glare of the foot-lights was familiar to him as the light of common day. While but a child, he made his appearance on the boards, and on one occasion gave a recitation before George III. at Windsor castle. In 1803 he joined a strolling company in Scotland, and for 11 years he performed in country theaters. He came to London in 1814, in which year he appeared as "Shylock" in *Drury Lane*, his immense popularity filling the coffers of the managing committee, and enriching himself. All London flocked to hear him; and Hazlitt, Hunt, and Lamb, who were constantly in the pit, declared that his acting was like "teaching Shakespeare by a flash of lightning." Kean made his first professional visit to the United States in 1820, and was received at first with great enthusiasm; but in the following spring, having broken an engagement in Boston on account of the smallness of the audiences attracted by his fame, he was severely censured, and not long afterwards returned to England, where worse troubles, caused by his vices, awaited him. An action was brought against him in 1825 for criminal conversation with the wife of another man, and he was mulcted for damages in the sum of £800. In consequence of this scandal he was hissed from the stage in London and Edinburgh. In the same year he came again to the United States, but was met at first with riotous hostility wherever he attempted to act. Having made an apology for his conduct, he appeared in New York and Philadelphia, but was denied an opportunity to act in Boston and Baltimore. The Tuscarora Indians, however, elected him a chief, giving him the name of Atlantenouidet. This honor not being sufficient to retain him in this country, he returned to England in 1826, where his health and spirits were soon completely broken by his habits of intoxication, from which he never recovered. His dramatic talent was of a high order, and, if his intellect had not been beclouded by strong drink, he would no doubt have achieved an honorable and enduring fame. In spite of this drawback his acting was at times so grand as to excite the wonder and delight of his audiences. His death took place at Richmond, May 15, 1833. His great characters were "Othello," "Shylock," "Richard III.," and "Sir Giles Overreach." Kean, although small of stature, was effective and even grand on account of a noble mien and a strong and flexible voice.

KEAN, ELLEN (TREE), 1805-80; b. London; married to Charles John Kean in 1842. She made her first appearance upon the stage at Covent Garden theater, in London, in 1823, and soon established a high reputation both in tragedy and comedy. In 1836 she came to the United States, and here as well as in Canada met with great success. Upon the death of her husband in 1868 she retired from the stage.

KEANE, JOHN, first Lord Keane, 1781-1844; b. at Belmont, co. Waterford, Ireland. Entering the army as ensign in his 13th year, he served in the campaign in Egypt as aid-de-camp to lord Cavan. In Spain he gained the rank of maj. gen., and in 1814 was at first assigned to the command of the land forces sent to attack New Orleans, but, on being superseded by sir Edward Pakenham, he served in the expedition in a subordinate capacity and was twice wounded. In 1823 he was appointed commander-

in-chief of the army of the West Indies, serving until 1830, and for a part of the time administering the civil government of Jamaica. In 1833 he was transferred to the service in India, and in 1839 succeeded in taking the fortress of Ghuznee in Afghanistan, which till then had been thought impregnable. For this he was raised to the peerage as baron Keane, and received a pension of £2,000 from the East India company.

KEANE, JOHN JOSEPH, D.D., b. Donegal, Ireland, 1839; graduated at St. Charles' coll., and St. Mary's seminary, Baltimore; was asst. pastor of St. Patrick's Rom. Cath. church, Washington, D. C.; consecrated bp. of Richmond, 1878; appointed rector of the Catholic university of America, 1886; resigned at the pope's request, 1896; and was appointed bishop assistant at the pontifical throne in Rome, 1897.

KEANG-SI, an inland province of China, lies immediately n.w. of the maritime province of Fo-kien. See CHINESE EMPIRE.

KEANG-SU', an important province of China, the wealthiest and most densely peopled district of the empire. See CHINESE EMPIRE.

KEARNEY, a co. in w. Kansas; formed, 1873; drained by Arkansas river; crossed by Atchison, Topeka and Santa Fé railroad; 864 sq. m. Pop. '90, 1591. Co. seat, Hartland.

KEARNEY, a co. in the s. part of Nebraska, bounded on the n. by the Platte river, intersected by the Burlington Route and the Kansas City and Omaha railroads; 525 sq. m.; pop. '90, 9061. The surface is slightly undulatory, and the soil specially adapted to pasture. Timber is scarce. Co. seat, Minden.

KEARNEY, city and co. seat of Buffalo co., Neb.; on the Union Pacific and the Burlington Route railroads; 135 miles w. of Lincoln. It contains the Platte institute (Prot. Epis.), high school, public library, city hospital, gas and electric light plants, electric street railroad system, waterworks, national and state banks, flour, cotton, and oatmeal mills, bicycle factory, etc. The city is connected with the Platte river by a canal 13 miles long, by which power for manufacturing is provided. Pop. '90, 8,074.

KEARNEY, DENIS, b. Ireland, 1847; at the age of six years was employed as post boy in his native village, Oakmont, co. Cork; and when 11 years old went to sea as a cabin-boy on a voyage to New York. From this time he followed the sea until 1872, when, being in San Francisco, he obtained employment as foreman of a gang of stevedores, and soon after went into the draying business on his own account. He interested himself in local politics, and was secretary of a club. In 1877, influenced by the interference with his business of bonded draymen, he began to incite the laboring men of San Francisco to an incendiary condition of mind, and soon gained great ascendancy over them. Mass meetings were organized on the "Sand-lots," a suburb of the city, where Kearney ruled supreme, and where he soon attracted general public notice on account of the savage and uncompromising nature of his attacks upon capital, Chinese labor, and other so-called grievances. His influence rapidly increased, until his powerful following were able to pack a constitutional convention, and organize a new constitution for the great state of California which was largely in their own apparent interest, and certainly most detrimental to capital and vested interests within the state. In the summer of 1878 he visited the eastern states, accompanied by a private secretary, making something in the nature of a "progress," and delivering his excited and intemperate speeches in the leading Atlantic cities and in the west. He did not succeed in engrossing public attention or interest to any great extent, and returned to California without having made the impression which he had anticipated.

KEARNY, LAWRENCE, 1789-1868; b. N. J.; naval officer; entered the U. S. navy as a midshipman in 1807, and performed important services during the war of 1812. At the close of the war he was dispatched to the gulf of Mexico and the Caribbean sea, at this time infested with pirates, whose strongholds were hidden among the West India islands and along the coast. He discovered and destroyed their haunts and captured their vessels, and rid those waters of what was becoming a serious disturbance to commerce. In 1827 he performed a similar service for the Levant, breaking up the nests of the Greek pirates and destroying their ships. He was promoted to be lieut. in 1813, commander in 1825, capt. in 1832, and commodore in 1866. In 1841 he was appointed to the command of the East India squadron, and succeeded in gaining certain trade concessions from the Chinese, which were afterwards made permanent by treaty.

KEARNY, PHILIP, 1815-62; b. New York; military officer; graduated at Columbia college and studied law, but accepted the appointment of lieut. in the 1st U. S. dragoons in 1837. Being ordered to repair to France to study and report upon the French system of cavalry tactics, he entered the polytechnic school at Saumur, and afterwards volunteered to the ranks of the *chasseurs d'Afrique*, and fought with this celebrated corps in Egypt with such distinction that he was decorated with the cross of the legion of honor. From 1841 to the outbreak of the Mexican war he was on the staff of gen. Scott, with whom he served through the entire campaign in Mexico, winning a reputation for daring and determination unexcelled by that of any other American officer. For conspicuous gallantry in the fights of Contreras and Churubusco, he was brevetted maj.; and, during a magnificent cavalry charge at one of the gates of the city of Mexico, he lost his left arm. In 1851 Kearney resigned from the army and visited Europe, where he devoted himself, however, to the study of his profession, and on the outbreak of the Italian war,

in 1859, entered the French service as a volunteer aid. Being engaged at Magenta and Solferino he was once more decorated, this time by the emperor in person. He entered the war of the rebellion as a brig. gen. of volunteers in the union army, but was soon placed in command of a division in gen. Heintzelman's corps, in which position he distinguished himself at Williamsburg and during the seven days of the peninsula retreat. Gen. Kearney was made a maj. gen. of volunteers July 4, 1862, and on Sept. 1 following was killed while making a night reconnoissance within the confederate lines after the battle of Chantilly, Va. He was a brave and dashing officer, and his loss was mourned by the entire country.

KEARNY, STEPHEN WATTS, 1794-1848; b. N. J.; was appointed a lieut. in the 13th U. S. infantry in 1812, and received rapid promotion for meritorious conduct. In 1846 he was brig.-gen., and commanded the army of the west, which conquered New Mexico. He was appointed governor of California in 1847, and in the following year received the brevet of maj.-gen. He wrote a *Manual for the Exercise and Maneuvering of U. S. Dragoons*, and other works. See FREMONT, JOHN CHARLES; STOCKTON, ROBERT FIELD.

KEAR-SARGE, MOUNT, an elevation in Carroll co., N. H., belonging to the White mountain group; lat. 44° 6' 20" n., long. 71° 5' 40" w.; height, 2,726 feet. It was for this mountain that the vessel was named which sank the confederate cruiser *Alabama* in 1864. Another mountain, situated in Merrimac co., N. H., is known by the same name. The latter was formerly known as *Kyar-Sarga*, which was easily changed to Kearsarge. Its Indian name was Cowissewaschook, and it is 2,943 ft. high.

KEATING, JOHN M., b. in Philadelphia, Apr. 30, 1852; studied at Seton Hall College and the university of Pennsylvania. In the latter he became lecturer on diseases of children. Besides being editor of the *Cyclopædia of the Diseases of Children* and *The Climatologist*, he published *The Mother's Guide in the Management and Feeding of Infants* (1881); *Maternity, Infancy, and Childhood*, and *Mother and Child*.

KEATS, JOHN, an English poet, was b. in London in 1795. He was educated at Enfield, and was afterwards apprenticed to a surgeon. Certain of his sonnets were published in the *Examiner*, then edited by Mr. Leigh Hunt, and received his cordial admiration. He published in 1817 his first volume of poems; and in the following year *Endymion* appeared, dedicated to the memory of Thomas Chatterton. This poem was severely handled in the *Quarterly Review* and in *Blackwood*. He published a third volume of poems, containing *Lamia*, *Isabella*, *Eve of St. Agnes*, the fragment of *Hyperion*, and the odes to the *Nightingale* and the *Grecian Urn*. His health was at this time delicate; and shortly after the publication of his book he went to Italy; and died at Rome, Feb. 23, 1821, his last moments soothed by the tender care of Mr. Severn the artist. His grave is close to Shelley's. There is an admirable memoir of Keats by Monckton Milnes (lord Houghton), also an edition of his poems (1877). See Forman's complete edition of K.'s works (1883); the *Letters of John Keats to Fanny Browne* (1878); and Colvin's *Life of Keats* (1886).

Keats's early poems are disfigured by conceits and affectations, but his latest place him amongst the masters of his art. The *Eve of St. Agnes* is as melodious as any portion of the *Faery Queen*; *Hyperion* has something of the organ-tone of Milton. His influence is strikingly apparent in the subsequent efforts of the English muse.

KEAYNE, Capt. ROBERT, supposed to have been b. in London in 1595. He was a merchant tailor, and, possessing wealth, aided the Plymouth colony as early as 1624. In 1635 he became one of the founders of the colony of Massachusetts Bay, settling at Boston, where in 1638 he organized the "ancient and honorable artillery company," which has been perpetuated to the present time. He represented the city in the general court, 1638-49. He was a liberal contributor to Harvard college, and a legacy left by him was the foundation of the free school, now known as the Boston Latin school. His wife was a daughter of sir John Mansfield, and he was therefore brother-in-law of rev. John Wilson, first minister of Boston. He was a man of many eccentricities, some of which found expression in his will, which is probably the longest, perhaps the oddest, ever made in this country.

KEBLAH, an Arabic word, signifying literally "the south," or "anything opposite." It is employed to designate the point of adoration, or that point of the compass towards which worshippers face when in prayer. Thus the Persian fire-worshippers turn to the east, as the place of the rising sun; the Jews face in the direction of Jerusalem, and the Mohammedans to Mecca.

KEBLE, JOHN, son of the Rev. John Keble of Coln St. Alwynds, Gloucestershire, and Sarah Maule, a lady of Scotch descent, was b. at Fairford, 3 m. from his father's living, April 25, 1792. The elder Keble, a divine of the school of Ken, educated his son at home, and with such success that at the early age of 15 he was elected scholar of Corpus Christi, Oxford, then a small college composed wholly of members on the foundation, but numbering among its scholars such names as Coleridge (sir J. T.) and Arnold of Rugby. In 1810 Keble took a first-class in classics and mathematics; and in the next year was elected to a fellowship at Oriel, one of the highest honors in the university. In 1812 he gained both the Latin and English prize essays, was ordained deacon in 1815, and priest in 1816. Even then he had chosen his career. Neither the prospect of

emolument at Oxford, nor the intellectual attractions of the Oriel common-room, of which Whately and Copleston were then members, and to which Arnold, Pusey, and Newman were soon afterwards added, could charm him from his first love, the life of an English parish priest. For a while he remained at Oxford as tutor and examiner, but soon took active clerical duty, principally assisting his father. In June, 1827, in deference to the wishes of his friends, he published *The Christian Year; or, Thoughts in Verse for the Sundays and Holidays throughout the Year*, portions of which had been written as early as 1819. The success of the small volume, and its influence on religious thought in England, can hardly be overrated. The number of editions sold (some of 3,000 copies) is marvelous. Although of unequal merit, many of the pieces being evidently written to complete the original plan, it is a work of genuine inspiration, combining with rare depth and fullness of religious feeling, the tenderest sensibility and a poet's appreciation of nature in her more sympathetic and human aspects. In 1831 Keble succeeded Milman as professor of poetry. His official prelections are ingenious in theory, and composed in elegant Latin prose. But the time had come when he must quit the pleasant paths of poesy for the tumult of theological controversy. It was a period of peril for the English church. Within was apathy and want of spiritual life, save only in the extreme evangelicals, from whose defects of learning and taste Oxford naturally revolted. Without, a reformed parliament had already suppressed three Irish bishoprics, and seemed not unreluctant to lay hands upon the church at home. In his sermon on national apostasy (1833) Keble gave the signal for the tractarian movement—a movement remarkable for the learning and ascetic saintliness of its promoters, and whose principles were deep submission to authority, implicit reverence for Catholic tradition, with firm belief in the divine prerogatives of the priesthood, the real nature of the sacraments, and the danger of independent speculation. Early in 1835 old Mr. Keble died, and at the close of the same year the poet married Miss Charlotte Clark, the daughter of an old friend of his father, and quitted Fairford for Hursley, a living in the gift of sir W. Heathcote, M.P. When Newman seceded to Rome, Keble, less logical perhaps, but with a truer instinct of fidelity to the Anglican church, remained firm, and amidst the general dismay exerted himself to the utmost to confirm those who wavered. From this period till his death his influence, though comparatively unseen, was not less felt. His *Lyra Innocentium*, in 1847, never equaled *The Christian Year*. Keble died at Bournemouth Mar. 29, 1866, at the age of 74. Keble was the author of a *Life of Bishop Wilson*; an edition of Hooker; and several lesser contributions to periodical literature. A permanent memorial of Keble exists in Keble college, Oxford, incorporated June 6, 1870. Intended as a memorial to Keble, it provides an academical education, economical living, with Christian training in accordance with the principles of the church of England. See *Memoir of Keble* by sir J. T. Coleridge, 1869.

KECSKEMET. See KETSKEMET.

KEDGE, or **KEDGE-ANCHOR**, a small anchor used in large ships to keep the bow of the vessel clear of the bower, or principal anchor. Another use of the kedge is to move the ship from mooring to mooring in the harbor; for this purpose it is conveyed to a distance in a boat, then dropped, and the vessel hauled up towards it by a cable attached.

KEE'CHIES, the remnant of an Indian tribe, formerly resident in Texas, but since 1859 removed to the Washita river in Indian territory. Analogies of language indicate that this tribe is closely allied to the Pawnees. In 1890 they numbered 66.

KEEL is the backbone, as it were, of a ship, running longitudinally along the middle of the bottom. It consists of massive timbers clinched together lengthwise. From it spring, on either side, the ribs on which the ship's sides are laid, and from it, at the bow and stern respectively, the stem and the stern post. As the decks bear by transverse beams upon the ribs, it follows that the whole weight of the ship and its contents exercise an oblique lateral pressure on each side of the keel. It is usually protected by strong iron binding, so that the keel may be as little injured as possible, in the event of the ship taking the ground. In iron vessels of modern construction the keel is frequently dispensed with, corresponding strength being obtained by internal tie-beams, etc.; but the absence of the keel takes away one preventive to rolling from side to side. To be "on an even keel" is to have the keel parallel to the surface of the water, i.e., the bow and stern equally deep.

KEELAGE, a toll or custom payable by ships for resting in a port or harbor.

KEELEY, **LESLIE**, b. in St. Lawrence co., N. Y., in 1836; educated in Chicago. Served as surgeon during the civil war. In 1879 he claimed to have found "in gold as a chloride" a cure for the opium and alcohol habits. He opened an institute at Dwight, Ill., and this and other "Keeley Institutes" gained unusual success, it being stated that out of 200,000 patients only 5 per cent. had relapsed.

KEELHAULING, a punishment formerly in use, for punishing sailors. The culprit was suspended from one yard-arm, and attached to him was a rope passing beneath the keel to the yard-arm on the opposite side of the ship. The punishment consisted in dropping the prisoner suddenly into the water, and hauling him beneath the keel up to the yard-arm on the other side.

KEEL'SON, in a ship, passes inside the vessel from stem to stern, as the keel does outside. The floor-timbers are passed below it, each being bolted through the keel, and alternate ones through the keelson. Like the keel, the keelson is composed of several massive timbers scarfed longitudinally together.

KEELY MOTOR, began to attract attention in 1874, and for several years excited wide interest. Its inventor, John W. Keely, made, and still makes, astounding claims—such as that, from a mixture of water and air made in the “generator” or “multiplier,” he obtains an elastic vapor producing an enormous pressure. The vapor is claimed to be produced mechanically without heat or chemical agents; an analysis of it reveals nothing more than common air. After the vapor moves the piston it passes to the condenser, and is again turned to water to be used in the generator. The mixture of air and water in the “generator,” under the influence of vibratory impulses, the inventor claims, produces the vapor. Various exhibitions have been given, with some remarkable features; but the promised developments have failed to appear, and the force manifested has been thought to be produced by the use of compressed air. The invention, whatever it be, has not yet been perfected.

KEENE, city and co. seat of Cheshire co., N. H.; on the Ashuelot river and the Boston and Maine and the Fitchburg railroads; 50 miles s.w. of Concord. It is within 10 miles of the Monadnock mountains; is surrounded by lofty hills; and was settled 1734, named as at present 1753, and chartered as a city 1874. It contains a high school with full college preparatory course, Elliot City hospital, Unitarian invalids' home, public library, Wheelock, Ladies', and trotting parks, city waterworks plant, Waring sewerage system, national and state banks, gas and electric light plants, and electric street railroads. The industrial interests include the repair shops of the Fitchburg railroad, several chair and furniture factories, pottery, brick yards, toy factories, oil plant, indurated paper works, and door, sash, and blind factories. Pop. '90, 7446.

KEENE, LAURA, the stage name of Miss Mary Moss, given her by Charles Reade 1820-73; b. England; a professional actress on the London boards, where she achieved some reputation in comedy and the drama, particularly in the character of “Pauline” in Bulwer's *Lady of Lyons*. She left England in 1852, and visited the United States and Australia, making her first appearance in New York, Sept. 20, 1852, and afterwards performing in San Francisco. In 1855 she established herself in New York in the management of the Varieties theatre, and at a later period directed the establishment to which she gave her own name. She married John Lutz in 1857; and here, in 1858, she produced *Our American Cousin* for the first time, with Joseph Jefferson as “Asa Trenchard,” and E. A. Sothorn in the small character-part of “Lord Dundreary,” which he afterwards elaborated to be the feature of the piece. It was during one of her presentations of this play in 1865 that President Lincoln was assassinated. In 1860 Miss Keene formed a traveling company, which she continued to direct during the next ten years. Returning to New York in 1870, she continued to appear until a brief period before her death.

KEENER, JOHN CHRISTIAN, D.D., b. Baltimore, 1819; graduated at Wesleyan univ., Conn., 1835; entered the Ala. conference of the Meth. Epis. ministry, 1843; was a pastor in New Orleans, and editor of the *Christian Advocate*, of that city; was elected bp. of the Meth. Epis. church South, 1870. He has been prominent in furthering Mexican missions, and is a pulpit orator of rare ability.

KEEP, in mediæval fortification, was the central and principal tower or building of a castle, and that to which the garrison retired, as a last resort, when the outer ramparts had fallen. See CASTLE.

KEEPER OF THE GREAT SEAL, a judicial officer, whose duties are now generally merged in those of the lord chancellor.

KEEPING THE PEACE. When a person has been assaulted, or is apprehensive of an assault, he may apply to justices to order the assaulting or threatening party with sureties to keep the peace. This is done by the justice ordering the party to enter into recognizances under articles of the peace.

KEEWATIN, properly KEEWAYDIN, an Indian name for the n.w. wind, but now adopted for the territory lying to the n. and e. of Manitoba, and extending to Ontario. Keewatin comprehends an area of 395,000 sq.m.; by the act of Oct. 7, 1876, this division of land was detached from the n.w. territories, and erected into the “district of Keewatin.” That portion of it bordering on lake Superior exhibits some splendid scenery, cliffs rising to the height of hundreds of feet—in the case of Thunder cape, to the height of 1350—and in every variety of form. The country in the interior is rugged, but large portions are covered with fine timber. Rocky ledges, swamps, lakelets, patches of good arable land, larger areas of good or sandy soil, lakes and rivers teeming with fish, with many a fall, are its leading features. Very rich mines of silver have been discovered, and are being worked, and in their neighborhood villages have sprung up, particularly Silver Islet and Prince Arthur's Landing on Thunder bay, and Fort William on the Kaministiquia river, which has been selected as the eastern terminus of the Canada

Pacific railway. That portion of it to the w. of lake Winnipeg is, however, low and fertile, and is being settled principally by immigrants from Iceland.

KEIFER, JOSEPH WARREN, b. O., 1836; educated at Antioch coll.; practiced law at Springfield, O.; served with distinction as a col. in the Union army; was breveted brig.-gen. for gallantry on the battle-fields of Va.; afterwards breveted maj.-gen. for meritorious services in the campaign ending in the surrender of Gen. R. E. Lee. At the conclusion of the war he was appointed lieut.-col. of the 26th U. S. Infantry, but declined the honor. He was a member of the O. senate, 1868-9; and was in congress as a repub. from O. 1877-85. He was a speaker of congress, 1881-83.

KEFF, or **EL-KEFF**, a strongly fortified t. of north Africa, near the Algerian frontier; pop. about 4000. Occupied by the French since 1881.

KEFIR, a drink made by the Tartars of the northern Caucasus, resembling koumiss, but richer in albuminoids and containing less alcohol and not so much acid. It is made by adding a species of native mushroom to cow's milk. Russian physicians prescribe it as an aliment or food, especially in cases of affection of the stomach.

KEIGHLEY, a market and manufacturing t. in the West Riding of Yorkshire, is situated on the river Aire, 8½ m. n.w. of Bradford. Is the principal seat of the manufacture of the machinery used in worsted spinning. A mechanics' institution, opened in 1870, contains also a flourishing art school and museum. Many new churches, factories, and other buildings have been erected. The manufactures of worsted, machines, and paper are important. Pop. '91, 30,810.

KEIGHTLEY, THOMAS, 1789-1872; graduated at Trinity college, Dublin, and passed his life in study, and in the compilation of text-books in history and mythology. He wrote *Mythology of Ancient Greece and Italy*; *Outlines of History*; *History of India*, etc.

KEIM, THEODOR, D.D.; b. at Stuttgart, Württemberg, 1825; was in the university of Tübingen from 1843-48, where, under the guidance of Baur, he devoted himself to philosophy, ecclesiastical history, and biblical criticism; was tutor at Bonn in 1850, and at Tübingen from 1851-55; was ordained deacon in 1857, and archdeacon in 1859, and in 1860 became professor of theology at the university of Zürich. He was prominent among the liberal Protestant theologians of Germany, and published several volumes upon the history of the reformation in different parts of that country. Among his works are *The Historical Christ* and *The History of Jesus of Nazareth*. He d. 1873.

KEITH, a co. in s.w. Nebraska, adjoining Colorado, intersected by the two branches of the Platte river, and traversed by the Union Pacific railroad; 1254 sq.m.; pop. '90, 2556. Co. seat, Ogallala.

KEITH, THE FAMILY OF. The origin of this, as of most other Scottish historical houses, is unascertained. It first appears in record during the latter half of the 12th c., and undoubtedly took its name from the lands of Keith in East Lothian, to which the office of the king's marischal was attached. The family enters the page of history in the beginning of the 14th century. In 1305 sir Robert of Keith, hereditary marischal of Scotland, is found high in the confidence of king Edward I. of England, holding under him the office of joint justiciar of Scotland from the Forth to the Mounth, and sitting in the English council at Westminster as one of the representatives of Scotland. He kept his allegiance to England for some years after Bruce was crowned king of the Scots, but joined that prince before Bannockburn, where he commanded the cavalry, and by a well-timed charge upon the English archers contributed not a little to the fortune of the day. His services were rewarded by a large grant of land in Aberdeenshire; and the possessions of the family were still further increased, before the close of the century, by a marriage with one of the co-heiresses of sir Alexander Fraser, chamberlain of Scotland, Bruce's brother-in-law. Through this alliance the Keiths acquired great estates in Kincardineshire, and having added to them the remarkable sea-girt rock of Dunnottar, they built or restored a castle upon it, which was henceforth their chief seat.

Earls Marischal.—About 1453 the family was ennobled in the person of sir William Keith, who was created earl marischal and lord Keith. His house reached its highest pitch of power in the person of his great-great-grandson, the fourth earl, nicknamed, from the seclusion in which he lived at Dunnottar, "William who kept the tower." By marriage with his kinswoman, the co-heiress of Inverugie, he nearly doubled the family domains, which now included lands in seven shires, Haddington, Linlithgow, Kincardine, Aberdeen, Banff, Elgin, and Caithness. He was reputed the wealthiest peer in Scotland, having a rental of 270,000 marks a year, and being able, it was boasted, to travel from the Tweed to the Pentland Firth, eating every meal and sleeping every night on his own lands. These vast possessions passed to his grandson, George, the fifth earl, who, in 1593, founded the Marischal college and university of Aberdeen. Its walls were inscribed with the words: "THAY HAIF SAID: QUHAT SAY THAY: LAT THAME SAY;" in allusion, it would seem, to the popular reproach which the earl had brought upon himself by adding the lands of the ancient abbey of Deer (q. v.) to his already overgrown estates. The story ran that his wife earnestly entreated him to forego the spoil. "But fourteen score chalders of meal and bear was a sore temptation," says Patrick Gordon of Cluny, and the earl was deaf to her entreaties. Hereupon, it is said, she dreamed a dream, which was thought to portend the downfall of the house of Keith.

She saw the monks of Deer set themselves to work to hew down the crag of Dunnottar with their pen-knives, and while she was laughing them to scorn, "behold! the whole crag, with all its strong and stately buildings, was undermined and fallen in the sea." This was written before 1660. Within little more than half a century Dunnottar was in ruins, and its lord a landless exile. At the age of 23, George, the tenth and last earl marischal, took part, with his younger brother James, in the rising of 1715. He was attainted, and his estates (yielding £1676 a year) were forfeited, but he himself escaped abroad, where he rose to distinction in the Prussian service. His communication to the British government of a political secret which he learned when Prussian ambassador at Madrid procured his pardon in 1759. A year or two afterwards he revisited Scotland, and bought back part of the family estates, but refused the proffered restoration of the family titles. He speedily returned to Prussia, and died there in 1778 at the age of 86. His brother, who had risen in the Prussian service to the rank of field-marshal, fell at Hochkirch in 1758. See KEITH, MARSHAL.

Lords Keith.—Neither having any issue, the direct male line of the house came to an end. His sister, lady Mary, by her marriage, in 1711, with John, sixth earl of Wigton, had a daughter, lady Clementina, who married Charles, tenth lord Elphinstone, by whom, besides other children, she had sir George Keith Elphinstone, who, in 1797, was created lord Keith of Stonehaven marischal in the Irish peerage, and in 1803, lord Keith of Banheath in the peerage of the United Kingdom.

Earls of Kintore.—Sir John Keith, third son of the sixth earl marischal, was, for his services in saving the Scottish regalia during the commonwealth, raised to the peerage by the titles of earl of Kintore and lord Keith of Inverury and Keith-hall. On the death of his grandson, the fourth earl, in 1761, the estates devolved on the last earl marischal; and on his death in 1778 the estates and titles passed to Alexander, sixth lord Falconer of Halkertoun, the grandson of the eldest daughter of the second earl, in whose family they remain.

KEITH, ALEXANDER, 1791–1880; b. Keith Hall, Aberdeenshire; educated in Scotland; a minister of the established church until the disruption in 1843, when he joined the free church. His principal work, *Evidences of the Truth of the Christian Religion Derived from the Literal Fulfillments of Prophecy*, is a standard work, has passed through 37 editions, and been translated into several languages. It was followed by *The Signs of the Times*; *The Land of Israel*; *Demonstration of the Truth of the Christian Religion*. He was an enthusiastic student of prophecy. With Dr. Black and others, as a deputation from the church of Scotland, he visited Palestine to make researches respecting the condition of the Jews, and published a *Narrative of the Mission to the Jews*. This has been illustrated by his son, Dr. G. S. Keith of Edinburgh, who accompanied him in his tour.

KEITH, GEORGE, about 1640–1716; b. Aberdeen, Scotland; educated for the Presbyterian ministry at the university there. He adopted Quaker principles about 1664, and was subsequently associated with both Robert Barclay and George Fox in public discussions for the defense of the sect. In 1682 he taught a Quaker school, and in 1684 was imprisoned in Newgate for preaching without license and for refusing to take an oath. Not long after this he came to America and became surveyor-general of East Jersey. Subsequently, for a short time, he was master of a Quaker school in Philadelphia. In 1690 he visited New England as a Quaker preacher, where he fell into religious disputation with Cotton and Increase Mather. On returning to Philadelphia he became involved in difficulties with his own sect upon doctrinal points, and was denounced as an apostate by William Penn. After this he organized a new sect of Christian (or Baptist) Quakers, contemptuously called by his opponents "Keithians." His next step was to enter the church of England, by which he was appointed a missionary to the members of the sect which he had founded and to the Quakers generally. From 1702 to 1705 he was engaged in this employment, traveling through the northern colonies in America, and preaching wherever he could gain a hearing. Hundreds of Quakers are said to have been baptized by him as a sign that they had renounced their former faith. He returned to England in 1706, and was appointed rector of Edburton in Sussex, where he died. He was a man of wide learning, and wrote extensively, first in favor of, then in opposition to, Quakerism, and published two volumes, giving an account of his travels and experiences in America. He was also the author of *A New Theory of Longitude* (1709).

KEITH, GEORGE KEITH-ELPHINSTONE, Viscount, 1746–1833; b. at Elphinstone, Scotland. He entered the navy in his boyhood, and commanded the frigate *Perseus* at the battle of Bunker Hill in 1775, and in the action at fort Mifflin on the Delaware in 1777. He served in the Mediterranean squadron, under lord Hood, at Toulon, in 1793; was afterwards made an admiral, and in 1795 sent to operate against the Dutch colonies. In this expedition he was very successful, taking possession of Cape Colony, Ceylon, Cochin, Malacca, and the Molucca islands, and finally in Aug., 1796, capturing the Dutch squadron in w. Africa. For these exploits he was elevated to the Irish peerage as baron Keith of Stonehaven marischal. In 1800 he co-operated with the Austrians in the capture of Genoa. He also co-operated with Abercrombie in the Egyptian expedition, and in 1815 commanded the channel fleet which prevented the escape of Napoleon I., and led to his subsequent surrender to capt. Maitland of the *Bellerophon*. In 1814 he

was created viscount Keith of the peerage of the United Kingdom. He died at Perthshire, Scotland.

KEITH, JAMES, best known as **MARSHAL KEITH**, second son of William, ninth earl marischal of Scotland, and lady Mary Drummond, daughter of the earl of Perth, was b. at the castle of Inverugie, in Aberdeenshire, on June 14, 1696. He and his elder brother, George, earl marischal, had for their preceptor their kinsman, Robert Keith, afterwards a bishop in the Scottish Episcopal church, and author of two valuable historical works. The brothers took part, on the side of the house of Stewart, in the insurrection of 1715, and after its suppression were attainted (see **KEITH, THE FAMILY OF**). Having effected his escape, Keith remained in France for some years, improving his knowledge of the military profession, and waiting for an opportunity of obtaining service. In 1719, along with his brother and other Scottish noblemen, he sailed on board the fleet which was fitted out by cardinal Alberoni and the Spanish court for the invasion of Scotland. The Jacobites were defeated at Glenshiel by the royal army, under gen. Wightman, and obliged to retreat. The Spanish auxiliaries were ready to renew the battle, but the Highlanders dispersed, and Keith, after lurking for some time among the mountains, got across the country to Peterhead, and again escaped to the continent. He continued in the Spanish service, but all his expectations of promotion were disappointed, in consequence of his firm attachment to the Protestant Episcopal church. In 1727 he made an application for the colonelcy of an Irish regiment, and received, as he himself tells us, the following answer from the king of Spain, "that how soon he knew I was Roman Catholic, I should not only have what I asked, but that he would take care of my fortune." In consequence of this he applied for a recommendation to the Russian government, which was immediately given, and he received from the czar Peter II. a commission as maj.gen. He distinguished himself in the wars with the Turks and Swedes, particularly at the siege of Oczakoff, and the reduction of the islands of Aland; but finding the Russian service in various respects disagreeable, he entered that of Prussia in 1747. King Frederick knew his merits, and gave him the rank of field-marshal. From this time his name is associated with that of the king of Prussia, who relied as much on the military genius of Keith as he did on the diplomatic ability of his brother, the earl marischal. Keith's talents became still more conspicuous upon the breaking out of the seven years' war. He shared the doubtful fortunes of the king before Prague, and was present at the great victory of Rossbach, and at the retreat from Olmütz. His last battle was not far distant. The Austrians under Daun, and the Prussians under their king, met at Hochkirch on Oct. 14, 1758, Keith commanding the right wing. The Prussian army was beaten, and Keith, surrounded and overwhelmed by numbers while endeavoring to force his way at the bayonet-point, was shot through the heart. His body was recognized by count Lacy, formerly his own scholar in the art of war, and was buried at Hochkirch. Keith wrote a brief but interesting fragment of a memoir of his own life, commencing with the year 1714 and ending in 1734, which was printed in 1843 by the Spalding club. For his military career after entering the Prussian service, reference may be made to Mr. Carlyle's *History of Frederick the Great*.

KEITH, Sir WILLIAM, about 1680-1749; b. in Scotland. After acting for a time as surveyor-general of customs in the southern colonies of America, he was governor of Pennsylvania, 1717-26. His reputation is that of a man intriguing, treacherous, and vain. He wrote a *History of Virginia*, published in 1738, and was the author of a volume of miscellaneous papers that appeared just before his death, which took place in London.

KELAT', or THE FORTRESS. In Persia, near the Russian border. A tract of country 20 m. in length and 5-7 in breadth; is so surrounded by precipitous mountains as to be nearly inaccessible. Wherever the difficulties of ascent or descent on either side of this natural wall were not insurmountable they have been made so by the skill of man. There is also an outer wall or low range of hills inclosing a hollow corresponding to the moat of a fortress. The only two passes into this remarkable region, called the gates of the fortress, have been built up and strongly fortified. It was formerly considered an important stronghold. Part of the valley is under cultivation, and the population amounts to nearly 1,000.

KELAT', the capital of Beloochistan, stands at an elevation of more than 7,000 ft., in lat 28° 53' n., and long. 66° 28' east. Kelat contains about 14,000 inhabitants. Seated on the summit of a hill, Kelat is a place of great military importance. It was occupied by England during the Afghan war; and in 1877 a treaty was concluded with the khan, by which a British agent, with military escort, became resident at the court of Kelat. Pop. about 14,000.

KELLER, GOTTFRIED, Swiss poet and novelist, was born at Zürich in 1819. He studied painting for a time, but turned to literature in 1842. He published a successful volume of poems in 1846. He lived in Heidelberg and Berlin for some time, returning to Zürich in 1861 as first secretary of state, which position he held until 1876. *Neuere Gedichte* was published in 1851, and a complete edition of his poems in 1883 (Berlin). His tales are *Der grüne Heinrich* (1854; 3d ed., Stuttgart, 1884); *Die Leute von Seldwyla*

(Brunswick, 1856); *Sieben Legenden* (Stuttgart, 1872; 2d ed., 1874); *Züricher Novellen* (1876); *Das Sinngedicht* (3d ed., 1881). He died in 1890, leaving his fortune to the university and library of Zürich, and partly as a fund for disabled Swiss soldiers.

KELLER, HELEN ADAMS, deaf, dumb, and blind prodigy; b. Tusculum, Ala., 1880. Her natural afflictions resulted from sickness in infancy. She was placed under the instruction of a teacher from the Perkins institution for the blind at Boston, and her progress in education was so remarkable that she was taken to that institution, where Dr. Howe's methods with Laura Bridgman were followed in the main. The case attracted wide-spread interest and every means to facilitate her development was used. She speedily mastered audible speech, and in 1897 passed the preliminary examinations for admission to Radcliffe college.

KELLERMANN, FRANÇOIS CHRISTOPHE, duke of Valmy; b. May 28, 1735, at Wolfenbuttel, in Alsace; entered the French army, and had risen to the rank of a *maréchal-de-camp* before the revolution broke out. He warmly espoused its cause, and contributed much to its progress in Alsace. In 1792 he received the command of the army of the center on the Moselle, repelled the duke of Brunswick, and delivered France by the famous cannonade of Valmy. Yet, on allegation of treason against the republic, he was imprisoned for ten months, and only liberated on the fall of Robespierre. He afterwards rendered important services in Italy, and on the erection of the empire he was made a marshal and a duke. In the campaigns of 1809 and 1812 he commanded the reserves on the Rhine. At the restoration, he attached himself to the Bourbons. He was moderate and constitutional in his views. He died Sept. 12, 1820.

KELLERMANN, FRANÇOIS ÉTIENNE, 1770-1835; duke of Valmy. A French gen., son of Gen. François Christophe, who served the French republic of 1792-93 with brilliant success, and inheritor of the title conferred by Napoleon on that general. The son was attached to the army of the first consul, distinguished himself by dash and bravery in many battles under Napoleon I., and claimed the credit of the victory of Marengo by reason of the brilliant cavalry charge he led changing the face of the battle. On the first fall of Napoleon he promptly accepted office under Louis XVIII. On Napoleon's return in 1815 he commanded royal troops to oppose him, and ended by humbly offering his services to the emperor. After the battle of Waterloo, in which he distinguished himself by a brilliant and successful cavalry charge, he failed to receive position again from Louis XVIII., but proved a pliant courtier to each succeeding head of the French government.

KELLEY, WILLIAM DARRAH, b. Philadelphia, 1814; orphaned young, supported and educated by his own work and will; first a printer, afterwards learned the trade of jeweler, and while working at his trade studied law; was admitted to the bar in Philadelphia in 1841. From 1846 to 1856 was judge of the court of common pleas of Philadelphia. In 1856, on the repeal of the Missouri compromise, he left the democratic party, became the republican candidate for congress, and was defeated. In 1860 he was delegate to the republican convention at Chicago which nominated Lincoln; and the same autumn was elected representative to the 37th congress from Philadelphia, and his service was interrupted only by his death (1890). The oldest member in consecutive service, he was styled the father of the house. In the first terms of his congressional service Mr. Kelley was recognized as an earnest and eloquent supporter of all measures to circumscribe slavery, to carry on the war for the union, and at its close to assert and defend the equal rights of all races in the privileges of citizenship. Later he became conspicuous for his energetic defense of a tariff for the protection of the iron interests of Pennsylvania, and of protection to all American manufactures. During the later years of his service he was conspicuous by his able championship of opinions on the subject of money, and financial legislation, differing from those usual in both political parties. He was erroneously classed with the advocates of unlimited issues of government notes for money. Nothing in his public life warranted this. But he was an opponent of the monopoly in the issue of money granted to bank corporations, and favored the issue of government notes, payable in gold or silver on demand, in lieu of private corporation bank-notes. He was the great supporter of a bill known as the 3.65 interconvertible bond scheme, introduced in congress in Jan., 1874, which, though ridiculed and violently opposed by both parties when presented, has since been reached in gradual approaches by the secretary of the treasury. Mr. Kelley's views changed much after he began to speak on financial questions, as the result of careful study, which made him a disciple of Henry C. Carey of Philadelphia. He was ever peculiarly comprehensive in his observation of the practical effects of financial legislation on the active industries of the country. At first he saw no great evil lurking in the legislation demonetizing silver; but, when he had studied its effects, he advocated remonetization in speeches so powerful in facts and reasonings, that, before the session closed, remonetization was carried by a majority of five to one in the house of representatives. He was distinguished for the earnestness of his protests against the violent efforts to contract the national "greenback" circulation after all the business transactions of the country for ten years had become adjusted to its volume.

KELLEY'S ISLAND, one of a group of islands at the w. end of lake Erie, a township of Erie co., Ohio. The group is noted for producing the best grapes for wine grown in the United States e. of the Rocky mountains. The southerly side of the island is only 3 m. from the mainland and 12 m. from Sandusky. Area about 3000 acres; pop. '90, 1,156. First surveyed as island No. 6; afterwards known as Cunningham's island; in 1840, by act of the Ohio legislature, it was made the township of Kelley's Island, having been purchased by the brothers Datus and Irad Kelley in 1833-34.

The leading industry is grape-growing and wine-making. The first vines were planted in 1842; the first wine made in 1850. Limestone is largely exported.

Aboriginal antiquities of peculiar interest were discovered in 1834 by Charles Olmstead of Connecticut. These consist of mounds and earthworks, some of which inclose from 3 to 5 acres, in which abounded broken pottery, pipes, hatchets, arrow heads, etc. But more important are the sculptured rocks on the n. side of the island, where the hieroglyphics on the surfaces of rocks are of so marked a character that gen. M. C. Meigs called the attention of the government to them. They were made the subject of a special report by col. Eastman in 1851, with accompanying drawings. One, known as inscription rock, is engraved and described in Schoolcraft's *Indian Antiquities*. He says of it: "It is by far the most extensive and well sculptured and best preserved inscription of the antiquarian period ever found in America."

KELLOGG, CLARA LOUISE, b. Sumterville, S. C., 1842, but removed with her parents to New Haven, Conn., and afterwards to New York, where she prosecuted her musical education under Albites and other excellent teachers. She made her first appearance in Italian opera in the season of 1861-62, playing "Gilda" in *Rigoletto* with remarkable success for a *débutante*. Three years later she appeared in "Marguerite" in Gounod's *Faust*, and established her reputation as a leading vocalist. In 1867 she made her appearance at her majesty's theater, London, under the management of col. Mapleson, and produced a profound impression. Indeed, it is doubtful if Miss Kellogg was ever so highly esteemed in her own country as in England. She returned to America in 1868, and during the next three years traveled through the states, appearing in the cities and large towns, meeting with the most cordial reception at the hands of critical audiences. Returning to London in 1872, she sang with Nilsson at Drury Lane theater, and with even more pronounced success than before, singing before the queen at Buckingham Palace, and being generally complimented in the most flattering terms by the London critics and connoisseurs. From 1874 Miss Kellogg devoted herself to popularizing English opera in America, and with marked success. She organized a strong company, which she rehearsed in a comprehensive repertoire, and traveled through the country, performing in the leading theatres. She first introduced to American audiences the operas of *The Talisman* and the *Lily of Killarney*. Miss Kellogg, while not to be compared with the leading singers of her time—Nilsson, Lucca, Albani, and Patti—is a vocalist of decided natural gifts and acquired excellence. Possessing a voice of great power and remarkable compass, her execution is phenomenal in brilliancy and exactness. Miss Kellogg is, however, unsympathetic, and her voice exhibits a metallic quality which is not grateful to the ear. Her singing appeals rather to the intellect than to the heart, while she has few of the qualities which go to the composition of a great actress. She married, 1887, Carl Strakosch.

KELLOGG, GEORGE, 1812-80; father of Clara Louise; b. Conn.; graduated at the Wesleyan university in 1837; from 1838 to 1841 was principal of an academy at Sumterville, S. C. He is distinguished mainly as an inventor and manufacturer, having invented a machine for making jack-chains, a dovetailing machine, a type-distributing machine, improved surgical instruments, etc.

KELLOGG, WILLIAM PITT, b. Vermont, 1831; graduated at Norwich university, and in 1848, at the age of 18, removed to Peoria, Ill., where he studied law, and was entered at the Fulton co. bar in 1853. He became prominent as delegate to republican conventions, and was chosen presidential elector in 1856 and 1860. In 1861 he held the office of chief-justice of Nebraska. In the war of the rebellion he commanded the 7th Illinois cavalry; was promoted to the rank of brig. gen. for his services in south Missouri, and in the Corinth campaign, in which he commanded Gen. Granger's cavalry brigade until the evacuation of Corinth. He left the army on account of ill-health, and was appointed collector of the port of New Orleans in April, 1865. In 1868 he was elected U. S. senator from Louisiana; was placed on the committees of commerce and private land claims, and resigned in 1872. In 1873 he was elected governor of Louisiana, after a bitter contest between the political parties of the state, which compelled the interference of federal military authority, and resulted in a compromise. He held the office from 1873 to 1877; was elected to the U. S. senate, 1877; to the house, 1883; and was defeated for re-election, 1885.

KELLS (originally *Kentis*), parl. and market t. of the co. of Meath, Leinster, Ireland, is situated on the Blackwater, 9½ m. n.w. of Navan, and has been associated, from a very early period, with the most important events of Irish history, sacred and profane. The town originated in a monastery, which was founded in the middle of the 6th c. by St. Columba; in which monastery the Columban community of Iona found a refuge

when that island was devastated by the Norsemen between 802 and 815. Kells is renowned for an ancient manuscript copy of the gospels, called the book of Kells. It is beautifully executed with colored ornamentation, and is believed to be the work of the 6th or 7th century. It is now preserved in Trinity college, Dublin. Kells was a bishop's see, and before the act of union, it returned two members to the Irish parliament. Its oldest charter is of 11 and 12 Richard II. This was modified by several succeeding charters, under which the municipal body was maintained until the Irish municipal reform act, which created a body of town commissioners. New roads have been formed, and new schools, workhouse, etc., built. Pop. '91, 2,427.

KELLY, JAMES EDWARD, sculptor; b. New York, 1855. He won the designation of "the sculptor of American history" by his works, which include *Sheridan's Ride* (1878); *Paul Revere*, statuette (1882); *Monmouth Battle Monument*, with five historical panels (1883-85); groups for the *Saratoga Monument* (1887); *Grant at Fort Donelson* (1886); *Gen. Devan* and the *Sixth N. Y. Cavalry Monument* at Gettysburg (1890); *Call to Arms*, colossal figure for the Troy Soldiers' monument (1891); *Buford Monument* at Gettysburg (1895); *Battle of Harlem Heights*, for Sons of the Revolution (1897); and a colossal monument to commemorate the *Defense of New Haven*.

KELLY, JOHN, b. N. Y., 1821; began at a very early age to earn his living, being employed in a rope-maker's shop when only eight years old, and after that with a mason. In 1835 he learned the printer's trade in the office where the N. Y. *Herald* was printed, and attracted the notice of James Gordon Bennett, its founder, who employed him in his office. But he returned to the mason's trade as an apprentice, and, having learned it, in 1842 started in business for himself. Having had but little education he devoted his leisure to the study of languages and other subjects, and with great success. His facility for the rapid acquisition of knowledge was always remarkable, and in later years was commended by prof. Bonamy Price and Horace Greeley as quite an exceptional characteristic. While still a young man Mr. Kelly interested himself in politics, particularly of New York city, and in 1849 became a member of the Tammany general committee. In 1853 he was elected alderman for a term of two years, and the following year to congress, to which he was re-elected in 1856. While in congress he gained a reputation by his industry, and by the earnestness with which he supported his convictions. He was a member of the ways and means committee, and was active in pressing the homestead bill, and in opposition to the know-nothing movement. In 1858 he was elected sheriff of New York; held the office until 1861, and was re-elected in 1864. At the close of his term (1869) he visited Europe, remaining abroad two and a half years, and traveling through the Holy Land, Egypt, and Arabia. Mr. Kelly had withdrawn from the Tammany committee in 1864, and during the manipulations of the "Tweed ring" was out of the country. On his return in 1872 he applied himself to the reorganization of the democratic party in the city, and with entire success. In 1876 he was appointed to the important position of comptroller of the city of New York, and so conducted the vast transactions of the finance department as to gain the respect and admiration even of his enemies. Bitterly engaged in the local political faction-fighting for supremacy in the party, Mr. Kelly was the target for constant and severe criticism and animadversion; but his integrity and ability in the administration of his high office were never questioned. Besides his importance in local politics, in which he was recognized as the leader of his party, Mr. Kelly possessed great influence in regard to national affairs, having been a member of nearly every presidential convention after that of 1860. In 1879 he antagonized the regular democratic nominee for governor of the state of New York with such force as to defeat him, running for the office himself on an independent ticket, and polling over 70,000 votes. In Dec., 1880, the term of Mr. Kelly's office as comptroller having expired, he retired from the public service, and after the campaign of 1880 he held no official position, but exercised considerable influence in local and national politics. He was largely instrumental in securing the nomination of Gen. Hancock as democratic candidate for president in 1880; but was less successful in his attempt to defeat the nomination of Grover Cleveland in 1884. During the campaign which resulted in the election of the latter a serious breach occurred between the Tammany wing of the democratic party, of which he was the head, and the "County Democracy," each faction nominating its own candidate for mayor of New York; and he was accused of having neglected the national interests of the party in the ineffectual attempt to secure the election of his candidate for municipal office. The accusation was strongly repelled by him. He d. 1886.

KELLY, ROBERT, LL.D., 1808-56; b. New York; graduated from Columbia college, at the head of his class in 1826. He entered at once into partnership with his brothers, devoting himself to business until 1837, when he retired to give his attention to educational and other public affairs. He was president of the board of education; a member of the state board of regents; a trustee of Madison and New York universities; one of the founders of the free academy (now college) of New York, and also of the university of Rochester. He was for many years president of the board of managers of the New York house of refuge, and active in many other benevolent, financial, and literary associations. He was a scholar of fine attainments, and a master of many languages. At the time of his death he was chamberlain of New York city.

KELLY, WILLIAM, 1807-72; b. New York; son of Robert, and one of three brothers, John, William, and Robert, who at an early age conducted the extensive business of J. W. Kelly & Co., being distinguished as the "boy merchants." In 1837, John

having died, the firm was dissolved, the remaining partners retiring from business. In 1842 he went to reside at Ellerslie, near Rhinebeck, Dutchess co., New York, 15 m. n. of Poughkeepsie, engaging largely in agricultural pursuits. In 1854 he was elected president of the New York state agricultural society, and president of the overseers of the state agricultural college at Ovid, being one of the founders of that institution. He was for years the president of the trustees of Rochester university; was president of the board of Vassar college, and of several religious and charitable organizations. He was an energetic promoter of all enterprises of a benevolent character, and a clear-headed man of business, whose talent was employed in all departments of mercantile activity, railroads, steamboats, manufactures, and banking. He was a democrat in politics, and served his state in its senate, 1855-56, coming before the people as candidate for governor in 1860.

KELOID, or **CHELOID**, a semi-malignant growth of the skin situated on the trunk and extremities, generally occurring in those who are otherwise in good health. The growths are generally flat and expanded, and of an oval, round, or irregular shape. They sometimes remain stationary for years, but have a tendency to ulcerate and bleed, although they often advance slowly, leaving a red, contracted cicatrix behind them. Negroes are said to be more subject to the disease than whites. Similar growths sometimes follow the imperfect cicatrization of burns or blisters, which are more warty and vascular, and often cause much itching and burning. Cooling applications afford temporary relief, but the proper treatment is excision with the knife, which should be thoroughly done, as the bordering parts appear to have a tendency to malignant degeneration, and do not easily heal, repeated operations often being necessary. See **TUMORS**.

KELP (Fr. *varce*) is the crude alkaline matter produced by the combustion of seaweeds, of which the most valued for this purpose are, *fucus vesiculosus*, *F. nodosus*, *F. serratus*, *laminaria digitata*, *L. bulbosa*, *Himanthalia lorea*, and *chorda filum*. These are dried in the sun, and then burned in shallow excavations at a low heat. About 20 or 24 tons of sea-weed yield one ton of kelp, which, as met with in commerce, consists of hard, dark-gray or bluish masses, which have an acrid, caustic taste, and are composed of chloride of sodium, of carbonate of soda (formed by the decomposition of the organic salts of soda), sulphates of soda and potash, chloride of potassium, iodide of potassium or sodium, insoluble salts, and coloring matter. It used to be the great source of soda (the crude carbonate); but as this salt can now be obtained at a lower price and a better quality from the decomposition of sea-salt, it is prepared in far less quantity than formerly. A ton of good kelp will yield about 8 lbs. of iodine (which is solely obtained from this source), large quantities of chloride of potassium, and additionally, "by destructive distillation, a large quantity (from 4 to 10 galls.) of volatile oil, from 4 to 15 galls. of paraffine oil, 3 to 4 galls. of naphtha, and from 1½ to 4 cwt. of sulphate of ammonia."—Ansted's *Channel Islands*, p. 515.

In Brittany the total annual production of kelp is as much as 24,000 tons, while in all the British islands the total manufacture is only 10,000 tons. Prof. Ansted, in the work already quoted, shows that the manufacture of kelp might be made a source of great wealth to the Channel isles. The Guernsey sea-weed is stated by Prof. Graham to be the richest known source of iodine.

KELPIE is a Scottish word denoting a water-sprite, usually in the form of a horse, which is believed by the vulgar and superstitious to forewarn by preternatural lights and sounds those who are destined to be drowned in the vicinity where it appeared to them.

KELSEY, FRANCIS WILLEY, was born near Rochester, New York, in 1858, and graduated from the university of Rochester in 1880. He was instructor in Lake Forest university, near Chicago, from 1880 to 1883; first in the ancient languages, and then in Latin; and in 1883 he was made professor of Latin. Since then he has gone twice to Europe, visiting the universities, and traveling in Italy and Greece. In 1889 he was appointed professor of Latin in the university of Michigan. Professor Kelsey's first publication was a revised American edition of Reid's *Cicero de Senectute*, et de *Amicitia* (1882). In 1884 he published the *De Rerum Natura* of Lucretius, with an extended introduction, and notes on the first, third, and fifth books. His other works are *Cæsar's Gallic War*, with historical introduction, notes and vocabulary (1886); *Xenophon's Anabasis*, Books 1-4, edited in conjunction with professor A. C. Zeno (1889); *Selections from Ovid*, with an introduction on the Greek and Roman mythology (1891); and *Brief Bibliographies of Roman Antiquities and of Latin Literature* (1891).

KELSO, a t. in Scotland, finely placed on the n. bank of the Tweed, 52 m. s.e. from Edinburgh by the North British railway, and 24 m. w. from Berwick by the North-Eastern railway. The name was anciently written *Kalcu* or *Calchou*, and is supposed to have had its origin in a precipitous bank abounding in gypsum, still called the *Chalkheugh*. The town derived its importance if not its existence, from a richly endowed abbey of Tironensian monks, planted at Selkirk in the year 1113, by king David I., when prince of Cumbria, and transplanted, after his accession to the Scottish throne in 1124, "to the church of the blessed Virgin Mary, on the bank of the Tweed beside Roxburgh, in the place called Calkou." The abbey was ruined by the English under the earl of Hertford in 1545, and all that now remains of it is part of the abbey church. It is in the later Norman or Romanesque style, and

had a nave of two bays, n. and s. transepts each of two bays, a central tower still 91 ft. high, and a choir of unascertained length all more or less restored by the Duke of Roxburgh in 1866. A handsome bridge, designed by Rennie, connects Kelso with its suburb of Maxwellheugh, and commands a noble view. On the n.w. of the town, in the midst of a beautiful park, is Floors castle, the seat of the duke of Roxburgh; it was built in 1718, from the design of Sir John Vanbrugh, and was enlarged and improved by the present duke from the designs of the late Mr. Playfair of Edinburgh. On the opposite bank of the Tweed are the ruins of Roxburgh castle, once the strongest fortress on the eastern border. The town of Roxburgh, which rose under the shelter of its walls to be one of the four chief towns in Scotland, has so completely disappeared, that scarcely a vestige of it remains. Kelso was made a burgh of barony in 1634. It has extensive coach building, fishing tackle making and manufactures of agricultural manures and implements. Its pop. in '91 was 4175.

KELUNG, a t. and treaty-port of China, in Formosa, on the n. coast. Deposits of coal are found in its vicinity, for supplies of which the place is much visited by steamers. It has a general trade in camphor, coal, and coal-dust. Pop. 5,000.

KELVIN, LORD. See THOMSON, SIR WILLIAM.

KEMAON, or KAMAUN. See KUMAON.

KEMBLE, ADELAIDE, 1814-79; b. England; the daughter of Charles Kemble, who was the youngest son of Roger Kemble. She was the niece of Mrs. Siddons, the famous actress, and the sister of Mrs. Frances Anne Butler, better known as Fanny Kemble, and began public life with great promise as an operatic singer, making a successful début at Covent Garden, and appearing at several Italian cities, with ever-increasing celebrity. In 1843, after a short, though brilliant professional career, she married Mr. Edward Sartoris, an Italian gentleman of fortune, and retired to his estates in Italy. In 1867 she published *A Week in a French Country House*. In May, 1874, her son, Algernon Charles Sartoris, married the daughter of President Grant.

KEMBLE, CHARLES, brother of John Philip, was b. at Brecknock, in south Wales, Nov. 25, 1775. He received his education, like his brother, at Douai, and like him also, he, on his return to England, devoted himself to the stage. In April, 1794, he made his first appearance at Drury Lane in the character of Malcolm. In July, 1806, he married Miss De Camp, a lady who had distinguished herself in the walk of high-comedy. Kemble, on being appointed examiner of plays, relinquished the stage on April 10, 1840. He died on Nov. 12, 1854, having almost completed his 79th year.

KEMBLE, ELIZABETH, 1761-1836; a daughter of Roger Kemble; made her first appearance upon the stage in 1783 at Drury Lane Theater, taking the part of "Portia" in the *Merchant of Venice*. She was married in 1785 to Mr. Whitlock, an actor, with whom in 1792 she visited the United States on a professional tour. Mrs. Whitlock attained a high degree of public favor, and had the honor of appearing before Washington at Philadelphia. In 1807 she retired from the stage.

KEMBLE, FRANCES ANNE (MRS. FANNY KEMBLE), b. England, 1809; daughter of Charles Kemble, and granddaughter of Roger Kemble. The famous Mrs. Siddons was her father's sister. She made her first appearance on the stage, Oct. 5, 1829, in the character of "Juliet," with her father in the part of "Romeo." In 1832, better known to the world as Fanny Kemble, she came to New York, accompanied by her father. She appeared for the first time as "Bianca," in *Fazio*, at the old Park Theater. She was then in the midst of her theatrical career; success was assured. As "Portia" and "Lady Teazle" she shone unrivaled, and reached her crowning triumph as "Julia," in Sheridan Knowles's masterpiece, the *Hunchback*, written expressly for her. In 1834 she married Pierce Butler of Philadelphia, a descendant of Pierce Butler of South Carolina; retired from the stage, and in 1838 went to South Carolina. In 1847 she made a reappearance on the English stage as "Lady Teazle," at the Theater Royal, Manchester. In 1849 she returned to the United States, and, having obtained a divorce from her husband, resumed her maiden name and went to reside in Lenox, Berkshire co., Mass. After that time she gave public readings from Shakespeare and other dramatic authors in the principal cities of the United States and Great Britain. She had a magnificent presence; her voice is characterized as flexible, ample in quantity, and harmonious, and her self-possession as remarkable. During the war of the rebellion she resided in England, and contributed valuable articles to the *London Times* in favor of the U.S. government. She published *Francis the First, an Historical Drama* (Lond., 1832); *Journal of Frances Anne Butler* (Phila., 1835); *The Star of Seville, a Drama* (1837); *Poems* (Phila., 1844); *A Year of Consolation* (1847), descriptive of a tour through France to Rome, and Italian life and scenery; *Residence on a Georgia Plantation* (1863); a volume of poems; *Records of Girlhood*; *Records of Later Life*. Died 1893.

KEMBLE, GEORGE STEPHEN, 1758-1822; the second son of Roger Kemble, the founder of the family of British actors; b. Kingston, England. He was intended for the medical profession, and was placed with a surgeon at Coventry, but preferred the stage, and, after practicing in the country, made his first appearance at Covent Garden in 1783. He was engaged also at the Haymarket. He afterwards was the manager of a company in London, Edinburgh, and Glasgow. His favorite rôle was *Falstaff*.

KEMBLE, GOUVERNEUR, 1786-1875; b. New York; son of Peter Kemble and Gertrude Gouverneur Kemble; graduated at Columbia college in 1803; traveled extensively in Europe during the Napoleonic wars; was engaged in procuring supplies for the American squadron at the time of the war with Algiers, about 1815. In 1817 he established the West Point foundry at Cold Springs; 1837-41 was a member of congress. In 1846 he served as one of the delegates from New York to the state constitutional convention. He was a public-spirited citizen, warmly interested in every project for promoting the commercial growth of the city and the nation; also a lover of art and a judicious friend of artists.

KEMBLE, JOHN MITCHEL, chiefly distinguished for his researches in Anglo-Saxon literature and the early history of England, was the son of Charles Kemble, and was b. in London, 1807. He studied at Trinity college, Cambridge, where he took the degree of B.A. in 1830, and afterwards that of M.A. While an undergraduate he spent some time at Göttingen, under Jacob Grimm, which perhaps determined the bent of his mind towards Anglo-Saxon studies. The first fruits of these studies was an edition (1833) of the poem of Beowulf (q.v.), to a second edition of which he added a translation, with a glossary and notes. Not to mention several minor publications, he edited for the English historical society a valuable collection of charters of the Anglo-Saxon period, entitled *Codex Diplomaticus Aevi Saxonici*, 2 vols. (1839-40). But his most important work, which contains the chief results of all his researches, is *The Saxons in England*, 2 vols. (1849). This work is unfinished. The author had been making preparations for two more volumes when he died suddenly, Mar. 26, 1857. Kemble was for a good many years editor of the *British and Foreign Review*; he also held the office of censor of plays under the lord chamberlain.

KEMBLE, JOHN PHILIP, son of Roger Kemble, an actor, was b. at Prescott, in Lancashire, Feb. 1, 1757. He received his education at a school in Worcester, afterwards at a Roman Catholic seminary in Staffordshire, and finally at the English college of Douai, in France. On his return to England he adopted the stage as his profession, making his first appearance at Wolverhampton Jan. 8, 1776. Sept. 30, 1783, he made his first appearance at Drury Lane in "Hamlet"—always a favorite character of his—and in 1788 he succeeded to the management of that theater. In 1802 he purchased a share in Covent Garden theater, of which he also became manager. On the destruction of the building by fire Kemble raised a new theater, which was opened in 1809, the management of which he retained till the close of his theatrical career. In June, 1817, he took leave of his patrons in London; and a few days thereafter a public dinner was given to him, under the presidency of lord Holland. Thomas Campbell made his retirement from the stage the subject of a spirited set of verses. He finally took up his residence in Switzerland, where he died, Feb. 26, 1823, aged 66 years.

Kemble was a great actor, and he loved to personate the loftier characters of the drama—kings, prelates, heroes. His figure was commanding, his voice sonorous and well modulated. He was especially successful in "Brutus" and "Coriolanus;" and the ancient playgoers, who remembered his intonation and his Roman look, used to find the more modern stage comparatively unworthy of regard.

KEMBLE, MARIE THÉRÈSE (De Camp), 1774-1838; b. Vienna, Austria; the daughter of George Louis De Camp, whose name was properly De Fleury. Miss De Camp, who was a popular actress in the line of high-comedy, married, 1806, Charles Kemble. She was the author of several dramatic pieces; among them, "The Day after the Wedding, an Interlude;" and the comedy "Smiles and Tears, or the Widow's Stratagem," is believed to have been written by her also.

KEMBLE, ROGER, 1721-1802; the founder of the family of actors bearing his name, of which his daughter Sarah (see SIDDONS, SARAH) and his son John Philip (see KEMBLE, JOHN PHILIP) are the most celebrated. He is described as a strolling actor, of some note. He married in 1753 Sarah Ward, an actress, by whom he had twelve children.

KEMP, JAMES, D.D., 1764-1827; b. Scotland; emigrated to the United States in 1787; in 1789 took orders in the P. E. church; was rector at Great Choptank and other places in Maryland, and in 1816 became bishop of that diocese. From that date until his death he was also provost of the state university.

KEMP, JOSEPH, Mus. Doc., 1778-1824; b. Exeter, England; 1802-09 organist of Bristol cathedral; 1809-14 was settled in London, but after the latter year resided chiefly in Exeter. In 1810 he delivered lectures on the "New System of Musical Education," and it is claimed that this was the first method propounded in England for teaching music to numbers simultaneously. Among Dr. Kemp's works were the anthem "I am Alpha and Omega;" "Twelve Psalmical Melodies;" "Musical Illustrations of the Beauties of Shakspeare;" "Musical Illustrations of the Lady of the Lake;" and many chants, single glees and duets.

KEMPELEN, WOLFGANG VON, Baron, 1734-1804; b. Hungary; attained to high official station, but became chiefly renowned for his extraordinary mechanical talent.

He was a chess-player of profound ability, and this fact doubtless induced him to turn his mechanical skill to the construction of the automaton chess-player, with which his name has ever since been connected. See AUTOMATON. Kempelen also produced an automatic figure which articulated certain words distinctly, in explanation of which he wrote *Le Mécanisme de la Parole, servir de la Description d'une Machine Parlante, etc.*, 1791.

KEMPEN, the name of two towns in Prussia.—1. A t. in Prussian Poland, in the government of Posen, on the border of Silesia, 43 m. e.n.e. of Breslau. It has two churches, a beautiful synagogue, and a court-house. The manufacture of snuff and brewing are carried on, and there is a trade in horses. Pop. '90, 5465, more than half of whom are Jews.—2. A t. of Rhenish Prussia, in the government of Düsseldorf, and 20 m. n.w. of the town of Düsseldorf near the Niers. There are manufactures of silk and woolen, cotton and flax goods and of velvet, and candles. It is said to be the birth-place of Thomas à Kempis (q.v.). Pop. '90, 5878.

KEMPENFELT, RICHARD, 1720-82; b. England; was made rear-admiral in the royal navy in 1779. In 1781, during the French war, he distinguished himself by capturing a French convoy which was on its way to the West Indies. In 1782 he was in command of the *Royal George*, a man-of-war carrying 108 guns, which sank on Aug. 29 off Spithead. Being keeled over for repairs, a sudden gust of wind caused the sea to flow into her open ports, when she went down with all on board, numbering about 600 persons, and including the rear-admiral, officers and crew, marines, women, and a number of Jews. More than half a c. later portions of the vessel and cargo were brought to the surface by divers.

KEMPER, a co. in e. Mississippi, bordering on Alabama: 740 sq.m.; pop. '90, 17,961, inclu. colored. It is intersected by the Mobile and Ohio railroad, and is drained by a number of streams, chiefly by Sucarnoochee creek. The soil is fertile, but a considerable portion of the surface is covered with forests. The productions are Indian corn, cotton, and sweet potatoes. Co. seat, DeKalb.

KEMPER, JACKSON, D.D., LL.D., 1789-1870; b. Pleasant Valley, N. Y.; graduated in 1809 at Columbia college; ordained priest in the Protestant Episcopal church in 1812; was rector for 20 years in Philadelphia and Norwalk, Conn., then missionary bishop of Indiana and Missouri, and subsequently of Iowa and Wisconsin.

KEMPER, JAMES LAWSON, b. Madison co., Va. 1823; educated at Washington coll., and Virginia military institute; served in the Mexican war; was in the Va. legislature for a number of years; was a confederate maj.-gen. in the civil war, and was seriously wounded at Gettysburg; gov. of Va., 1874-78. He d. in 1895.

KEMPER, REUBEN, 1770-1826; b. Va.; emigrated to Ohio, and to Mississippi, where Kemper co. was probably named in his honor. He was adventurous in disposition, and was continually engaged in organizing expeditions against the Spaniards, who, until 1819 held possession of Florida, and were at this period also engaged in suppressing Mexican insurrection against their dominion in that country. Kemper was identified with several movements of this character, and became noted as a desperate fighter and confirmed "filibuster." In 1812 he joined a powerful expedition under Gutierrez and Toledo, being elected colonel of the American contingent, which was successful in gaining several important battles. Owing to disagreements between the Mexicans and Americans, the latter abandoned the cause, and returned home. At the battle of New Orleans Kemper held an important charge and distinguished himself.

KEMPIS, THOMAS À, was so called from Kempen (now a t. of 5,878 inhabitants in the Prussian Rhine province), where he was born in 1379. His family name was Hämerken (Latinized, *Malleolus*, "little-hammer"). He was educated at Deventer, and in 1400 entered an Augustinian convent in the diocese of Utrecht, of which his brother John was prior. Here he took the vows in 1406. He entered into priest's orders in 1413, and was chosen sub-prior in 1429, to which office he was re-elected in 1448. His whole life appears to have been spent in the seclusion of this convent, where he lived to an extreme old age. His death took place in 1471, at which time he certainly had attained his 90th year, and most probably his 92d. The character of Kempis for sanctity and ascetic learning stood very high among his contemporaries, but his historical reputation rests almost entirely on his writings, which consist of sermons, ascetical treatises, pious biographies, letters, and hymns. Of these, however, the only one which deserves special notice is the celebrated ascetical treatise, *On the Following (or Imitation) of Christ*, the authorship of which is popularly ascribed to him. This celebrated book has had, next to the sacred Scripture itself, the largest number of readers of which sacred literature, ancient or modern, can furnish an example. In its pages, according to Dean Milman (*Latin Christianity*, vi. 482), "is gathered and concentrated all that is elevating, passionate, profoundly pious in all the older mystics. No book, after the holy Scripture, has been so often reprinted; none translated into so many languages, ancient and modern," extending even to Greek and Hebrew, or so often retranslated. Sixty distinct versions are enumerated in French alone, and a single collection, formed at Cologne within the present century, comprised, although confessedly incomplete, no

fewer than 500 distinct editions. It is strange that the authorship of a book so popular, and of a date comparatively so recent, should still be the subject of one of the most curious controversies in literary history. The book, up to the beginning of the 17th c., had been ascribed either to Thomas à Kempis or to the celebrated John Gerson (q.v.), chancellor of the university of Paris, except in one MS., which, by a palpable anachronism, attributes it to St. Bernard; but in the year 1604 the Spanish Jesuit, Mauriquez, found a MS. in which it is attributed to the abbot John Gersen, or Gesen, whom he regarded as clearly a distinct person from the chancellor Gerson. From the time of this discovery three competitors have divided the voices of the learned—not alone individuals, but public bodies, universities, religious orders, the congregation of the Index, the Parliament of Paris, and even the French academy; and the asserters of these respective claims have carried into the controversy no trifling amount of polemical acrimony. One of the best accounts of the details of the discussion, as well as its history, will be found in Malou's *Recherches Historiques et Critiques sur le Vritable Auteur du Livre de l'Imitation de Jésus Christ* (Louvain, 1849; 3d edition, 1858). We shall only state that M. Malou gives his verdict in favor of the claim of Thomas à Kempis, an opinion in which the learned have now generally acquiesced. The first edition of the *Imitation* was printed at Augsburg, in 1846, and before the end of that century, it was reprinted upwards of 20 times in Germany. The most remarkable modern edition is a heptaglot, printed at Sulzbach (1837), containing, besides the original, later versions in Italian, Spanish, French, German, English, and Greek. The theology of the *Imitation* is almost purely ascetical, and (excepting the 4th book, which regards the eucharist, and is based on the doctrine of the real presence) the work has been used indiscriminately by all Christians. See Kettlewell's *Authorship of the De Imitatione* (1877) and *T. à K.* (1882).

KEMPTEN' (anciently, *Campodunum*, *Campidona*), a city of Bavaria, situated on the river Iller, 48 m. s.e. of Ulm, with which it is connected by railway. Like most of the Swabian cities, Kempten grew up around a monastery, which was founded by the disciples of the great Irish missionary monk, St. Gall, about the end of the 7th century. Partly by the favor of the emperors, partly through the natural sequence of the events of the period, the abbots of the monastery were the suzerains of the town and its environs, and eventually the abbot of Kempten became a prince-abbot of the empire (1348). In the secularization of the ecclesiastical principalities in 1803-4 it shared the common fate, the abbey, as well as the city and territory—comprising at that time 7 market towns, 85 villages, and above 40,000 inhabitants—being assigned to Bavaria. The present city contained (1890) 15,760 inhabitants, and is divided into the abbatial town (*Stifts-Stadt*), and the city proper, which lies in the plain at the foot of the hill on which the abbey stands. It is a place of considerable trade, and carries on manufactures of cotton, machinery and paper.

KEN, THOMAS, Bishop, 1637-1711; b. Berkhamstead, England; educated at Winchester and Oxford; fellow of Winchester college; domestic chaplain to bishop Morley; rector of Brixton in the isle of Wight, and prebend of Westminster. In 1674 he visited Rome with his nephew, Isaac Walton, and on his return, after five years' absence, accompanied Mary, princess of Orange, as her chaplain, to Holland. In 1684 he became chaplain to Charles II., whom he attended in his last illness, "speaking to him," as Burnet records, "with great elevation of thought and expression, and like a man inspired." Shortly before the king's death he nominated Ken to the bishopric of Bath and Wells. He was not fully invested with the episcopal functions till after the accession of James II. He was the enemy of popery, and for refusing to obey the order of the king to read the declaration of indulgence was sent to the tower with six others. Nevertheless, when, after the revolution, the prince of Orange ascended the throne as William III., he refused to transfer his allegiance to the new king, considering James still his lawful sovereign. For this he was deprived of his bishopric. But many even of his opponents esteemed him, and queen Mary on her accession settled on him a pension. He was a man of solid and extensive learning, refined taste and wide sympathies, and in office displayed great zeal and self-devotion. He is the author of several volumes of sermons, theological treatises and of many devotional writings, of which his morning and evening hymns are the most popular. The familiar doxology, "Praise God, from whom all blessings flow," is of his composition.

KENAI'ANS, a group of Indian tribes inhabiting Alaska, n. of the Atna, or Copper river; so named from the peninsula of Kenai, which divides Cook's inlet from Prince William's sound. They belong to the Athabascans, one of the two great families of aborigines in which are included all the Pacific tribes from Behring's straits to New Mexico and even as far e. as Texas. The Kenaian are also called Tnainas: they are a peculiar people, exhibiting unmistakable evidences of their northern Asiatic origin. They practice cremation and infanticide, and divide by caste into clans having no intimate relations with each other, as of intermarriage, etc. They include many distinct tribes, varying in language, however, more than in customs. Their language, which belongs to the Athabaskan group, was described by Radloff in the *Bulletins* of the St. Petersburg Academy (1852 and 1858).

KENDAL, or KIRKBY KENDAL, a municipal and parliamentary borough of England in the co. of Westmoreland, is situated on the right bank of the Kent, 22 m. s.s.w. of

Appleby. Here, in the reign of Edward III., a settlement of Flemings, under a certain John Kemp, was formed, and afterwards the town became well-known for its manufactures of woollen cloths, called, from the name of the town, *kendals*. The letter of protection, dated 1331, and granted by king Edward III., "on behalf of John Kempe of Flanders, cloth weaver, concerning the exercise of his craft," may be found in Rymer's *Fœdera*, vol. ii, p. 283. The name "kendals" is still applied to the cloths produced here, which, with carpets, worsted stockings, cottons, linsey-woolseys, doeskins, tweeds, and coat-linings, are the staple manufactures of the town. In the immediate vicinity are also several mills, dye, marble, and paper works. The weekly market is the chief one for corn and provisions in the county. Kendal returns one member to the imperial parliament. Pop. '61, 12,029; '81, 13,696.

KENDAL, MRS. MARGARET ("Madge") GRIMSTON (née Robertson), actress, was born at Great Grimsby, in Lincolnshire, March 15, 1849. At a very early age she appeared in parts like that of "Eva" in *Uncle Tom's Cabin*, but made her regular *début* in 1865, at the Haymarket, London, as "Ophelia." In 1867 she again appeared in London, acting at Drury Lane Theatre and at the Haymarket, appearing in the following characters, among others, at the latter: in 1868, "Hypolita," in *She Would and She Would Not*, 1869; "Lady Clara Vere de Vere," in *Dreams*, a play by her brother, T. W. Robertson, and "Lilian Vavasour," in *New Men and Old Acres*, 1870; "Lydia Languish," in *The Rivals*, 1874; "Mrs. Van Brugh," in Gilbert's *Charity* (with which part she obtained a veritable triumph). In 1875 she played "Pauline Deschappelles," in "Rosalind," and "Miss Harcastle" (the latter being considered one of her most successful rôles), at the Opéra Comique. Meanwhile, she had been married, in 1869, to William Hunter Grimston, better known by his stage name, Kendal. In 1875 she became a member of the Court Theatre company, and three years later went over to the Prince of Wales's Theatre, where she scored a great "hit" as "Dora" in the English adaptation of Sardou's *Diplomacy*. In 1879 she returned to the Court Theatre. Among the rôles in which she appeared after this are "Susan Hartley," in *A Scrap of Paper*; "Countess d'Autreval," in *The Ladies' Battle*; "Kate Verity," in *The Squire* (which part was written for her by A. W. Pinero), and "Claire de Beaupré," in *The Ironmaster*. In the seasons of 1889-90, and 1890-91, Mr. and Mrs. Kendal gave a series of performances in the United States, which proved highly successful in every way. Mrs. Kendal has been called the leading actress in comedy of the British stage in recent years.

KENDALL, a co. in n.e. Illinois; intersected by the Fox and Pishtaka rivers; 330 sq.m.; pop. '90, 12,106. The surface is undulating and diversified by prairie and woodland. Corn, oats, hay, pork, and butter are the chief productions. The county is intersected by branches of the Chicago, Burlington, and Quincy railroad. Co. seat, Yorkville.

KENDALL, a co. in s. central Texas; intersected by the Guadalupe river; 620 sq.m.; pop. '90, 3809. The surface is hilly or undulating. The soil partly fertile. Cattle, corn, and grass are the staple productions. Co. seat, Boerne.

KENDALL, AMOS, LL.D., 1787-1869; b. Mass.; graduated at Dartmouth, and commenced the practice of law in Kentucky. For a time he held the position of tutor in the family of Henry Clay, and afterwards edited the Georgetown, Ky., *Argus*. He was appointed by president Jackson to the position of fourth auditor in the U. S. treasury department, and during Jackson's second term of office to the postmaster-generalship. Kendall founded the deaf and dumb asylum at Washington, and interested himself generally in the cause of education and of public charity.

KENDALL, GEORGE WILKINS, 1807-67; b. N. H.; a practical printer, who, in 1835, founded in New Orleans the *Picayune*, which he succeeded in building into a valuable property and a powerful influence in southern politics. In 1841 he joined the venture whose history he afterwards wrote in his *Narrative of the Texan Santa Fé Expedition*. Having witnessed the progress of the Mexican war, he devoted himself to the production of an expensive and handsomely illustrated volume, entitled *The War between the United States and Mexico, embracing 12 colored plates of the principal conflicts*, by Carl Nebel. The latter part of his life was passed on an extensive cattle-farm which he established in Texas.

KENDALLVILLE, a city in Noble co., Ind.; on the Lake Shore and Michigan Southern and the Grand Rapids and Indiana railroads; 26 miles n. of Fort Wayne. It contains a high school, public school library, waterworks supplied by driven wells, and electric light plant, and has manufactories of agricultural implements, bee-hives, machinery, etc. Pop. '90, 2960.

KENDELL, ROBERT VON, b. at Königsberg, 1824. In 1862 he held a position at the court of Breslau. In 1863 Bismarck appointed him to a place in the ministry of foreign affairs, and after that time he was long the confidential companion of the great minister in his diplomatic negotiations and travels. Sometimes he has been sent alone on important diplomatic business. He represented the North German confederation at the opening of the Suez canal in 1869, and in the same year was elected to the diet. In 1873 he was appointed ambassador to Rome.

KENDRICK, ASAHEL CLARK, D.D., LL.D., b. Vt., 1809; graduated at Hamilton college in 1831; appointed in 1832 professor of Greek and Latin in Madison university at Hamilton; was elected professor of Greek in the Rochester university in 1850, where he served till 1888. He visited Europe 1852-54, attending lectures in Athens, Italy, and Germany. His contributions to reviews and magazines were numerous, and he published a revision of *Olshausen's Commentaries* on the New Testament; *Echoes*, a volume of translations from the French and Greek poets; an edition of *Xenophon's Anabasis*, with notes and vocabulary; translation of the epistle to the Hebrews, with notes, for Lange's *Commentary*; *Life and Letters of Emily C. Judson*; *Our Poetical Favorites*, 3 vols. Dr. K. was one of the American revision committee on the New Testament, in connection with the British committee, and ranks among the foremost American scholars in his department. He d. in 1895.

KENDRICK, JOHN, 1745-1800; b. Martha's Vineyard; was 1st lieut. of the *Rising Empire* in 1776, commissioned by the state of Massachusetts, and afterwards commanded a privateer. In 1787 commanded the brig *Columbia*, which, in company with the sloop *Washington*, was dispatched from Boston by Barrell, Bulfinch & Co., under the American flag, to explore the n.w. coast. He arrived at Nootka sound Sept. 17, 1788, and wintered there. After a voyage to China, he returned to Nootka, and sailed through the entire length of the strait of Juan de Fuca, and to 55° north. He explored the country in which Nootka sound is situated, and ascertained its insular character. For his services as an explorer he was awarded a medal by congress. In Aug., 1791, while lying at Nootka sound (which was then a subject of dispute between European nations), fearing to be taken by Spanish vessels if he ventured out to sea, he discovered a strait leading north-westward into the Pacific, which he named Massachusetts sound. He first drew the attention of the inhabitants of the Hawaiian islands to sandal-wood as an article of export, which was then in demand in the China market. His residence was in Wareham, Mass. He was mortally wounded in the harbor of Kealakekua bay, during the firing of a salute in his honor, by an English captain, having been struck, while standing in his own vessel, by a portion of grape-shot that was left accidentally in one of the guns.

KENEALY, EDWARD VAUGHAN HYDE, D.C.L., 1819-80, received his education at Trinity college, Dublin, and developed a surprising aptitude for the acquisition of languages, of which he learned, sufficiently at least to enable him to translate songs and ballads with facility, no fewer than ten modern and three ancient. A man of surprising versatility and varied accomplishment, he was no less at home in pleading a cause at the bar than in constructing a pantomime or writing a contribution for *Fraser's* or the *Dublin University Magazine*. He assisted at Maginn's *Homeric Ballads*, and published *Brallaghan, or the Deipnosophists*, of his own work. He was an enthusiastic legal advocate, and became most widely known for the persistency which characterized his conduct of the celebrated Tichborne case in the interest of "the claimant." In 1874 he established a newspaper called *The Englishman*, which exerted a powerful influence and gained a wide circulation. In 1875 he was elected to parliament, and carried into the house of commons the same combative disposition which had previously influenced his course. The defeat and condemnation of his client, the self-styled sir Roger Tichborne, soured and embittered his disposition, and rendered the latter years of his life distressingly prominent in their antagonism to general public opinion.

KE'NEH, or GHENEH, the ancient Cænopolis, a t. of upper Egypt on the n. bank of the Nile, nearly opposite the ruins of Denderah, and 34 m. n. of Thebes. It has a large trade with Arabia by way of Cossein, and is one of the stations for the pilgrims from west and central Africa. Travelers to and from India sometimes travel by the Nile through Keneh. The culture of the sugar-cane has greatly developed in recent years. Pop. '82, 15,402.

KENILWORTH, a market t. of England, in the co. of Warwick, situated 5 m. n. of the town of that name, and the fashionable town of Leamington. There are here remains of an abbey erected in 1122. Pop. '91, 4173. The town, however, is chiefly interesting from historical association. The castle of Kenilworth, united to the crown domains in the reign of Henry IV., was conferred by Elizabeth upon Robert Dudley, earl of Leicester, who here, in 1575, entertained his sovereign for 17 days, at a daily cost of £1,000. The present proprietor is the right hon. the earl of Clarendon. Extensive remains of the castle still exist, which are well preserved and much visited by the aristocracy and by tourists from all parts of the country. There are also ruins of the ancient monastery.

KENITES, a tribe or nation originally occupying with the Amalekites the country of Arabia Petraea. In the time of Abraham they are mentioned (Gen. xv. 19) in connection with the Kenizzites and Kadmonites. At the exodus they pastured their flocks around Sinai and Horeb. Jethro was a Kenite (Judges i. 16), and as he is represented in Exod. ii. 15, 16, as dwelling in the land of Midian, and as being prince or priest of Midian, and in Num. x. 29, as being a Midianite, it may be inferred that the two people were the same, or at least that the Kenites were a branch of the larger nation of the Midianites. The Kenites led a nomadic life in the region n. of Sinai. The kindness

which Jethro showed Moses led to a firm alliance between the two peoples. The family of Jethro accompanied the Israelites into Palestine, where they continued their nomad life. Heber, the husband of Jael, who slew Sisera, belonged to the family of Jethro, and is called "Heber the Kenite." Other families of Kenites resided in Palestine, among whom were the Rechabites (1 Chron. ii. 55, Jer. xxxv. 2). The region which they received in the southern border of Judah they retained in the time of David, but after this nothing more is heard of them in sacred history. The Kenites in the time of Jethro possessed a knowledge of the true God, and there is reason to believe that that knowledge continued with the families that settled in Palestine.

KENNA, JOHN EDWARD, b. Valcoulon, Va., 1848; fought as a private in the confederate service; was admitted to the bar at Wheeling, 1870; was elected (as a democrat) prosecuting atty. for Kanawha co., 1872; served in the XLVth, XLVIth, XLVIIth, congresses, and had been elected to the XLVIIIth, when he was chosen to the U. S. senate, from W. Va., 1883. He was re-elected, 1889, and died 1893.

KENNAN, GEORGE, traveler, b. Norwalk, O., in 1845; became a telegraph operator at the age of twelve; in 1865 became connected with the Russian-American Telegraph Expedition, returning in 1868. With the exception of the year 1871 (spent in Daghestan), the subsequent years were passed at Washington, in work for the Associated Press. In May, 1885, he was sent to Russia by the Century Company of New York to study the exile system, and devoted a year to the work, giving his conclusions in papers published in the *Century Magazine*, and in lectures throughout the United States. One result of his investigations was the forwarding from America of a monster petition to the Czar. He published *Tent Life with the Wandering Koraks* (1870); *Siberia and the Exile System* (1891), etc. In 1891 he lectured in the principal cities and towns of the United States.

KENNEBEC, a river in the state of Maine, which rises in Moosehead lake, in the w. of the state, and runs in a southerly direction into the Atlantic ocean, after receiving the Androscoggin, 18 m. from its mouth. On its banks are the important towns of Bath, Gardiner, Hallowell, and the state capital, Augusta. It is navigable by ships to Bath, 12 m.; by steamboats to Hallowell, 40 miles. In its course of 150 m. the river falls 1000 ft., affording abundant water-power. At Augusta are falls, increased by a dam 584 ft. long, supplying water to large factories, saw-mills, etc.

KENNEBEC', a co. in s.w. Maine, established Feb. 20, 1799; 888 sq. m.; pop. '90, 57,012. Portions of its territory were taken off in 1809, 1827, 1838, and 1854, to form other counties. It contains the cities of Augusta, Gardiner, Hallowell, and Waterville. The Kennebec river flows through its center, and the Androscoggin crosses the western portion. Its rich valleys and wide arable lands are diversified by beautiful lakes, brooks, and waterfalls. The climate is healthy, though the winters are long and severe. It has great grazing facilities. Co. seat, Augusta.

KENNEBUNK, a t. in York co., Me.; settled 1650, incorporated 1820; on the Mousam river and the Boston and Maine railroad; 24 miles s.w. of Portland. It contains a public library, high school, national and savings bank, waterworks supplied from the Mousam river, electric light plant, and several churches, and has valuable water power used in manufacturing, of which shoes, twine, and leatheroid are the principal articles. Pop. '90, 3172.

KENNEBUNKPORT, a t. in York co., Me.; settled 1629, incorporated 1653 and 1717; formerly known as Arundel; name changed as at present 1821; on the Atlantic ocean at the mouth of Kennebunk river and on the Boston and Maine railroad; 25 miles s.w. of Portland. It has an excellent harbor; is a popular summer resort; and contains numerous hotels, Talbot's library, circulating and public libraries, and a number of manufactories. Pop. '90, 2196.

KENNEDY, BENJAMIN HALL, b. 1804; graduated at Cambridge in 1827, and the following year was elected a fellow and classical lecturer of St. John's college, Cambridge. After having held for 6 years the position of assistant master at Harrow, he became head master of Shrewsbury school in 1836, in which office he remained during 30 years. He resigned it in 1866 to accept the regius professorship of Greek at Cambridge, becoming canon of Ely in 1867, and a member of the university council in 1870. Dr. Kennedy published a number of classical text-books, translated *The Birds* of Aristophanes into English verse, likewise the Psalter, besides publishing a collection of Greek, Latin, and English poetry. He died in 1889.

KENNEDY, GRACE, 1782-1825; a Scotch writer of prominence during the early part of the 19th century. She wrote novels of a religious tendency, among which were *Father Clement*; *Anna Ross*; *Dunallan*; *Jessie Allan*; *Decision*, etc., which were translated into German and French, and were highly esteemed.

KENNEDY, JOHN PENDLETON, LL.D., 1795-1870; b. Baltimore. He was admitted to the bar, was for several years a member of the Maryland house of delegates; from 1839-1845 was a member of congress, where he advocated whig principles, and during Fillmore's administration was secretary of the navy. But he is now remembered chiefly as a writer of sketches and novels of considerable merit. Of these, *Horse-Shoe Robinson*

(1835), whose action takes place during the American revolution, was the most popular and still finds readers. The scene of *Rob of the Bowl* (1838) is laid in Maryland in the time of Cecil Calvert.

KENNET, a river in Berks co., England, whose course lies nearly eastward from East Kennet, near which place it rises, until it empties into the Thames at Reading.

KENNET, WHITE, D.D., Bishop, 1660-1728; b. Dover, England; educated at Westminster school and Oxford; he early became rector of Amersden. In 1691 he returned to Oxford as tutor and vice-principal of Edmund hall, where he had for a pupil the famous antiquary, Hearne. He was afterwards archdeacon of Huntingdon, dean of Peterborough, and in 1718 bishop of Peterborough. He was an eloquent preacher, a learned antiquary, historian, and theologian, and a man of great mental activity. He was a keen disputant, took an active part in the religious controversies of the time, and was a strong opponent of the high church party. He published numerous works, the most important of which are *Parochial Antiquities; History of England from the Accession of Charles I. to that of Queen Anne; A Register and Chronicle, Ecclesiastical and Civil, from the Restoration of King Charles II.* His sermons and pamphlets are now interesting principally to the antiquary. He left numerous historical manuscripts now a part of the Lansdowne collection in the British museum.

KENNICOTT, BENJAMIN, an eminent biblical scholar, was b. at Totnes, Devonshire, England, April 4, 1718, and educated at Oxford, where he highly distinguished himself. He took his degree of M.A. in 1750, having been previously elected a fellow of Exeter college; in 1767 he was appointed Radcliffe librarian; and in 1770 canon of Christ church, Oxford, where he died, Sept. 18, 1783. The whole interest and importance of Kennicott's life are comprised in his great undertaking for the improvement of the Hebrew text. In 1753 he published a work entitled *The State of the Printed Hebrew Text of the Old Testament Considered*. This contained, among other things, observations on 70 Hebrew MSS., with an extract of mistakes and various readings, and strongly enforced the necessity for a much more extensive collation, in order to ascertain or approximate towards a correct Hebrew text. He undertook to execute the work in the course of 10 years, and labored, until his health broke down, from 10 to 14 hours a day. In spite of considerable opposition from bishops Warburton, Horne, and other divines, Kennicott succeeded in enlisting the sympathies and obtaining the support of the clergy generally. Upwards of 600 Hebrew MSS., and 16 MSS. of the Samaritan Pentateuch, were collated, with the assistance of other English and continental scholars. The first volume of his edition of the Hebrew Bible appeared in 1776, and the second in 1780, accompanied by a very useful and instructive dissertation. The text chosen was that of Van der Hooght, and the various readings were printed at the bottom of the page. The *Varie Lectiones Veteris Testamenti* (Parma, 1784-88), published by De Rossi, is a valuable addition to Kennicott's Hebrew Bible. Jahn published at Vienna (1806) a very correct abridgment, embracing the most important of Kennicott's readings.

KENNING TO THE TERCE, a phrase in Scotch law to denote the process by which a widow, whose husband has died infert in lands, acquires a separate interest in a definite part thereof. She is bylaw entitled to the rents of one-third of the husband's lands, called her terce (q.v.); and the above process is carried on before the sheriff of the county, the object being to define and set out a particular portion of the lands to which her life-rent may attach.

KENO'SHA, a co. in s.e. Wisconsin, bordering on lake Michigan on the e., drained by the Fox and Des Plaines rivers; 280 sq.m.; pop. '90, 15,581. Its fertile soil affords a luxurious production of wheat, oats, Indian corn, hay, flax, etc. This county is traversed by the Chicago and Northwestern railroad. Co. seat, Kenosha.

KENOSHA, city and co. seat of Kenosha co., Wis.; on Lake Michigan and the Chicago and North-western railroad; 34 miles s. of Milwaukee. It contains Kemper hall school and library (Prot. Epis.), University school (non-sect.), high school, public library, gas and electric light plants, waterworks supplied from the lake and artesian wells, national bank, and several churches and daily and weekly newspapers. The principal industries are dairying, farming and manufacturing flour, carriages, wagons, furniture, etc. Pop. '90, 6532.

KENO'ZA LAKE, in Haverhill, Mass., a small but very beautiful sheet of water, a favorite resort for parties of pleasure. The poet Whittier, whose boyhood was spent in the town, has made it a subject for his verse.

KENRICK, FRANCIS PATRICK, D.D., 1797-1863; b. Dublin; was sent in 1815 to Rome, where he studied two years at the house of the Lazarists and four years in the college of the Propaganda; was ordained a Roman Catholic priest in 1821, and immediately came to the United States to take charge of an ecclesiastical seminary about to be started at Bardstown, Ky., which he conducted for nine years. In 1828 he published *Letters of Omicron to Omega*, in defense of the Roman Catholic doctrine of the eucharist in reply to Dr. Blackburn, of Danville college. In 1830 he was consecrated bishop of Arath *in partibus*, and made coadjutor to bishop Connell, of Philadelphia, whom he succeeded in 1842. In the anti-papal riots in Philadelphia he prevented, by his wisdom and firmness, retaliatory acts on the part of his people. He founded the

theological seminary of St. Charles Borromeo in Philadelphia. In 1851 he was appointed by the pope, archbishop of Baltimore and "apostolic delegate" to preside over the first plenary council of the United States held at Baltimore in May, 1852, and in 1859 the "primacy of honor" was conferred upon him and his successors, giving them precedence over all Roman Catholic prelates in the United States. He published, in 1837, letters *On the Primacy of the Holy See and the Authority of General Councils* in reply to bishop Hopkins, of Vermont. His most celebrated works are his Latin treatises, *Theologia Dogmatica*, 4 vols., and *Theologia Moralis*, 3 vols., which are used as text-books in nearly all the Roman Catholic seminaries. At the time of his death he was engaged in revising the English translation of the Scriptures with copious notes. He was a vigorous writer, an acute controversialist, and able biblical critic. During the rebellion he was thoroughly loyal to the Union.

KENRICK, PETER RICHARD, D.D., archbishop of St. Louis, Mo., and brother of the archbishop of Baltimore; b. Dublin, 1806; educated at Maynooth; ordained priest in Ireland, and soon afterwards emigrated to Philadelphia, where he was editor of the *Catholic Herald*, and published several works. He was also made vicar-general of that diocese. In 1841, at the request of bishop Rosati, of St. Louis, he became coadjutor with the right of succession. In 1843 he was appointed bishop, and in 1847 archbishop. He was active in the cause of education; founded numerous charitable institutions; and was the author of *The Holy House of Loretto* and *Anglican Ordination*. He was a member of the Vatican council, and though he opposed the defining of the dogma of papal infallibility as inopportune, he acquiesced in the final decree, and promulgated it. In 1895 he was deposed because of mental trouble. He d. in 1896.

KENSETT, JOHN FREDERICK, 1818-72; b. Conn.; was, when quite young, an engraver of vignettes for bank-notes, and, while practicing this art, studied painting for amusement. He made a journey to England in 1840, and remained there some years. In 1845 he exhibited in the royal academy, and meeting with success, studied in Rome during two seasons, contributing some of his finished works to the American art union. In 1848 he exhibited in the national academy of design, where his works attracted general public notice. From this period he made his residence in New York, contributing regularly to exhibitions and gaining a high reputation. The distinguishing features of his work are harmony in composition, with delicacy and refinement in execution. He was a close observer and an accurate delineator of nature, in whom the poetic temperament was manifest. His works are frequently luminous, and always pleasing in color.

KENSINGTON GARDENS, one of the public ornamental parks of London, extends on the w. side of Hyde park, from which it is partly separated by the Serpentine. It is traversed by walks, and ornamented with rows and clumps of noble trees. Near the western border of the park stands Kensington palace, an edifice of brick, originally the seat of Heneage Finch, earl of Nottingham and lord chancellor of England, and afterwards bought by king William III. William III., queen Mary, queen Anne, and George II. all died in this palace, and here her majesty queen Victoria was born. The gardens at first consisted of the grounds attached to the palace, and were only 26 acres in extent, but have been frequently enlarged, and now are two and a half miles in circuit.

KENT, the central co. of Delaware; bounded e. by Delaware bay, and drained by Choptank river and Duck and Mispillion creeks; 630 sq.m.; pop. '90, 32,664. An extensive portion of the surface is covered with forests. The soil is generally fertile. Corn, wheat, oats, peaches, and pork are the chief products. The county is intersected by branches of the Philadelphia, Wilmington, and Baltimore railroad. Co. seat, Dover.

KENT, a co. in the n.e. part of Maryland; bounded n. by Sassafras river, on the s.e. by Chester river, and on the w. by Chesapeake bay; 315 sq. m.; pop. '90, 17,471. It has an undulating surface and a soil moderately fertile. Wheat, oats, corn, peaches, and other fruits are the staple productions. It is intersected by the Baltimore and Delaware Bay railroad. Co. seat, Chestertown.

KENT, a co. of Michigan, in the s.w. central part of the southern peninsula; 860 sq. m.; pop. '90, 109,922. The surface is rolling, with a rich limestone soil. Cattle, wool, grain, hay, and butter are among the chief productions. The chief branches of manufacture are lumber, carriages, flour, cooperage, clothing, and saddlery. The county is traversed by numerous railroads, chiefly centering in Grand Rapids, the co. seat.

KENT, a co. of Rhode Island, bordering on Connecticut: bounded on the e. by Narragansett bay, and drained by the Pawtuxet, Moosup, and Wood rivers; 180 sq. m.; pop. '90, 26,754. Its surface is partly hilly, and much of it is covered with forests. The chief agricultural productions are hay, potatoes, and corn. The prosperity of the county depends chiefly upon cotton manufacture, there being within its limits 25 establishments for printing cotton goods. The county is intersected by branches of the New York, New Haven and Hartford railroad. Co. seat, East Greenwich.

KENT, a co. in n.w. Texas, formed 1876; organized in 1892; 900 sq. m. Pop. '90, 324. Co. seat, Clairemont.

KENT, an important maritime co. of England, occupies a portion of the s.e. angle of the country, and is bounded on the n. by the Thames and the Nore, and on the e. and s.e. by the strait of Dover. Area, 975,824 acres; pop. '91, 807,269. Besides the

river which forms the northern boundary of the county, the chief streams are the Medway, which flows n.e. into the estuary of the Thames; the Stour, and the Darent. The surface is undulating, being traversed from w. to e. by the North Downs (see article Downs). With a climate which is in general mild and genial, and a fertile soil of mixed chalk, gravel, and clay, Kent is, in an agricultural sense, a highly productive county. Besides the usual crops there is a large traffic in fruit to the northwest of England. There are also numerous market-gardens and orchards, the latter putting Kent fourth in rank in that respect among English counties. Hops (see Hop) are one of the chief products of the county. In the cultivation of hops Kent has always been the leading county, its acreage therein being more than six times as extensive as that of any other hop-growing county of England, but since 1885 the area under this crop has decreased by about 10,000 acres. Great numbers of sheep are fattened on the excellent pasturage found on the tracts of alluvial soil that skirt the banks of the Thames and Medway, and especially on the marshes. The county returns eight members to parliament. Ecclesiastically it belongs to the diocese of Canterbury.

Kent is unusually rich in historical association. For its early history, see article HEPTARCHY. It has been the scene of frequent sieges, battles, and revolutions; and the county is also bound up with the social history of the country through the three well-known insurrections which broke out here under Wat Tyler, Jack Cade, and sir Thomas Wyatt. Of its numerous and interesting ecclesiastical edifices, it will suffice to specify here the cathedrals of Canterbury and Rochester. It contains the important dock-yards and arsenals of Woolwich, Chatham, and Sheerness; and the famous watering-places of Margate, Ramsgate, and Tunbridge-Wells.

KENT, a co. of New Brunswick, bordering on the gulf of St. Lawrence and Northumberland strait; drained by the Richibucto, Cocagne, and other navigable streams; 1720 sq. m.; pop. '91, 23,845. The harbors of Cocagne, Buctouche, and Richibucto offer capital facilities for shipbuilding, and much timber is shipped thence to England. The county is traversed by the Intercolonial and other railways. Capital, Richibucto.

KENT, a co. of Ontario, bordering on lakes St. Clair and Erie; intersected by the Thames river, and traversed by the Grand Trunk and the Michigan Central railroads; 644 sq. m. pop. '91, 31,434. Capital, Chatham.

KENT, EDWARD AUGUSTUS, Duke of, 1767-1820; the fourth son of George III. and father of queen Victoria; entered the army and served under sir Charles Grey in the attack on the French West India islands; and in recognition of his valor, fort Royal, in Martinique, was changed to fort Edward. He was made duke of Kent and Strathearne, and appointed commander-in-chief of the British forces in North America. The name of the island of St. John was changed in his honor to Prince Edward island. In 1818 he married Victoria Maria Louisa, relict of the prince of Leiningen. Alexandra Victoria, now queen, was his only child.

KENT, JAMES, LL.D., b. in Fredericks, N. Y., July 31, 1763; d. Dec. 12, 1847. He graduated from Yale college in 1781, and was admitted to the bar in 1785. He was elected to the New York assembly in 1790 and 1792, and again in 1796, having in the meanwhile removed to New York city, where, 1793-98, he was professor of law in Columbia college. His ability was already recognized by men like Hamilton and Jay, with whose political principles he was in sympathy, and the latter, then governor of New York, appointed him in 1798 a justice of the supreme court, of which from 1804-14 he was chief-justice. In 1814 he became chancellor of the state, which office he retained till 1823, when his age passed the constitutional limitation, and compelled his retirement. He then resumed his lectures at the Columbia college law school. His *Commentaries upon American Law* appeared from 1826-30. Their great merits were speedily recognized both in this country and England, and have made the work, which has since passed through many editions, the classic of American law literature. Kent's services to American jurisprudence, however, can be best judged by his printed decisions in the N. Y. reports. He administered law with all the learning of the books, but with a regard for the needs of a new community in which hitherto unmooted questions were constantly arising for adjudication. As a chancery judge he enlarged the sphere of his court, which till his time had been of little importance, and it is not too much to say that he created courts of equity in New York.

KENT, WILLIAM, 1685-1748; b. Yorkshire; was apprenticed to a coach-painter, but believing that he had talent for something higher, he went to London to pursue portrait and historical painting. Here he found those who furnished him the means of completing his studies in Italy. After residing there six years he formed the acquaintance of the earl of Burlington, and returning to England he lived with him for several years; but not having the prospect of success in the pictorial art, he relinquished it for ornamental architecture and landscape gardening, greatly distinguishing himself as the founder of a new style of landscape gardening, the main feature of which was the restoration of nature, which previous artists had entirely banished from their designs. His new style is illustrated in the Kensington gardens. Walpole styles him "the creator of modern gardening." As an architect, he designed the splendid palace of the earl of Leicester at Holkham and the temple of Venus at Stowe.

KENTIGERN, SAINT. See MUNGO, SAINT.

KENTISH FIRE, a term employed to denote the vehement and protracted cheers with which the rabble greeted the No-popery orators at the public meetings held in Kent to prevent the passing of the Roman Catholic relief bill (1828-29).

KENTISH RAG, a dark-colored, hard, calcareous sandstone, which occurs at Hythe, and other places on the coast of Kent, in the lower greensand measures. It sometimes attains a thickness of 60 or 80 feet.

KENT ISLAND, the largest island in Chesapeake bay, 15 m. long, belongs to Queen Anne co., Md.; pop. 2500. Its soil is fertile. The first settlement of the state was made upon it, 1631, by William Claiborne and others. It has 4 churches, and is the seat of a profitable oyster fishery.

KENTON, a co. of Kentucky, lying upon the Ohio river, directly s. of Cincinnati; 152 sq.m.; pop. 90, 54,161. Its surface is hilly, its soil fertile. Tobacco, corn, and live-stock are its chief productions. It has also considerable manufacturing interests. Branches of the Louisville and Nashville railroad pass through the county. Capital, Independence.

KENTON, city and co. seat of Hardin co., O.; on the Scioto river and the Cleveland, Cincinnati, Chicago and St. Louis and the Toledo and Ohio Central railroads; 74 miles s.w. of Sandusky. It contains St. Anthony's institute, union school, business college, public library, electric light plant, waterworks, and national and savings banks, and has manufacturing, agricultural, and lumbering interests. Pop. '90, 5557.

KENTON, SIMON, 1755-1836; b. Va.; one of the first settlers of the state of Kentucky. He fled from Virginia on account of a dispute with a rival in love, whom he supposed himself to have killed, and became an associate of Daniel Boone. He was a daring scout and Indian fighter, and for twelve years was engaged in almost constant Indian warfare. He also served through the war of 1812. Despite his great services his lands, to which he had never perfected his title, were taken from him; but they were subsequently restored and he was pensioned.

KENT'S CAVERN, or **KENT'S HOLE**, a celebrated bone-cave, situated in a small, wooded, limestone hill, at the junction of two valleys, about a mile eastward from Torquay, England, and half a mile from the northern shore of Torbay. It consists of two parallel series of chambers and galleries, having an approximately north and south direction. The aggregate length of the eastern series is upwards of 250 ft., and the western is probably longer. It has two narrow external openings or entrances, in the face of one and the same low natural cliff, on the eastern side of the hill, and both opening into the eastern suite of apartments. They are nearly on the same level, about 50 ft. apart, 70 ft. above the bottom of the valley immediately beneath, and from 180 to 190 ft. above the level of mean tide.

KENTUCKY, an e. central state of the Mississippi valley, and the 2d in order of admission; between lat. 36° 30' and 39° 6' n.; long. 82° 3' and 89° 26' w.; separated on the w. from Missouri by the Mississippi; on the n.w. from Illinois and Indiana by the Ohio; bounded on the n. by Indiana and Ohio, the Ohio river still intervening; on the e. by West Virginia; on the s.e. by Virginia, and on the s. by Tennessee; extreme length from e. to w., about 500 m.; extreme breadth, 180 m.; land area, 40,000 sq. m.; gross area, 40,400 sq. m. or 25,856,000 acres; area by state survey, 41,263 sq. m.

HISTORY.—K. was formerly a portion of the western territory of Virginia, and as such was included in Augusta co., but was long the common hunting ground of several aboriginal tribes. The name K. has been said to mean "the dark and bloody ground," in allusion to the contests between these tribes or to their struggles with the invading whites. The first white explorer was John Finley, who in 1767 went there with a few companions from North Carolina. Two years later, Daniel Boone, Finley, and four or five others visited the region, and in 1770 James Knox, with a number of others from Virginia, made extensive surveys for the purpose of locating land-bounty warrants. In 1774 a settlement was made at Harrodsburg by James Harrod and others. In 1775 Daniel Boone built a fort at Boonesboro. The Indians met these white settlers with a stern and bloody resistance. Daniel Boone in 1775 made a treaty with the Cherokees, who agreed to sell the region to Richard Henderson and his party. Virginia rightfully claimed the territory as her own, and refused to treat the sale as valid, but finally consented to give the purchaser a title to 200,000 acres at the mouth of Green river. A step toward independence was taken in 1775, May 23, by the organization at Boonesboro of the "assembly of Transylvania," an act pronounced null and void by the Virginia legislature. In 1776 K. was organized as a Virginia co., and that state held jurisdiction through the revolutionary war and for several years afterwards. In 1782, a desperate battle with the Indians took place near Blue Lick Springs, resulting in the defeat of the whites. The inhabitants, in 1784 and in 1785, sought to effect a peaceable separation from Virginia, and the latter in 1786 assented to the proposed arrangement, which, however, was not at that time consummated, nor did conventions in 1786 and 1787 secure the desired freedom. The citizens were very much prejudiced against the national government on account of a report which gained wide currency that Mr. Jay, while minister to Spain, had ceded to that country the navigation of the Mississippi. Spain, under these circumstances, entered upon an intrigue to induce K. to set up a government independent

AREA AND POPULATION OF KENTUCKY BY COUNTIES.

of the U. S., promising special commercial advantages in such a case. The excitement continued for some time, but in 1790 K. was organized as a territory of the U. S., and in 1792, June 1, admitted to the union as a state. The white population then numbered 75,000. Indian wars continued to distract the frontiers, and there was great dissatisfaction with the national government for its neglect to afford protection to the inhabitants. There were other grievances, such as a burdensome whisky-tax and the course of the government in relation to the French republic, with which the Kentuckians felt a very strong sympathy. The scheme for independence was partially revived, but the storm soon blew over. The navigation of the Mississippi, however, was a subject of much uneasiness until the retrocession of Louisiana to France and the subsequent purchase of the territory by the U. S. put an end to all the pending troubles.

The state gained distinction by her part in the war of 1812 and in the Mexican war. The outbreak of the civil war found a large majority of the people of K. opposed to secession. The legislature in Feb., 1861, refused to call a convention to consider the question, and later Gov. Magoffin endeavored to keep the state in a neutral position and exclude both the union and the confederate forces from its territory. But the geographical position of the state—to say nothing of other circumstances—rendered this scheme impracticable. The U. S. claimed the allegiance of the state, and sent its armies there as it found occasion, and 91,900 troops, 11,000 of whom were colored, were recruited to aid the union side. The confederates made a desperate effort to set up a state government in the interest of the confederacy, but with small success. Several battles were fought in K., notably Mill Spring, Perryville, and Richmond, with the final result of driving the confederate forces out of the state. The majority of the people, though disapproving of the armed rebellion, were yet in strong sympathy with the south in the political matters at issue, and made all the opposition in their power to the emancipation policy of Mr. Lincoln. Fully 40,000 entered the confederate army, and when the struggle was over the state made a stout opposition to the reconstructive measures of the government. In 1865, Oct. 18, the civil authority was restored.

TOPOGRAPHY.—The w. portion of the state is slightly undulatory, with broad level plains here and there. The s.e. part is broken by the Cumberland mountains and their spurs, none of whose summits attain an altitude of more than 3000 ft. The hills and valleys here are well wooded. W. and n. of this region lies a gently undulating upland, intersected by rivers flowing through narrow and deep valleys. The soil, in spite of the scarcity of spring water, is of the very finest quality, being in part what is known as the "blue grass region," extending from the Ohio river southward to the Cumberland, through the central portion of the state. In the western part of the state are the "barrens," so-called, which were once thought to be of small value, but which are now more highly appreciated, though not equal to the "blue grass region" in point of fertility. K. is well watered. The Mississippi flows along its western border for 80 m., while along the n. and n.w. border the Ohio has a course of nearly 600 m., and is navigable the whole distance. Only a few small streams empty into the Mississippi from K. Those which flow into the Ohio are the Big Sandy, which has its sources in West Virginia; the Licking, which has its mouth at Covington, opposite Cincinnati; the Kentucky, which has its sources in the Cumberland mountains, and has a course of 250 m. within the state; Green River, 300 m. in length, and navigable for steamboats 200 m.; the Cumberland, which rises in the valley between the Laurel and Cumberland Mountains, flows tortuously through 7 or 8 cos., passes into Tennessee, then returns, flows tortuously in a n.w. course, and empties into the Ohio about 10 m. above the mouth of the Tennessee, and is navigable for 200 m. to Nashville, Tenn.; and the Tennessee, which has a course of 70 m. within the state.

GEOLOGY AND MINERALOGY.—The southern end of the coal measures of Indiana and Illinois extends across the Ohio into Breckenridge co., and continues almost to the mouth of that stream, along the whole w. and n.w. boundary of the state. The coal measures, which occupy the whole eastern part of the state, are a part of the great Appalachian coal-field which overspreads western Virginia and Pennsylvania. Limestones and shales of wide extent and great thickness are found, abounding in marine animals and plants. Hydraulic limestone is found near the falls at Louisville, and is extensively used in the manufacture of cements. The limestone region abounds in caves, some of which are very remarkable. The Mammoth Cave in Edmonson co., near Green River, is one of the wonders of the world. It has been explored for a distance of more than 10 m. Low swamps, called "licks," frequented by deer and elk, occur in the limestone region. They were once the resort of the buffalo, and at a very early age, of several species of animals now extinct. One of the most famous of these places is the Big Bone lick not far s. of Cincinnati, where remains of the mastodon, mammoth, musk-ox, elk, etc., are found in great numbers. Lead ores are found in some places and near Cumberland falls small deposits of silver. Salt springs are of frequent occurrence among the sandstone rocks, and sulphur, chalybeate, and saline springs abound. In Clay and Meade cos. salt in large quantities is obtained by boring. Iron ores are found in the n.e. corner of the state, where numerous furnaces are in operation; also in the slate and limestone regions, and in the s.w. cos. bordering on the Tennessee and Cumberland Rivers. Other products are saltpetre, gypsum, natural gas, asphaltum, and petroleum.

ZOOLOGY AND BOTANY.—Of the larger wild animals, the deer is still abundant, but the

wolf and bear are seldom seen. The badger, raccoon, ground-hog, rabbit, opossum, etc., are common, as are the wild turkey, grouse, partridge, etc. The most interesting fish is the species found in the Mammoth Cave and erroneously called eyeless. In the forests, which are still extensive, or in the river valleys, are found, according to latitude, the ash, elm, white pine, yellow pine, tulip, hickory, sweet gum, black walnut, sugar maple, water maple, black, white, red, post and black jack oaks, honey locust, buckeye, cottonwood, pecan, coffee tree, cypress, catalpa, kalmia and rhododendron. The principal fruit trees are the apple and peach.

CLIMATE AND AGRICULTURE.—The climate is somewhat variable, but on the whole very pleasant. The mean annual temperature is about 55°. In winter the mercury occasionally falls to zero, and even below, while in summer it rises to 94° or 100°. Winter usually continues from the end of Nov. to the beginning of Apr., but the snows are light and seldom remain long upon the ground. The yearly mean temperature at Danville is 57.07°; at Paris, 52.45°; the average annual rainfall at Springdale is 48.58 ins.; for the state, 47 ins. As an agricultural state K. holds a high rank, and it is said that there are not over 200 sq. m. of irreclaimable land. The rare fertility of soil in the beautiful Blue Grass region, which covers fully 10,000 sq. m., is due to the constant decay of a rich substratum of lower silurian limestone. Many fields have been cultivated for a century or more. The most important production is tobacco, in which the state has long held first place. Other crops in their order are corn, oats, wheat, potatoes, hay, and rye, the state ranking seventh in corn, and fifteenth in oats. The census of 1890 showed 179,264 farms in the state, comprising 21,412,229 acres, of which 11,818,882 were improved. The value of land, fences, and buildings was \$346,339,360, and of farm implements and machinery, \$10,906,506. Kentucky is famous the world over as a stock-raising state, producing more especially thoroughbred horses and shorthorn cattle that are absolutely unsurpassed in beauty and quality. In 1890 the horses numbered 401,356; milch cows, 364,516; oxen and other cattle, 701,575; swine, 2,036,746; and sheep, 937,124. Official reports indicate a falling off in the agricultural and live-stock industries, and a large increase in manufacturing.

MANUFACTURES.—In 1890 there were 7745 manufacturing establishments, with an aggregate capital of \$79,811,980, which employed 65,579 persons (to whom \$27,761,746 was paid in wages), paid \$61,588,583 for materials, and had an output valued at \$126,719,857. The principal industries, in the order of value of output, were distilling liquors, flour and grist milling, lumber working from logs or bolts, manufacturing chewing and smoking tobacco, and snuff, foundry and machine shop work, slaughtering and meat-packing, stemming tobacco, tanning leather, malt liquors, woolen goods, iron and steel, furniture, agricultural implements, cigars and cigarettes, brick and tile, and cotton goods.

COMMERCE.—Of direct foreign commerce K. has very little. Louisville is the principal port of delivery. The principal exports are hemp, flax, tobacco, horses, mules, hogs, cattle, bagging, and rope. The quantity of shipping is small. Several of the large rivers, chiefly the Kentucky and Green, have been made navigable by dams, locks, etc. The locks and dams on the Kentucky were transferred, 1880, to the general government. The canal around the falls of the Ohio at Louisville enables large boats to pass at most seasons of the year.

RAILROADS.—The principal lines extending through the state are the Chesapeake, Ohio and Southwestern; Louisville and Nashville; Cincinnati, New Orleans and Texas Pacific; Illinois Central; Southern; Yazoo and Mississippi Valley; Louisville, Evansville and St. Louis; and Louisville, Henderson and St. Louis. The total mileage in operation exceeds 4,600; the operating companies have a combined capital of over \$117,000,000, a funded debt of over \$154,000,000, and a total investment of over \$280,000,000. The cost of the roads and their equipment exceeded \$243,000,000.

BANKS.—In 1896 there were 77 national banks in operation, with capital \$13,084,400, deposits \$18,565,222, and reserve \$5,631,672; and 188 state banks, with capital \$22,437,936, deposits \$25,557,816, and resources \$51,648,744. The exchanges at the clearing-house at Louisville during the year aggregated over \$210,000,000.

CHURCHES, EDUCATION, ETC.—The leading denominations numerically are the Baptist, Methodist Episcopal, Christian (Disciples), Cumberland Presbyterian, and Roman Catholic.

Widows with children to be taught are allowed to vote for trustees. Three colored trustees are annually appointed for each colored district, but the colored schools are too often under incompetent teachers. The school buildings of Louisville are alone worth almost as much as those of the rural districts. The principal collegiate institutions are Kentucky Univ. at Lexington, embracing the Agricultural and Mechanical coll. established by the congressional land grant; the Kentucky Military institute at Farmdale; Bethel coll. (Bap.), Russellville; Berea coll. (non-sect.), Berea; Center coll. (Presb.), Danville; Georgetown coll. (Bap.), Georgetown; Ogden coll. (non-sect.), Bowling Green; Eminence coll. (Christian), Eminence; Central univ. (Pres. S.), Richmond; South Kentucky coll. (Christ.), Hopkinsville; Liberty coll. (Bap.), Glasgow; Christian coll. (Christ.), Columbia; Kentucky Wesleyan coll. (M. E. S.), Winchester; GIRRARD coll., Lancaster; and St. Mary's coll. (R. C.) at St. Mary's Station. There are a number

of institutions for the education of women, each under the direction of some Christian denomination. Instruction in theology and medicine is afforded in several institutions. Many of the higher institutions are co-educational, and there are colleges exclusively for women at Bowling Green, Danville, Glendale, Hopkinsville, Lexington, Millersburg, Nicholasville, Owensboro, Pewee Valley, Russellville, Stanford and Winchester. There are public normal schools at Frankfort (colored) and Louisville, and about 15 private ones elsewhere. The public school population exceeds 645,000, of whom over 467,000 are enrolled in public schools and 26,000 in private schools. There are over 8,000 public school houses, about 10,000 teachers, and public school property valued at \$6,000,000. The annual cost of maintaining the public schools is about \$3,500,000. In 1896 there were 47 libraries of 1000 volumes and upward each, with 318,661 volumes and 27,739 pamphlets, and 300 periodicals of all kinds.

GOVERNMENT, ETC.—Frankfort is the capital of the state. The gov. is chosen by the people for 4 years, and receives a salary of \$5000. He is ineligible for 2 consecutive terms. The lieut.-gov. is elected for 4 years, and presides in the senate for \$10.00 per day. The legislature, consisting of a senate of 38 members and a house of representatives of 100, meets biennially in the odd years. Members are paid \$5.00 per day and mileage. The court of appeals, which has only an appellate jurisdiction, consists of a chief-justice and 3 judges, each of whom receives an annual salary of \$4000 and serves 6 years. The circuit and county judges are elected by the people. The general election occurs on the Tues. after the first Mon. in Nov. Suffrage is restricted to citizens who have resided 2 years in the state (or one year in the co. previous to the election) and 60 days in the precinct. The legal rate of interest is 6 per cent.; 6 per cent. is allowed by contract, and the penalty for usury is forfeiture of excess over 10 per cent.

The state institutions are the asylum for the blind, Louisville, the institution for deaf mutes, Danville, the asylums for the insane at Anchorage, Lexington and Hopkinsville, at Frankfort a penitentiary and an institution for the feeble-minded, and at Eddyville a branch of the state penitentiary.

The electoral votes of K. for pres. and vice-pres. of the U. S. have been cast as follows: 1792, 4 for Washington and Jefferson; 1796, 4 for Jefferson and Burr; 1800, 4 for Jefferson and Burr; 1804, 8 for Jefferson and Clinton; 1808, 7 for Madison and Clinton; 1812, 12 for Madison and Gerry; 1816, 12 for Monroe and Tompkins; 1820, 12 for Monroe and Tompkins; 1824, 14 for Jackson, and 7 each for Calhoun and N. Sanford; 1828, 14 for Jackson and Calhoun; 1832, 15 for Clay and Sargeant; 1836, 15 for Harrison and Granger; 1840, 14 for Harrison and Tyler; 1844, 12 for Clay and Frelinghuysen; 1848, 12 for Taylor and Fillmore; 1852, 12 for Scott and Graham; 1856, 12 for Buchanan and Breckinridge; 1860, 12 for Bell and Everett; 1864, 11 for McClellan and Pendleton; 1868, 11 for Seymour and Blair; 1872, 8 for Hendricks and 4 for B. Gratz Brown for pres., and 8 for B. Gratz Brown, 3 for T. E. Bramlette, and 1 for W. B. Macken for vice-pres.; 1876, Tilden and Hendricks, 12; 1880, Hancock and English, 12; 1884, Cleveland and Hendricks, 13; 1888, Cleveland and Thurman, 13; 1892, Cleveland and Stevenson, 13; 1896, McKinley and Hobart, 12, and Bryan and Sewall, 1.

In 1896 the equalized property valuations aggregated \$570,926,762; the total bonded debt (the greater part held by the school fund) was \$2,992,990, and the net floating debt, \$1,239,684.

POPULATION.—1790, 73,077—11,830 slave, 114 free col'd; 1820, 564,317—126,732 slave, 2941 free col'd; 1840, 779,820—182,258 slave, 7317 free col'd; 1860, 1,155,684—225,483 slave, 10,684 free col'd; 1880, 1,377,179—271,451 col'd; foreign born, 59,517; male, 582,590; female, 816,100; families, 302,631; dwellings, 286,600; persons to sq. m., 41.2; engaged in agriculture, 320,571; in mining and mechanical industries, 61,481. The rank of K. among the states was 8 in population, 12 in value of agricultural products, and 17 in value of manufactures. Pop. in 1890, 1,858,635. There are 119 cos.; for pop. 1890, see census tables, vol. XV. The largest cities, 1890, were Louisville, 161,129; Covington, 37,371; Lexington, 21,567; and Newport, 24,918. See histories by Allen (Louisville, 1872), Collins (Covington, 1874), and Shaler (Boston, 1884).

KENTUCKY, a river which rises in the Cumberland mts., on the s.e. frontier of the state of K., its chief feeders being the north, middle, and south forks. After a winding n.w. course of 260 m., during which it receives no large tributaries, it enters the Ohio about 45 m. s.w. of Cincinnati. It is navigable by steamboats to Frankfort, 62 m. from its mouth; by means of locks and dams 40 m. above the city, and flatboats ascend 100 m. farther. The scenery along its course is very beautiful, and near Frankfort it flows through a deep chasm between perpendicular limestone rocks. Coal, iron ore, and marble abound along its banks.

KENTUCKY UNIVERSITY, at Lexington, Fayette co., Ky., organized at Georgetown, Ky., as Bacon College in 1836; removed to Harrodsburg, Ky., in 1839; reorganized as Kentucky University under a new charter granted in 1858. It was removed to Lexington, Ky., in 1865, and Transylvania University (chartered in 1798) was merged in it. The institution embraces the College of Liberal Arts, with an academy attached, the College of the Bible, and the Commercial College. Each college has its own faculty and presiding officer, the president of the university being, ex-officio, the presiding officer of the College of Liberal Arts. In 1897 the libraries contained nearly 15,000 volumes;

the museum and cabinet of natural history about 10,000 specimens. The buildings of the University, six in number, occupy a campus of about 13 acres in the heart of the city. An additional tract of about 3 acres has been set off as a park. The endowment is \$270,000; the ground and buildings are estimated at \$250,000. In 1895 it had 25 instructors and 888 students. The president (1897) was Chas. Louis Loos, LL.D. It is under the control of the Disciples of Christ.

KENYON, JOHN, 1784-1856; b. in Jamaica, W. I.; d. in the Isle of Wight. He published *Rhymed Plea for Tolerance* (1833) and *Poems* (1838). He was best known as the patron and friend of literary men, among whom at his death he distributed a large part of his fortune.

KENYON COLLEGE, at Gambier, Knox co., Ohio, was founded in 1825 by the efforts of Bishop Philander Chase, of the Protestant Episcopal Church, who collected, in England, a large portion of the funds for its endowment. The college is named for Lord Kenyon and the village for Lord Gambier, two of the largest English contributors. Its endowment in 1897 amounted to \$250,000, and its annual income to \$22,000. It had 14 buildings for various uses; a library of 30,000 volumes; good physical and chemical laboratories; an observatory and museum. The number of professors and instructors in 1897 was 19; students, 162, including those in the preparatory department. There is a theological department, Bexley hall. President, 1897, the Rev. William Foster Peirce, LL.D.

KEOKUK, a co. in the s.e. part of Iowa, intersected by the Skunk river, the n. and s. forks of which unite within its limits; and the s. fork of the English river drains a part of the county; 576 sq. m.; pop. '90, 23,862. The surface is undulating, the soil fertile. Wheat, corn, oats, hay, cattle, and pork are the chief products. Bituminous coal is found in some places. The Chicago, Rock Island and Pacific, and the Chicago, Milwaukee and St. Paul railroads pass through the county. Co. seat, Sigourney.

KEOKUK, a city in Lee co., Ia.; at the junction of the Mississippi and Des Moines rivers, and on Des Moines Rapids canal and the Burlington route, Chicago, Rock Island, and Pacific, Keokuk and Western, Toledo, Peoria and Western, and the Wabash railroads; 46 miles s. of Burlington. The city, locally known as the "Gate City," extends from the river to the summit of a bluff, and has wide streets, gas and electric light plants, Holly system of waterworks, electric street railroads, and over 20 churches. The noteworthy institutions are the Keokuk medical college, the college of physicians and surgeons, high school, St. Vincent's academy, Keokuk bar association, public, and I. O. O. F. libraries, business college, St. Joseph's and Mercy hospitals, the Home for the friendless, and the U. S. government building. Among the points of special interest are the locks and canal built by the federal government around the rapids, and the burial place of the noted Indian chief after whom the city was named. There are several public parks, national and state banks, and daily, weekly, and monthly periodicals. The city has a large trade by rail and water. Industrial interests include flour and lumber mills, foundries and machine shops, canning and pork-packing plants, shoe, starch, pickle, and garment factories, iron works, and sash, door, and blind factory. The canal around the rapids, about 9 miles long and 300 ft. wide, with three locks, which cost about \$8,000,000 and was opened in 1877, affords exceptional power for manufacturing. Pop. '90, 14,101.

KÉPI, (Fr.) The French name of the shako or foraging cap of a French infantry soldier. It consists of a red cap of the shape usually worn by a common soldier, and is fitted at the front with a patent-leather visor.

KEPLER, or **KEPLER**, **JOHANN**, one of the greatest astronomers of all ages, was b. at Magstatt, a small village in Würtemberg, 10 m. from Stuttgart, Dec. 27, 1571. While a mere child he was left to his own resources, and his early education in consequence would have been entirely neglected had he not been admitted into the convent of Maulbronn. Kepler afterwards studied at the university of Tübingen, and devoted nearly the whole of his time to mathematics and astronomy. In 1593 he was appointed professor of mathematics at Grätz. At this time Kepler's views of astronomy, as seen in his *Prodromus*, were somewhat mystical; he supposed the sun, stars, and planets were typical of the Trinity, and that God distributed the planets in space in accordance with the regular polyhedrons, etc. Yet this searching after harmony led him to the discovery of the three remarkable truths called *Kepler's laws*. Kepler, about 1596, commenced a correspondence with Tycho Brahé, and in 1599 went to Prague to aid him in his researches. Tycho obtained for him a government appointment; but the salary was not paid, and Kepler lived for eleven years there in great poverty. He then obtained a mathematical appointment at Linz, and, fifteen years afterwards, was removed to the university of Rostock; but poverty from the same cause still pursued him, and he died shortly after at Ratisbon, Nov. 15, 1630. Kepler's connection with Tycho Brahé had a salutary effect upon his fiery enthusiasm, but, happily for science, the timid councils of the old astronomer were only partially followed. Kepler established the law of the diminution of light in proportion to the inverse square of the distance, and was acquainted with the fact "that the attractive force of the sun decreases as his light;" it is strange that this latter fact did not lead him to anticipate the discovery of Newton. In 1609 he published his *Astronomia nova*, a commentary on the motions of Mars, in which, taking for his base of operations the observations of Tycho, he

determined the eccentricity and aphelion of this planet, on the supposition of a circular orbit, and found the results quite irreconcilable with observation. This led him to his first law, *that the planets move in ellipses with the sun in one of the foci*. The second law, *that the radius-vector (q.v.) sweeps over equal areas in equal times*, he at first asserted dogmatically, and was for a long time puzzled to find some proof of it (the infinitesimal calculus not having at that time been invented); but at last he hit upon the expedient of dividing the ellipse into an immense number of small triangles, whose areas could be easily found. His third law (the first discovered) was an attempt to harmonize in some way the period and mean distance of the planets, and after twenty-two years of vigorous application, he discovered *that the square of the periodic time is proportional to the cube of the mean distance*. These discoveries, great as they undoubtedly are, are rendered still more so when we take into account the little real knowledge of the heavenly bodies existing at that time, and the scanty means in the hands of astronomers for making discoveries. Kepler also affirmed the essential inertia of matter, the first of Galileo's laws of motion; the dependence of the curvature of the path of planets on the attraction of the sun (Kepler unfortunately thought it was *magnetic attraction*) and the proportionality of the mutual attraction of bodies to their respective masses; he demonstrated the four new planets of Galileo to be satellites of Jupiter; gave a complete theory of solar eclipses; and calculated the exact epoch of the transits of Mercury and of Venus across the sun's disk. He also made numerous discoveries in optics, general physics, and geometry. A collected edition of Kepler's works was published by Frisch (1858-71).—See Brewster's *Lives of Galileo, Tycho de Brahé, and Kepler* (1841); and Reitlinger, Neumann, and Gruner, *Johannes Kepler* (1868).

KEPPEL, AUGUSTUS, Viscount, 1725-86; son of William, second earl of Albemarle. Entering the navy in 1740 he accompanied Anson in his voyage round the world. For several years he made successful expeditions. In 1761, with a small squadron, he captured Belle Isle, was created the following year rear-admiral of the blue, and in 1778 admiral of the red. In an engagement with the French off Ushant, July, 1778, he was censured for neglect of duty by sir Hugh Palliser, tried by court-martial, but honorably acquitted. In 1782 he was raised to the peerage as viscount Keppel, baron Eldon. Twice he was first lord of the admiralty.

KEPPEL, Sir HENRY, b. 1809; younger son of the earl of Albemarle and brother of George Thomas; rose from lieutenant in the British navy in 1829 to the rank of admiral in 1869. He was early stationed in India, the Mediterranean, and at the cape of Good Hope; on the coast of China he had command of the *Dido*, 1841-45; at Sebastopol, in the Crimean war, had command of the naval forces; in 1857-58 commanded the naval forces against China, destroying a Chinese war-fleet, for which he was made K.C.B.; in 1867-69 was vice-admiral and commander-in-chief in China and Japan; in 1877, admiral of the fleet.

KEPPLER, JOSEPH, 1838-94; b. Vienna; caricaturist. He studied art in Italy; became an opera singer in Vienna; came to the United States in 1868; started the German *Puck* in St. Louis; removed to New York in 1872; was cartoonist for Frank Leslie till 1877; and afterward conducted *Puck* in English and German till his death.

KERAMIC. See CERAMIC.

KERATINE, or ELASTINE, one of the nitrogenous non-crystalline bodies which are allied to the proteids. See PROTEINE and PROTEINE BODIES. The other members of this group, as now known, are mucine, chondrine, glutine, elastine, and nucleine. Keratine, though somewhat resembling the proteids in composition, differs from them widely in other properties. Hair, epidermis, nails, feathers, and horn are composed principally of keratine. Heated with water in a digester at 302° F., keratine is partially dissolved, with evolution of sulphureted hydrogen. Prolonged boiling with alkalies and acids will dissolve keratine. The alkaline solutions when treated with acids evolve sulphureted hydrogen, the sulphur constituent being loosely united to the other elements. The exact chemical composition of keratine has not been determined, but lies somewhere between the following numbers: Oxygen, 20.7 to 25; hydrogen, 6.4 to 7; nitrogen, 16.2 to 17.7; carbon, from 50.3 to 52.5; sulphur, .7 to 5 per cent. According to Lear, the composition of human hair, exclusive of ash, is as follows: Carbon, 50.42; hydrogen, 6.34; nitrogen, 17.33; oxygen, 20.91; sulphur, 5.

KÉRATRY, AUGUSTE HILARION DE, 1769-1859; b. Rennes, France; was a member of the chamber of deputies in 1818 and 1827, and by his liberal measures after the restoration of the Bourbons did much to promote the revolution of 1830, resulting in the downfall of Charles IX. and accession of Louis Philippe. He was made a peer of France in 1837 by Louis Philippe. In 1848 he was again a member of the legislature. After the *coup d'état* of Napoleon, to whom he was strongly opposed, he withdrew from public life. His principal published works are *Inductions Morales et Philosophiques*, and several poems and romances.

KÉRATRY, ÉMILE DE, Comte, b. Paris, 1832, of a noble family in Bretagne; son of Auguste Hilarion, who was a moderate participant in every revolution in France from 1789 to 1851. Émile entered the army, served in Africa, the Crimea, and Mexico. In 1865, returning to Paris, he became one of the editors of the *Revue Contemporaine*, in which his articles on the French occupation and campaigns of Mexico threw such light

upon them as to produce a lively sensation in France. Afterwards editor of the *Revue Moderne*, he renewed attention to the same subject. The articles brought out disdainful allusions to their author by Rouher from the tribune; to which Kératry replied by a published letter, announcing that if the government failed to investigate the Mexican misdoings he would make public complete revelations of them. In 1869, against the opposition of the government and the clergy, he was elected deputy to the *corps législatif*. There he became an active member of the opposition, which denounced the prorogation of the legislature by Napoleon III. During the session of 1870 Kératry was active in pressing measures for the reorganization of the army, the suppression of the *garde mobile*, the creation of a militia, and the imposition of the condition of suffrage that each elector should know how to read and write. He demanded the restitution to the national archives of papers which Napoleon had caused to be abstracted; and became an advocate of the restoration of rights and citizenship to the Orleans princes. On the opening of diplomatic difficulties with Prussia in July, 1870, Kératry was hot for war. When, Sept. 4, 1870, the empire crumbled under defeat and the public contempt, Kératry was made prefect of police by the new committee of defense. He ordered the removal of all Germans from Paris and its environs, sent the Orleans prince back to England, and made quick changes in the police department of Paris to deprive its organization of a political or partisan character. He soon resigned this position to take a diplomatic mission to Spain; leaving Paris in a balloon. The mission was futile. On his return Gambetta made him commander-in chief of the forces organizing in the five departments of Bretagne; but, disagreeing with Gambetta, he resigned Nov. 27. In Mar., 1871, Thiers appointed him prefect of the department of the *Haute-Garonne*, where he took prompt and harsh measures to signalize his detestation of ultra-democratic opinions. In Nov., made prefect of the *Bouches-du-Rhône*, he exhibited such lack of tact, and hostility to the republican party, that his resignation was willingly accepted in Aug., 1872; and he was made an officer of the legion of honor. He then became one of the editors of the journal, *Le Soir*. He is the author of several comedies and graver works, as follows: *A bon chat bon rat*; *Toile de Pénélope*; *La Guerre des Blasés*; *Vie de Club*; *Contre-Guerilla*; *la Créauce Jecker*; *L'Elevation et la Chute de Maximilien*; and *Le Quatre Septembre*: the last is a curious exposition of the police system under the empire. He has also published *Murad V. Prince, Sultan, Prisonnier d'état*.

KERBELA, or **MESHED-HOSSEIN**, a large city of Asiatic Turkey, 60 m. s.s.w. of Bagdad; pop. over 50,000, and is the second town of Mesopotamia. Around the old town now extend four broad well-lighted streets. Kerbela's ancient name was *Vologesia*. It is a great resort for Mohammedan pilgrims, as the spot where Hossein, the son of Ali by Fatima, the daughter of the prophet, having been slain in the vicinity, was buried. An ancient canal connects the town with the Euphrates. Many Persians reside here.

KERFOOT, JOHN BARRETT, D.D., LL.D., born in Dublin, Ireland, 1816; educated at the Flushing institute and St. Paul's college, N. Y., graduating in 1834. He was ordained deacon in 1837, priest in 1840, and bishop of Pittsburg in 1866. He received the degree of D.D. from Columbia college in 1850 and also in 1865 from Trinity college, Hartford, and the degree of LL.D. from the university of Cambridge, England, in 1867. From 1842 to 1864 he was president of St. James's college, Md.; and of Trinity college, Hartford, Conn., 1864-66. He d. 1881.

KERGUELEN'S LAND, or **ISLAND OF DESOLATION**, is situated in the Southern or Antarctic ocean, the latitude and longitude of its southern extremity, cape George, being 49° 46' s., and 70° 12' e. It is about 110 m. long and about 50 m. broad. It consists chiefly of moss-covered rocks of primary formation, forming a perfect land of desolation. The island was discovered in 1772 by the French navigator, Yves Joseph de Kerguelen Tremarec, and annexed by France in 1893.

KERGUELEN'S LAND CABBAGE, *Pringlea antiscorbutica*, the only known species of a very curious genus of plants of the natural order *cruciferae*, found only in Kerguelen's land. It has a long, stout, perennial root-stock; a *bolled* head of leaves very similar to those of the common garden cabbage. Captain Cook first discovered this plant, and directed attention to it. It is exceedingly abundant in all parts of Kerguelen's land, which produces only seventeen other flowering plants. The root-stocks have the flavor of horse-radish. The dense white heart of the cluster of leaves tastes like mustard and cress, but is coarser. The whole foliage abounds in a very pungent pale-yellow essential oil, which is confined in vessels that run parallel to the veins of the leaf. The Kerguelen's land cabbage is used by voyagers, boiled either by itself, or with beef, pork, etc., and its antiscorbutic qualities make it very important to them.

KERKI, a t. of Bokhara, Central Asia, about 113 m. s.e. of Bokhara city, on the left bank of the Jihoon or Oxus. Kerki is a place of considerable importance, being a frontier fortress, and the key to Bokhara on the side of Herat. The town, which is spread around the fortress, consists of 150 houses, several mosques, a small bazar, and a caravansary; it is also defended by a good wall and deep ditch. The inhabitants are Uzbegs and Turkomans, employed a little in trade, but more in agriculture.

KERLÉRIC, LOUIS BILLOUARD DE, 1704-70; b. at Quimper, France; entered the marine corps in his boyhood, and distinguished himself in many campaigns, especially

on board the *Neptune* in 1746 and 1747. In 1752 he was made governor of Louisiana, and remained in that position 10 years. On his return to France in 1764 he was accused of peculation and cruelty, and committed to the Bastille. In 1769 he was sentenced to banishment, but while he was preparing to submit new exculpatory evidence to the tribunal, he died. He is believed to have written memoirs of Louisiana; but if so they have been lost.

KERMAN' (ancient *Caramania*), one of the eastern provinces of Persia, lying s. from Khorassan, and approximately 28° and 31° n., and 55° and 59° e. The n. and n.e. are occupied by a frightful salt waste called the *desert of Kerman*, which forms a part of the great central desert of Lut. On this extensive tract not a blade of grass is to be seen. The southern portion, although mountainous, is equally arid and barren with the n., except the small tract of Nürmanshir, towards the e., which is fertile and well watered. Silk and wool weaving and the making of fine shawls are the chief occupations. Coal, iron, copper, and lead exist, but are little worked. Cattle, sheep, goats, and camels are reared, and the hair of the last two has long been celebrated for its length and fineness. The inhabitants are chiefly Persians proper; the climate is hot, dry, and unhealthy.

KERMAN, the chief town, is situated near the middle of the province, in the central mountain range, and contains a population estimated at 40,000. The manufactures are chiefly shawls, carpets, and silk. The trade, though still considerable, is very small compared with what it was during the last century, when Kerman was the great emporium for the trade by the Persian gulf and the Indian ocean. In 1794 it was taken and pillaged by Aga Mohammed, and 30,000 of the inhabitants made slaves. But the chief cause of the decline of its trade was the fall of Gombroon (q. v.), its port, before the rising prosperity of Bushire.

KERMANSHAH', a small province of Persian Kurdistan, approximately between 34° and 34° 50' n. It is one of the richest cereal producing provinces in Persia and is renowned for its breed of horses and mules and the manufacture of carpets.

KERMES, sometimes also known in commerce as *scarlet grain*, a dyestuff which consists of the bodies of the females of a species of *coccus* (q. v.) (*C. ilicis*). It has been supplanted over the greater part of Europe by cochineal (q. v.), but is still used in some parts of the south of Europe, and more extensively in India and Persia. The kermes insect is abundant in these regions, attaching itself to the leaves of a small species of oak, the kermes oak (*quercus coccifera*), a low bushy shrub with evergreen spinous leaves, much resembling a holly. In some parts of Spain the kermes oak grows in great profusion, as on the slopes of the Sierra Morena. Many of the inhabitants of Murcia live by collecting kermes. This is chiefly the employment of women, who scrape the insects from the trees with their nails, which they suffer to grow long on purpose. The kermes insect attacks the young shoots of the shrub, the female affixing itself and remaining immovable, till, after attaining its full size, about that of a pea, it deposits its eggs, and dies. Kermes is gathered before the eggs are hatched. It is thrown into vinegar, and afterwards dried in the sun or in an oven. It has been employed from time immemorial to dye cloth of a blood-red color. It was called *thola* by the Phenicians, *coccos* by the Greeks, kermes by the Arabians. From kermes comes the French *cramoisi*. It is supposed to have been the substance employed in dyeing the curtains of the Jewish tabernacle (Exod. xxvi.).

KERMES MINERAL, so called from its resemblance in color to the insect kermes, is an antimonial preparation which was discovered by Glauber (q. v.). The method of preparing it subsequently became known to M. de la Ligerie, from whom the king of France purchased the prescription in the early part of the 18th century. It was at that period often described as *Carthusian powder*, or *poudre des Chartres*, in consequence of a Carthusian friar having effected some remarkable cures by it. Chemists differ slightly as to its composition, but it is generally regarded as a tersulphuret of antimony. Kermes mineral is scarcely ever employed in this country, but it is much used in France and Italy. Its effects are much the same as those of the golden sulphuret (sulphide) of antimony and of the oxysulphuret of antimony of the London pharmacopœia, it being a sudorific in small doses (e.g., half a grain), and an emetic and purgative in large doses.

KERMESSE, church festivals or out-door *fêtes* in Europe, particularly in Belgium and Holland, where they are the scenes of all kinds of amusements like those of any other kind of village *fête* or fair. The word is derived from *kerk*, the Dutch for church, and *messe*, the French for mass. The kermesse probably originated in the tact of the priests or pastors in promoting the enjoyment of their people and making them minister to the popularity and support of the church, as church fairs do now. Teniers and other Flemish artists have pictures that represent the old-time scenes of the kermesse. Dancing, comic processions, and many of the scenes of the carnival are among the amusements. K. (or *Kirmess*) is applied in the U. S. to an indoor festival and fair combined.

KERN, a large co. in the s. central part of California, drained partly by Kern river. Tulare lake lies upon its n. border, while the Coast range of mountains lies along the s.w. boundary; pop. '90, 9808. Between this Coast range and the Sierra Nevada is an

extensive valley or plain. Several high peaks of the Sierra Nevada are within the county. The Tejon pass, in the s. part, is more than 5,000 ft. above the sea. The highlands produce good timber, including pine, fir, and oak. The valleys are well adapted to pasturage. Gold, salt, sulphur, and petroleum are found in some places. Gold, wool, and barley are the chief products. The southern Pacific railroad passes through the county. Area, 7971 sq. m. Co. seat, Bakersfield.

KERN, a name applied formerly to Irish and Gaelic infantry soldiers.

KERN, J. CONRAD, a Swiss statesman, was b. in 1808, near Arenenberg, in Thurgau. He studied theology at Bâle; but he abandoned his intention of entering the church, and turned his attention to law, which he studied successively at Berlin, Heidelberg, and Paris. On his return to his native canton he was appointed to the presidency of the supreme court and of the council of public instruction; and in these offices he made himself remarkable by his talent for public speaking, and his great legal and administrative sagacity. When in 1838 the French government demanded the extradition of prince Napoleon, Kern took the most prominent part at the diet in stirring up the Swiss to refuse to be intimidated. In 1848 Kern took an active part in the preparation of the federal constitution. He afterwards established the polytechnic school of Zurich, one of the most admirable institutions of its kind in Europe. In 1857 he was selected to complete the negotiations regarding the dispute with Prussia; and at the conference of Paris between the great powers, Kern represented Switzerland. D. 1888.

KERNAN, FRANCIS, b. N. Y., 1816, studied at Georgetown, D.C., and, immediately after graduating, adopted the profession of law, commencing practice at Utica, N. Y., in 1839. He gained a high reputation as a lawyer, reporting the decisions of the court of appeals for three years. Having interested himself strongly in politics as a democrat, he was elected to congress by his party, and in 1872 ran for governor of his state, but was defeated by John A. Dix. In 1875 he became U. S. senator from the state of New York, his term expiring in 1881. Mr. Kernan was a member of the electoral commission in 1877. He died Sept. 7, 1892.

KERNER, ANDREAS JUSTINUS, a German poet, one of the leading members of the so-called "Swabian school," was b. at Ludwigsburg, in Würtemberg, Sept. 18, 1786. He studied medicine at Tübingen, and finally settled as a physician at Weinsberg. Here he died Feb. 21, 1862. The most conspicuous qualities of Kerner's poetry are a dreamy fancy and a highly original humor. His chief works are: *Reiseschatten von dem Schattenspieler Lux* (Heidelb. 1811); *Romantische Dichtungen* (Karlsr. 1817); and *Der letzte Blütenstrauß* (Stuttg. and Tüb. 1853). As a physician he displayed quite a morbid interest in the phenomena of animal magnetism, and wrote several books on the subject, one of which, *Die Seherin von Prevorst* (2 vols. Stuttg. 1829; 4th edit. 1846), excited a great interest in America.

KERN LAKE, in Kern co., Cal., flows at high water into Kern river, through a channel which at other times is a slough. The lake abounds in fish, and in the tule around it are found game-birds of all kinds, and beaver, otter, raccoons, and other game animals. Its size depends upon the amount of rain.

KERN RIVER, AND KERN RIVER SLOUGH. The river has its sources in Tulare co., Cal., whence it flows s. and s.w. for a considerable distance, and then divides into two branches, one of which flows into Tulare lake, the other into the tule region around lakes Kern and Buena Vista. Near its sources it abounds in trout. The slough is the channel by which at high water Tulare lake discharges its surplus waters n. to San Joaquin river. The lake has no connection with the ocean except at high water.

KEROSENE (Gr. *keros*, wax), the name of a mixture of certain fluid hydrocarbons used for illumination. It has been prepared from bituminous coal and shales, asphaltums and wood, and from rosin, fish-oil, and candle tar; but is now more economically obtained from petroleum. The density of the mixture called kerosene should be about .810 or 43° Baumé, and should not yield inflammable vapors below a temperature of 110° or 120° F. It is, therefore, not explosive under ordinary circumstances, and a lighted match may be plunged into it without igniting it. If, however, it be burned in a metal lamp, and this be heated to 115° or 120° F., gases might be formed in the upper part of the lamp which, on taking off the cap or burner, might cause an explosion. But there are many lighter hydrocarbons in petroleum, and much of the kerosene in market contains them in greater or less proportion. They are cheaper than the heavier oils contained in the kerosene, and there is a temptation among dealers to mix them with this article after it is bought of the manufacturer or wholesale dealer. The extraction of fluid hydrocarbons from bituminous substances, as shales, coals, and asphaltums, commenced in the latter part of the 17th century. In 1694 a patent was granted in England to Martin Eele, Thomas Hancock, and William Portlock for making pitch, tar, and oil out of shales. In 1716 a process was patented by the Bettons of Shrewsbury for making oil from shales overlying the coal beds. They reduced the shales to powder by grinding, and employed the process of destructive distillation. The oil so extracted was used only for medicine, and called British oil. It was more than a century after this before much information was obtained in regard to the distillation of these oils, when baron Reichenbach investigated their properties, and called a mixture of several of the hydrocarbons in

purified coal oils eupione. He discovered a great many new substances, and published an account of them in three different German scientific journals. Many patents were taken out by French and other inventors for methods of distilling these oils from coal and shales, and many conflicting claims to inventions and varying processes have arisen, which need not be discussed here. The discovery of petroleum in large quantities has practically put a stop to the manufacture of oils from shales or coal, and the name kerosene is now scarcely known to the trade, the term petroleum having taken its place either as crude or refined petroleum. See NAPHTHA; PETROLEUM.

KEROWLEE, a native state of Hindustan, 1229 sq. m.; pop. 156,600. On account of the disturbed condition of the territory, the reigning prince applied to the British government for aid. This was granted and order was restored. On the death of the rajah, Nursing Pal, in 1852, the British government recognized his adopted son as his successor, and arranged for the administration of affairs during the minority of the prince.

KERR, a co. in the s. w. central part of Texas; drained by the head waters of Guadalupe river; about 1100 sq. m.; pop. '90, 4445. The surface is hilly and much of it yet in forest. The soil produces excellent pasturage for great numbers of cattle. Co. seat, Kerrville.

KERR, MICHAEL CRAWFORD, 1827-76; b. Penn. Having studied law at Louisville university, he entered the practice at New Albany, Ind., and in 1856 was elected to the state assembly. In 1862 he was reporter of the state supreme court. In 1866 he was elected to congress, where he was continued in service by successive re-elections till 1876. In 1875 he was elected speaker of the house by the democratic party, but ill health compelled him to resign, and he died in the following year.

KERR, ORPHEUS C. See NEWELL, ROBERT H.

KERRY, a maritime co., in the s. w. of Ireland, in the province of Munster, is bounded on the n. by the mouth of the Shannon, and on the w. by the Atlantic ocean. Area, 1,159,356 statute acres. Surface very rugged, wild and mountainous. In 1893 the total acreage under crops was 165,000, the half of which was in meadows and pasture, the rest chiefly in oats and potatoes. The county is 60 m. in length from n. to s., and 58 m. broad. Its coast-line is about 220 m. in length, fringed with islands, of which the chief are Valentia, the Blasquets, and the Skelligs, and is deeply indented by Kenmare, Dingle, and Tralee bays. Between these bays are two peninsulas, occupied by branches of the mountain system, which, stretching westward from the county of Waterford, traverses the whole of the s. of Ireland. The principal group is that of Macgillicuddy's Reeks, the chief summit of which, Carran Tual, 3,414 ft., is the highest in Ireland. The largest rivers are the Laune, the Maine, and the Cashen. The county contains numerous lakes, some of them, especially those known as the lakes of Killarney (q. v.) of exquisite beauty. The climate is mild, but moist, especially on the coast. The soil rests on slate and sandstone, with limestone. Agriculture is very backward, and this county is one of the most "congested" in Ireland. The manufactures are inconsiderable; oats and butter are the chief exports. The fisheries on the coast are extensive and profitable; they employ nearly 3,000 men and boys. Kerry returns four members to the house of commons. Pop. in '91, 179,136.

KERSEY, or KERSEYMERE, a variety of woolen cloth, differing from ordinary *broad-cloth* by being woven as a *twill*. See TWILL. It is easily distinguished from the common cloth by the diagonal ribbed appearance of its under side, where the nap, not being raised, admits of its structure being seen.

KERSHAW, a co. in n. South Carolina; 775 sq. m.; pop. '90, 22,361. It is traversed by the Wateree river, and the South Carolina and Georgia and other railroads. Auriferous quartz is found here. The surface is diversified, much of it being woodland. The chief productions are cotton and corn. Co. seat, Camden.

KERSHAW, JOSEPH BREVARD, 1822-94; b. in S. C. In the civil war he commanded a regiment of South Carolina volunteers, raised principally by himself, and was engaged in the first battle of Bull Run, July, 1861. Through the Virginia campaign of 1862 he commanded a brigade which went into action at the second battle of Bull Run; he engaged in the capture of Harper's Ferry, Sept. 15, 1862, and two days later in the battle of Antietam. His command held the strong position of Marye's Heights at the battle of Fredericksburg, so disastrous to the union forces, and was prominent at Chancellorsville and at Gettysburg. With Longstreet's corps he was transferred to the west, and was in the battle of Chickamauga and the siege of Knoxville. As maj.-gen. in 1864 he returned to Virginia, and commanded a division in the campaign of Lee's army, which ended at Appomattox court-house. After the war he was president of the state senate and judge of the circuit court, 1877-93.

KERTCH, previous to 1855, the most important port of the Crimea, with the largest trade in the export of corn, is situated on the eastern shore of the peninsula, on the strait of Kaffa or Yenikale. The town has a distinctly eastern air; and the appearance of the houses is greatly enhanced by the pillars and balconies with which they are

furnished. The streets, like those of Constantinople, are haunted by troops of homeless dogs. Kertch, the ancient *Panticapæum* or *Bosporus*, was the capital of ancient Taurica. Previous to 1475 it belonged to the Genoese; subsequently, it came into the hands of the Turks; and finally, in 1774, it was acquired by the Russians. On May 25, 1855, it was taken by the allies during the Crimean war, on which occasion the catacombs, a very valuable collection of antiquities connected with early Greek times, were ruthlessly plundered by the soldiery. Pop. '80, 22,449.

KESHUB CHUNDER SEN. See SEN, KESHUB CHUNDER.

KESTREL, or WINDHOVER, *Falco tinnunculus*, a small species of falcon, and one of the most common of the British *falconide*. It is rather larger than the merlin, its whole length being from 13 to 15 inches. It may be at once recognized by its peculiar habit of hovering or sustaining itself in the same place in the air by a rapid motion of its wings, always with its head to the wind, evidently looking for prey on the surface of the ground. Its prey consists in great part of mice; and although of course included by game-keepers in the large category of "vermin," and destroyed on every opportunity, it deserves the most careful protection by farmers, as a check to the excessive multiplication of mice. It more rarely captures small birds, and does not disdain cockchafers and other insects. It is a very widely distributed bird. The male and female differ considerably in color; ash-gray prevailing more in the former, and rusty brown in the latter.

KESWICK, a market t. of England, in the co. of Cumberland, is situated in a charming district on the Greta, at the northern extremity of Derwentwater, 22 m. s.s.w. of Carlisle. Manufactures of coarse woollen cloth and blankets are carried on here. In the vicinity, at Borrowdale, are black lead mines, no longer worked, but silver, lead, and zinc ore are mined near, and Keswick is well-known for the black-lead pencils here manufactured. Pop. '91, 3905.

KESZTHE'LY, a market t. of Hungary, in the co. of Zala, contains an old church, three cloisters, and a castle. In the vicinity marble and basalt quarries are worked. Pop. '90, 6195.

KETCH, a broad, strongly-built vessel of two masts—viz., the main and mizzen. It is now almost obsolete, but formerly was the favorite form for state yachts, and still more recently was the prevailing mortar-boat. In this latter capacity it was called a bomb-ketch.

KET'CHO, or KESHO. See CACHAO.

KETCHUM, WILLIAM SCOTT, 1813-71; b. Conn.; graduated at West Point in 1834, and served in Florida, Texas, on the plains, in Kansas, Utah, and California. He was brevetted brig.gen. and maj.gen. for meritorious services during the civil war and in the war department. Retired in 1870, and died by poison in Baltimore in the following year.

KET'CHUP, or CATSUP, a name common to several esteemed kinds of sauce, much used with meat, fish, toasted cheese, etc.—**MUSHROOM KETCHUP** is made from the common mushroom (*agaricus campestris*), by breaking it into small pieces, and mixing it with salt—which so acts upon it as to reduce the whole mass to an almost liquid state—straining, and boiling down to about half the quantity. Spices of different kinds are added, for which there are many receipts, and sometimes wine. Mushroom ketchup must be kept in tightly corked bottles.—**WALNUT KETCHUP** is made from unripe walnuts, before the shell has hardened. They are beaten to a pulp, and the juice separated by straining. Salt and vinegar are added, also spices variously, and after considerable boiling down, the ketchup is bottled, and may be kept for years.—**TOMATO KETCHUP** is made in a similar manner from tomatoes, but is not strained. These are the three most esteemed kinds.

KE'TONES, or ACETONES, are organic substances or bodies which in general terms may be defined as composed of acid and alcohol radicals. See RADICAL. Chancel proposed the hypothesis that they are formed on a nuclear molecule of carbonic oxide, or carbonyl, CO, and Wanklyn's researches have demonstrated its correctness. Dimethyl ketone, or *acetone*, may be taken as the type. It is composed of carbonic oxide, as the acid radical, and two monatomic alcohol radicals, and in general it may be said that ketones contain the group CO associated with two monatomic alcohol radicals, which may be the same or different. Thus, ethyl-methyl ketone is $C_2H_5 \cdot CO \cdot CH_3$ or $C_4H_{10}O$. The mode of formation of the ketone may be explained by regarding it as derived from an aldehyde by the substitution of an additional alcohol radical in place of the hydrogen atom attached to the group CO. Thus, acetic aldehyde C_2H_4O , which may be written $CH_3 \cdot CO \cdot H$, by substitution of the radical CH_3 for the single atom H, becomes $CH_3 \cdot CO \cdot CH_3$, or $CO:2(CH_3)$, as it is more commonly written, or $CO(CH_3)_2$, or C_3H_6O . The only ketones which have been carefully studied are those which contain the alcohol radicals C_nH_{2n+1} ; and which are analogous to the aldehydes $C_nH_{2n}O$, and the fatty acids $C_nH_{2n}O_2$. The ketones of this group, containing two equivalents of the same alcohol radical, are produced: 1. By the action of carbonic oxide on sodium ethylate and its homologues; 2. By the action of zinc-methyl and its homologues on the acid chlorides; 3. By the oxidation of the secondary alcohols; 4. By the dry distillation of calcium salts of the fatty acids. The ketones formed in this manner from the successive members of

the fatty acid series, of which acetic acid is one, differ from one another by twice the radical CH_2 ; thus, the salt containing

Acetic acid	$\text{C}_2\text{H}_4\text{O}_2$	yields	Acetone	$\text{C}_3\text{H}_6\text{O}$
Propionic acid	$\text{C}_3\text{H}_6\text{O}_2$	"	Propione	$\text{C}_5\text{H}_{10}\text{O}$
Butyric acid	$\text{C}_4\text{H}_8\text{O}_2$	"	Butyrone	$\text{C}_7\text{H}_{14}\text{O}$
Valeric acid	$\text{C}_5\text{H}_{10}\text{O}_2$	"	Valerone	$\text{C}_9\text{H}_{18}\text{O}$

There are intermediate ketones obtained from different alcohol radicals. Thus ethyl-methyl ketone $\text{C}_4\text{H}_8\text{O}$ is intermediate between acetone and propione. The ketones which contain two different alcohol radicals are obtained by the second process enumerated above, that is, by the action of zinc methyl upon acid chlorides, or by distilling a mixture of calcium salts of two different fatty acids. Ketones in general are also formed by the gradual oxidation of the lactic acid series, and by the dry distillation of wood, sugar, and other carbon compounds.

Every ketone is isomeric with an aldehyde belonging to the same series; thus, acetone is isomeric with propionic aldehyde $\text{C}_3\text{H}_6\text{O}$, and formic acetone is identical with formic aldehyde, COH_2 . These bodies are generally volatile liquids, insoluble in water. Those in which the group CO is associated with a methyl group resemble the aldehydes in forming crystalline compounds with alkaline bisulphites, from which the ketone may be obtained by distillation with an alkali, which abstracts the second equivalent of sulphurous acid. In regard to acetone, the typical and most common of the ketones, it is best prepared by the dry distillation of acetate of calcium or acetate of lead. The crude distillate is then saturated with carbonate of potash and rectified in a water bath from chloride of calcium. When pure, acetone is a colorless limpid liquid having a peculiar, agreeable odor and a biting taste somewhat like that of peppermint. Density, 0.792; boiling point, 133.7°F . (56.5°C). It is inflammable, burning with a bright flame.

KETSKEMET, a t. of Hungary, co. of Pesth, 50 m. s.e. of Buda; pop. '90, 48,493. It has various institutions of learning, including a normal school and a school of design; also churches of various denominations; gymnasia, an orphan asylum, and a hospital. The principal industries are the manufacture of wine, tobacco, the tanning of leather, and breeding live-stock. It was the birthplace of the poet Joseph Katona.

KET'S REBELLION, an outbreak which took place in England, in 1549, under the leadership of William Ket, a tanner, living in Wymondham, Norfolk. He is said to have had 20,000 followers; but the rising was suppressed by the earl of Warwick, after an engagement in which more than 2000 of the insurgents were killed. The leader, Ket, with others, suffered death on the gallows.

KETTELER, WILHELM EMANUEL VON, 1811-77; b. Westphalia; studied law and was attached to the civil service of Münster, but entered upon the study of theology, and was ordained a priest in 1844. In 1850 he was made bishop of Metz, and became a prominent leader in the ultramontane party.

KETTERING, a market t. of England, in the co. of Northampton. The parish church is large and handsome, with a tower dating from about 1450. The town has iron ore quarries, blast furnaces, and factories for boots and shoes. Pop. '91, 19,454.

KETTLE-DRUMS, metallic kettles or basins, made of copper, or brass, with a head of vellum, which is lapped over an iron ring, and fitted outside of the kettle. By means of screws the head may be tightened, or loosened. Two are generally used in orchestras, usually tuned to the tonic and dominant. Beethoven was the first to treat the kettle-drum as a solo instrument, and Berlioz gave it greater importance, frequently employing three in his band. In the cavalry two kettle-drums are used, one on each side of the horse's neck.

KETTLE-DRUM, as applied to a social gathering, originated in the British army in India. It sometimes happened in the emergencies of camp life that in an entertainment given by officers and their wives there was a lack of requisite furniture, and the heads of kettle-drums were made to serve in place of tables to hold the cups of tea. So by metonymy the article used gave name to the occasion on which it was used. The name came to mean an informal party, and specifically an afternoon party in which elaborate dress and costly viands gave place to every-day attire for ladies and business suits for gentlemen, with very simple side-table refreshments. This kind of visit was introduced into this country at a time of general financial depression by some who wished to meet their friends socially, yet could not, as before, entertain sumptuously. See **DRUM**.

KEUKA LAKE. See **CROOKED LAKE**.

KEUPER, the upper division of the triassic period, consisting in the typical German series of a thickness of more than 1000 ft. of (1) various colored sandstones; (2) marls, with gypsum and dolomite; and (3) a series of carbonaceous slate-clay, with gray sandstones and small irregular beds of impure earthy coal. In Britain, it consists of (1) an extensive series of red marls, with large deposits of rock-salt and gypsum; and (2) white and brown sandstones with beds of red marl. The whole reaches a maximum thickness of 1300 feet. The Keuper occupies a large portion of the valleys of the Ouse and the Trent, and is extensively developed in Worcester, Stafford, and Cheshire, where beds of salt, often as much as 80 or 100 ft. in thickness, occur. The Keuper does not abound in fossils. The contained organisms differ from those of the Permian and older periods;

they have the general appearance of the fossils of the lias and oolite. The plants consist of ferns, equisetum-looking plants, cycads, and conifers. The character of the rocks, and the quantity of oxide of iron, which seems to have been injurious to life, account for the paucity of fossils. The strata are chiefly of interest to the paleontologist, because of the numerous footprints they contain (see **ICHTHOLOGY**), and the remains of the reptiles which produced them, as well as because in them are also found the only observed fragments—the teeth—of the oldest mammal yet known. See **MICROLESTES**. See *illus.*, **MUSCHELKALK** vol. X.

KEW, a small village in Surrey, on the right bank of the Thames, and $1\frac{1}{2}$ miles n.e. of Richmond. On the opposite side of the river is Brentford, with which Kew is connected by a bridge. The most interesting object at Kew is the royal botanic gardens, containing a large and choice collection of plants, native and exotic, which have been arranged with great skill and care by sir W. J. Hooker. The hot-houses and conservatories are very numerous. There are also a *palm-house*, 362 ft. by 100, and 60 ft. high; an arboretum of 178½ acres has been lately added to the gardens, which extend over 70 acres. The botanic gardens were commenced by the mother of George III., but owe much of their celebrity to the able management of sir W. J. Hooker (q.v.). They were presented to the nation by Queen Victoria in 1840, since when they have been open to the public in the afternoons, Sundays not excepted. There is also an observatory, which, however, is used chiefly as a meteorological station.

KEWAUNEE, a city in Henry co., Ill., chartered in 1896; on the Burlington Route railroad; 32 miles n.e. of Galesburg. It is in a coal-mining region, and has a public library, gas and electric light plants, water supply from deep wells, over 15 churches, several national banks, and daily and weekly newspapers. Pop. '90, 4569.

KEWAUNEE, a co. in northeastern Wisconsin, on lake Michigan, but touching Green Bay on the northwest; 336 sq. m.; pop. '90, 16,153. Co. seat, Kewaunee.

KEWAUNEE, city and co. seat of Kewaunee co., Wis.; on Lake Michigan, Kewaunee river, and the Kewaunee, Green Bay and Western railroad; 36 miles e. of Green Bay. It makes large shipments of grain, flour, lumber, and bark. Pop. '90, 1216.

KEWEENAW, a co. in n. Michigan, consisting of the large tract of country that lies north of Torch lake and projects into lake Superior; called Keweenaw point, from an Indian word signifying, *the canoe is carried back*; also of the island of Isle Royal, with a few smaller islands; area 350 sq. m.; pop. '70, 4205, of whom 2059 were Americans, and 5 were Indians; in '90, 2894. It is the center of the copper-mining interest. This mining district was discovered by Jesuit missionaries in 1659; in 1845 was brought into public notice through operations on the north shore; and, with the adjacent counties, is known as the "copper region." The soil produces scanty crops. There are mines, quartz-mills, and a manufactory of explosive compounds. Co. seat, Eagle River. Like other portions of the state which are washed by lake Superior, Keweenaw has but two seasons—summer and winter; and the beaver, the partridge, and the owl attain their perfection in fur and plumage. The inhabitants engage to some extent in fishing, taking the fish with trap-nets, which are made in Massachusetts. The fish are salted and sent to western states. Lake Superior white-fish, famous for their size, are packed in ice and sent south.

KEW-KIANG, or **KI-W-KIANG** (Chinese, Nine Rivers), a town of China, in Kiang-si; of small extent and very sparsely populated 227 m. s. w. of Nanking; at the northern boundary of Poyang lake, on the banks of the Yangtze river; the most convenient outlet for the green-tea district. This province is notable for the Taeping rebellion, which had its rise in an outbreak in the province of Kiang-si in 1850. It assumed such formidable proportions as to obstruct all efforts for the extension of navigation and the establishment of commercial relations with foreign countries; until, in 1861, after a treaty obtained by lord Elgin, an expedition, with a squadron under command of sir James Hope, determining to open two of the principal cities—Hukon and Kew-Kiang—to foreign trade, took possession of those cities and installed consuls in them, and left a gun-boat in each port to protect British subjects. Thus was opened to the world the great center of the tea traffic. Ning Chow congou tea is produced in the n.w. of the province of Kiang-si; but the finest of this kind is grown at Wuning, a place s.w. of the city of Kew-Kiang, the latter city being the chief market for teas of this kind. The population before the Taeping rebellion was 800,000; in 1874 it had dwindled to 35,000. Severe famines and inundations from the overflow of the Yangtze in successive years drove many fugitives to the town for shelter, and the missionary chapels were at the mercy of Mohammedan fanatics until they were overcome by the aid of vessels-of-war. In the rear of the British settlement, which fronts the river, are the remains of the Chinese town and the monument of a general who fell during the siege, which was erected to his memory by the emperor. This port controls the carrying-trade on the lake and the river. Exports consist chiefly of tea, which is constantly decreasing; while the annual value of both exports and imports is now only about \$12,500,000, or one-tenth of what it has been. The port of Kew-Kiang is subsidiary to Shanghai, and at certain seasons of the year navigation is impeded by low water and sand-bars, necessitating the transfer of the cargoes to lighters at Hukon, 16 miles below Kew-Kiang, at the mouth of the lake.

KEY, a common heraldic bearing in the insignia of sees and religious houses, particularly such as are under the patronage of St. Peter. Two keys in saltire are frequent, and keys are sometimes *interlaced* or linked together at the *bows*—i.e., rings. Keys

indorsed are placed side by side, the wards away from each other. In secular heraldry, keys sometimes denote office in the state.

KEY, a musical term synonymous with *scale*, from *scala*, a stair. The diatonic scale, as produced by nature, is a certain succession of tones and semitones, ascending from any sound taken as a basis to the octave of that sound, the semitones of which will be found to lie between the 3d and 4th, and between the 7th and 8th degrees, ascending from the basis. In rendering this succession of sounds available for musical purposes by our artificial method of notation, the sounds have, so to speak, been fixed at a certain recognized pitch. Any of the sounds of the natural scale may be taken as a note to form the basis of a new scale, observing always the due succession of the tones and semitones. The note forming the basis is denominated the key-note of the scale, and such scale is said to be in the key of that note. As in our notation each whole tone can be artificially divided into two semitones (see **CHROMATIC**), it follows that, with the already existing diatonic semitones, there are 12 equal semitones between a key-note and its octave; and as each of these semitones may be taken as a new key-note, there are therefore twelve keys major, and the same number minor, all differing in pitch. In written notation the scale of the note named C has been assumed as the natural key, the notes forming that scale being held to fall naturally into the requisite succession of tones and semitones. It follows that if any other note be taken as a key-note, one or more or all of the notes of the so-called natural scale must be altered, by being either sharpened or flattened, to bring the scale of the new key into the due succession of tones and semitones. Such alteration is indicated by the marks of sharps or flats placed at the beginning of the staff, and is termed the *signature* of the key. In the minor mode, the key of A minor stands exactly in the same relation to the other minor keys as the key of C does to the other major keys, A being the key-note on which the natural minor scale is found. All other keys have sharps or flats, in greater or less number as they are distant from the natural key of C major or A minor, reckoning by perfect fifths, ascending or descending; thus, the key of G major, which is a perfect fifth above C, has one sharp for its signature—viz., F sharp; the key of D, which is two fifths above C, has two sharps—viz., F sharp and C sharp; and so on to the key of F sharp, adding a sharp for every ascending fifth. The keys with flats are found exactly in the reverse order—viz., by descending fifths; thus, the key of F, a perfect fifth below C, has one flat—viz., B flat; the key of B flat has two flats—viz., B flat and E flat; and so on to the key of G flat with six flats, which in practice is regarded as the same as the key of F sharp with six sharps. The number of flats or sharps is in some cases, for a harmonical purpose, extended still further; such as the key of C sharp with seven sharps, which is the same as D flat with five flats; or the key of G sharp with eight sharps, which is the same as A flat, with four flats. The unnecessary increasing of either sharps or flats only increases the difficulty of reading the music. The term *key* is often used in the sense of *mode*, and we frequently hear of the major or minor *key*.

KEY, DAVID MCKENDREE, b. Greene co., Tenn., 1824; graduated Hiwassee coll., 1850; was admitted to the bar, 1853; served in the confederate army, 1861-65; was appointed Andrew Johnson's successor in the U. S. senate, 1875; was postmaster-gen. of the U. S. 1877-80; appointed a U. S. district judge in Tenn., 1880; dean of the law school of Grant university, 1891.

KEY, FRANCIS SCOTT, 1780-1843; b. Md.; completed the regular course of study at St. John's college, Annapolis, and then turned his attention to the study of law, which he subsequently adopted as a profession. He commenced practice in Frederick City, Md., where he attained eminence as a jurist, and held the office of district attorney of the district of Columbia for several consecutive terms. He was intimately associated with chief-justice Taney, having married his sister. Detained against his will, he was an indignant spectator from the deck of a British man-of-war of the memorable attack on fort McHenry which inspired that enduring example of heroic verse, *The Star-Spangled Banner*. On this composition rests his literary fame, though a volume of his poems was published in 1857. In 1876, James Lick, of San Francisco, bequeathed \$60,000 for the erection of a bronze monument in that city to his memory.

KEY, THOMAS HEWITT, 1799-1875; b. England. Having graduated in 1821 from Trinity college, Cambridge, and studied medicine at Grey's hospital, London, he was called in 1824 to fill the chair of mathematics in the university of Virginia, an institution then in its infancy. Ill health compelled his return to his native land in 1827. In 1828, when the university of London was founded, he accepted the professorship of Latin, and held it until 1841. He filled other professorships with honor, and at the time of his death the preparatory school connected with that university was under his especial control. As a philologist, he produced numerous pamphlets containing essays and reviews, and a controversial argument on Donaldson's *Varronianus*. The *Penny Cyclopaedia* and the *Journal of Education* advantageously employed his pen, and he published a Latin grammar (1843-46); *Philological Essays* (1868); and *Language, its Origin and Development* (1874). His best energies were given to the construction of a Latin-English lexicon, which was published in an unfinished state in 1889.

KEY, THOMAS MARSHALL, 1818-69; b. Ky.; graduated at Yale college, 1838, and devoted himself to the study of law. Removing to Cincinnati, Ohio, he was admitted to the bar of that state, and soon distinguished himself as an able and eloquent lawyer.

He was a member of the state senate during several sessions. He is chiefly to be remembered for having been the author of the first bill enacted by congress for the emancipation of slaves and that for the emancipation of the slaves in the district of Columbia. During the civil war he was on the staff of Gen. McClellan.

KEYAPAHA, a co. in northern Nebraska, formed 1883 from part of Brown co.; bounded on the n. by the state line, and on the s. by Niobrara river; pop. '90, 3920. Area, 660 sq. m. Co. seat, Springview.

KEY-BOARD, a frame containing a set of keys, placed in the front part of the pianoforte to elevate the levers and set the strings into vibration. The natural keys are of wood covered with white ivory, and the raised keys touched to produce sharps and flats are blocks of ebony, or other hard black wood. The influence of the key-board upon the development of modern music is important. The date of its introduction is unknown. It was probably synchronous with the invention of the clavichord and clavicembalo of the 14th century. The oldest keyed instrument with an original key-board is a spinet in the museum of the Paris Conservatoire, in which the natural notes are black and the sharps and flats white. It bears the inscription Francisci de Portalupis, Veronen, 1533. The oldest instrument in England is in the South Kensington Museum, made by Annibale Rossi, Milan, 1555. Several attempts have been made to reform the key-board. Among these may be mentioned a symmetrical key-board with a uniform fingering for all scales, called the enharmonic harmonium, and invented by Mr. Bosanquet of Oxford; a key-board made by Mr. A. B. Lunn under the name of Arthur Wallbridge, in which six lower and six upper keys are grouped together; an instrument by K. B. Schumann of Germany; a key-board by Paul von Janko; and a double grand pianoforte with reversed key-boards, by MM. Mangeot of Paris, in 1878, called Piano à double claviers renversés. In 1876 a society, the Chroma Verein des gleish stufigen Tousystems, was formed in Germany to reconstruct the key-board of the pianoforte, and to simplify musical notation. See JANKO KEY-BOARD, FINGER-BOARD.

KEYES, ERASMUS DARWIN, b. Mass., 1810; graduated at West Point in 1832, and from 1844 to 1849 was instructor of artillery and cavalry in that institution. In 1856-58 he distinguished himself in the movements against the Puget sound and Snake river (Wash. terr.) Indians. He was active during the war between the states, commanding a brigade at the first battle of Bull Run, and the 4th corps of the army of the Potomac in 1862. He was made maj.-gen. of volunteers for gallant conduct during the Peninsula campaign, and brev. brig.-gen. U. S. A., after Fair Oaks. Resigned from the army May 6, 1864. He published *Fifty Years' Observation of Men and Events* (1884). He d. in 1895.

KEY-NOTE. See KEY.

KEYPORT, a t. in Monmouth co., N. J., on Raritan bay, 28 m. from New York; on the New Jersey Central railroad. It has a considerable trade, manufactures brick, and is largely interested in the oyster business. Pop. '90, 3,411.

KEYS, HOUSE OF. See MAN, ISLE OF.

KEYS, POWER OF THE (*Potestas Clavium*), in Roman Catholic theology, properly signifies the supreme authority in the church, which Catholics believe to be vested in the pope, as successor of St. Peter. The phrase is derived from the metaphor addressed by our Lord to Peter in Matt. xvi. 19, and which Catholic interpreters, relying on the analogous use of the phrase in Isaiah xxii. 22, Apoc. iii. 7, and again i. 18, and also in classical writers, understand as implying the supreme power in the church. The power of the keys is divided by Catholics into two branches—that of order, which, though possessed by all bishops and priests, is believed to belong specially and primarily to the pope; and of jurisdiction, which chiefly regards the supreme government of the church, and embraces the power of enacting laws and dispensing in them, and of directing and governing not only the Christian flock, but also its pastors in their several spheres. The jurisdiction of the keys is exercised in a more limited field, and in a subordinate way, by patriarchs, primates, archbishops, bishops, and other dignitaries; but that, according to the Roman theory, it has its source, as well as its chief seat, in the pope, is implied in the distinctive use of the emblem of the keys as a symbol of papal jurisdiction. The metaphor of the keys was frequently appealed to in the debates of the late Vatican council on the papal privileges. The phrase is also applied to the sacrament of penance, to designate the power of remitting or retaining sin, and with the same distinction of order and jurisdiction, of which the former is imparted to every priest by his ordination, while the latter is only communicated by an express act of the bishop or other superior.

Protestants in general regard the power of the keys as equally intrusted to the whole ministry of the church of Christ, and as including *doctrine* and *discipline*. They admit the argument from the use of the key in Scripture as a symbol of authority; but refuse to acknowledge any limitation of that authority inconsistent with their views of Christian doctrine and of the relation of the ministry to the whole church of Christ, and of Peter to the rest of the apostles.

Protestants say that when Christ said to Peter, to all the apostles, and to his disciples generally, "Whosoever sins ye remit, they are remitted unto them; and whosoever sins ye retain, they are retained," he assumed that they would act in his name, and according

to the conditions which he prescribed. He had made known to them the terms on which sins were to be remitted, and when he sent them forth it was to preach "repentance and remission of sins in his name." Therefore their power to remit sins was a power to declare that they who repented and believed had their sins forgiven as the act of God, through Christ. This is what Peter did declare on the day of Pentecost, when, in answer to the anxious multitude, he said, "Repent, and be baptized, every one of you, in the name of Jesus Christ, for the remission of sins, and ye shall receive the gift of the Holy Ghost." This was the way in which he "opened the kingdom of heaven" to Jews. When sent to Cornelius he said, "To Jesus bear all the prophets witness that, through his name, whosoever believeth in him shall receive remission of sins." This was the way in which he "opened the kingdom of heaven" to Gentiles. Even to Simon Magus he said, "Repent of thy wickedness, and pray God if, perhaps, the thought of thy heart may be forgiven thee." All that is recorded of Peter's preaching and action shows that he professed to exercise only declarative power in the name of Christ. Paul and the rest of the apostles pursued a similar course. This being the way in which they exercised the power of the keys, all different or higher claims, up to the pope's assertion of power over all the church and over two worlds, are, in the judgment of Protestants, assumptions, contrary to Scripture, disproved by history, and reached by successive stages through many centuries.

KEYSER, EPHRAIM, sculptor, b. Baltimore, 1850; studied art in Baltimore, Munich, Berlin, and Rome; won the Michael Beer *prix de Rome* of the Berlin academy with his figure of *Psyche*, and the silver medal of the Munich academy with *The Page*; studied and worked in Rome, 1879-86; and became professor of modeling in the Maryland institute, Baltimore, 1893. His best known work done in the United States is the heroic-size angel for the tomb of President Arthur.

KEYSTONE. This term is used in architecture to designate the central stone of an arch, or vault, placed directly on the top, which, being made wider at the top than at the bottom, is driven in like a wedge and thus fastens and completes the work.

KEYSTONE STATE. See STATES, POPULAR NAMES OF.

KEY WEST, the name of an island 7 m. long, 1 to 2 m. wide, which forms a part of Monroe co., Florida; pop. '90, 18,080. A lighthouse on the s.w. point and another on the n.w. show fixed lights, and are, respectively, 72 and 40 ft. above the water. The soil of the island, whose elevation above the sea is about 11 ft., is composed of coral, reduced to a powder by the action of the elements and otherwise, and a small proportion of decayed vegetable matter. There are no springs, the rainfall or artificial means being the only resource of the inhabitants for the supply of water. Yet there is a luxuriant growth of the wild chapparal, of cactus, and other native vegetation, while tropical trees and flowers flourish, and cocoa-nuts, bananas, guavas, pineapples, and oranges are cultivated freely. The Florida reef is a peculiarly dangerous spot to navigators.

KEY WEST, city, co. seat of Monroe co., Fla., also a port of entry and a U. S. naval station; on the island of Key West (Sp. *Cayo Hueso*, Bone Key), the most westerly of the group of Florida keys, and the southern extremity of the U. S. It is the largest city in the state, but, although settled in 1822, remained a village for many years. It became of great importance to the federal government during the civil war, being defended by fort Taylor, built on an artificial island in the main entrance to the harbor, and commanding the best entrance to the Gulf of Mexico. Key West is reached by the Mallory line of steamers for New Orleans, and the New York and Galveston line, both sending vessels from New York every Saturday. There is also a semi-monthly line from Baltimore. It is reached by rail from New York, connecting with a steamer at Cedar Keys, and there are mail packets to Biscayne bay and the intermediate keys. Telegraph cables give communication with Cuba and the mainland. The city is a beautiful one, with broad streets, gardens filled with tropical trees, and ornamental cottages, and the delightful temperature attracts a large number of invalids. There are several churches, a convent, a marine hospital, a custom house, a United States dock, a marine railway for hauling out ships needing repairs, a number of public and private schools, and several newspapers. The United States courts for the southern district of Florida are held here. The harbor is a fine one, admitting vessels drawing twenty-eight ft. of water, and has 2 lighthouses. The chief industry, established after the Cuban insurrection of 1870, is the manufacture of cigars, employing several thousand persons, mostly Cubans, who produce annually about 100,000,000 cigars. The frequent disasters to vessels among the islands afford a profitable wrecking business, carried on chiefly by natives of the Bahama islands, or descendants of immigrants from those islands. The chief exports are cigars, salt, sponges, turtles, fruit and vegetables. Pop. '80, 9890; '90, 18,080.

KHABOUR, a river in Asiatic Turkey, one of the tributaries of the Euphrates, into which it empties at Kerkesich, after a course of nearly 200 miles. It was on this river that the captive Israelites were settled, and it is mentioned in the cuneiform inscriptions.

KHALKAS', the northern part of Mongolia, on the Siberian frontier between 96° and 118° e. The Chinese governor of the province resides in the capital, Urga or Oergo. The Khalkas Mongols came under the dominion of China in 1688, when they voluntarily submitted, to avoid total destruction at the hands of the Kalmucks, with whom they were carrying on an unsuccessful war. Khalkas was the birthplace of Genghis Khan.

KHAN, a title of Mongolian or Tartar sovereigns and lords. A *khanate* is a principality. *Khagan* means "khan of khans," but has seldom been applied. The word *khan* is probably of the same origin as king (q.v.).

KHANDESH'. See CANDEISH.

KHANG-HI, or **KANG-HI**, 1654-1722; second emperor of China under the present Manchu dynasty; succeeded his father, Chun-Chi, as emperor in 1662, under the regency of four mandarins; assumed full power in 1667, when he put one of the regents to death. He studied the Copernican system of astronomy under one of the Jesuit fathers, and caused it to be officially taught in the empire in 1667. He suppressed the revolt led by the prince of Yunnan in 1673, and afterwards annexed Kwang-Tung, Fo-Kien, and Formosa to the empire. In 1689 he concluded a treaty of peace with Russia, annexed Thibet about 1700, and in 1717 authorized the persecution of Christians. He ranks as the greatest of Chinese sovereigns, and through the Jesuit missionaries was well known in Europe. He promoted the publication of important works on the history, language, and literature of the nation; and in 1708 employed the Jesuits to make a topographical survey, which is still an authority in Chinese geography.

KHANIA. See CANEA.

KHANPUR', a flourishing commercial t. of north-western Hindustan, on a canal which connects it with the Indus, 400 m. w. of Delhi, in lat. 26° 28' n., long. 80° 24' e. It is noted for the massacre of British prisoners by Nana Sahib during the rebellion of 1857. Pop. 7,500.

KHAZARS, or **CHAZARS**, one of the tribes of the Finnic or Magyar stock, settled near the mouth of the Volga, in the Caucasus. They had their own sovereigns, and were an independent and powerful tribe. In the 8th c. they became conspicuous by their conversion to Judaism.

KHARASM'. See KHIVA.

KHARGEH. See EL-KHARGEH.

KHARKOV' a government of Little Russia, immediately e. of the government of Poltava. Area, 21,041 sq. m.; pop. '92, 2,537,337. The surface is flat, with chalk hills following the courses of the streams. The soil is a rich and fertile loam, watered chiefly by affluents of the Don. In the n.w. the principal occupations are agriculture and distilling corn-brandy; in the s.e., the breeding of cattle and sheep. The breeding of horses is also carried on. Corn, tobacco, wax, honey, and tallow are largely produced, beet-root sugar is manufactured, and there is an extensive trade in sheep and cattle; well connected by railways with Baltic ports, Moscow, Azov Sea and Odessa. The climate is severe, though warmer than in middle Russia.

KHARKOV, capital of the government of the same name in European Russia, on the banks of three streams, affluents of the Donetz, in lat. 50° n., long. 36° 14' e., 916 m. s.s.e. of Petersburg. It had, in '97, a pop. of 170,682, and ranks as one of the chief towns of the Ukraine. Its position between Moscow, Odessa, Kief, Taganrog, and the Caucasus has made it an important market for the exchange of the products of the n. and s. The chief mercantile transactions are effected during the time of the fairs, of which there are four, the principal being the Troitsk fair. The transactions during the fairs amount to about \$30,000,000. The staple article of commerce is wool. The town contains 70 factories of various kinds, and manufactured goods are supplied to the surrounding governments. An enormous quantity of wool (value \$5,750,000) is washed here annually. Kharkov has a university attended by 800 students, with a library of 55,000 vols., a veterinary college, and a government model farm.

KHARTOUM', the head-quarters of the Egyptian government in the Soudan, the center of commerce for that region, stands in a sterile district, in lat. 15° 37' n., long. 32° 40' e., at the junction of the Blue and White Nile. The houses are built principally of sun-dried bricks. Khartoum is the center of many converging caravan routes, and carries on considerable commerce. The imports consist chiefly of Manchester manufactured goods; the exports are ivory, gum-arabic, ostrich-feathers, and tamarinds. Pop. estimated to be about 50,000. It was from here that the slave-traders of the Soudan fitted out their expeditions and found a market until the slave bazars were closed by the order of the Khedive Ismail Pasha. The city was founded by Mohammed Ali in 1821. It has extensive bazars, and some of the buildings, houses of merchants, are large and commodious. An extensive domestic trade is carried on in cattle, fruit, grain, and other agricultural products. Several European consuls reside here. Some years ago an Austrian Rom. Cath. mission was established in K. which included a cathedral, hospital, and other buildings, all surrounded by a high wall. The enclosure was used as a fort by the late Gen. Gordon, whose name and fate have given K. a melancholy interest.

KHAYYAM. See OMAR.

KHEDIVE, a title granted in 1867 by the sultan to his tributary, the viceroy of Egypt, and since then used by the latter as his official title. The word (pronounced as a dissyllable) is derived from Persian *Khidiv*, and means *sovereign*. It is therefore a more dignified title than the former one of *vah*, viceroy.

The first khedive was Ismaïl, sovereign of Nubia, Soudan, Kordofan, and Darfour, son of Ibrahim Pasha (eldest son of Mohammed Ali Pasha, founder of the dynasty), was born in 1830, and succeeded his uncle, Saïd Pasha, in 1863, as fourth viceroy of Egypt. He traveled through the capitals of Europe, informing himself concerning their manners and customs, and these he introduced into his own dominions on his return. He fell under the displeasure of the sultan, through the jealous fears of the latter regarding European ascendancy in Egypt, but succeeded in obtaining from him important concessions. By a firman dated May 21, 1866, he gained the right of the succession in the direct masculine line in his branch; by that of June 8, 1867, the title *khedive*, or sovereign, was granted him; and by the firman of Sept. 29, 1872, he obtained the right to increase his army and navy at his pleasure, and to borrow money. Finally, he was conceded, in 1873, the right to conclude treaties of commerce, with the full autonomy of the administration of the country. Yet, despite all this, the sultan retained in his hands the disposition of the government in Egypt, since, in April, 1879, he proposed to the western powers to depose Ismaïl in favor of his uncle, Halim Pasha, the rightful heir. This proposition was not received favorably, though repeated in June, and the sultan was finally induced to issue a firman deposing Ismaïl in favor of his son, prince Mohammed Tewfik. This was on June 26, and the firman abolished that of 1873, and deprived the khedive of the power to conclude treaties with foreign powers, and to maintain a standing army. Ismaïl Pasha accordingly quitting the throne, his son was proclaimed khedive, under the title of Tewfik I. Since the English occupation of Egypt in 1882, the khedive has been little more than a figurehead. See EGYPT; EGYPTIAN QUESTION.

KHERSON, a government of southern Russia, on the borders of the Black sea, first appearing in history during the 4th c. B. C., when it formed a portion of the kingdom of the Bosphorus. From the 11th c. the right of possession was claimed by the Poles, the Cossacks, and various Tartar tribes, the last being ultimately successful. In the 17th c. Russians commenced to settle in the province, and during the next century their example was followed by a number of Servians. The province, with an area of 27,523 sq. m., is uniformly fertile in the n. and n.w.; in the s. it is sometimes dry and arid, with here and there sandy wastes, which towards Odessa become incrustated with salt. Notwithstanding that three large rivers—the Dnieper, Bug, and Dniester—run through the s. of the province, the want of water is often severely felt, especially in July, when the vegetation is almost completely burned up by the heat. The climate is very changeable, being very hot in summer, and piercingly cold in winter. Destructive ravages by locusts are not uncommon. The population in 1890 was 2,250,100, consisting of Little Russians (natives of the Ukraine), Moldavians, Bulgarians, Greeks, Germans, and Jews, who are chiefly employed in agriculture. The Germans cultivate tobacco and rear silkworms. Much of the arable land, however, is lost from want both of capital and labor. Cattle and sheep breeding are also carried on on a large scale.

KHERSON, or **CHERSON**, capital of the government of that name in European Russia, and 808 m. s. by rail from Moscow, lies on the right bank of the Dnieper, which here widens to 10 miles with numerous low islands, becoming the seat of fever infections after the inundations. It was built by Catherine II. in 1778, as a port for the construction of ships of war, but in a very few years was supplanted by Odessa and Nikolaief, both as dock-yard and a commercial outlet. Only ships of light draught are now built at Kherson, and only such ships can navigate the estuary. Milling, tallow-melting, and wool-washing are the chief branches of trade, and the products are largely exported. Pop. '97, 69,219. Kherson has a gymnasium, naval school, school for training pilots, an observatory, and a monument to John Howard, who died here.

KHIVA (anc. *Chorasmia*), **KHAUREZM**, **KHARASM**, or **URGUNGJE**, a khanate of Turkistan in central Asia, lies between lat. 41° and 43° n. and long. 58° and 61° 50' e., and contains about 25,000 sq. m., the surface being mostly a sandy desert, with many fertile tracts scattered over it. It is bounded on the n. by the Russian territory and sea of Aral, e. by the khanate of Bokhara, and on the s. and w. by the Russian transcasian territory, where the boundary is unsettled. The chief oasis, in which the capital, Khiva, is situated, stretches from the mouth of the Oxus or Amu-Daria for 200 m. along its banks, and is watered by artificial canals supplied from that river, to which it entirely owes its fertility. The area of oasis is 5210 sq. m., area of steppes is estimated at 17,000 sq. m. According to a recent estimate made in January, 1891, the population consists of 360,000 settled and 400,000 nomad inhabitants. There are from 10,000 to 40,000 Persian freedmen or slaves who have been captured in Khorassan by the Turcomans.

Khiva in ancient times was nominally subject to the Seleucidæ; subsequently it formed a part of the kingdoms of Bactria, Parthia, Persia, and the caliphate, and became an independent monarchy in 1092 under a Seljuk dynasty. The Khivans, or, as they were then called, the Khaurezmians, after conquering the whole of Persia and Afghanistan, were obliged to succumb to the Moguls, under Genghis Khan, in 1221. In 1372 it came into the hands of Timûr. Timûr's descendants were subdued in 1511 by Shahy Beg (called Sheibani Khan by western writers), chief of the Uzbeks, a Turkish tribe, and his successors have ruled over Khiva to our times. Ever since the Russians entered

Central Asia, they have complained that the Khivans fostered rebellion among their Kirghis subjects, and plundered their caravans. In 1717 Peter the Great endeavored to conquer Khiva, but was defeated, and in 1839 the attempt was renewed by the czar Nicholas, but with no better success. War may be said to have recommenced when new Russian forts, in 1869 and 1871, were founded on the shores of the Caspian. It was not, however, till 1873 that a great effort was made finally to crush Khiva. To diminish the difficulties of crossing the deserts, the Russian force was divided into five columns, each about 3,000 strong, to approach Khiva by different routes. After enduring with admirable fortitude great privations and fatigue, the Russians entered Khiva on June 10. The khan agreed to pay a war indemnity (which has never been paid) and to cede to Bokhara the Khivan possessions on the right bank of the Amu-Daria (Oxus). Shortly afterwards, however, these possessions were incorporated with Russian territory, and now Kizil-Kum and the annexed part of Khiva form the Russian government of Amu-Daria, with an area of 39,820 sq. m., and an estimated pop. of 109,600.—KHIVA, the capital of the khanate, is situated in the great oasis. It is surrounded by a wall, with a citadel, and also by large gardens. It has 17 mosques, and 4 large and 3 small Mohammedan schools. Pop. 10-15,000. See Burnaby's *A Ride to K.* For type of people, see *illus.*, JAKUTS, ETC.

KHLISTIE, or **DANIELITES**, a Russian fanatical sect which originated in the first year of the emperor Alexis, A.D. 1645. They call themselves "people of God," "tribe of Israel," "worshippers of the true God," "brothers and sisters." According to their traditions, *God the Father* manifested himself in the person of Daniel Philippon or Philippitch. This they hold was his second manifestation in the flesh, and that as Jerusalem and Zion were by the previous manifestation enlightened, so now Russia and Kostroma, the birthplace of Daniel, are by this reappearance blessed with the divine favor. The historical facts are that Daniel Philippon, a peasant of the province of Kostroma, ran away from the Russian army, declared himself the Almighty, and wandering about, taught the people twelve commandments inculcating certain moral duties. They observe some of the practices of the regular church to avoid persecution. They have pictures of their god Daniel Philippon; their Jesus Christ, Ivan Timofegen; their mother of God, saints, prophets, and teachers, whom they adore. They call the church edifices of the orthodox ant-nests, and their priests idolaters and adulterers. Notwithstanding their absurdities, their sect is numerous, and has among its members many of the nobles of the land. After service they partake of an ordinary meal, which is prolonged till late in the evening. The sect is known in different regions by different names.

KHODAVENDIGH'AR, a mountainous and well-watered region in Asiatic Turkey, on the coast of the sea of Marmora; pop. 1,300,000. Its soil is fertile, producing grain and fruit in abundance; manufactures of cotton and silk are among the industries. This country formed a portion of the ancient Bithynia and of Phrygia, and presents as a striking feature of its landscape the Keshish Dag, which was the Mt. Olympus of the fabulous court of Jupiter, at the foot of which is the capital, Brusa, or Broussa.

KHOI, a t. of Northern Persia, province of Azerbaijan, on the Kotoura, a feeder of the Araxes, 75 m. n.w. of Tabriz, and has a strong fortress. Pop. 30,000.

KHOJENT' is a t. of Russian Turkistan, on the Sir Daria, the ancient Jaxartes, about 90 m. n.w. of Khokan. It is the seat of some cotton manufactures and of a considerable transport trade. Pop. estimated at 35,000.

KHOKAN' (originally *Kokand*), once a khanate of Turkistan extending e. of 64° long. over the whole of the upper basin of the Jaxartes or Sir-Daria. But long previous to the commercial treaty in 1868 between Russia and Khokan, the khanate had been confined to an area of some 30,000 sq.m., lying between 70° and 74½° e. long. and between 39° 40' and 42° n. lat. In summer 1875 a rebellion against the khan, who was already practically a Russian vassal, led to a Russian intervention. After a fierce struggle, the immediate result was the annexation to Russia of all the territory of Khokan lying n. of the Sir-Daria. Now the whole khanate forms the Russian government of Ferghana, a name under which Khokan was famous throughout the east in the middle ages. The area of Ferghana is 28,160 sq.m., and the population, consisting of Kipchaks, Kirghiz, Tajiks, Sarts, and Uzbeks, is estimated at 960,000. Khokan was far from being the richest of the three independent khanates; and the cost of governing a hardy and warlike people is expected to prove a heavy burden on the Russian exchequer. Manufactures of coarse cottons and a considerable trade in grain, hides and leather, are carried on. The chief town is Khokan.

KHOKAN' is a city, capital of the khanate of that name, 220 m. from Samarcand; pop. 1897, 54,452. It is the seat of a considerable trade in grain, cotton, hides, leather, and other animal produce. There are several fine mosques in the city, which is also supplied with public schools.

KHOLMOGO'RY, a t. in the government of Archangel, European Russia, was a place of great note when the White sea trade was in its glory, but since the seat of government has been removed to Archangel, Kholmogory has steadily declined, and in 1880 contained less than 2000 inhabitants. Peter the Great, on his return from his travels, brought

to Kholmogory several specimens of the Dutch breed of cattle, by means of which the natives so improved their own, that the Kholmogory breed is now considered to be the best in Russia.

KHONDISTAN', a small district in the province of Orissa, India, at the source of the Nerbudda river. The inhabitants, called Khonds or Khoonds, are a wild, uncultivated tribe of the non-Aryan stock, of the coarsest negro type in complexion and features, living upon wild fruits, roots, and game. Human sacrifices formerly prevailed among them, but were suppressed by the persevering efforts of maj.-gen. Campbell, the British agent. The Khonds, on account of their language and customs, are an interesting study for ethnologists.

KHONSAR', a t. of Persia, in the province of Irak-Ajemi, 80 m. n. w. of Ispahan and on the route from that city to Hamadan. Orchards abound here, and the raising of fruit and weaving are the chief employments of the people. Pop. about 12,500.

KHOOLOOM', **KHULM** or **TASH-KURGAN** ("stone fort"), a t. of central Asia, 65 m. w. of Koondooz and about 4 m. s. of the ruins of Khulm on the Khooloon river, a tributary of the Oxus. The houses are of one story, of clay or sunburned brick. The town is surrounded by a wall defended by citadels.

KHORASSAN' (anc. *Parthia*, *Margiana*, and *Aria*), the most n.e. province of Persia, lies between lat. 30° and 38° 30' n. and long. 56° and 61° e.; contains about 210,000 sq. m., of which nearly one-third is a vast salt waste; of the remainder, a large portion consists of plains of shifting sand; and the rest is fertile. The fertile districts are in the n., where the high range of the Elburz crosses the province, throwing out spurs, forming a mountainous district, abounding with fertile and well-watered valleys. Artificial fertilization by means of canals was here carried on to a great extent in ancient times, but the incessant disturbances which have unsettled the district for the last 1000 years have almost put an end to this practice. The chief products of Khorassan are wool, carpets, and shawls. The province has the reputation of being rich in lead, copper, and coal, but its mineral resources are quite undeveloped. There is nevertheless a considerable turquoise mine near Nishapur. In the more thickly-peopled districts, manufactures of silks, woollens, and camels' and goats' hair fabrics, also of muskets and sword-blades, are carried on to a considerable extent. The chief towns of the province are Meshed, the capital, Nishapur, Yazd, and Astrabad. The inhabitants are Mohammedans of the Shia sect.

Khorassan, in ancient times, also included the desert of Khiva or Kharasm and the district now known as the kingdom of Herat; but the first was separated from it by the Seljuks at the commencement of the 11th c., and the latter about 1510, since which period it has been on several occasions seized and held for a short time by the Persians.

Khorassan has been several times separated from the Persian empire, but was finally reunited to it at the commencement of the 16th c. by Ismail Sofi, the first Suffavean shah of Persia. See **PERSIA**.

KHORSABAD'. See **NINEVEH**.

KHOSRŪ, or **KHŪSRŪ I.**, surnamed **NŪSHĪRVAN** (the noble soul), and known in Byzantine history as Chosroes I., the greatest monarch of the Sassanian dynasty, was the son of Kobad, king of Persia. Khosrū mounted the throne on his father's death in 531 **A.D.**; gave shelter to great numbers of those whom Justinian, the Byzantine emperor, persecuted for their religious opinions; in 540 commenced a war of 20 years' duration with the Roman emperor; but though the Persians reaped an abundant harvest of glory, the other results were unimportant. On the accession of Justin II., the Persian ambassadors having been ignominiously abused, and the Greeks having taken possession of Armenia, Khosrū, justly indignant, again declared war in 570, took Dara, the eastern bulwark of the empire, but was terribly defeated at Melitene (577) by Justinian, grand-nephew of the emperor of that name; this defeat was, however, counterbalanced by the victorious Greek being in his turn totally routed in Armenia. Khosrū did not live to see the end of the contest, as he died in 579. His government, though very despotic, and occasionally oppressive, was yet marked by a firmness and energy rarely seen among the orientals. Agriculture, commerce, and science were greatly encouraged, ravaged provinces were repopled from his conquests, and wasted cities rebuilt. His memory was long cherished by the Persians, and many a story of the stern justice of Khosrū is still current among them. Persia, during his reign, stretched from the Red sea to the Indus, and from the Arabian sea far into central Asia. (For a full account of this prince, see sir John Malcolm's *History of Persia*.)—**KHOSRŪ II.**, grandson of the preceding, surnamed **Purviz** (the Generous), was raised to the throne in 590, but being immediately deposed by another claimant, was, by the assistance of emperor Maurice, reinstated, and in gratitude surrendered Dara, Nisibis, and a great part of Armenia, to the Romans. In spite, too, of numerous and just grounds of quarrel, he preserved peace with that nation till the murder of his benefactor by Phocas. Khosrū then invaded Mesopotamia in 604, took Dara, and during 17 years inflicted upon the Byzantine empire a series of disasters, the like of which they had never before experienced. Syria was conquered in 611; Palestine in 614; Egypt and Asia Minor in 616; and the last bulwark of the capital, Chalcedon, fell soon after. At this crisis the fortune of war changed sides. See **HERACLIUS**. Khosrū, driven in turn to the very gates of Ctesiphon, was deposed and mur

dered by his eldest son, Shlroueh, or Siroes, Feb. 28, 628. It was to this prince that Mohammed sent a letter demanding a recognition of his mission. See MOHAMMED.

KHOTAN', or **ILCHI**, one of the four provinces of Kashgaria, formerly Chinese Toorkistan; the capital, Khotan, in lat. 37° n., long. $77^{\circ} 55'$ e., was anciently a city of great importance, and is still a large place, having manufactories of silk, leather, paper etc. The inhabitants are mainly Uzbek Tartars.

KHOTIN. See **CHOTYN**.

KHURJA, a t. of British India, in the district of Boolundshuhur, 50 m. s.s.e. of Delhi, between which and Háthras it is the principal trading town. Pop. '91, 26,300.

KHUZISTAN' (anc. *Susiana*), a province of Persia, in lat. 30° to $33^{\circ} 7'$ n., and long. $47^{\circ} 45'$ to 51° e., with the Fars and the Persian gulf on the s. The soil of this province is very fertile, and produces besides the staple products a large quantity of dates. A large number of mules, horses, sheep, goats, and asses are raised, while wool is a valuable product. The pop. is estimated at from 170,000 to 200,000, mostly Arabians and in great part nomad.

KHYBER PASS, the most practicable of all the openings, four in number, through the Khyber mountains, is the only one by which cannon can be conveyed between the plain of Peshawur, on the right bank of the upper Indus, and the plain of Jelalabad, in northern Afghanistan. It is 30 m. in length, being here and there merely a narrow ravine between almost perpendicular rocks of at least 600 ft. in height. It may be said to have been the key of the adjacent regions in either direction from the days of Alexander the great to the Afghan wars of 1839-42, during which it was twice forced by a British army, in spite of an obstinate defense by the natives. The first fighting in the Afghan war of 1878-80 was in forcing an entrance into this pass, over which, as was stipulated in the conditions of peace, the Anglo-Indian authorities are henceforth to have full control.

KHYERPUR', a t. of Sind, stands about 15 m. e. of the Indus. The town was once the residence of the northern Ameers of the country, and lies in the fertile and well irrigated province of the same name.

KI, a word in the Chinese language meaning a grand division of time, employed in relation to periods of 3,000 years, of which 10 are assumed to have preceded the first imperial dynasty B.C. 2,205.

KIABOU CCA, **KIABOOCA**, **KYABUCA**, or **AMBOYNA WOOD**, a beautifully-mottled wood which is found in our timber-yards in small pieces, very evidently the wens or excrescences formed on the stem of the producing tree, *pterospermum indicum* (natural order *byttneriaceæ*). The color of this wood is yellowish red of different shades, and covered with a most elegant mottled figure in darker shades. It is much used for small ornamental articles, especially snuff-boxes, its scarcity and the small size of the pieces forbidding its employment in the manufacture of larger articles.

KIAH TA, or **KIACHTA**, a t. in Siberia, 150 m. s. of lake Baikal, and close to the Chinese frontier, being only separated by a piece of neutral ground 280 yards broad from the Chinese town of Maïmatchin. The population is about 5000. Through this town began the commercial intercourse between Russia and China which had been arranged by the treaties of 1689 and 1727. Since the middle of last century a lively and profitable barter-trade has been carried on both in Kiahta and in Maïmatchin; but it was not till the end of the century that the Russians were able to produce on their side any articles besides furs, but since then cloth and cotton goods, first of English or French, and later of Russian manufacture, have in part been substituted. Formerly the export to China of coins and the precious metals was forbidden at Kiahta, but this restriction is now in part removed. The exports from China consist chiefly of tea, of which about 100,000 cwts. finds its way into Russia by this road. This tea is very dear, on account of the enormous distance it has to be brought to Kiahta (more than 3,000 m.), and the Russian import duty, which amounts to from 40 to 70 kopeks. It is generally imported by the Russians at \$0.45 a pound. But it must not be overlooked that the Kiahta tea is the first crop, immensely superior to all that reaches Europe by any other route.

KIANG'SI, an inland province of China between $24^{\circ} 30'$ and 30° n., and $113^{\circ} 35'$ and $118^{\circ} 45'$ e. It lies entirely within the basin of the Yangtse-Kiang. The soil is rather inferior, although tea of the best quality is the chief export. Rice, wheat and tobacco are the chief staples. Capital, Nanchang. Area 69,499 sq. m. Pop. (estimated 1890), 24,600,000.

KIANG'SU, a province of China, between lat. 31° and 35° n. and long. 116° and 122° e.; 40,140 sq. m.; pop. 39,647,000. It is one of the most fertile regions of China. The surface is level, abounding in marshes, lakes, rivers, and canals. It exports silk and rice and tea in great quantities. Capital, Nanking.

KICKAPOOS' a tribe of North American Indians belonging to the comprehensive Algonquin family, formerly inhabited the region about the upper Mississippi, whence they gradually moved down into Illinois, and settled about the Wabash and Rock rivers.

They were hostile to the English during the early settlement of the country, and on the outbreak of the revolution supported the colonists for a time, but at length turned against them, and a state of war continued until 1792, in which gen. Scott took an important part. In 1811 the Kickapoos fought with Tecumseh against gen. Harrison, and on the outbreak of the war with England they assumed the offensive, but were defeated by Zachary Taylor at fort Harrison. Treaties made in 1815-16 ceded a large portion of their lands, and the U. S. government procured their removal and settlement on the Osage river, paying them \$2,000 a year for 15 years for their own lands. Here for a few years, there was established a degree of civilization, missionaries of various denominations making every effort to educate and cultivate this troublesome tribe. But the predatory and savage instincts of the Kickapoos soon resumed the ascendancy, and their warriors went out killing and horse-stealing, making descents upon Texas and other Mexican states, and at length even turning upon the U. S. Indian agents, one of whom they murdered in 1854. They were then removed to a reservation in Atchison co., Kansas. A considerable number of individuals of the tribe eventually settled down on separate holdings, and became farmers and citizens; the remainder went into Mexico, where they lived by raids over the frontier for booty. In 1890 the number of Kickapoos on the Kansas reservation was 237.

KIDD, BENJAMIN, sociologist, born 1858 in England, entered the British civil service at the age of nineteen, and did not become known to the literary and scientific world until his publication in 1894 of a work called *Social Evolution*. This passed through many editions both in England and America, and before the end of the year was translated into German, French, and Swedish. The author had for years been a student of biology, and had come to believe that the progress of society should be interpreted in terms of biological law. He had followed with intense interest the Weismann controversy, and believed that it was destined to revolutionize social philosophy. *Social Evolution* has as its main idea the antagonism between individual interests and the social good, the stress and strain which kill off the unfit being the necessary condition of progress. The solution of this difficulty is that men act from motives which have their seat in something else than reason. This controlling influence Kidd finds to be religion, which supplies the motive for individual self-sacrifice for the sake of the general welfare. The style of the book is easy and at the same time forcible. Weismann published an important introduction to the German translation.

KIDD, WILLIAM, known as **ROBERT KIDD**; b. England about 1650; was a trader out of New York, and in the war between England and France, in the early part of the reign of William III., commanded a commissioned vessel in the West Indies, and was noted for his bravery. In 1695 he was appointed by the earl of Bellomont, governor of the province of New York, to assist in suppressing piracy, and received two commissions from the king, one as a privateer against the French and the other a roving commission to pursue and capture pirates wherever he might find them. He sailed from Plymouth, Eng., April, 1696, in a galley called the *Adventure*, carrying thirty guns and a crew of eighty men. After proceeding to New York he captured a French ship, divided the booty, and increased his crew to 155 men, when he disobeyed his orders to cruise on the American coast by sailing for Madeira, thence to St. Jago, Madagascar, Malabar, and the Red sea. He had not been very successful in capturing vessels, and he now turned pirate and attacked whatever he met that promised booty. He first took some small Moorish vessels, then fought a Portuguese man-of-war, which defeated him, and finally captured a Portuguese ship from Bengal and an Armenian vessel with a rich cargo. At Madagascar he burned his vessel and went on board the Armenian, the *Quedagh Merchant*, afterward purchasing the sloop *Antonio* and sailing in company. By this time he had been proclaimed a pirate by the English, who had dispatched a man-of-war in search of him. Proceeding to New York he coasted from Delaware bay to Block island, corresponding with the earl of Bellomont in the mean time, and finally delivered up to the governor in Boston the treasure which he had acquired by his captures, including 1111 ounces of gold, 2,353 ounces of silver, 57 bags of sugar, 41 bales of goods, and 17 pieces of canvas. On July 6, 1699, Kidd was arrested, the immediate charge against him being that of murder, he having killed a gunner on board the *Adventure* who had become mutinous. He was sent home to England, and in April, 1700, was tried and found guilty of murder and on five separate indictments for piracy. He was condemned and executed. After Kidd's death it became rumored about that he and his crew had buried immense treasures prior to his capture, and the coast from Block island s., and even islands in the Hudson river, have been many times searched for this rumored wealth, of which no portion has yet been discovered.

KIDDER, DANIEL PARISH, D.D.; b. N. Y., 1815; graduated from Wesleyan university (Conn.) and became a Methodist preacher. From 1837 to 1840 he was a missionary in Brazil; 1844-56 secretary of the Sunday-school union of the Methodist Episcopal church; 1856-71 professor of practical theology at the Garrett biblical institute, Evanston, Ill.; in 1871 he was elected to the same position in Drew theological seminary, Madison, N. J. He published a number of books, of which a popular account of Brazil, the joint production of rev. J. C. Fletcher and himself, with the title *Brazil and the Brazilians*, is the most noteworthy. He d. in 1891.

KIDDERMINSTER, a well-known manufacturing t. and municipal and parliamentary borough of England, in the county of Worcester, is situated on the Stour, 14 m. w. of

Worcester. There are worsted spinning mills, tin-plate works, and dye works. The Stafford and Worcester canal goes through the town, opening communication with Liverpool, Bristol and Hull. Kidderminster is chiefly noteworthy on account of the carpet manufactures which are here carried on. Pop. '91, 24,803.

KIDNAPPING is not a legal term, but is frequently applied in popular language to the offense of stealing or forcibly carrying off a child or adult. The offense of forcibly carrying off a grown person, in general, now amounts only to an assault or false imprisonment, though formerly punishable with death. Child-stealing, where the child is under 14 years of age, if done with intent to steal any article upon or about the person of the child, or to deprive the parent or guardian of the possession of the child, is in England and Ireland a felony, punishable with penal servitude for not less than three nor more than seven years, or with two years' imprisonment. See also ABDUCTION.

KIDNEY-BEAN, *Phaseolus*, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having nine stamens united by the filaments, and one separate stamen, a downy stigma, a two-lipped calyx, and the keel of the corolla with the stamens and style spirally twisted. The species are mostly annual herbaceous plants, natives of the warm parts both of the eastern and western hemispheres. The common kidney-bean (*P. vulgaris*) is the *haricot* of the French. In Britain it is sometimes called *French bean*. In the south of Europe, and as far north as Germany, in the United States, and many other countries, the kidney-bean is a field-crop, and the ripe seeds are an important article of food. Within the tropics it is sown at all seasons; but in countries subject to frost only in spring, after the danger of frost is over. The seeds are used for food in a boiled state. In Britain they are not regularly ripened, except in the most favorable situations in the south. The plant is therefore cultivated chiefly for the sake of the unripe pods, which, when boiled with the young seeds in them, form a well-known and very delicate dish.—The **SCARLET RUNNER** (*P. multiflorus*) has often been regarded as merely a larger variety of the kidney-bean, with long, twining stem. It is doubtful, however, if they are originally from the same native country, an American origin being assigned to the runner, which is also a perennial—although in the climate of Britain usually destroyed by the winter's frost, and therefore treated as an annual—and has tuberous roots. The roots, in common with those of some other species of *Phaseolus*, are narcotic and dangerous; serious consequences have ensued from the accidental eating of them. The plant is cultivated for the same uses as the kidney-bean, and affords, even in Scotland, a very abundant crop of green pods in the latter part of autumn, although the seed is not sown till about the first of May. It is a very ornamental plant, particularly the common variety with scarlet flowers. It readily covers any trellis or paling, and requires stakes of 6 to 10 ft. in height.—Closely allied to the kidney-bean, if indeed more than varieties, and cultivated for the same uses, are the *Haricot de Soissons* (*P. compressus*), the *Haricot Princesse* (*P. tumidus*), etc. In some parts of India one of the most esteemed kinds of pulse is the *MOOG*, *MOONG*, or *MUNG* (*P. mungo*); in others, the *KALA MOOG*, or *BLACK GRAM* (*P. maa*).

KIDNEYS, THE, are two glands having for their office the secretion of the urine. That this office or function is of extreme importance is sufficiently shown by the facts that if, in consequence of disease, it is altogether suspended in the human subject, even for a day or two, death not unfrequently occurs, and that urinary glands corresponding in function to our kidneys are found, not only in all vertebrate animals, but in almost all mollusks, in the arachnidans, in insects, and in myriapods.

The human kidneys are situated in the region of the loins, on each side of the spine, and are imbedded in a layer of fatty tissue. Their form is too well known to require any description. The average length of each kidney is a little more than four inches, and its usual weight is from four to six ounces. The substance of the kidneys is dense, extremely fragile, and of a deep red color. On making a vertical section of the kidney, it is seen to consist of two different substances, which are named, from their position, the external or cortical, and the internal or medullary substance.

The *cortical substance* forms by far the greater part of the gland, and sends numerous prolongations inwards between the pyramids of the medullary substance. It is soft, granular, and contains numerous minute red globular bodies diffused throughout it, which are called, from their discoverer, the Malpighian bodies, and which will be presently noticed more fully. Its substance is made up of the *uriniferous tubes* (which are described in the notice of the medullary portion), capillaries, lymphatics, and nerves, held together by an intermediate parenchymatous substance.

The *medullary substance* consists of pale-reddish conical masses, called the "pyramids of Malpighi." They are usually about twelve in number, but vary from eight to eighteen, and their apices (the *papille*) point towards the hollow space (termed the *sinus* or *pelvis*) which occupies the interior of the gland. The medullary structure is firmer than the cortical, and instead of being granular, presents a striated appearance, from its being composed of minute diverging tubes (the uriniferous tubes, or tubes of Bellini), which run in straight lines through this portion of the kidneys, after having run in a highly convoluted course through the cortical portion.

The cavity occupying the interior of the kidneys (the *sinus* or *pelvis*) is lined by mucous membrane, which, through the medium of the ureter, is continuous with that of the bladder, and which extends into the tissue of the kidneys, to line the uriniferous tubes. The mucous membrane forms a cup-like cavity around the termination of each

pyramid, and the cavity, termed the *calyx*, receives the urine from the open terminations of the tubes and conveys it towards the pelvis, from whence it passes down the ureter into the bladder.

Each kidney is supplied with blood by a renal artery, a large trunk which comes off at right angles to the aorta. The blood, after the separation of the various matters which constitute the urine (q. v.), is returned into the venous system by the renal or emulgent vein, which opens into the inferior vena cava.

The nerves are derived from the renal plexus, which is formed by filaments of the solar plexus and the lesser splanchnic nerve. They belong entirely to the ganglionic or sympathetic system.

The Malpighian bodies are found in all vertebrate animals. In mammals, which are the only animals in which there is a division into a cortical and a medullary portion, these bodies are only found in the former. In an injected specimen, they appear to the naked eye as mere colored spots. They are for the most part of a spherical, oval, or flask-like form. Their diameter in man may range from $\frac{1}{80}$ th to $\frac{1}{144}$ th of an inch, the mean being $\frac{1}{104}$ th. A small artery, termed the *afferent vessel*, may be traced into each Malpighian body, while a minute venous radicle, the *efferent vessel*, emerges from it close to the point at which the artery had entered. The Malpighian body itself consists of a rounded bunch or tuft of capillaries, derived from the afferent, and terminating in the efferent vessel, and inclosed in a clear and transparent capsule, lined at its lower part with epithelium, continuous with that of the uriniferous tube which springs from each capsule.

The convoluted portion of the tube which proceeds from, and is continuous with, the Malpighian capsule is composed of a delicate basement membrane in immediate relation externally with an abundant capillary net-work, and lined in its interior by the spheroidal or glandular variety of epithelium. The diameter of its central canal is about $\frac{1}{1000}$ th of an inch. The straight portion of the tubes of which the pyramids are composed is lined with epithelium which approaches more nearly to the scaly or tessellated variety, and which seems to serve as a protecting layer, rather than to take part in the function of secretion. The tubes unite with one another to a great degree as they pass through the structure of the pyramids, so that at the base of a pyramid there may be many thousand tubes, while the number of openings at the extremity of a papilla are comparatively few.

It now remains to consider the respective functions of these two essential elements of the kidney (as it exists in the vertebrate animals), viz., the Malpighian bodies and the tubes. From the admirable researches of Mr. Bowman (*Philosophical Transactions*, 1842), and from the labors of subsequent anatomists, it appears that in animals in which the urinary excretion is passed in an almost solid form (as in birds and reptiles), the tufts are small and simple as compared with those of the kidneys of animals which (like man and most mammals) pass the urinary constituents dissolved in a large quantity of water. On these grounds, as well as from the fact that the anatomical arrangement of the tufts is well calculated to favor the escape of water from the blood, Mr. Bowman arrives at the conclusion, that the function of the Malpighian bodies is to furnish the fluid portion (the water) of the urine. The arrangement of the convoluted portion of the tubes, with a capillary net-work on one side of their basement membrane, and secreting epithelial cells on the other, is the exact counterpart of the arrangement in other secreting glands, and there can be no doubt that the functions of the cells in the convoluted portion of the tubes is to separate from the blood the various organic constituents (urea, uric acid, creatinine, etc.) and inorganic salts (chloride of sodium and phosphate of soda, etc.), which collectively form the solid constituents of the urine. It does not necessarily follow that these secreting cells undergo rapid decay and renewal; it is more probable that they have the power of selecting certain materials from the blood, and of transmitting them, without the disintegration of their own structure, to the interior of the tube.

The physical and chemical characters of the secretion yielded by the kidneys will be considered in the article URINE.

DISEASES OF THE KIDNEYS.—The most important affection of the kidneys is *Bright's disease* (q. v.), the symptoms of which have already been described. On examining the kidneys in a case of death from this disease, it is found that there is a great increase in the size and number of the oil-globules which exist in small quantities in the epithelial cells of the healthy gland. The urinary tubes becoming thus gorged and distended, compress the capillary vessels on their exterior; and hence, in consequence of passive congestion of the Malpighian vessels, which gives rise to obstruction of the circulation, the serum of the blood exudes in place of pure water, and gets mixed with the urine, which thus becomes albuminous in this disease. *Inflammation of the kidneys*, or *nephritis*, is not uncommon. In acute inflammation, there is a deep-seated pain in the small of the back, on one or upon both sides, often extending downward towards the inside of the thigh. The pain is increased by pressure, sudden change of position, coughing, etc. The urine is scanty, high-colored, albuminous, or bloody, and often deposits pus and sedimentary matter on standing. There is more or less fever, preceded by rigors; nausea and vomiting are frequent; and the bowels are usually constipated. In chronic inflammation, most of the above symptoms are present but in a milder form, and there is little or no fever. In both the acute and chronic form, the blood may become contaminated,

as in Bright's disease (q.v.), from the want of due purification by the kidneys, and various secondary affections may arise.

The causes of inflammation of the kidney are various. It may be due to mechanical violence, exposure to cold and wet, and to the ingestion of substances which have the property of irritating the kidneys, as cantharides, oil of turpentine, etc. A gouty diathesis and the presence of concretions may also be noticed as causes. Any affection capable of producing retention of urine may, by distending the pelvis of the kidney, occasion inflammation, as, for example, stricture of the urethra and affections of the spinal cord producing paralysis of the urinary organs.

The treatment must, on the whole, be antiphlogistic (or lowering) in the early stage of the disease, but must be considerably modified in accordance with the origin of the disease.

Nephralgia, or pain in the kidney without inflammation, which usually but not invariably depends upon the passage of a concretion through the ureter, is one of the most painful affections to which the human frame is subject. It usually comes on when the concretion makes its way from the pelvis of the kidney into the ureter, and does not cease till it has passed into the bladder. During an ordinary fit of gravel (see CALCULUS), or even in apparent health, a severe pain is suddenly felt in the loins, extending to the groin, thigh, or abdomen, and sometimes simulating colic. The pain comes on in paroxysms, with intervening periods of comparative ease. The paroxysm is usually accompanied by vomiting, a small and feeble pulse, and a profuse sweat. There is a frequent desire to pass urine, but the effort is usually futile. At length, usually after some hours, or even one or two days, the concretion escapes into the bladder, and the pain suddenly ceases.

This affection may be readily distinguished from inflammation by the sudden access and paroxysmal character of the pain and by the absence of fever.

As the disease is one which is very liable to return, the patient should know what steps to take before advice can be obtained. Opium is our sheet-anchor in this affection. The patient (assuming that he is an adult) may take two grains of opium, or an equivalent dose (35 or 40 minims) of laudanum or solution of muriate of morphia, when the attack comes on, and may repeat the medicine in half-doses every hour or two hours, until the pain is somewhat alleviated, or signs of the narcotic influence of the drug begin to manifest themselves. Should the stomach be so irritable as to reject the medicine, a dram of laudanum in a little thin starch may be injected into the rectum. Hot fomentations to the abdomen and loins also give partial relief. Chloroform may be inhaled with great benefit during the paroxysms, but only under the superintendence of a physician.

Suppression of urine, or *ischuria renalis*, is an affection in which there is either a complete cessation of the secreting action of the kidney, or so considerable a diminution as to be clearly morbid. It is undoubtedly, in most cases, a mere symptom of some other disease, but occasionally no other disorder is obvious, and it must be regarded as an independent or idiopathic affection. If no urine be separated from the blood, coma (intense stupefaction) and death rapidly supervene from the retention of urea (or of carbonate of ammonia, into which it readily breaks up) in the blood, which thus becomes impure, and acts as a poison on the brain. The treatment, which is seldom successful, is too purely professional for notice in these pages.

For further information on diseases of the kidneys and allied affections, see the articles BRIGHT'S DISEASE, DIABETES, DROPSY, and CALCULUS.

KIDNEY-VETCH, *Anthyllis*, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*, containing a number of species, some shrubby, and some herbaceous, natives chiefly of the warmer temperate parts of the Eastern Hemisphere. They have the petals nearly equal in length, and an oval 1 to 3-seeded pod, inclosed in the permanent inflated and generally downy calyx. The only British species is the common kidney-vetch (*A. vulneraria*), also called *lady's fingers*, a herbaceous perennial, with pinnated unequal leaves, and crowded heads of yellow (or sometimes scarlet) flowers. It grows on very dry soils, and is eaten with avidity by cattle, but does not yield much produce.

KIDO TAKAYOSHI, a Japanese statesman, b. in the province of Choshu about 1833, of gentle but not of noble birth. He actively participated in the acts and councils of his clan, that, with Satsuma and Tosa, led the coalition that overthrew the Tokugawa shogunate in 1868. He was present at the bombardment of Shimonoseki by the four allied foreign fleets in 1864, and was there converted to the idea of the superiority of foreigners and the impossibility of their expulsion from Japan. Thenceforward he became one of the most potent forces in that national movement, and one of the leading persons in that group of men, that overthrew the usurpation of 264 years and the effete feudalism of ten centuries. While Saigo was the heart and sword of the revolution, Kido became its brain and pen. He composed the able address to the throne, purporting to come from the four daimios of Satsuma, Hizen, Tosa, and Choshu, which proposed and secured the abolition of the feudal system and the retirement of 270 daimios to private life, relinquishing their lands and incomes to the mikado. He was appointed envoy in the embassy to the United States in 1871, established the first newspaper in Japan, and secured the formation of an assembly of local rulers—a step towards representative gov-

ernment. Of pre-eminent political genius, of stainless life, and gentle manners, his loss to the nation was profoundly deplored by the mikado and the whole nation. He died in Kioto, May 23, 1877.

KIDRON, or **KEDRON**. See **GEHENNA**.

KIEF, or **KIEV**, a government of Little Russia, lies immediately n. of the government of Kherson, and is bounded on the n.e. by the river Dnieper. Area, 19,691 sq. m., two thirds of which is arable, and one-fifth under wood. Pop. '90, 3,138,900. In the northern portions the surface is flat and marshy; the s. is covered with ranges of hills, branches of the Carpathian mountains, running from n.w. to s.e. The chief river is the Dnieper, with its tributaries, the Pripet and the Teteriv. The soil, chiefly loam, and partly clay and sand, is very fertile, beetroot being largely cultivated for sugar works. The climate is exceedingly mild; everything is in blossom in April, and frosts do not set in till November. Agriculture and horticulture are the chief occupations of the inhabitants. Wheat is extensively exported to Odessa.

KIEF, or **KIEV**, the chief t. of the government of that name, on the r. bank of the Dnieper, is one of the oldest of the Russian towns, and was formerly the capital. In 864 it was taken from the Khazars by two Norman chiefs, companions of Ruric, and conquered from them by Oleg, Ruric's successor, who made it his capital. In 1240 (when it ceased to be the capital) it was nearly destroyed by the Tartars. Christianity was first proclaimed in Russia at Kief in 988. In the 14th c. it was seized by Gedimin, grand duke of Lithuania, and annexed to Poland in 1569, but in 1654 was restored to Russia. The Kief of the present time is one of the largest towns in the empire, possessing (1897) a pop. of 248,750, and rapidly increasing. It is strongly fortified, has a remarkable suspension bridge over the Dnieper, a university of over 2000 students, and an ecclesiastical school. In its neighborhood is the convent of Kievo-Pecherstaya, a celebrated Russian sanctuary, which annually attracts thousands of pilgrims from the most remote corners of the empire. It contains also large sugar works and refineries, woolen manufactories, tanneries; large fairs take place here annually, the most celebrated of which is the "contracts" during the winter, which is attended by all the surrounding proprietors and by many foreign merchants. The trade is chiefly with Odessa, Poltava, and Austria.

KIEKIE, *Freyinetia Banksii*, a shrub of the natural order *Pandanacee*, yielding an edible, aggregated fruit, said to be the finest indigenous fruit of New Zealand. The species of this genus are tropical Asiatic or Polynesian climbing shrubs, with sheathing long, rather grassy leaves, usually spinous or serrated on the margin, and terminal, solitary, or clustered spadices of unisexual flowers. The kiekie is found in the northern part of New Zealand. It climbs the loftiest trees, branching copiously. The leaves are 2 or 3 ft. long. The spadices are clustered. The fruit is a mass of fleshy berries. The jelly made of it tastes like preserved strawberries.

KIEL, capital city of the Prussian province of Sleswick-Holstein, lying on a deep fjord or bay of the Baltic, which admits large ships to anchor close to the town, is the station of the greatest portion of the German navy, and is situated in lat. 54° 20' n., and long. 10° 7' east. Pop. '90, 69,127. Kiel is the seat of the supreme court of appeal for the province, and of a university which was founded in 1665, and has a library of 200,000 volumes, an observatory, a botanic garden, a natural history museum, and a good collection of northern antiquities. In 1872 an imperial order was issued that an academy for the benefit of all seafarers should be established at Kiel. The town has two bridges, connecting the northern or older parts with the rapidly increasing southern suburbs. The most ancient of its five churches is St. Nicolai, which dates from the 13th century. The castle has a good sculpture-gallery, containing, among other copies of the best works of art, casts of the Elgin marbles, and of Thorwaldsen's best productions. The public gardens and the wooded shores of the fjord, together with the woods of Düsternbrook afford numerous pleasant walks. Kiel, which became a member of the Hanseatic league in the 14th c., was formerly the chief mart for the farm and dairy produce of the Danish islands; and the very ancient annual fair, which was held for four weeks after Epiphany, was attended by buyers of all classes from every part of the duchies. Kiel, besides large oil works, has manufactures of tobacco, spirits, sugar, machinery, ironmongery, etc. Butter is extensively exported. It is an important link in the line of communication between Germany and the Baltic islands and ports; and steam-packets daily convey passengers and mails to and from the ports of the Baltic and North sea. In June, 1895, it became the terminus of the Baltic and North Sea Canal, which was completed in this month, and opened by Kaiser Wilhelm amid a gathering of warships from 14 nations, constituting a naval force greater than the world had ever before seen collected.

KIELCE, a Russian government of Poland on the Austrian frontier; 3897 sq. m.; pop. '91, 737,663. It is a rich mineral region, producing coal, zinc and tin. The Vistula separates it from Galicia, and it is watered by the Nida and Pilica.

KIELCE, capital of the government of that name; pop. '90, 17,488. It is situated about 107 m. from Warsaw, in the midst of iron, copper, lead and coal mines. It is the seat of a Roman Catholic bishopric, and contains a number of churches, a theological seminary, and a monastery.

KIELLAND, **ALEXANDER**, a prominent Norwegian novelist, born in 1849 in Stavanger, studied at the University of Christiania and fitted himself for the practice of law, but

instead of following his profession purchased and assumed the management of a brick and tile factory near his native town. He began to publish short stories in 1878, and these were collected in his first two books, *Novelletter* (1879) and *Nye Novelletter* (1880; 4th ed. 1893). These were followed by a number of novels including *German and Worse* (1880), *Laboring People* (1881), *Skipper Worse* (1882), *Snow* (1886), *Jacob* (1890), and a number of slight comedies and dramas. It is rather as a novelist than as a dramatist that he has become known, although many of his pieces have attained success on the stage. The style of his books is vivacious and epigrammatic. He has been compared to Daudet and his style is certainly unlike those of his Norwegian contemporaries. Although he came of a rich and patrician family, the spirit of his books is intensely liberal and even radical. Among the conservative people, they have aroused great opposition, and when his fellow-writers called the attention of the Storting to Kielland's deserts and requested that he should receive the customary poetical pension, it was refused, on the ground that the state ought not to stamp with its approval writings "opposed to the prevailing moral and religious ideas of the nation."

KIEPERT, HEINRICH, b. Berlin, 1818; an enthusiastic student of geography in his youth, and later a pupil of Ritter; devoted two years to the exploration of Asia Minor (1841-42), and made an atlas of Greece and the Greek colonies on his return to Berlin. He was for seven years director of the geographical institute of Weimar, and in 1859 became a professor in the university of Berlin. He published numerous geographical works, among which are *Neuer Hand-Atlas der Erde* and *Atlas der alten Welt*.

KIESEWETTER, RAFAEL GEORG, 1773-1850; studied law in Vienna and held important official positions under the Austrian government, but devoted himself assiduously to historical writings on music, including that of Holland, Greece, and the Arabs. Among these, the chief work from his pen was a history of song from the period of the middle ages down to modern times.

KIEV. See **KIEF**.

KIKIN'DA, NAGY-KIKINDA, or **GROSS-KIKINDA**, a t. of the Austrian empire, in the Temeser Banat, 134 m. s.e. from Pesth. It is in a level fertile country. Pop. '90, 22,768.

KILAUE'A, a vast crater in the e. part of the island of Hawaii, 10 m. from the sea, on the e. slope of the great volcano of Mauna Loa, 4,000 ft. above the sea, and 9,800 ft. below the summit of Mauna Loa. It is 30 m. by bridle-road from the seaport of Hilo, from which it is usually visited. The entire island of Hawaii is one vast pile of lava, the outflow of many craters, of which the summit crater of Mauna Loa is the greatest, and Kilauea, near the base of the mountain, the most constantly active. The latter forms no cone of itself, but is a great sink on the side of the mountain, in the midst of grazing land, trees, and ferns on the side to the windward of the crater. This sink is 3 m. long, 2 m. wide, and in the parts where the lava is not boiling from 500 to 800 ft. deep. The floor of the crater, being formed by the streams that constantly flow and cool in one or another part of it, is being filled up slowly in periods of moderate activity, but is liable to fall in or sink at any time, especially during great volcanic activity when eruptions elsewhere draw off the lava from below. At the e. end of this great sink are the pots and lakes of boiling lava, around which are low conical slopes of lava and ashes, but nowhere rising to the level of the ledges that surround the crater-sink. The lava in one or another of these little lakes is in perpetual ebullition, and flows out through a subterranean channel under the rim of the active craters to the lower level of the main crater-basin, forming small or large streams upon its black surface, which cool quickly and can be walked upon within a day or two after the lava ceases to flow. Travelers walk for miles upon these streams where the red, partly cooled lava can be seen in the crevices under their feet. In 1868, when Samuel L. Clemens (Mark Twain) visited the crater, it showed signs of unusual violence in its eruptions, and bid fair to fill and overflow the great sink; but a mud and lava eruption broke out on a grazing slope of the mountain 20 m. away, when the unusual activity of this crater ceased, while the mud flow submerged a valuable grazing country and made its way down the mountain far into the sea. The great eruptions from this crater were those of 1789, 1823, 1832, 1840, and 1868. There seems to be no subterranean connections between the sources of the eruptions from Mauna Loa and Kilauea, each having its periods of terrible activity without seeming to affect the other. There is, or was, a pleasant rustic inn or volcano-house on the ledge overlooking the crater, and the road from Hilo to the crater furnishes an example of an ancient Hawaiian paved road, 6 ft. wide, that rises and falls on a straight course over the low lava ridges towards the crater. The crater is about 250 m. by sea from Honolulu.

KILBOURNE, JAMES, 1770-1850; b. Conn.; was engaged in trade in early life, but, having acquired sufficient means for his support, adopted the ministry as a profession, and attached himself to the Episcopal church, in which he continued until 1804, when he retired. Having formed an organization for the settlement of western lands, he emigrated to Ohio, and founded Worthington township in that state. Here he became a magistrate, and also filled the office of surveyor of public lands. He was sent to congress in 1813, and served four years. He was president of the board of trustees of Worthington college during 35 years.

KILDA SAINT. See SAINT KILDA.

KILDARE, an inland co. of the province of Leinster, Ireland, distant, at its eastern border, about 14 m. w. from the English channel. Its greatest length from n. to s. is 40 m.; from e. to w., 27 m.; area, 418,497 acres, of which 418,000 are arable. Its surface is almost one unvaried plain, with the exception of the s.e. border, which meets the range of Dublin hills, and the eastern border, which likewise is slightly elevated. Its principal rivers are the Liffey and the Barrow, the latter of which forms in part its boundary. The Boyne has its source in Kildare, as has also the Blackwater. It is traversed by the Grand and Royal canals. The most remarkable features of Kildare are the celebrated plain called the "Curragh of Kildare"—an undulating down, 6 m. long, and 2 broad, the site of the well-known race-course, the Newmarket of Ireland—and the bog of Allen. The solitary hill called Allen, which rises in the great central limestone plain, is a mass of granular compact greenstone and porphyry, with some red sandstone conglomerate, which is quarried for millstones. The soil is generally a rich loam, resting on limestone or slate. The total extent of land under tillage, in 1853, was 140,837 acres; but the proportion of pasture land to tillage has been much increased, the acres under crop in 1876 being only 121,940. The pop. (1891) was 70,206, of whom 88% were Roman Catholics. The principal towns are Naas, Athy, and Kildare; but the number of minor towns is beyond the average of Irish counties. Kildare sends two county members to the imperial parliament. In antiquities of all historical periods, Kildare is peculiarly rich. In the time of Geraldus Cambrensis the plain of the Curragh had a stone circle similar to that of Stonehenge; it is now a military camp. There are five round towers and some stone crosses still preserved, and many castles of the Anglo-Norman period, three of which are still inhabited. The well-known Roman Catholic college of Maynooth (q.v.) is situated in this county, as is also the Jesuit college of Clongowes wood.

KILDARE' (Hib. *Kill-dara*, church of the oaks), a parliamentary and market t. in the county of the same name in Ireland, 25 m. s.w. of Dublin. It owed its origin to a monastery, founded, according to the annalists, in the end of the 5th c. by St. Bridget, the daughter of an Irish chieftain, who received the veil from St. Patrick himself. Around the monastery a town of some importance sprang up, which, as well as the abbey, was repeatedly plundered by the Danes. After the English invasion it rose to considerable importance, and a parliament was held in it in 1309. In the wars of Elizabeth, and subsequently in the great civil war, it suffered almost complete ruin, from which it but partially recovered. Prior to the union Kildare returned two members to the Irish parliament. The county has some woolen and paper factories. The pop. in 1851 was 1298; it is now slightly increased, being (1891) 2000. The see of Kildare, together with that of Glendalough, in the Protestant church, is united to that of Dublin. The united sees of Kildare and Leighlin form a distinct Roman Catholic diocese. Notwithstanding its present decayed condition, Kildare is exceedingly interesting for its antiquities, which comprise the ruined cathedral, a Franciscan and a Carmelite abbey, a portion of the chapel of St. Bridget, popularly called "The Fire-house," from a perpetual fire anciently maintained there, and, above all, the round tower, 130 ft. in height, which crowns the elevation on which the town is built, and is seen from a great distance.

KILDEER, an American bird belonging to the plover family, of the order *grallatores*, or waders; allied therefore to the cranes and herons. It is the *charadrius vociferus* of Linnaeus, but now placed in another genus, *agialitus*, and is called *agialitus vociferus*. It inhabits North and South America. It is about 10 in. long, with a spread of wing of 20 inches. Head small; neck rather short with a black ring around it; body slender, weight from 5 to 7 oz.; legs rather long, but not as much so as in others of the order; feet long and slender. Feathers on breast and underpart nearly white; on back and upper surface of head, grayish brown; below the ring on the neck there is a black transverse band on the breast. Quills dark-brown, with half their inner webs white. Four middle tail feathers white-tipped, with a wide subterminal black band, and the lateral ones widely tipped with white. The kildeer is common throughout North America, going to the south in winter and to Atlantic and Pacific islands. In summer it frequents plowed fields and sandy or gravelly banks of clear streams, feeding principally on worms and insects. In the winter it goes to the sea-shore and frequents marshes, mud flats, and oyster beds. Its flight is powerful, and it is a very rapid runner. It breeds at the south in April; later in the middle states. It usually lays four eggs, $1\frac{1}{2} \times 1\frac{1}{4}$ in., cream colored, with brown blotches. It frequently utters a shrill cry, especially when alarmed, which somewhat resembles a repetition of its name. The flesh is said to be tough, like that of other members of the order, but it is one of the most inoffensive and useful birds, as it feeds mostly on destructive insects, and should never be killed. See CHARADRIADÆ; and GRALLÆ.

KILHAM, ALEXANDER, 1762-98; the founder of the "New Connection of Wesleyan Methodists," often called Kilhamites. He was the first to advocate the representation of the lay element in the government of the church; was converted at the age of 18; and in 1785 received by Wesley into the regular itinerant ministry. After the death

of Wesley there was much controversy among his followers as to the duty of continuing their submission to the established church. At the first conference after Wesley's death in 1791 it was decided to "take the plan as Mr. Wesley had left it." But the controversy continued, some from their attachment to the establishment opposing any change, while others were determined to administer the sacraments as well as preach the word, and urged a total separation from the church of England. Kilham was of the latter class. Three years before Wesley's death he had declared, "Let us have the liberty of Englishmen, and give the Lord's supper to our societies." At the next conference he was severely criticised for his assertion of the popular rights, and for the publication of a pamphlet on the *Progress of Liberty*, in which he urged a distribution of the powers of government between the clerical and lay element. For severe remarks which he made that the preachers regarded as defamation of the society, he was formally arraigned at the conference held in 1796, and expelled from the connection. This resulted in the formation of the independent body now called "New Connection Methodists." He did not long survive the censure. All acknowledged him to be a man of fervent piety, and zealous for the success of the Wesleyan cause.

KILIA, a t. in the portion of Bessarabia ceded by Rumania to Russia in 1878, is situated on the left bank of the Kilia branch of the Danube, 100 m. s.w. of Odessa. Commerce is carried on here to some extent; pop. '85, 8014.

KILIAN, a saint of the Roman Catholic church, and bishop of Würzburg in the 7th century. He was a native of Ireland, and a member of that distinguished body of Irish missionaries among the Teutonic nations, to whose labors, in the 6th and 7th centuries, Christianity and civilization were so largely indebted in the southern and south-eastern countries of Europe. He was of a noble family, and while yet young entered the monastic life in his native country. Having undertaken, in company with several of his fellow-monks, a pilgrimage to Rome, he was seized in his journey through the still pagan province of Thuringia with a desire to devote himself to its conversion, and being joined by his fellow-pilgrims, Colman and Donatus, he obtained for the project at Rome, in 687, the sanction of the then pope, Conon, by whom he was ordained bishop. On his return he succeeded in converting the duke Gosbert, with many of his subjects, and in opening the way for the complete conversion of Thuringia; but having provoked the enmity of Geilana, who, although the widow of Gosbert's brother, had been married to Gosbert by declaring the marriage invalid and inducing Gosbert to separate from her, he was murdered at her instigation, during the absence of Gosbert, in 789, together with both his fellow-missionaries. The work which Kilian commenced was completed some years later by Boniface and his fellow-missionaries.

KILIMANJARO (the Great Mountain), supposed to be the highest known mountain of Africa, is situated on the western border of Zanzibar, in lat. 3° 40' s. and long. 36° east. It is covered with perpetual snow, and is reported to reach an elevation of 18,700 ft. above sea-level. It was first ascended in 1890, by Dr. Hans Meyer.

KILKENNY, an inland co. of the province of Leinster, in Ireland, bounded on the s. by Waterford, is 46 m. in its greatest length from n. to, s. and 24 in its greatest width from e. to w. Its area is 506,333 acres, of which 507,000 are arable. The population has been steadily decreasing since 1841, when it was 189,312. In 1851 it was 138,775; in 1861 it had fallen to 110,341, in 1881 (including the population of the city) to 99,531, and in 1891 to 87,261. The surface of the county is very varied, the southern portion being especially elevated, the hills rising to a height of 1696 ft. in the summit of Mt. Brandon. In the western district are situated the Walsh mountains. The principal rivers are the Nore, which traverses the whole length from n. to s.e., and falls into the Barrow; the Barrow, and Suir, which form the eastern and southern boundary. The surface of Kilkenny, except the mountains in the s., is mainly of the limestone formation, overlaid in the n. districts by shale and sandstone. In the hilly districts is an extensive deposit of anthracite coal, but of inferior quality. In the neighborhood of the city of Kilkenny a valuable black marble, interspersed with fossil shells, is quarried, of which a considerable manufacture of chimney-pieces and similar objects is carried on. Marl is generally found throughout the country. The soil is generally fit for tillage, being especially fertile in the valleys. The capital is the city of Kilkenny (q.v.). The towns of secondary importance are Callan, Thomastown, Freshford, Urlingford and Castlecomer, which is the center of the coal-district. Kilkenny has two county members, and the city a third. Kilkenny having been, from an early period after the invasion, the seat of the great Anglo-Norman families of Fitzgerald, Butler, Grace, Purcell, and others, has been the scene of much of the conflict of the English and Irish races, and is still thickly studded with remains of the military strongholds of the English settlers. The ecclesiastical remains are no less numerous; and it possesses five round towers and a considerable number of raths or tumuli, cairns, stone-circles, and pillars. The most remarkable natural curiosity is the cave of Dunmore, between Castlecomer and Kilkenny, opening by a natural arch of 50 ft. in height, and containing several chambers incrustated with stalactites. It is traversed by a subterranean stream.

KILKENNY, CITY OF (Gael. "Church of St. Kenny, or Canice"), the capital of the county of that name, and a county of itself, is situated on the river Nore, 73 m. s.s.w. from Dublin by the Great Southern and Western railway. Pop. of city in 1861, 14,174; in 1871 it had decreased nearly 10 per cent., being only 12,710 (of whom 11,369 were Catholics, 1181 Episcopalians, and 80 Presbyterians); pop. '91, of parliamentary borough, 13,700. Kilkenny returns one member to the imperial parliament. This city owes its origin to the cathedral church of the diocese of Ossory, which dates from the 12th century. Almost from the time of the invasion Kilkenny was a strong seat of the English power, its castle dating from the time of William earl of Pembroke, in 1195. From an early date Kilkenny was a place of much political importance, as well as the seat of numerous religious establishments. Being seated on the southern frontier of the pale, it was strongly walled in the end of the 14th c., and several parliaments were held in it, of which the most notable was that of 1367, in which was enacted the well-known "statute of Kilkenny," the great nucleus of all the distinctively English legislation for Ireland. The cathedral dates in part from the 13th c.; and the abbey church of St. John's, called the Black Abbey, has been partially restored, and is one of the very few ancient Irish churches now in actual occupation for the religious use of the Roman Catholics. A handsome Roman Catholic cathedral also has been recently completed. The so-called college or grammar-school of Kilkenny was founded by the Butlers in the 16th c., and was further endowed by the great duke of Ormond. Here Swift, Congreve and Berkeley were educated. St. Kyrans college is an educational establishment for the Roman Catholics, and is interesting as one of the first opened by that religious community after the repeal of the law which made Catholic education penal in these countries. Kilkenny formerly possessed considerable manufactures of blankets and coarse woolen and linen cloths, but of late they have much declined. It is the seat of tolerably extensive marble-works, and has a large and active provision-trade, the chief outlet of which is Waterford, with which Kilkenny is connected both by river and by the Kilkenny and Waterford railway. Pop. '91, 11,048.

KILLARNEY, a parl. and civic t. of Ireland, in the co. Kerry, Munster, is situated $1\frac{1}{2}$ m. from the lower lake of the same name, 16 m. s.e. of Tralee, and 46 m. w.n.w. of Cork. It contains an imposing Roman Catholic cathedral, a Dominican friary, and a nunnery, has little trade, is exceedingly dull in winter, though it wakes up into animation in spring and summer, when it is visited by crowds of tourists, attracted by the beauty of the scenery in the vicinity. Pop. '91, 5510.

KILLARNEY, LAKES OF, a series of three connected lakes, near the center of the county of Kerry, Ireland. The surplus waters are conveyed by the river Laune n.w. to Castlemain harbor. The upper lake is $2\frac{1}{4}$ m. long and three-fourths of a m. broad, and contains several islands. The Long Range river, leading to the middle lake, is about 3 m. in length. The middle lake is 2 m. long by 1 m. broad; and the lower lake, with about 30 islands, is 5 m. long by 3 broad. The beauty of the scenery, which is widely celebrated, consists in the gracefulness of the mountain outlines, the rich and varied coloring of the wooded shores, deepening through gray rock and light-green arbutus to brown mountain heath and dark firs.

KILLER, or **ORCA**, a cetacean of the dolphin family, noted for its great ferocity and voracity. The average length of the males is 20 ft., of the females, 15 feet. An extremely prominent dorsal fin is situated about two-fifths of the distance between the nose and tip of the tail. This fin is 6 ft. in height in the largest of the animals, the *orca rectipinna* of Cope, and has the shape of a dagger. There is also the *orca ater* of the same naturalist, somewhat smaller and having a much shorter fin. There has always been a want of precise classification in this branch of the dolphin family, on account of the difficulty of capturing these fierce and powerful animals. The *orca gladiator* of the Atlantic is said to be a distinct species, and the fiercest of all the genus. The *orca rectipinna*, according to capt. Scammon, is more slender in proportion and less marked with light spots than the other species. It is almost of a jet-black above, and lighter beneath; but the smaller species are beautifully variegated, and often contrast in color like the stripes of a tiger. There is a transverse, crescentic dorsal band of white just behind the dorsal fin, which forms a prominent characteristic in two varieties of *orca ater*. The mouth in all the species is armed with strong, sharp, conical teeth which interlock like those of the smaller dolphins. The short-finned killers of the western coast were till recently supposed to be confined to the colder regions, but it has been found that they frequent both high and low latitudes, and capt. Scammon regards them as "marine beasts that roam over every ocean, entering bays and lagoons, where they spread terror and death among the mammoth balenas and smaller species of dolphins, as well as pursuing seal and walrus, devouring in their marauding expeditions up swift rivers numberless salmon and other large fishes that come in their way." Sometimes the orcas are seen in schools from 5 to 10 abreast, but more frequently go in smaller squads of less than a dozen, gliding near the surface of the water, showing nothing but their tall dorsal fins; sometimes showing more than half the body; sometimes leaping out. The larger orcas are possessed of great power of locomotion, quickly overtaking other species of dolphins and swallowing them whole. Capt. Scammon saw

an attack made by three killers upon a cow whale and her calf in a lagoon on the coast of lower California in the spring of 1858: "The whale was of the California gray species, and her young was grown to three times the bulk of the largest of the killers engaged in the contest, which lasted for an hour or more. They made alternate assaults upon the old whale and her offspring, finally killing the latter, which sank to the bottom, where the water was five fathoms deep. As soon as their prize had settled to the bottom the three orcas descended, bringing up large pieces of flesh in their mouths, which they devoured after coming to the surface. While gorging themselves in this wise the old whale made her escape, leaving a track of gory water behind." He also states that orcas have captured whales from whalers, hauling them away under the water. Eschricht, in his *Northern Species of Orca*, says that they have been known to swallow four porpoises in succession, and that 13 of these animals, together with 14 seals, have been found in the maw of one of these killers. Among the icy regions the orcas pursue and destroy the white whale or beluga and carry off the young of the walrus. They sometimes pursue the white whale into the bays and literally tear them to pieces, devouring only a portion of what they destroy.

KILLINGLY, a town in Windham co., Conn., incorporated in 1708; on the Quinebaug and Five Mile rivers and the New England railroad; 25 miles n. of Norwich. It contains several villages, the Danielson high school, Danielson public library, Davis park, electric light plants, national and savings banks, and several churches, and has manufactories of cotton and woolen goods, hosiery, mill supplies, turned shoes, harness, etc. Pop. '90, 7027.

KILLINGTON PEAK, an elevation of the Green mountain range, 9 m. e. of Rutland, Vt., and 4380 ft. above the sea. The prospect from the summit is exceedingly fine.

KILMAINE', CHARLES JENNINGS, 1750-99; b. Dublin; was an officer in the French army, and with La Fayette in the American revolution. He also fought in the Vendean war, and when, in 1797, a descent upon England was contemplated, he was chosen general-in-chief of the proposed army of invasion.

KILMAINHAM HOSPITAL, an establishment near Dublin for the reception of wounded and pensioned soldiers. It was originally founded by king Charles II., and is conducted on similar principles to the sister institution, Chelsea hospital (q.v.). Kilmainham hospital is maintained by an annual parliamentary grant, and provides everything necessary for the comfort of upwards of 250 veterans and officers.

KILMARNOCK, the largest t. in the co. of Ayr, Scotland, and one of the chief stations on the Glasgow and South-western railway, is situated on a small stream of the same name, 12 m. n.n.e. of Ayr. Kilmarnock was once celebrated for its manufacture of "cowls," and the Kilmarnock websters, a notable class, have received from the satiric pen of Burns a not altogether enviable immortality; but the introduction of machinery has reduced them to insignificance. Later the town became one of the chief seats of calico-printing in Scotland; but though this manufacture is still carried on, it has lost its former importance. Kilmarnock has several large engineering establishments, woolen mills, carpet manufactories, machine shops and blast furnaces. It has also some endowed schools, numerous churches, and has recently acquired a public park. The country round about is one of the richest in Scotland in coal and iron, and its dairy produce is also extensive. The largest cheese-show in Scotland is held here, the value of the quantity exhibited generally amounting to about £35,000. Kilmarnock is a parliamentary burgh, and unites with Rutherglen, Dumbarton, Port Glasgow, and Renfrew in sending one member to parliament. Pop. '91, 28,447.

KILN, a name applied to various kinds of furnaces, ovens, or other devices made of stone, brick, or iron, or of the material itself to be operated upon. They may be divided into intermittent and continuous, or perpetual; or into furnace-kilns, oven-kilns, and what may be termed mound-kilns, such as are used in making charcoal; and also a kind which are intermediate between oven and mound-kilns, as certain kinds of brick-kilns, where the raw brick is a part of the kiln, and forms a structure which cannot be strictly called an oven.

The *furnace-kiln*, for burning limestone, may be of an intermittent or of a perpetual kind. An intermittent kiln is one in which the fire is let to go out after the charge is burned; a continuous kiln is one which is so arranged that the charge may be removed and a fresh one put in while the fire is kept burning, and the furnace kept at its reducing heat. An intermittent furnace-kiln may be made of stone or brick of an oval form, like an egg standing on either end. That form resembling an egg standing on its larger end is perhaps the most common, although some lime-kilns are shaped more like deep bowls, without much contraction at the top. Where wood is very plentiful and cheap, and the lime is burned for agricultural purposes, so that ashes is a desirable ingredient, a common bowl shape is perhaps preferable, because it is readily charged with both limestone and wood, and a mass of wood may be placed upon the top in addition to what is used in the charge, by which thorough burning will be secured. In a furnace-kiln a grating of iron is placed at the bottom, or an arch of open brickwork, and then the charge is ingeniously placed, first with fuel, and then with the broken masses of limestone in such a manner as to allow the flame to pass through, and thoroughly perform the work of heating. These kilns may be from 10 to 30 ft. high, or even

higher. Intermittent oval kilns are used in burning Portland and other kinds of hydraulic cement, and they are 40 or 50 ft. high, and employ coke or coal for fuel. The charge is usually composed of one part of coke or coal and two parts of raw cement. There are, however, several kinds of cement which do not require so prolonged high heat as Portland cement, and these may be burned in a kind of kiln so constructed as not to require the fire to go out when the burned contents are removed. These kilns are cylindrical, except at the bottom, where they have the shape of an inverted cone, and a chamber below and a kind of spout leading into it from the bottom of the cone, so that the charge when burned may be raked down from time to time with a suitable apparatus, and removed, while it may be renewed at the top. Cement-kilns should be lined with fire-brick. A preferable form of continuous kiln is one in which the kiln cylinder is charged only with the material to be burned, and a current of flame or heated gas is introduced at the side near the bottom. The heat thus passing up through the material reduces it to the proper condition, without adding any of the ashes of the fuel to it.

Brick-kilns are of three kinds: 1. That in which the raw brick are piled up in such a way as to form flues for the flame and hot gases of the fuel to pass through, and which are in more common use than the others, and called by the workmen clamps. 2. That kind of kiln in which common stoneware is baked, which is a sort of reverberatory furnace, and unlike the kiln in which the better kinds of earthenware are baked. 3. An example of a third form of brick-kiln, now used to a considerable extent, is Hoffann's annular brick furnace, which was on exhibition at Paris in 1867. It consists of a large annular chamber, divided into sections, with openings on the periphery for the reception of the bricks or material to be baked. Movable partitions divide the sections. Each compartment of bricks is burned successively, the heat passing from one section to another, so that very little is lost. Kilns or furnaces of this kind are used for other purposes, as the degree of heat can be easily regulated. It is a very fine form of kiln for drying and seasoning lumber. Pottery-kilns are usually in the form of a tall cylinder of various dimensions, from 15 to 30 ft. in diameter, rising from 15 to 20 or more ft., and terminated by a truncated cone of about two-thirds the height of the cylindrical part. Coal-burning furnaces are placed at different parts of the circumference at the floor of the kiln and rather below it, the flues from all of them passing to a common opening at the center of the floor, where the heat enters and passes through the contents of the kiln, which are usually placed in receptacles called seggars. The porcelain-kiln differs from the earthenware-kiln in having two stories instead of one, the upper one being used for the first "firing," which is done at a lower heat than for earthenware. For the manner of using the various forms of kiln see **BRICK, POTTERY, and WOOD CHARCOAL.**

KILO, or KILOGRAM. See **GRAM and METRIC SYSTEM**

KILOLITER. See **METRIC SYSTEM.**

KILOMETER. See **METRIC SYSTEM.**

KILPATRICK, HUGH JUDSON, b. N. J., 1836; graduated at West Point in 1861, and was appointed to the 1st artillery. He was wounded at the battle of Big Bethel, and received rapid promotion, being a col. of cavalry in 1862, and commissioned brig. gen. of volunteers the following year. He was in command of a division at Gettysburg, and the following spring, 1864, joined gen. Sherman, with whom he continued until the close of the war, being severely wounded during the battle of Resaca. He was commissioned maj.-gen. in 1865, and resigned from the regular army in 1867, and from the volunteer service Jan. 1, 1866. From 1865 to 1868 he was U. S. minister to Chili. In 1880 he was a prominent candidate for the republican nomination for governor of New Jersey; reappointed minister to Chili, April, 1881; died there in Dec.

KILRUSH, a parl. civic, and seaport t. of Ireland, in the co. of Clare, is situated on an inlet of the same name, on the northern shore of the estuary of the Shannon, 50 m. w. of Limerick. It is much resorted to for sea-bathing, has a good harbor with secure anchorage from westerly gales, and carries on considerable trade in corn, butter, pigs, fish, feathers, hides, flags, Irish moss, and in turf cut in the vicinity. Stone and slate are quarried here, and there are manufactures of flannels, friezes, and linen-sheetings. Pop. '91, 4095.

KILSYTH, a burgh of barony and parl. t. in Stirlingshire, Scotland, is distant about 12 m. n.e. from Glasgow, with which it is connected by railway. There are here several factories, and coal and iron works. Pop. '91, 6073.

KILWA, or QUIL'OA, a t. on an island off the e. coast of Africa, 6 m. long, between which and the mainland there is a fine harbor. Lat. 8° 58' s. It contains the remains of a fortress of the Portuguese who held this island during the 16th and 17th centuries.

KILWINNING, a t. in the co. of Ayr, Scotland. It consists chiefly of one long, irregular street. Hand-loom weaving, which at one time was carried on to a large extent, is now comparatively nothing. Hand-sewing or embroidery, introduced about a century ago, was the source from which a large proportion of the female community derived their support, but very few are now employed in this branch of industry. The prosperity of the town now depends mainly on large engineering and fire-clay works, a

woolen factory and the numerous coal-pits in its vicinity, and on its proximity to the Eglinton iron-works. The parish church, built in 1775, occupies part of the site of the famous abbey of Kilwinning. The town is noted as being the birthplace of freemasonry in Scotland, and until the institution of the grand lodge in 1736, all other lodges in Scotland received their charters from "mother Kilwinning"; even after 1736, down to 1807, when the disputes between the two lodges were adjusted, many charters were issued by the mother-lodge. It is also celebrated for its archery, and is the only place in Scotland where shooting at the papingo is practiced. Pop. in 1891, 3,835. About a mile and a half to the s.e. of the town stands Eglinton castle.

KIMBALL, a co. in Neb., formed in 1890; 923 sq. m.; pop. '90, 959. Co. seat Kimball.

KIMBALL, HEBER CHASE, 1801-68; a noted Mormon priest; was an active missionary of the sect, one of the 12 apostles, and high priest of the order of Melchizedek. He visited England in 1839-41 on a proselyting expedition, and was one of the foremost promoters of the Mormon religion, both at Nauvoo and Salt Lake.

KIMBALL, RICHARD BURLEIGH, b. N. H., 1816; graduated at Dartmouth college in 1834, went abroad, and returning began the practice of law in New York city. He has written a number of novels, of which the earliest, *St. Leger* (1849), was the most successful, having been republished in England and Germany. He d. in 1892.

KIMBLE, a co. in s.w. central Texas, drained by the Llano river and its n. and s. forks; 1302 sq. m.; pop. '90, 2239. The surface is rough and broken, but the soil is good for pasturage. The valleys are fertile, but require irrigation. Salt is found in many places and timber abounds. Co. seat, Junction.

KIMCHI, DAVID (generally quoted by his initials, *ReDaK*), the most eminent Jewish grammarian and exegete, was b. towards the end of the 12th c., probably at Narbonne, where he spent the greater part of his life. He died in Provence about 1240. His father, Joseph Kimchi, was the author of a number of commentaries and other theological works. His brother Moses is renowned for works of a similar description, more especially a Hebrew grammar, *Mahalach Shebile ha-Daat*, of which there are several editions. His own celebrity, however, far exceeds theirs. His grammar, *Michlol*, and his lexicon, *Shorashim*, have, to a certain degree, been the basis of all subsequent Hebrew grammars and lexicons. He wrote also commentaries on almost all the books of the Old Testament, most of which have been separately printed, and translated into Latin by Nelo, Pontaco, Leusden, Muis, Janvier, etc., besides several polemical works, such as the *Vikuach*, *Teshuvot le-Noarim*, etc. He was also made arbiter in the great Maimonides controversy (1233).

KIMCHI, DAVID. See **KIMCHI**.

KIM'POLUNG, a t. of Wallachia, 80 m. n.w. from Bucharest. Pop. 6400.

KIN, NEXT OF. When a person dies intestate, leaving personal property, such property devolves upon and belongs to the next of kin, who are the blood-relatives of the deceased. The law has declared a certain order of precedence among next of kin, which is not exactly the same in the three kingdoms. The degrees of kindred are divided into lineal and collateral. The lineal consists of the ascending, such as father, mother, grandfather, grandmother, paternal and maternal, and so on *ad infinitum*; and the descending, such as son, daughter, grandson, granddaughter, and so on *ad infinitum*. The collateral kindred consists of brothers, sisters, uncles, aunts, and the children of such *ad infinitum*. The mode by which the civil law computed the propinquity of degree was this: it allowed one degree for each person in the line of descent exclusively of him from whom the computation begins, and in the direct line counted the degrees from the deceased to his relative; but as regards collaterals, it counted the sum of the degrees from the deceased to the common ancestor, and from the common ancestor to the relatives. Thus, a brother was in the second degree, counting one to the father, and one from the father to the brother; a nephew, and also an uncle, a great-grandfather and a great grandson, were all in the third degree; a son and a father were in the first degree; and so on. This mode of computing the degrees of kindred has been adopted in the law of England and America.

When a person dies intestate, leaving personal property, there are two classes of rights to which the next of kin are entitled: one is the right to administer the estate, or to take out letters of administration; the other is the right to a share of the property itself. As regards the right of administration, the widow or next of kin may be selected, both or either. But among the next of kin, those are to be preferred who are nearest in degree according to the above computation: thus, a son or father is preferred to a brother, grandfather, or grandson; and these to a nephew, uncle, great-grandson, or great-grandfather; and so on. As regards the more valuable right of a share in the property, the rule is, that if there is a widow surviving, and also issue of the deceased, who are in that case the next of kin, then two-thirds of the property go to the next of kin; if there are no issue, but a widow survives, then one-half only goes to the next of kin; but if there is no widow surviving, then the whole goes to the next of kin. But the next of kin take according to the statute of distributions, which slightly differs from the order of the civil law as to the degrees of priority; thus, the children exclusively take the

whole, if children survive; if some of the children are dead, leaving issue, then the issue collectively of each dead child take an equal share with the living children, by what is called the principle of representation. If there are none nearer than grandchildren, all take an equal share, and the issue of a deceased grandchild also take one of such shares. After all the children and grandchildren are dead without issue, then the father, if alive, is entitled to the whole. If he also is dead, then the mother, the living brothers and sisters (together with the issue of deceased brothers and sisters collectively), take each one share. After these are dead, then grandfathers and grandmothers, paternal and maternal, and nephews and nieces, if alive, take each a share. The right of representation, i. e., the right of the children of a deceased person being one of a class (and who, if alive, would have been one of the next of kin), to represent him, and take his share, applies as far as the children of brothers and sisters, but no further. The heir-at-law, if of equal degree, is one of the next of kin, and takes his share with the rest, though he also gets all the real estate. The half-blood counts among the next of kin equally with the whole blood.

KINCARDINESHIRE, or **THE MEARNs**, a maritime co. of Scotland, with Aberdeen-shire and the Dee on the n., Forfarshire and the North Esk on the s. and w., and the North sea on the east. The rocks are granite, gneiss, sandstone, conglomerate, mica-slate, clay-slate, limestone and trap. Area, 246,000 acres, of which 121,000 are in cultivation. Returns one parl. member. The county may be divided into five sections—viz., the coast, Garvock, the "How o' the Mearns," the Grampians, and Deeside.

KINDERGARTEN (German "children's garden"), a sort of school, invented by Friedrich Froebel, in which, by a system of organized play, children, between the ages of three and seven years, are helped to a natural development, physically, mentally, and morally. This system of education, of which only the special methods are limited to children too young for mere instruction, is based upon the philosophical idea of the unity of all things, of the one underlying law, to which may be referred back all natural development, all organic growth. To this law, which Froebel calls the Law of the Connection and Contrasts, and upon which is founded the entire kindergarten system, can be traced the choice of material used by Froebel for the three-sided, out-pressing growth of the child. To place the young human being in the proper relations toward himself, toward nature, toward society, toward God, is the object broadly stated of the kindergarten. Based, as it is, upon the educational principles of the reformers preceding Froebel, it adds other, and new elements, discovered through a wider look-out upon education, whose meaning is no longer limited to instructional training only, but covers the ground of a continuous, unbroken growth, involving obedience to a universal, natural law. Under the form of play, the kindergarten is intended not only to compass the secondary object, of placing the child in possession through his own willing activity, of certain fundamental facts of the material world around him, but by strengthening, through gradual, continuous exercise, his best tendencies, and weakening, through disuse, undesirable qualities, it aims to put him in possession of himself, to develop powers of thinking, to engender self-control, and to start him in life with habits set in the proper direction. Again and again does Froebel insist upon the importance of clinching impressions by expression, through language and handiwork. Self-doing, self-activity, the exercise of every faculty, are to be continually the means of growth, of taking in and giving forth again, the well-trained senses acting as mediums of communication between the inner mind world and the outer, material world. Froebel summarizes the meaning of the kindergarten in the following words: "So, founded on the nature of man, and his impulse to formation and activity, and connected with the fostering of this impulse, this institution (the kindergarten) aims to represent a life whole (as it were a tree itself), as well as to furnish a means of employment, and so of training and of instruction, founded on the relations of man to nature and life, which, in their life full application to the child, from the first stage of its spiritual awakening, of its first use of its limbs and senses, develop it constantly, advancing with the growth of its powers on all sides, and thus in union with itself, with nature, and with the laws of life." A close, intelligent, sympathetic observation of children, in their unguided play, showed Froebel a ceaseless activity, a spontaneous delight in the use of the senses, a keen pleasure in investigation, in pulling to pieces, in reconstruction, in invention. He saw also, the joy which children find in association with others of their age, and an instinctive adaptation of themselves to society. Upon these observations Froebel builded, making of his new institution, the kindergarten, a school of play to the child, in which the individual shall have free scope to be himself while being also one of a community of equals, toward whom he must observe his duties, and accept the responsibility of his part in the whole. Froebel invented new methods and new material especially adapted to his ends, and which he designated as "gifts." Upon these we can barely more than touch, here, to illustrate slightly, their peculiar characteristics. Beginning with the *first gift*, the introduction of them to the child is gradual and logical. As he becomes familiar with the properties of one, he is led on to the next, which properly grows from the first, each introducing new impressions and repeating the old.

The *first gift* is composed of six rubber balls, each with a covering of wool, three of the primary and three of the secondary colors. The ball is chosen as the simplest type form, from which may be derived all other forms,—as embodying the element of

constancy, unity, its shape never varying under varying conditions ;—as representative of life, the mobile, the ever-moving, contrasted with one another in color, these balls are connected in shape, material, elasticity, etc. The *second gift*, comprising a wooden ball, cylinder and cube, carries impressions further, and offers not only in itself, but also with the first gift, a strong illustration of contrasts and their connections. In diversity of shape, in material, in hardness, in color, etc., it contrasts with its predecessor, with which it is connected, in one of its parts, by the shape of the wooden ball. Within itself, the ball is in almost every way the direct opposite of the cube,—one curved surface, as opposed to six plane ones, no corners and edges, in contrast with eight and twelve respectively ;—motion at every touch, at every incline set against stability, rest, in the cube,—while in the cylinder lies the reconciliation of variance,—the curved surface, and the flat, the rolling tendency, and the staying power, the loss of the corner, with the retention of the edge. With the *third gift*, consisting of a wooden cube cut once in each dimension to form eight smaller cubes, begins the first impression of a whole divisible into similar parts ; the first steps in number, of analysis of construction, the first suggestion, in the gifts, of the relation of the individual to the whole, and of the need of every perfect part to form a perfect unit. Still is at work the law of the reconciliation of opposites ;—the whole and its parts, the large and the small, lending themselves to difference, while the similarity of shape, of material, etc., again bridge over these differences. The *fourth gift*, a cube like that of the third, but cut once horizontally and twice vertically into eight rectangular parallelograms, introduces especially the new element of a whole composed of parts unlike itself. The *fifth and sixth gifts* are but extensions of the *third and fourth*, with more material and differing forms of solids. Beyond these, the gifts work toward the more abstract representations of the ideas of plane surfaces, edges and points, as illustrated in differently shaped wooden tablets, stick-laying, pease-work, etc., and carried to an extreme in the occupations, such as paper-folding and cutting ; sewing, perforating, etc. The industrial connection of the kindergarten with life is shown in the beginnings of industrial art, in the paper-weaving, drawing, sewing, clay-modeling, etc., all these, in such simple fashion and in so elementary a way, that to the child, with whom the kindergarten deals, it is an attractive form of play. Equally with the industrial, is considered the artistic connection of the kindergarten with the outside world, in designing, in the training of the color-sense, and in pure musical taste. The union of part with part in the kindergarten periods, is maintained by a central, seasonable thought, from which spring all the exercises of day, week, and month, that thought always dealing with subjects within the general and local experience of the kindergarten children. The songs, games, and stories, which hold together the periods of gift and occupation exercises, are also an integral part of them, growing out of them and their necessities. While they are the means of developing the singing voice, facility in language, grace and strength of body, they are also compassing the powers of attention, observation, imagination,—they are helping the child to think, to obey law, to govern himself, to stand in the proper attitude toward his environment. Manual training, not in special directions, but in general dexterity, forms an important part of the kindergarten training. From the delicacy of touch, as needed in such gifts as paper-folding and parquetry, to the strength and decision gained by the hands in clay-modeling, all degrees of handling are introduced, accuracy becomes a second nature, and crisp, distinct action. Work is made interesting, adapting itself to the capacity of the child, and the habit of industry is acquired. Froebel considered it of prime importance that to every child in the kindergarten should be given the entire charge of a small plot of ground for the cultivation of growing plants, not only that he might thus be brought into intimate relation with vegetable nature, and watch her growth from the seed to the seed, but that again might be emphasized, practically, the law of interdependence, and the doctrine of responsibility. In the year 1840, in the village of Blankenburg, in the Thuringian Forest, Friedrich Froebel opened the first kindergarten. Until his death, in 1852, Froebel gave himself up to the work of establishing other of these institutions, and of interesting and enlisting the friends of education in the cause. After his death, the Baroness Marenholtz-Bulow, Froebel's ardent disciple, gave her strength, her wealth, her fine intelligence toward interesting the European world in the kindergarten principle. In the United States, Miss Elizabeth Peabody and Mrs. Horace Mann were the pioneers of the new system of education. So rapid has been the growth of favorable opinion upon the kindergarten system, that in Austria, Italy, Belgium, England, France, Holland, Switzerland, Greece and Russia it has taken root more or less firmly. In Asia and South America, Japan, Argentine Republic, and Brazil have given it room, while the United States, through its length and breadth, has proved its most fertile growing-ground. St. Louis, Mo.; Milwaukee, Wis.; Philadelphia, Pa.; Boston, Mass.; Providence and Newport, R. I., have established kindergartens as a part of their public school system.

The reader is referred to Goldammer's *Manual* (tr. by Weibe, 1869) ; Hailmann's *Kindergarten Culture* (1873) ; *Reminiscences of Froebel* (tr. by Mrs. H. Mann, 1877) ; H. Barnard's *Kindergarten and Child Culture* (1881) ; Baroness Marenholtz-Bulow's *Child and Child-Nature* (tr. by Alice M. Christie, 1884) ; and Froebel's *Education of Man* (1889).

KINDERHOOK, a town and village in Columbia co., N. Y., 20 m. s.e. of Albany. It was the birthplace and home of President Martin Van Buren, who was hence popularly known as "the Fox of Kinderhook." Pop. '90, t. 3709; v. 963.

KINETICS (Gr. *Kinētikos*, "fit for moving"), is the science that determines the motion of bodies due to the action of forces. See **POLYGON OF FORCES**.

KINETOGRAPH. See **PHONOGRAPH**.

KING (Saxon, *Cyning*; Sanskrit, *Ganaka*, father, from the root *Gan*, to beget: "What the husband was in his house, the lord, the strong protector, the king was among his people"—*Max Müller*), the person vested with supreme power in a state. According to feudal usages the king was the source from which all command, honor, and authority flowed; and he delegated to his followers the power by which they exercised subordinate rule in certain districts. The kingdom was divided into separate baronies, in each of which a baron ruled, lord both of the lands, which he held under the obligation of rendering military service to the king, and in many cases also of the people, who were vassals of the soil, and his liege subjects. In modern times the kingly power often represents only a limited measure of sovereignty, various constitutional checks being in operation in different countries to control the royal prerogative. The king may succeed to the throne by descent or inheritance, or he may be elected by the suffrages of the nation, or by the suffrages of some body of persons selected out of the nation, as was the case in Poland. Even when the kingly power is hereditary, some form is gone through on the accession of a new king, to signify a recognition by the people of his right, and a claim that he should pledge himself to perform certain duties, accompanied by a religious ceremony, in which anointing with oil and placing a crown on his head are included as acts. By the anointing a certain sacredness is supposed to be thrown round the royal person, while the coronation symbolizes his supremacy. There is now no very clearly marked distinction between a king and an emperor (q.v.). A queen-regnant or princess who has inherited the sovereign power in countries where female succession to the throne is recognized possesses all the political rights of a king.

In England it is said that the king never dies, which means that he succeeds to the throne immediately on the death of his predecessor, without the necessity of previous recognition on the part of the people. He makes oath at his coronation to govern according to law, to cause justice to be administered, and to maintain the Protestant church. He is the source from which all hereditary titles are derived, and he nominates judges and other officers of state, officers of the army and navy, governors of colonies, bishops, and deans. He must concur in every legislative enactment, and sends embassies, makes treaties, and even enters into wars, without consulting parliament. The royal person is sacred, and the king cannot be called to account for any of his acts; but he can only act politically by his ministers, who are not protected by the same irresponsibility. A further control on the royal prerogative is exercised by the continual necessity of applying to parliament for supplies of money, which practically renders it necessary to obtain the sanction of that body to every important public measure.

The crown (q.v.) now in use as the emblem of sovereignty differs considerably in form in different countries of modern Europe; but in all cases it is distinguished from the coronets of the nobility in being closed above.

KING, a co. in n.w. Texas; formed 1876; organized in 1891; 900 sq. m. Pop. '90, 173. Co. seat, Guthrie.

KING, a co. in the w. central part of Washington, bounded on the e. by the Cascade mountains and w. by Admiralty inlet and Puget sound; organized Dec. 22, 1852; area, 1944 sq. m.; pop. '90, 63,989. Co. seat, Seattle.

KING, CHARLES, LL.D., 1789-1867; b. New York; son of Rufus; educated at Harrow, England, and at Paris, while his father was minister to Great Britain; and served afterwards for a time in a banking-house in Amsterdam. In 1806 he returned to New York, and in 1810 entered into business with his father-in-law, Mr. Archibald Gracie. He was a volunteer soldier in the war with England in 1814, and was afterwards sent as commissioner to that country to investigate the case of the Dartmoor prisoners. He was associate editor with Verplanck of the *New York American*, 1823-27, and sole editor 1827-47. After this he was for a time associated with James Watson Webb as editor of the *Courier and Enquirer*. He was appointed president of Columbia college in 1849, and held that office until 1864. He died at Frascati, Italy. He was the author of a *History of the New York Chamber of Commerce*, of a sketch of the Croton aqueduct, and of many pamphlets.

KING, CHARLES, author; b. Albany, N. Y., 1844; graduated at the U. S. military academy, 1866; became captain U. S. A., 1879; and was retired the same year because of wounds received in action. He published many historical works, and stories and sketches, all based on army life, including *Famous and Decisive Battles* (1884); *Campaigning with Crook*, etc. (1890); *Under Fire* (1894); *Captain Dreams*, *The Story of Fort Frayne*, *Starlight Ranch*, and *Trooper Ross and Signal Butte* (all 1895).

KING, EDWARD, b. Mass., 1849; son of a Methodist minister; was privately educated, but in this manner went through the entire course of study in vogue at Williams college. When only 17 years of age he entered the office of the Springfield (Mass.) *Union* as a compositor, becoming almost immediately local editor. The late Samuel Bowles, editor of the Springfield *Republican*, noticed his work, and being impressed with his ability sent him to Europe as a special correspondent. This was in 1867, and on his return Mr. King became literary editor of the *Republican*. In the following year he edited the *Evening News*, an offshoot of the *Republican*. In 1869 he

was again in Europe as special correspondent of the *Boston Journal*, and in that capacity followed the Franco-Prussian war and the incidents of the Paris commune in 1870. Until 1872 Mr. King was a member of the *Journal* editorial staff; he then traveled through the south, accompanied by an artist, and contributed to *Scribner's Monthly* a series of illustrated articles on that section. During this journey he traveled 25,000 m., of which 1200 was on horseback. In 1875 he went to Europe again, and from Paris corresponded with American papers. The following year he represented the *Boston Journal* at the Centennial exhibition in Philadelphia; and in 1877, being once more in Europe, wrote letters for the American press from the seat of war in Bulgaria. Mr. King has published in book form—*My Paris*, 1868; *Kentucky's Love*, a novel, 1872; *The Great South*, 1874; and *French Political Leaders*, 1876. He d. in 1896.

KING, J. FLOYD, b. Ga., 1842; was educated at the univ. of Virginia; was col. of artillery in the confederate army; was appointed brig.-gen. of state troops by Gov. McEnery, of La., in which state he held several important offices; was elected as a dem. from La. to the XLVIth and three succeeding congresses.

KING, JOHN ALSOP, 1788-1867; b. New York; eldest son of Rufus; educated at Harrow, England, and at Paris, while his father was minister at the court of St. James; served as a cavalry officer in the war of 1812-15 with England; was a member of the New York assembly in 1819, and of the senate in 1823. He was secretary of legation in England in 1826, and subsequently *chargé d'affaires* there; a member of congress, 1849-51; governor of New York, 1857-58; delegate to the "peace convention" of 1861 in Washington, and to the New York constitutional convention of 1867.

KING, JOHN PENDLETON, b. Ky., 1799; was soon afterwards taken by his father to reside in Bedford co., Tenn., where he remained until 1815, when he removed to Georgia, where he studied law, and was admitted to the bar at Augusta in 1819. In 1822 he went to Europe, where he was engaged for two years in completing his education. Returning home he soon attained eminence in his profession, and in 1833 was a delegate to the Georgia constitutional convention, in which he served with distinction. In 1834 he was elected by the democratic party to the U. S. senate, serving until 1838, when, on account of differences with his party, he resigned his seat and returned to the practice of his profession. In 1841 he was elected president of the Georgia railroad and banking company. He d. 1888.

KING, JONAS, D.D., 1792-1869; b. Mass.; graduated at Williams college, 1816; Andover seminary, 1819. On leaving the seminary he engaged in home-mission work in Massachusetts; also in Charleston, S. C., where he was ordained as an evangelist. In preparation for mission work in the east he went to Paris and studied Arabic under De Sacey. From 1823 to 1825 he traveled in Egypt and Syria with the rev. Pliny Fisk under the patronage of the American board, distributing the Scriptures and preaching Christ. He returned to America in 1827. In 1828 he relinquished the professorship of languages in Amherst college which he had held for some years, declined a similar one from Yale, and acceded to a request from the ladies' Greek committee of New York that he would go to Greece as their missionary. They had been stirred by his recitals of the sufferings of that country from Turkish despotism; had prepared a shipload of food and clothing, and wished to send food for "the soul as well as the body." He reached Poros, Greece, July 28. Supplies for the body and Christian books and instruction seemed for a time to be received with almost equal eagerness. Every day persons came begging for the New Testament, sometimes the number of applicants reaching 150. Sometimes a school of boys with their teacher would come for this purpose before breakfast. In one instance a bishop asked for New Testaments for the use of his priests, that they might "be able to teach the people properly." Dr. King made known the gospel in the streets, under a fig tree, or wherever he could find hearers. People would assemble in companies of fifty or sixty and listen with eagerness. Even the priests would give attention and approve what was said. The president of Greece seemed to look favorably on his efforts. He visited many important places, everywhere preaching, and promoting the interests of education and morality, and, where there was need, relieving want. There were many who testified to the value of his instructions and his aid in their own experience. In 1829 Dr. King married Miss Mengous, a Greek lady of influence. In 1830, at the request of the American board, his mission was transferred to its care. When Dr. King established schools, it was with the condition that the Scriptures should be studied in them. In 1855 the minister of education wrote to all the teachers of Greece commending the reading of the Scriptures as tending to regulate morals and citing the teachings of St. Chrysostom in their favor. Meanwhile the hierarchy of the Greek church had not looked on with indifference. As early as 1835 a member of the "holy synod" preached against the American schools, threatening with excommunication those who sent children to them. The minister of the interior, however, said: "Go on with your work; it is good." In 1844, being accused in some of the Greek papers of speaking against the doctrines of the church, Dr. King answered in the same papers, showing by quotations that Chrysostom, Basil, and Epiphanius taught what he taught. In 1845 there was issued against him, by both the Greek synod at Athens and the so-called "great church" at Constantinople, "an excommunication from the whole community." These were sent to churches throughout Greece and Turkey. In 1846, at the instigation

of the Greek synod, he was brought before the Arcopagus charged with having in one of his books reviled the mother of God, the holy images, etc. When asked, "Have you any defense to make?" he answered: "Those things in my book with regard to Mary, with regard to transubstantiation, and with regard to images, I did not say; but the most brilliant luminaries of the eastern church, St. Epiphanius, St. Chrysostom the Great, and others, say them." He was condemned to be tried before the felon's court in Syra. An inflammatory pamphlet was circulated in advance, with the avowed sanction of a high priest. His life was threatened, the governor of Syra declared himself unable to protect him. Through the influence of several distinguished lawyers, also of the minister of foreign affairs and the minister of justice, this trial did not take place. In another instance a conspiracy of fifty men against his life was thwarted. In 1847 an accusation brought against him, though proved false, caused such an excitement that the king advised his leaving the country for a time. He therefore visited various parts of Europe, returning in 1848 to his work. In 1851 he was appointed consular agent for the United States. A flag for the use of the consulate was received by him, and the same evening it became necessary to unfurl it in the presence of a mob which threatened violence. In Mar., 1852, he was again brought to trial on a charge of reviling the God of the universe and the Greek religion, and condemned to fifteen days' imprisonment and to leave the country. He protested in the name of the U. S. government. Soon afterwards George P. Marsh, minister-resident of the United States at Constantinople, was ordered by his government to investigate the whole affair, which he did. In 1854 the king of Greece issued an order freeing Dr. King from the penalty of exile. He remained at his work as usual. In 1857 he attended the meeting of the evangelical alliance at Berlin. In 1864, after an absence of three years, he returned to Greece, where his useful life closed. His original works, in Arabic, Greek, and French were ten in number, some of them being widely read and translated into other tongues.

KING, PETER, Lord, 1669-1734; studied at the university of Leyden, read law in the Inner Temple, and was called to the bar. In 1699 he entered parliament, where he was one of the managers of the impeachment of Dr. Sacheverell. George I. made him chief-justice of the common pleas, and in 1725 he became lord chancellor. He resigned in 1733.

KING, PHILIP PARKER, 1793-1855; b. on Norfolk island, Australasia; entered the British navy in 1807; went on an exploring expedition to Australia in 1817, and to South America in 1825. In 1854 he was made Rear-admiral of the Blue, the first native Australasian who attained that rank in the profession.

KING, PRESTON, 1806-65; b. Ogdensburg, N. Y.; was educated at Dartmouth college, and afterwards studied law, which he practiced in the interior of his native state. In 1830 he was an editor in St. Lawrence co., supporting Gen. Jackson, then president. He was made postmaster at Ogdensburg, and afterwards a member of the state assembly, member of congress, and U. S. senator 1857-63. In 1853 he had renounced the principles of the democratic party, and he continued to act with the republicans thereafter. In 1865 he was appointed by President Johnson collector of the port of New York, and during the same year, while temporarily deranged, leaped from a Jersey City ferry-boat and was drowned.

KING, RUFUS, 1814-76; b. New York; son of Charles; graduated at West Point military academy in 1833; remained in the army for 3 years, being commissioned as brevet second lieut. of engineers. In 1836 he resigned his commission in the regular army to take a position as engineer on the Erie railway, holding it for 2 years. From 1839 to 1843 he was adjt. gen. of the state of New York. He was at one time on the staff of the *Albany Evening Journal*, and in 1839 was editor of the *Albany Advertiser*, conducting it for 6 years, and on removing to Milwaukee took the same position on the *Milwaukee Sentinel*, which he filled from 1845 to 1861. In 1861 he was appointed U. S. minister to Rome. He returned to this country during the war of the rebellion, and was present, as a brig. gen. of volunteers, at the battles of Fredericksburg, Groveton, Manassas, Yorktown, and Fairfax in command of a division. In 1863 he resumed his former position at Rome, remaining there until 1867.

KING, RUFUS, LL.D., 1755-1827; b. Scarborough, Maine. After his graduation from Harvard college he read law with chief-justice Parsons, and was admitted to the bar in 1780. In 1782 he took his seat in the legislature of Mass., to which he was several times re-elected. In this capacity he supported a measure which gave congress power to lay an impost of 5 per cent. He became a member of the continental congress in 1784 and introduced a resolution prohibiting slavery in the territories. The substance of this resolution was subsequently incorporated by his colleague, Nathan Dane of Mass., into the famous ordinance of 1787. He took a prominent part in the proceedings of the convention which formed the U. S. constitution, and, in the convention called in Massachusetts to decide upon the adoption or rejection of the new constitution, he was one of the most distinguished defenders of that instrument. In 1788 he removed to New York, from which state he was elected senator in 1789, and at once took a high place as a leader of the federalists. King was re-elected to the senate in 1795, and in 1796 he accepted from president Washington, who had previously offered him a place in his cabinet as

secretary of state, the responsible post of minister to England. He distinguished himself highly in the diplomatic service, in which he continued for eight years. In 1813 and again in 1819 he received the honor of an election to the U. S. senate by a legislature a majority of which was republican and strongly opposed to his politics. During the war with England Mr. King did not side with the extreme federalists, but supported the administration in such measures as seemed to him to be for the general good. After the war he opposed the bill for the creation of a U. S. bank, and he was strongly opposed to the admission of Missouri to the union. Mr. King retired from the senate in 1825 and re-entered public life only to accept for a time the post of ambassador to England during the administration of John Quincy Adams, but owing to ill-health he remained but a short time.

KING, THOMAS STARR, 1824-64; b. New York; an eminent Unitarian minister; studied theology in intervals of leisure from necessary employment, and preached his first sermon at Woburn, Mass., in 1845. The next year he became pastor of the Univ. church which his father had served, in Charlestown, and remained in that charge until he removed to Boston, where, for 12 years, he was pastor of the Hollis street church. Besides fulfilling the duties of his profession, and acquiring a high reputation as an eloquent, fervent, and spiritual preacher, Mr. King gained wide popularity as a public lecturer, in which capacity he found constant employment from 1845 to 1860. In the latter year he received a call to the only Unitarian church in San Francisco, and, having accepted it, began his ministrations there in the summer. The outbreak of the rebellion afforded Mr. King an opportunity of manifesting the firmness of his loyalty, and of exercising a powerful influence toward the national government among the people of California, a state which, in the beginning, was at least lukewarm in its devotion to the union. His stirring speeches, made in different parts of the state, revived the drooping patriotism of the people, many of whom were from the southern states, while others were adventurers who were bound by no ties of attachment whatever, national or local. He specially employed his almost matchless eloquence in soliciting aid for the noble purpose undertaken by the U. S. sanitary commission, and to him was chiefly due the splendid gift of California to that cause. Mr. King's death, which occurred in San Francisco, was sudden, and was deeply deplored throughout the country. Besides his ability as an orator, he was an agreeable and striking writer. He wrote *The White Hills: their Legends, Landscapes, and Poetry*, 1859, and contributed frequently to reviews and other periodicals.

KING, WILLIAM, D.D., 1650-1729; graduated from Trinity college, Dublin, and took orders in 1674. In 1688 he was made dean of St. Patrick's; in 1691 bishop of Derry; and in 1702 archbishop of Dublin. He wrote several theological books, and one of them, his treatise *De Origine Mali*, was assailed by Bayle and Leibnitz.

KING, WILLIAM RUFUS, 1786-1853; b. N. C.; graduated from the university of North Carolina in 1803, and was admitted to the bar in 1806. He served for several years in the legislature of his native state, and in congress, 1812-16, where he was a strong advocate of the war with England. He was attached to the U. S. legation 1816-18, first at Naples and afterwards at St. Petersburg. On his return he removed to Alabama, and was a member of the convention which drew up a constitution for the new state, of which in 1819 he was elected the first senator. He remained in the senate till 1844, when President Tyler appointed him minister to France, where he remained till 1846. In 1848 he went back to the senate, of which in 1850 he was elected president upon the succession of Vice-president Fillmore to the presidency. In 1852 he was elected vice-president upon the democratic electoral ticket with Franklin Pierce as president. Early in 1853 he went for health to Cuba, where he was permitted to take his oath of office. He returned early in April and died in the same month.

KING AND QUEEN, an eastern co. of Virginia; bounded on the s.w. by the Mattaponi and York rivers, and on the e. by the Plaukatank; 400 sq. m.; pop. '90, 9669, having an undulating surface and valuable marl beds. Corn and wheat are the staple products. Co. seat, King and Queen.

KING-AT-ARMS, or KING-OF-ARMS. The principal heraldic officer of any country. There are four kings-at-arms in England, named respectively Garter, Clarenceux, Norroy, and Bath, but the first three only are members of the college of arms.

Garter principal king-of-arms was instituted by Henry V., 1417 A.D., for the service of the order of the Garter. His duties include the regulation of the arms of peers and the knights of the Bath. In the capacity of king-of-arms of the order of the Garter, he has apartments within the castle of Windsor, and a mantle of blue satin, with the arms of St. George on the left shoulder, besides a badge and scepter. His official costume as principal king-of-arms of England is a surcoat of velvet, richly embroidered with the arms of the sovereign, a crown, and a collar of SS. The insignia of the office are borne by Garter impaled with his paternal arms, the latter on the dexter side of the shield. These are argent, St. George's cross, on a chief gules a ducal coronet encircled with a garter, between a lion of England on the dexter side and a fleur-de-lis on the sinister, all or.

Clarenceux and Norroy are provincial kings-of-arms, with jurisdiction to the s. and

n. of the Trent respectively. They arrange and register, alone or conjointly with Garter, the arms of all below the rank of the peerage. The official arms of Clarencieux are argent St. George's cross, on a chief gules a lion of England ducally crowned or. Those of Norroy are argent St. George's cross, on a chief per pale azure and gules a lion of England ducally crowned between a fleur-de-lis on the dexter side, and a key, wards in chief, on the sinister, all or. Both provincial kings have a crown collar and surcoat. The crown is of silver gilt.

The crown of a king-of-arms is of silver gilt, and consists of a circle inscribed with the words, *Miserere mei Deus secundum magnam misericordiam tuam*, supporting 16 oak leaves, each alternate leaf higher than the rest. Within the crown is a cap of crimson satin turned up with ermine, and surmounted by a tassel wrought of gold silk. Kings-of-arms were formerly entitled to wear their crowns on all occasions when the sovereign wore his; now they assume them only when peers put on their coronets. The installation of kings-at-arms anciently took place with great state, and always on a Sunday or festival-day, the ceremony being performed by the king, the earl-marshal, or some other person duly appointed by royal warrant.

Bath king-of-arms, though not a member of the college, takes precedence next after Garter. His office was created in 1725 for the service of the order of the Bath. On Jan. 14, 1726, he was constituted Gloucester king-of-arms (an office originally created by Richard III., in whose reign it also became extinct), and principal herald of Wales. He was at the same time empowered, either alone or jointly with Garter, to grant arms to persons residing within the principality.

The chief heraldic officer for Scotland is called Lyon king-of-arms (q.v.), who since the union has ranked next to Garter. His title is derived from the lion rampant in the Scottish royal insignia, and he holds his office immediately from the sovereign, and not, as the English king-at-arms, from the earl-marshal. His official costume includes a crimson velvet robe embroidered with the royal arms, a triple row of gold chains round the neck with an oval gold medal, with the royal arms on one side and St. Andrew's cross on the other; and a baton of gold enameled green, powdered with the badges of the kingdom. His crown is of the same form with the imperial crown of the kingdom, but not set with stones. Before the revolution he was crowned by the sovereign, or his commissioner, on entry on office.

There is one king-of-arms in Ireland, named Ulster. In the 14th c. there existed a king-of-arms called Ireland, but the office seems to have become extinct, and Edward VI. created Ulster to supply the deficiency. His arms are argent, St. George's cross, upon a chief gules a lion between a harp and a portcullis, all or. The royal ordinance relative to the order of St. Patrick, issued May 17, 1833, declares that in all ceremonials and assemblies Ulster king-of-arms shall have place immediately after the Lyon.

KINGBIRD, one of the members of the great order of *insessores*, or perchers. It belongs to the *colopteridæ*, or fly-catcher family, and is included in the genus *tyrannus*, its specific name being *T. Carolinensis* (Baird). It is sometimes called the bee martin, and inhabits that part of North America e. of the Rocky mountains. It is 8½ in. long, with a wing about 5 in.; color above, dark bluish ash; breast and throat, pale bluish ash; top and sides of head, bluish black; concealed crest, vermilion in the center, white behind, and an orange tint before. It is very courageous, attacking hawks, crows, and other large birds. It is an unerring insect catcher, and is one of the most useful, beautiful, and interesting of our birds.

The gray kingbird, *T. Dominicanensis* (Rich), is a native of the West Indies, but visits the southern states; body 8 in., wing 4½. Another species of this genus is *T. verticalis*, or Arkansas fly-catcher, of western North America, 8½ in. long, wing 4½ in. long; general color ashy, yellow beneath, tail nearly black, wings brown, crest vermilion in center, yellowish before and behind, and very much resembles the bee martin. There are also Cassin's fly-catcher of Mexico and Texas, *T. vociferans*, nearly 9 in. long; and Couche's fly-catcher, *T. Couchii* (Baird), of Mexico, 9 in. long, with a wing of 5 in. All these are useful and beautiful.

KING-CRAB, *Limulus*, a genus of *crustacea*, ranked by Cuvier among the *entomostraca*; but so widely differing from all the rest of the *crustacea*, that Milne-Edwards makes it a subclass by itself. The head and thorax are united together, and are covered by a shield, which is convex above and concave beneath. The abdomen is more or less hexagonal, no division into rings appears in it, and it is covered by a shield not so broad as that of the head and thorax. On each side it has along the margin six movable spines directed backward and outwards; and attached to it is a tail, which forms a long and strong dagger-like spine, sometimes exceeding in length the whole body of the animal. The legs are not large enough to be visible beyond the shield when the animal moves along the ground.—These remarkable animals are found only on the shores of tropical Asia, the Asiatic Archipelago, and tropical America. They feed on animal food, and are said to be themselves less agreeable food than crabs or lobsters. Some of them exceed 2 ft. in length, and the strong and jagged spine is a formidable weapon. In some of the Asiatic islands the spine is often used for pointing arrows. In tropical America the king-crab is called *casseroles fish*, and the shell is used as a ladle. The

number of species of king-crab is not great.—Fossil species are pretty numerous. Trilobites are supposed to have been allied to the *limuli*.

KINGFISH. See OPAH and LAMPRIE.

KINGFISHER, *Alcedo*, a genus of birds of the order *insessores* and family *halcyonidae*. The name is often extended to the whole family; the only British and almost the only European species of which is the common kingfisher (*A. ispida*), a bird not much larger than a sparrow, in brilliancy of color rivaling the finest tropical birds—blue and green being the prevailing colors. The kingfisher is generally distributed over Britain and Ireland, but is not so common in Scotland. It is not a bird of passage, although in many places it appears only as an occasional visitant. It is found in all parts of Europe except the most northern, and over a great part of Asia and Africa. It frequents the banks of rivers and streams, and is often seen flying near the surface of the water. Its food consists of small fishes, such as minnows, sticklebacks, and trout or salmon fry, and of leeches and water-insects. When it has caught a fish it often kills it by beating on a branch, and always swallows it head foremost. The indigestible parts are afterwards disgorged.

It seems probable, although not quite certain, that the kingfisher is the *halcyon* of the ancients, about which many wonderful fables were current among them: of its having power to quell storms, of its floating nest, and the stillness of the winds during the time necessary for its safety, etc. Shakespeare makes repeated allusion to the popular notion that if the stuffed skin of a kingfisher or halcyon is hung up by a thread, the bill will always point to the direction from which the wind blows.

The BELTED KINGFISHER (*alcedo halcyon* or *ceryle halcyon*) of North America is a much larger bird than the kingfisher of Britain, being fully 12 in. in length. It is common on most of the rivers of North America to 67° n. lat. in summer, but migrates southward in winter, and is then to be found in the West Indies. Its colors are dull when compared with those of the common kingfisher.

Many species of kingfisher are found in the warmer parts of the world. Some of them, forming the genus *ceyx*, want the hind toe. The common European kingfisher may be regarded as the type of the family, which belongs to the group called *syndactyle birds*, and is characterized by the much-united toes. The form is bulky; bill long, straight, quadrangular, sharp, and heron-like; wings, tail, and legs short, and feet small. See *illus.*, LARKS, ETC.

KING GEORGE, a co. of Virginia, between the Potomac and Rappahannock rivers; 190 sq. m.; pop. 1890, 6641. The surface is uneven, but much of the soil is fertile. Corn and wheat are the staple products. Co. seat, King George.

KING GEORGE'S SOUND, an inlet at the s.w. angle of Australia, which is an excellent roadstead, and contains two landlocked recesses, Princess Royal and Oyster harbors. On the former stands Albany, the coaling depot of the Peninsular and Oriental company's steamers.

KINGLAKE, ALEXANDER WILLIAM, was b. at Taunton, Somersetshire, in 1811, studied at Eton and Trinity college, Cambridge, and—having chosen the law as a profession—was called to the bar in 1837. His practice soon became very great; nevertheless, he found time to make a tour in the east of some length, the result of which was a book entitled *Eothen*, descriptive of his adventures and impressions. It was published in 1844, and at once attained an astonishing popularity, passing through many editions both in England and America, and being also extensively translated on the continent. The graceful vigor and liveliness of the style have made *Eothen* a model for subsequent works of a similar kind, but none have yet reached the exquisite talent of the original. In 1857 Kinglake entered parliament as member for Bridgewater. Vols. I. and II. of his *Invasion of the Crimea* appeared in 1863, and fully sustained his literary reputation, but the virulent antipathy shown towards the French emperor and all the actors in the *coup d'état* was not calculated to beget confidence in him as a historian. Vols. III. and IV. were published in 1868, vols. V. and VI. 1875–80. The last and eighth volume appeared in 1887. He died in 1891.

KINGLET, a bird belonging to the thrush family, sometimes called golden-crowned warbler and wren. It is a permanent resident of Great Britain. Its color above is a yellowish olive-green; below, a yellowish-gray, while the crest is orange-yellow, bordered with black. It has a soft and pleasing song, frequents fir-woods, builds a beautiful cup-like nest, which it hangs on the twigs of a tree. It is very bold in defense of its young. Two nearly allied species of the same genus (*regulus cristatus*) exist in North America, and are known as the ruby-crowned and golden-crested kinglet or wren.

KINGMAN, a s. co. in Kansas, drained by Chikaskia river and the s. fork of the Ninne Seah; 864 sq. m.; pop. '90, 11,823. Co. seat, Kingman.

KINGPOST. See ROOF.

KINGS, a co. of New York, at the w. end of Long island, and including some small islands along the coast; 37 sq. m.; pop. '90, 838,547. The soil is naturally light, but its proximity to New York makes it exceedingly valuable. Garden products are the prin-

cipal crops. The capital is Brooklyn, the fourth city in the union in population. The inhabitants of the county, outside of that city, number but 32,204.

KING'S, a co. in the s. central part of New Brunswick, intersected by the river St. John; 1565 sq. m.; pop. '91, 23,087. Its surface presents hills of a gentle elevation and level, fertile valleys. The Intercolonial and the Canadian Pacific railways cross the county. Capital, Hampton.

KING'S, a co. of Nova Scotia, bordering on the bay of Fundy and on Minas basin; traversed by the Dominion and Atlantic railway; 812 sq. m.; pop. '91, 22,489. The soil is fertile, and there are in some places rich deposits of iron ore. Shipbuilding is carried on to some extent, but the chief occupation is farming. Capital, Kentville.

KING'S, the easternmost co. of Prince Edward Island; 644 sq. m.; pop. '91, 26,623. Capital, Georgetown.

KING'S BENCH. See **QUEEN'S BENCH.**

KINGS, BOOKS OF (*Melakim*), the name given to two of the canonical books of the Old Testament. Originally they were but one, and were first separated by the Seventy, by whom they are designated "the third and fourth of the kingdoms"—the books of Samuel forming the first and second. This division was copied by the Vulgate, and passed thence into the general usage of Christendom. The exact titles of these books in the English authorized version are—*The First Book of the Kings, commonly called the Third Book of the Kings*, and *The Second Book of the Kings, commonly called the Fourth Book of the Kings*. They embrace (1) the reign of Solomon, (2) the history of the divided kingdoms of Judah and Israel, (3) the history of the kingdom of Judah after the dispersion of Israel, until the Babylonian captivity—a period of about 570 years in all. The books do not appear to be merely vague compilations from royal annals and other—rather contradictory—sources, as is held by some, but rather the diligent work of a historian—with a clear and distinct tendency—who gathered together all the written and unwritten information, provided it could be made useful for his purpose. The unity of style and language is indeed palpable throughout, nor are any later alterations of consequence apparent. The principal sources quoted are a *Book* [of the Chronicles] of *Solomon*, further a *Book of the Chronicles of the Kings of Israel*, and another of the *Kings of Judah*. The Talmud, and some of the earlier Christian theologians, ascribe it to Jeremiah; this view is also maintained by Hävernick in modern times. Huet and Calmet are in favor of Ezra, but all that can be safely asserted is that the compiler lived during the second half of the captivity and after the death of Joiachin, and probably in Babylon. The spirit of the work is *theocratico-prophetic* in a high degree (its historical fidelity with respect to the political events is generally recognized, but the stories relating to the prophets Elijah and Elisha are by most critics referred to the province of legend); while that of Chronicles (which goes over much the same ground) is held to betray the predominance of priestly influence. One of the best modern commentaries is that by Thienius (Leip. 1845).

KINGSBOROUGH, LORD (EDWARD KING), 1795–1837; devoted himself to antiquarian researches, particularly in connection with Mexico. In 1830 he began the publication of his great work on that country, at his own expense, and at a cost exceeding \$250,000. Seven volumes of this work appeared during the life-time of the projector, under the title *Antiquities of Mexico, comprising Facsimiles of Ancient Mexican Paintings and Hieroglyphics, together with the Monuments of New Spain by M. Dupaix, with their respective Scales of Measurement and Accompanying Descriptions; the whole illustrated by many valuable unedited MSS.* The two final volumes of this work were posthumous.

KINGSBURY, a co. of S. Dakota; 870 sq. m.; pop. 1890, 8562. Co. seat, De Smet.

KING'S COLLEGE, Cambridge, was founded in 1441 by Henry VI., for a provost, 70 fellows and scholars, 3 chaplains, with clerks, choristers, servitors, and poor scholars—in all, 140. Its revenues were seriously diminished by Edward IV. The chapel is the work of the three Henries, VI., VII., VIII. The architect is supposed to have been Nicholas Cloos, or Klaus, fellow of the college, and bishop of Lichfield, or, as others say, his father. It is perhaps the finest specimen of perpendicular Gothic in the world. Its internal dimensions are 290 ft. long, 45 wide, and 78 high. There is an inner roof of stone, which, though of enormously massive structure, has, from its proportions, and the beauty of the groining, the most airy and pleasing effect. Under the statutes of 1861 the foundation consists of 46 fellows, and not less than 48 scholars, governed by a provost. Twenty-four of the scholarships are appropriated to the scholars of Eton college. The fellowships are open to all members of the college of sufficient standing. In 1871 a scholarship of £80, tenable for three years, was established for natural science.

KING'S COLLEGE, London, a proprietary institution occupying the east wing of Somerset house, and founded in 1828 on the fundamental principle "that instruction in the Christian religion ought to form an indispensable part of every system of general education for the youth of a Christian community." The college being strictly in connection with the Church of England, church service is a regular part of its routine. The course

embraces theology, general literature and science, applied sciences, and medicine. A limited number of matriculated students reside within the walls. The museum contains the calculating-machine of Mr. Babbage and George III.'s collection of mechanical models and philosophical instruments, the latter presented by the queen. There is a school in connection with the college.

KING'S, or QUEEN'S, COUNSEL are certain barristers-at-law, in England and Ireland, who have been appointed by letters-patent to be her majesty's counsel. The office is entirely honorary, but it gives a right of preaudience in all the courts, according to the date of appointment. The appointment practically belongs to the lord-chancellor. Though called her majesty's counsel, they are not prevented from being retained and acting for ordinary clients, except that in defending prisoners and acting in suits against the crown, they require a special license from the crown, which is, however, never refused. In Scotland there is no distinction of queen's counsel, but the lord-advocate and solicitor-general are so in reality. The appointment of queen's counsel is for life, but in case of disgraceful conduct, the letters-patent are revoked, as was done in 1862 to Edwin James, who, in 1873, applied in vain for restitution.

KING'S COUNTY, an inland co. of Ireland, is bounded on the e. by Kildare, and on the w. by the Shannon, which separates it from Roscommon and Galway. Area, 493,985 statute acres, of which 353,256 are arable and 8,258 in plantations. In 1876, 118,762 acres were under crops, and only 66 were lying fallow. The population has steadily decreased—(1851) 112,076; (1861) 90,013; (1891) 65,408, of whom the most were Roman Catholics, and a small part Episcopalians. The surface is in general flat; it includes, however, in the s., a portion of the Slieve Blue Mountains, from which a line of low limestone hills extends n.e. through the center of the county, forming a water-shed between the basin of the Shannon on the w., and those of the Boyne and Barrow on the east. The soil, a light loam of medium depth, resting on limestone gravel, is of average fertility. The Bog of Allen (see Bog) extends from w. to e. the whole length of the county. The Grand canal traverses the north portion of this county. Notwithstanding great tracts of bog, the climate is not unhealthy. Two members are returned to the imperial parliament for the county. In the n. w. of the county are the ruins of the abbey Clonmacnoise, founded in 548.

KING'S DAUGHTERS, THE, is an unsectarian organization of Christian workers founded Jan. 13th, 1886, at the residence of Mrs. F. Bottome in New York city, for the promotion of spiritual sympathy and unselfish labor. The spirit of the organization is embodied in their motto,—“Look up and not down, Look forward and not back, Look out and not in, Lend a hand:” and in their watchword, “In His Name.” The badge is a royal purple ribbon which may be worn either with or without the Maltese cross. The general work of the order is in charge of the Central Council, having its headquarters in New York city, which is composed of the original ten members and five new ones chosen in '88. The branches of the order are known as “Circles,” and usually consist of ten or more members, though any one person may be a King's Daughter, and unite with no circle. In all details relating to work, there is largest liberty, each branch choosing its special work. These circles are found in Canada, Europe, and Australia, and the organization numbers more than 300,000 members. The authorized organ of the order is *The Silver Cross*, a monthly magazine published in New York city.

KING'S EVIDENCE (or Queen's), the name given to a person who, having been an accomplice in some crime, has confessed, and offered to give evidence, and make full confession. The usual practice of the crown, in such cases, is to pardon the person so acting, though he is not absolutely entitled to a pardon; and an application is generally made to the judge, to admit the party as a witness, on the trial of the fellow-criminals. A similar practice exists in Scotland, the public prosecutor having the power and discretion to admit the confessing party. See STATE'S EVIDENCE.

KING'S EVIL. See SCROFULA.

KINGSLEY, REV. CHARLES, late chaplain in ordinary to the queen, was born at Holne vicarage, Devonshire, in 1819. He entered Magdalen college, Cambridge, in 1838, where he highly distinguished himself in classics and mathematics. In 1842 he became curate, and, shortly after, rector of Eversley, in Hampshire. In the same year he published *Village Sermons*, characterized as honest, downright wisdom, conveyed in a plain and simple style. In 1848 appeared *The Saint's Tragedy, or the True Story of Elizabeth of Hungary*, an admirable and truly catholic representation of mediæval piety. The next two or three years of his life were devoted—in company with his friend Mr. Maurice and others—to a series of efforts for the amelioration and Christianization of the working classes. To these efforts may be traced the origin of those co-operative associations in which the workmen are also the masters, the results of which have proved in every way beneficial. His opinions on the social anarchy of modern times are to be found in his *Alton Locke, Tailor and Poet* (1849), a novel of extraordinary power and fascination, the hero of which is sought for in a London workshop. This was followed by *Yeast, a Problem*, in which Kingsley handles, among other questions, the condition of the English agricultural laborer; and in 1853 by *Hypatia, or New Foes with an Old Face*, a most vigorous and brilliant delineation of Christianity, in conflict with rude

Gothic paganism and the expiring philosophy of Greece in the early part of the fifth century. Both of these works appeared in *Fraser's Magazine*. Two years after, he published *Westward Ho!* probably the greatest of his works. Its glowing pictures of South American forests are said to have excited the admiration of Humboldt, who had himself really seen what Kingsley only imagined. Other works of his are *Message of the Church to Laboring Men*; *Sermons on National Subjects, preached in a Village Church*; *Phaethon, or Loose Thoughts for Loose Thinkers*; *Alexandria and her Schools*; *Sermons for the Times*; *Glaucus, or the Wonders of the Shore*; *The Heroes, or Greek Fairy Tales*; *Two Years Ago*; *The Water Babies*; *Good News of God*; *Hereward, the Last of the English* (1866); *The Hermits* (1869); *Madam How and Lady Why*; *At Last* (1871). He was appointed professor of modern history at Cambridge in 1859, and, after resigning that post, was made, in 1869, canon of Chester. He died in 1875. A biography by his wife appeared in 1876.

KINGSLEY, JAMES LUCE, LL.D., 1778-1852; b. Conn.; graduated at Yale college in 1799; was tutor there from 1801-05, librarian from 1805, and professor of Hebrew, Greek, Latin, and ecclesiastical history from 1805. Among his works are a *History of Yale College*; a *Life of President Stiles*; and editions of *Tacitus* and *Cicero de Oratore*. He was an accomplished scholar and writer, and contributed many valuable articles to the periodical literature of his time.

KING'S LYNN. See LYNN REGIS.

KING'S MOUNTAIN, BATTLE OF. This range, which crosses the border line between North and South Carolina, in Gaston and York counties, has given its name to an important battle of the revolution, Oct. 7, 1780. The British were commanded in this action by lieutenant-col. Ferguson, and the Americans by col. Benjamin Cleveland, the latter being the "mountain men" of Georgia and the Carolinas, while the opposing force was composed partly of regulars and partly of tory recruits, a most desperate class of men. The engagement took place on an elevation, a spur of the mountain range, and resulted, after an hour's hard fighting, in the total defeat of the British, whose commander was killed. The Americans captured nearly the entire force, the result having an important effect in determining the conclusion of the war in the southern states. The centennial of this battle was celebrated in the neighborhood of King's mountain, Oct. 7, 1880.

KINGS OF ORIENT, THE THREE. According to one of the most popular of mediæval legends, but quite outside of history, the magi, or "three wise men of the east," whose visit to the newly born Savior in Bethlehem is chronicled in simplicity by the evangelist Matthew, were three mighty kings (perhaps by an arbitrary interpretation of Ps. lxxii. 10) ruling over some indefinite oriental countries. Their names are given as Gaspar or Caspar, Melchior, and Balthazer. They were led to undertake the journey, not merely by the appearance of the star in the east, and the Messianic expectations which they shared with the Israelites, but also by prophecies in their own sacred writings. Having ascertained by their knowledge of astronomy that the star was different from any that they had studied, they recognized it as the star of prophecy, and with many attendants (8000, according to the legend in the Eastern Church, of which 7000 were left on the bank of the Euphrates) and with rich presents, they traveled over mountains and valleys until at last the star stood still over the lowly place where Jesus lay. Their faith was equal to the test of such a disappointment; they bowed down and adored the Divine Child, and presented gold as to a king, frankincense as to God, and myrrh as to a sufferer and martyr. Their homeward journey is, in one form of the legend, said to have been made in ships under the guidance of the star. They never resumed their former splendor, but gave their wealth to the poor and devoted themselves to turning men to righteousness. After 40 yrs. the apostle Thomas found them in Parthia and baptized them, and they were eventually martyred. The place of their sepulture was miraculously discovered by the empress Helena, who had their bodies taken to Constantinople, whence, early in the 4th century, they were removed to Milan. Numerous miracles were attributed to these supposed relics of the first Gentile worshipers of Christ, and they were regarded with great veneration throughout the Gentile Christian world. When Milan fell into the hands of Frederick Barbarossa, 1162, the archbishop of Cologne prevailed upon the conqueror to transfer the relics to the latter city, and for the past six centuries the shrine of the three kings has been one of the chief glories of the cathedral at Cologne. The legend has been extensively incorporated into literature and art; it has modified the details of all the numerous paintings and statues in which the "Adoration of the Magi" is represented; and has, in parts, been accepted as a fact by popular hymnologists.

KING'S SILVER, an ancient fine paid to the king in the court of common pleas, in England, on alienation of certain lands.

KING'S SONS, THE, is an associate order of the King's Daughters, which is the outgrowth of their labors among men and boys, having the same general methods and plans of organization.

KINGSTON, city and co. seat of Ulster co., N. Y.; on the Hudson river, the Delaware and Hudson canal, and the West Shore, the Ulster and Delaware, and the Wallkill Valley railroads; 55 miles s. of Albany. It contains Kingston and Ulster academies,

business collége, city hospital, children's industrial home, national and savings banks, water plant on the gravity system supplied from mountain streams, numerous churches, and libraries of Golden Hill school, Kingston free academy, Kingston school district, and the third judicial district. The industries comprise the handling of large shipments of coal, stone, brick, lime, lumber, and cement, and the manufacture of cement (one of the largest plants in the country), lime, car wheels, cigars, shirts, glass, and foundry products. Kingston was incorporated as a city in 1872, its boundaries being extended so as to include the villages of Rondout and Wilbur. It was chartered by Gov. Stuyvesant under the name of Wiltwyck in 1661, was first settled in 1665, and incorporated by patent in 1667. The first constitution of the state was adopted here, April 20, 1777. The legislature assembled here in Sept. of that year, but dispersed, Oct. 7, on the approach of a British force under Sir Henry Clinton, which afterwards burnt the town. It was soon rebuilt, and in 1805 was incorporated as a village. Pop. '90, 21,261.

KINGSTON, a city in the Canadian province of Ontario, lies in lat. 44° 12' n., long. 76° 41' w., on the n.e. shore of lake Ontario, at the mouth of the Cataragui and of the bay of Quinté, where the waters of the Canadian lakes issue into the St. Lawrence. It is distant from Montreal 172 m.; from Toronto, 165; and from New York, 274. A gathering-place of old to the neighboring Indian tribes, occupied by a French fort from 1673 till 1758, it fell into the hands of the British in 1762, was laid out in 1793, and was incorporated as a city in 1838. On the union of the two Canadas, in 1840, the seat of government was established at Kingston, but was removed again in 1845. The city has, in consequence, grown more slowly than many others in the new world, but it numbers already among its buildings some of the finest in Canada. Its harbor is sheltered by Wolfe and Navy islands. Next to Quebec and Halifax, is the most strongly fortified place in Canada. There is a fort on Messessaga point, and all other accessible points are secured by batteries. Navy point contains extensive military works, and Point Henry has a fortress which completely commands the harbor and city. The shipbuilding of Kingston is second in Canada only to that of Quebec. The Canadian Engine and Machinery company manufactures railway rolling-stock on the most approved principles. Besides it there are several large foundries for the manufacture of engines, locomotive and stationary, of agricultural implements, edge-tools, axles, nails, etc. There are also large tanneries and breweries. Besides its outlets by water, Kingston communicates with all parts of the country by the Grand Trunk railway, which passes within 2 m. of the city, and was in 1863 connected with it by a branch line. The noteworthy buildings include the Anglican and Roman Catholic cathedrals, Queen's college, Mechanics' institute, Royal military college, school of gunnery, Kingston ladies' college, conservatory of music, general hospital, house of industry, and, in the suburbs, the Provincial penitentiary and the Rockwood lunatic asylum, the city is the seat of the sees of the archbishops of Ontario and Kingston; returns one member each to the Dominion house of commons and the Provincial legislature; and is a port of entry with large commercial interests. Pop. '91, 19,264.

KINGSTON, the commercial capital of Jamaica (q. v.), stands on the n. side of a landlocked harbor, the best in the island, 10 m. long and 2-4 m. wide. It was founded in 1693, after the neighboring town of Port Royal had been destroyed by an earthquake. From this place, afterwards rebuilt, it is separated by its noble haven; while, with Spanish Town, towards the interior, it has, since 1846, been connected by a railway of about 10 m. in length. An irrigation canal has been constructed, to fertilize the plain lying between these two towns. Kingston contained 1891, 46,542 inhabitants. Though the city, as a whole, is like the generality of mere seaports, filthy and disorderly, it yet presents several handsome features. A large square, called the Parade, contains spacious barracks, a Wesleyan chapel, a theater, and some tolerable dwelling-houses. The negro market for fruits and vegetables is described as a lively and interesting scene. The temperature, which is generally oppressive on the immediate margin of the bay, becomes gradually mitigated towards the head of the sloping streets, which rise into the region of the sea-breezes. Most of the trade of Jamaica passes through Kingston.

KINGSTON, or **KINGSTOWN**, capital of the British island of St. Vincent, in the West Indies, stands on the s.w. coast, with a population of (1891) 4,547.

KINGSTON, a borough in the township of the same name in Luzerne co., Penn., is on the Susquehanna river, and the Delaware, Lackawanna and Western and the Lehigh Valley railroads, one mile west of Wilkesbarre. It has the well known Wyoming Seminary (Meth. Epis.), richly endowed and having about 400 pupils. Here, in 1778, occurred a massacre of Americans by Indians in the service of the British. A large monument marks the place. It has banking facilities, gas and electric lights and electric street railways and several churches. Pop. of tp. '90, 3809; of borough, '90, 2381.

KINGSTON-ON-HULL. See **HULL**.

KINGSTON-UPON-THAMES, a municipal borough and market t. of England, in the county of Surrey, is situated 3 m. s. of Richmond, on the right bank of the Thames, here crossed by two handsome bridges, one of stone, and the other an iron viaduct on the London and South-western branch railway connecting Twickenham with Wimbledon. The county spring assizes are held in Kingston-upon-Thames, alternately with

Croydon and Guildford. Educational and benevolent institutions are numerous; has a free library (opened in 1883), a recreation ground of 14 acres, and an endowed grammar school, founded in the reign of Queen Elizabeth. There are flour, cocoa-nut fiber, and oil mills, and brick and tile works. Pop. '91, 27,059. Around the Surbiton station, on the main line of the London and South-western railway, has grown up the elegant suburb of Surbiton. In the neighborhood are Hampton Court palace, and Bushy and Richmond parks. Numerous Roman remains have been discovered in the vicinity of Kingston-upon-Thames, and during the Saxon period it had already risen into importance. Here, in 838, a great council was held under Egbert of Wessex and Ethelwolf of Kent, and a treaty agreed to; and here also seven of the Anglo-Saxon kings were crowned. The name is said to be derived from the stone on which the ceremony was performed, which stands in one of the streets, inclosed by a railing. Hampton Wick (pop. '91, 5,822) is really part of Kingston-upon-Thames, being connected by the bridge, though situated across the Thames, and in Middlesex.

KINGSTON, ELIZABETH CHUDLEIGH, Duchess of, 1720-88; daughter of col. Chudleigh, governor of Chelsea college, England. Her father died when she was a child, leaving his family in poverty. Her remarkable beauty as a girl led to her appointment as maid-of-honor to the princess of Wales, mother of George III. She was privately married in 1744 to capt. Hervey, a grandson of the earl of Bristol, but refused to live with him, and for many years led a dissolute life. In 1769, the duke of Kingston, ignorant of her former marriage, took her to wife, and upon his death in 1773 she succeeded to his immense fortune. An attempt was made by the duke's relatives to set aside the will on the ground of bigamy, of which offense she was declared guilty by the house of lords in 1776; but her right to retain the property was conceded upon the ground that she received it by bequest. She died near Paris.

KINGSTOWN, a thriving and important seaport of Ireland, on the s. shore of Dublin bay, $6\frac{1}{2}$ m. s.e. of the city of that name. At the visit of George IV. in Sept. 1821, its former name, *Dunleary*, was changed to Kingstown. The royal harbor was begun in 1816, and finished in 1858. Its area is 250 acres. Vessels drawing 24 ft. can discharge at the wharf at any state of the tide. The situation of the town, and the invigorating air, have made Kingstown an important watering place. The mail packets sail from Kingstown to Holyhead twice a day. The railway to Dublin was opened in 1834, and there is regular communication by steamer between it and the principal Irish and British seaports. Coal, iron, and timber are imported, and cattle, corn, lead ore, and granite are exported. Pop., which in 1861 had been 11,584, was in 1881 18,230, and in 1891 17,352.

KING'S YELLOW is the term applied to a pigment which is a mixture of orpiment (tersulphide of arsenic) and arsenious acid.

KING-TE-CHIN', a t. of China, in the province of Kiang-si, 85 m. e.s.e. of Kiu-kiang, on a small river which falls into lake Poyang. It is the principal seat of the manufacture of porcelain in China, and contains an imperial porcelain factory. Pop. above 500,000.

KING WILLIAM, a co. of Virginia, lying between the Mattaponi and the Pamunkey rivers, about 30 m. n.e. of Richmond; 270 sq. m.; pop. '90, 9605. The surface is uneven, but the soil is generally fertile, producing grain and tobacco. The Richmond and Chesapeake railroad passes through the county. Co. seat, King William.

KING-WOOD, a very beautiful wood, in small pieces, used for ornamental work. It is brought from Brazil, and is believed to be the wood of a species of *triptolomia* (natural order *leguminosæ*, suborder *papilionaceæ*).

KIN IC or **QUINIC ACID**, $2\text{HO}, \text{C}_{28}\text{H}_{46}\text{O}_{20}$, is an acid existing in combination with quinia in the bark of the cinchonas.

KINK, a twist in a rope or cord, caused by the tightness of the coil, and a relaxation of pressure in the direction of its length. The best rope, however, rarely kinks.

KINK AJOU, *Cercoteptes candidivolulus*, a quadruped of the family *ursidæ*, and allied to the raccoons and coatis. By some naturalists it is referred to *viverridæ*. It has six incisors, one canine tooth, and five molars in each jaw, the three hinder molars tuberculous. The kinkajou is larger than a pole-cat, has a yellowish woolly fur, climbs trees, feeds on fruits, honey, etc., as well as on small animals, and from its ravages among the nests of wild-bees is in some countries called *honey bear*. It is a native of the warm parts of America. The negroes have transferred to it the name potto, from a lemurine animal of Africa. It is easily tamed.

KINKEL, JOHANN GOTTFRIED, a German author, b. at Oberkassel, Aug. 11, 1815. He studied theology at Bonn, and was for some time a distinguished Protestant preacher; but becoming involved in the revolutionary movements of 1848, he was imprisoned in the fortress of Spandau, whence, however, he escaped. Kinkel then went to America, but soon after returned to London, where he resided as a public teacher. D. 1882. Both as a poet and as a writer on art, Kinkel holds a distinguished rank. His principal works are—*Predigten über aussergewöhnliche Gleichnisse und Bildreden Christi* (Cologne, 1842); *Gedichte* (Stutt. 1846); *Otto der Schütz, eine Rhein. Geschichte in zwölf Abentheuern* (Stutt. 1846, 9th

edit. 1852), a very beautiful narrative poem; *Die Altchristliche Kunst* (Bonn, 1845), which forms the first part of the unfinished *Geschichte der bildenden Künste bei den Christlichen Völkern*; *Die Ahr, Landschaft, Geschichte und Volksleben* (Bonn, 1846); *Nimrod, ein Traversspiel* (Hamb. 1857).—Kinkel's wife, JOHANNA KINKEL, a distinguished musician, wrote *Acht Briefe über den Clavierunterricht* (Stutt. 1849); and together with her husband, *Erzählungen* (Stutt. 1849). After her death (in 1859) appeared her novel, *Hans Ibeles in London* (Stutt. 1860).

KINNAIRD'S HEAD, a promontory with a light-house, on the n.e. coast of Aberdeen-shire, Scotland, near Fraserburgh, in lat. 57° 42' n., long. 2° west.

KINNEY, a co. of Texas, bounded on the s.w. by the Rio Grande river; 1704 sq.m.; pop. '90, 3781. The soil is not well adapted to agriculture, but affords good pasturage. Water is scarce. Stock-raising is the chief occupation of the inhabitants. Co. seat, Bracketville.

KINNEY, COATES (1826-). Born at Penn Yan, N. Y., and successively teacher, journalist, and lawyer. He is best known by his short poem *Rain on the Roof*.

KINNEY, WILLIAM BURNET, 1799-1880; b. N. J.; descended of English ancestry in a line eminent for its talents, position, and influence; was designed by his parents for military life, but his love of letters led to a change of purpose. He studied law with Mr.—afterwards chief-justice—Hornblower; edited the *New Jersey Eagle*, in Newark, 1820-25; studied law and medicine in New York in 1825; and was one of the founders of the mercantile library. Made a public profession of religion, and began the study of theology, with a view to the ministry. His health being impaired, he returned to Newark in 1830, and devoted himself to literary and educational pursuits; was one of the founders of the Newark public library; took an active part in promoting the establishment of the American lyceum, and the introduction of the system of free schools into the state. He undertook the management of the *Newark Daily Advertiser*, which he edited for many years with great ability; received in 1836 the honorary degree of master of arts from Princeton college, of which in 1840 he was elected a trustee. In 1850 he was appointed by president Taylor minister-resident at the court of Sardinia, where he rendered important aid to Cavour and his court in establishing the liberal institutions of Italy. Upon the expiration of his term of office he retired to Florence, in order to be with friends devoted to literature and art, among whom were the Brownings and the Trollopes, with Hiram Powers and other American artists. Returning home after the close of the civil war, he devoted himself to the preparation of the material he had for many years accumulated for a history of Tuscany and the Medici family, but did not live to complete the work. Mr. Kinney was a man of splendid intellectual powers, of high literary culture, a brilliant conversationalist, and though at one time skeptical through the influence of German rationalism, possessed in after-life a firm belief in the Christian religion.

KINO, an astringent substance, resembling catechu (q.v.) and gambir, the concrete exudation of certain tropical trees, especially of *pterocarpus marsupium*, a native of the mountains of Coromandel, which yields EAST INDIAN KINO, and of *P. erinaceus*, a native of Gambia, which yields AFRICAN KINO. The genus *pterocarpus* belongs to the natural order *leguminosæ*, sub-order *papilionaceæ*, and has a 5-toothed calyx, and an irregular, nearly orbicular one-seeded pod, surrounded with a wing.

East Indian kino is the kind which now chiefly occurs in commerce, and is the ordinary kino or *gum kino* of the shops. It is in small angular glistening fragments, the smaller reddish, the larger almost black. Thin pieces are ruby red. It is brittle and easily powdered, has no smell, but has a very astringent taste. BENGAL KINO is a similar astringent substance, produced by *butea frondosa*. See BUTEA. It has been found capable of the medicinal uses of true kino. BOTANY BAY KINO is the produce of *eucalyptus resinifera*. See EUCALYPTUS.

The astringency of kino is mainly due to its containing tannic and catechuic acid, and in consequence of this property it is employed in medicine in certain forms of diarrhea (especially when a flux seems to be kept up by want of tone in the intestinal capillaries), the best mode of prescribing it being as *compound kino powder*, which is a mixture of kino, cinnamon, and opium, and the dose for an adult ranging from ten grains to a scruple. There is also a *tincture of kino*, which, when properly diluted with water, forms an excellent gargle for relaxation of the uvula.

Kino is employed to a considerable extent in the East Indies as a cotton dye, giving to the cotton the yellowish-brown color known as nankeen.

KINROSS-SHIRE, after Clackmannanshire, the smallest county of Scotland, lies between the counties of Perth and Fife. Area, 56,000 acres. Pop. 6,300. It is well cultivated, and coal occurs at Lochgelly. Its surface is elevated and gently undulating; its boundaries are hilly, with occasional level openings. On the n. and n.w. are the Ochil hills; on the n.e., the Lomonds; and on the s.e. and s., Benarty and the Cleish hills. The streams flow into Loch Leven (q. v.), and issue by the river Leven. The soil inclines to gravel, but is clayey in the districts n. and w. of the loch. Excellent pasture occurs on the moorlands, and some wool is raised.

KINSALE', a municipal and civic town and seaport of Ireland, in the county of Cork, is at the head of Kinsale harbor, which is formed by the estuary of the river Bandon, 14 m. s.s.w. of Cork. Pop. 91, 4605.

KINTYRE'. See **CANTIRE**.

KIOLEN, or **KJOLEN**, an extensive plateau in Scandinavia (q. v.).

KIOSK', a small ornamental pavilion, much used in India in the decoration of the tombs, ghâts, dams, and other works. It consists of a dome, supported on four or more detached columns, the space under the dome being left open, like the open niches under canopies in Gothic architecture.

KIO'TO. See **MIAKO**.

KIOWA, a co. in s.e. Col., on the Kansas border, formed 1890, from part of Bent; area about 1800 sq. m.; pop. '90, 1243. It is drained by Big Sandy creek and crossed by the Missouri Pacific railroad. Co. seat, Sheridan Lake.

KIOWA, a s.w. co. of Kan., organized 1886; 720 sq. m.; pop. '90, 1243. The Arkansas river touches the extreme n.w. corner, and the Medicine Lodge river drains the s.-eastern part. The Chicago, Rock Island, and Pacific railroad passes through. Co. seat, Greensburg.

KIOWAS, or **KIOWAYS**, an Indian tribe of the Shoshone family, numbering about 1150, living upon a reservation in the Indian territory, and partly civilized. They were very warlike and intractable, and have given the U. S. government much trouble.

KIP, **WILLIAM INGRAHAM**, D.D., b. N. Y., 1811; graduated at Yale in 1831; ordained deacon in the Protestant Episcopal church in 1835; was rector of St. Peter's, Albany, 1838-53, and in the latter year elected bishop of California. Among his works are *The Lenten Fast*; *Early Jesuit Missions in North America*; *Christmas Holidays in Rome*; *Domestic and Religious Life in Italy*; and *The Catacombs of Rome*. Died April, 1893.

KIPLING, **RUDYARD**, author, member of a gifted family and son of an English gentleman, who was for many years head of the school of art at Lahore, India, was born at Bombay in 1865. At the age of five he was brought to England, where he remained until he was sixteen, receiving his education at the United Service College, at Westward Ho, Devonshire, and while there, editing a school paper and contributing to a North Devon journal. Returning to India as sub-editor of the *Civil and Military Gazette*, he contributed tales and verses to that and other newspapers, published a small volume of parodies, *Echoes*, and subsequently *Departmental Ditties*; *Plain Tales from the Hills*; *Stories in Black and White*; *The Story of the Gadsbys*; *Under the Deodars*; *Soldiers Three*; *Mother Maturin*; *The Book of Forty-five Mornings*, and one novel, *The Light that Failed* (1890). His brief but brilliant stories are characterized by humor and by a remarkable knowledge of East Indian life and customs. For some years he resided in London; but in 1891 he visited the United States and published *American Notes*, and soon afterward permanently settled there. Recent works of his are *Mine Own People* (1892); *Many Inventions* (1893); *The Jungle Book* (1894); *The New Jungle Book* (1895); *The Seven Seas* (1896); *Slaves of the Lamp* (1897); and *Captains Courageous* (1897).

KIPPER. A word used in Scotland originally to denote a salmon after the spawning period; but as fish at this time are not good for food if fresh, they are usually split open, salted and dried, hence the terms *kipper* or *kippered salmon*, came to be generally used to denote smoked or pickled salmon.

KIPPIS, **ANDREW**, D.D., 1725-95; b. Nottingham, Eng. He was educated in the theological seminary of Dr. Doddridge at Northampton, and for several years was a Unitarian pastor at Boston in Lincolnshire and Dorking in Surrey. In 1753 he removed to London and became minister of the Unitarian chapel of Prince street, Westminster. In 1763 he accepted the position of master of Coward's theological seminary; he held also a similar place in the Unitarian institution at Hackney. His most important works are his *Biographia Britannica* (5 vols.) and a *Life of Capt. James Cook*. He edited the works of Dr. Nathaniel Lardner and Dr. Doddridge.

KIPTCHAK', or **KEPTCHAK**, a term which, in the middle ages, designated that vast territory stretching, n. of the Caspian sea, from the Don to Turkistan, and occupied by the Kumans and Polovises. This tract formed one of the four empires into which the huge dominion of Genghis Khan was divided, and was the portion of his eldest son Jûty.

KIPTCHAK', or **KAPTCHAK**, a race of Tartars or Mongolians, who gave name to a khanate founded in the 13th c., extending from the Jaxartes in Turkistan to the limits of Russia proper, and comprising all the region n. of the Caucasus traversed by the rivers Dnieper, Don, Volga, and Ural. Some districts, known as Kazan, Astrakhan, and Crimea, became independent in the 15th c., but were later annexed to Russia.

KIRÂTÂRJUNIYA, the name of one of the celebrated poems of Sanskrit literature. Its author is Bhâravi, and its principal subject is the conflict of *Arjuna* with the god Siva in his disguise of a *kirâta*, or mountaineer.

KIRBY, **EDMUND**, 1840-1863; b. N. Y.; graduated at West Point in 1861, and was at once assigned to the duty of drilling volunteers in Washington. When the army moved he was assigned to Ricketts's battery, of which he assumed command after Ricketts was taken prisoner in the battle of Bull Run. He was engaged successively at Ball's Bluff, in the Virginia peninsular campaign of 1862, fighting bravely at Yorktown,

Fair Oaks, Malvern Hill, etc., and in the Rappahannock campaign at Fredericksburg and Chancellorsville. In all the battles of these campaigns he displayed a coolness, skill, and courage remarkable in one so young. At Chancellorsville he received wounds which caused his death in Washington, May 28, 1863. As a tribute to his gallantry he was appointed on his death-bed a brig-gen. of volunteers.

KIRBY, Rev. WILLIAM, an eminent English naturalist, was b. at Winesham Hall, Suffolk, Sept. 19, 1759. He was educated at Caius college, Cambridge, and was afterwards appointed to the curacy of Barham, which he held for 14 years, when he was preferred to the rectory. This office he held until his death, which happened on July 4, 1850, when he had nearly reached the great age of 91. His principal works are *Monographia Apum Angliæ* (Ipswich, 1802), and *Introduction to Entomology* (4 vols. 1815-26), published conjointly with Mr. Spence. The first was very favorably received both at home and abroad, and at once secured for Kirby a distinguished place among European savants. The second work is written in the form of letters, and was and still is remarkably popular. Kirby also contributed a variety of very important entomological papers to the Linnæan Transactions. His greatest discovery in this department of science is that of the genus *stylops*—the type of a new order of insects, living for a time parasitically in the bodies of bees. He also wrote one of the Bridgewater treatises, entitled *Habits and Instincts of Animals*. Kirby was one of the first members of the Linnæan society (founded in 1788), honorary president of the entomological society, and fellow of the royal and geological societies.—See *Life*, by Rev. John Freeman (1852).

KIRCHENTAG, an association of ministers and laymen of the Lutheran, German Reformed, United Evangelical, and Moravian churches in Germany, for the promotion of the interests of religion, without reference to their denominational differences. It holds an annual meeting; the place of which is changed from year to year. The first meeting took place in 1848, at Wittenberg, in the church to which Luther affixed his theses. Its discussions and resolutions have exercised a considerable influence in Germany.

KIRCHER, ATHANASIUS, 1601-1680; b. Guysen, near Fulda; entered the order of the Jesuits at an early age, educated at the university of Würzburg, where he afterwards taught philosophy and the oriental languages. At the commencement of the thirty years' war he returned to France, and spent two years in the Jesuits' college at Avignon, occupied entirely in the study of antiquities. By advice of the learned Peirese he applied himself with great zeal to the task of deciphering the Egyptian hieroglyphics. He was preparing to return to Germany as professor of mathematics at Vienna, to which he had been appointed, when he received an order to repair to Rome, which he obeyed. In 1637 he was charged by the pope to accompany cardinal Frederick of Saxony to Malta, and was received with great honor by the knights of St. John. Having visited Sicily and the kingdom of Naples, he took the chair of mathematics in the Roman college, which he filled for eight years. In his researches and experiments he received liberal aid from German, Italian, and Spanish princes and nobles, and also collected a splendid museum of antiquities, which he left to the Roman college. He was a man of extensive and varied but ill-digested erudition, and a copious writer on mathematics, physics, philology, hieroglyphics, history, and antiquity. He had a vast memory and untiring perseverance, but he lacked judgment and critical skill; his theories are often fanciful, and he self-complacently believed that he could solve any question however difficult. Of his numerous works the most important are: *Prodromus Coptus sive Ægyptiacus*; *Latium*, with maps and figures; *Institutiones Grammaticales et Lexicon Copticum*; *China Illustrata*; *Mundus Subterraneus*; *Edipus Ægyptiacus*. The most valuable are those relating to the Coptic and Egyptian tongues, and his *Latium*, which, with its maps and plans, is interesting and instructive.

KIRCHHEIM, a t. of Württemberg, 15 m. s.e. from Stuttgart. Pop. '90, 2980, nearly all Protestants.

KIRCHHOFF, GUSTAV ROBERT, b. Königsberg, Germany, 1824; educated at the university of his native place; lectured on physics at Berlin in 1848, and at Breslau in 1850. In 1854 he was appointed professor of physics at Heidelberg. His researches in several branches of physical science have been of great value, but his principal achievement is the discovery of the spectroscopic, which he made in connection with Bunsen, and its application for the spectrum analysis, so important in the study both of chemistry and astronomy. He d. in 1887.

KIRGHIS, or KIRGHIS-KAISAKI, or COSSACKS OF THE STEPPES, a people spread over the immense territory bounded by the Volga, desert of Obshtchei (in 55° n. lat.), the Irtish, Chinese Turkistan, Ala-Tau mountains, the Sir-Daria, and Aral and Caspian seas. A few tribes of Kalmucks also live within these boundaries. Over this vast tract reigns a dismal monotony; the country has scarcely any important elevation or depression, no river of consequence runs through it, no great forest breaks the uniformity of the scene; it is a vast steppe, containing 850,000 English sq.m., sterile, stony, and streamless, and covered with rank herbage of 5 ft. high. It abounds in lakes and marshes, the water of which is generally brackish and unserviceable, and in the southern portion lies the Kara-Kum, an extensive salt desert.—The Kirghis are a Turkish race,

and speak the dialect of the Uzbeks, from whom they profess to be descended. They have, from time immemorial, been divided into the *Great, Middle, and Little Hordes*. The first of these wanders in the s.w. portion of the Russian steppe, partly in the Russian possessions n. of the Ala-Tau and Khokan, and partly in the territory of China. They are subject to the rulers within whose bounds they dwell. The Middle Horde possesses the territory (called the *country of the Siberian Kirghises*) between the Ishim, Irtysh, lake Balkhash, Khokan, and the territory of the Little Horde; and also a great portion of the Russian province of Semipalatinsk. Russia has gradually absorbed them, the result being finally achieved by the victory over Khiva in 1873, and the formation of the new province of Amu Daria. The Little Horde (now more numerous than the other two together) ranges over the country bounded by the Ural, Tobol, Siberian Kirghis, and Turkistan. Like the Middle Horde, they are claimed as subjects of the czar, though completely independent. This horde is partly agricultural, partly nomad. A small offshoot of the Little Horde has, since 1801, wandered between the Volga and the Ural river, and used to be under rule of the governor of Astrakhan. S. of lake Issikul is a wild mountain tribe called the *Diko-Kamennaja*, the only tribe which calls itself Kirghis. They are called by their neighbors Kara-Kirghis or Black Kirghis, and are of Mandshûr stock. All of them are now subject to Russia. Their collective numbers are estimated at upwards of 1¼ million of souls, more than half of whom belong to the Little Horde. See *ILLUS.*, *JAKUTS*, ETC.

KIRIN, or **GIRIN**, t. Mantchooria, situated between encircling hills on the n., and the river Sungari on the s. (at the head of its steam navigation) 225 m. n.e. of Mukden. The town is entirely built of wood; a large number of junks and boats are constructed here. It is a considerable mart for leather, cotton, and silk goods. Pop. 75-100,000.

KIRK, is the Scottish form of the word church, but fully defined it denotes the established Presbyterian church. The *Kirk session* is the lowest court of the Scotch Presbyterian church.

KIRK, EDWARD NORRIS, D.D., 1802-74; b. New York, d. Boston. He graduated at Princeton in 1820, and, after studying law for 18 months, entered the theological school at the same place, graduating in 1825. He was employed for some time as an agent of the American board of commissioners for foreign missions, and in 1828 became pastor of a newly organized Presbyterian church in Albany, N. Y. Here he remained until 1837, when ill-health compelled his resignation. He visited Europe, preaching in London and Paris, and in 1839 returned to the United States to accept the position of secretary of the American and foreign evangelical society. In 1842 he became pastor of the newly organized Mt. Vernon Congregational church in Boston, where he preached until 1871, when ill-health compelled him to retire from active service and accept the assistance of a colleague. In 1856 he visited Paris, as an agent of the American and foreign Christian union, to establish Protestant worship there. His style of preaching was fervent and pungent, and he was unusually successful in developing and directing what are known as revivals. As a pastor he was eminently faithful. In the later years of his life he was almost entirely blind, but this did not hinder his attendance upon religious meetings. He received the degree of D.D. from Amherst college, and at the time of his death was president of the American missionary association.

KIRK, JOHN FOSTER, b. New Brunswick, 1824, and educated in Nova Scotia; removed to the United States at the age of 18 years, and five years later became private secretary to William H. Prescott, the historian, a position which he held until the latter's death in 1859. Between 1862 and 1868 Mr. Kirk published his *History of Charles the Bold*. He edited an edition of Prescott's works; was the editor of *Lippincott's Magazine*, 1870-85; edited a *Supplement to Allibone's Dictionary of Authors*, 1891; and became lecturer on European history in the University of Pennsylvania, 1885.

KIRKALDY, Sir WILLIAM, OF GRANGE, son of James Kirkaldy; b. in Scotland early in the 16th c.; died 1573; was one of the earliest Protestants of Scotland; joined the conspiracy against cardinal Beaton in 1546; was imprisoned, but escaped to France, where he distinguished himself in the service of Henry II. In 1559 he returned to Scotland, where he took part in the movement against Mary Queen of Scots; was in the battle of Carberry Hill, where he narrowly escaped being killed by Bothwell, whom he pursued to the coast of Norway; aided in Mary's defeat at Langside, and was made governor of Edinburgh castle in 1568; afterwards espoused the cause of Mary, and defended the castle in her interest, 1570-73, against the attacks of marshal Berwick; but surrendered in the latter year, and with several followers was hung in Edinburgh.

KIRKBRIDE, THOMAS STORY, LL.D., b. Penn., 1809. He graduated at the university of Pennsylvania, 1832, and became resident physician to the Friends' asylum for the insane at Frankford. In 1833 he was appointed physician to the insane hospital at Philadelphia. Upon the establishment of the new Pennsylvania hospital for the insane in 1850 he was made its first superintendent. Dr. K. published *Rules and Regulations of the Pennsylvania Hospital for the Insane; Constitution, Organization, and General Management of Hospitals for the Insane; Appeal for the Insane*. In 1859 an insane hos-

pital was built for Dr. Kirkbride on his own plan, with separate departments for the sexes, and he assumed control of the female department. He d. 1883.

KIRKCALDY, a royal and parliamentary municipal borough, seaport, and market-town in the county of Fife, Scotland, a place of growing commercial importance. Including the suburbs of Linktown and Newtown of Abbotshall on the w., and Pathhead, St. Clairtown, and Gallatoun on the n.e., it is fully 3 m. in length, hence the name of the "Lang Toun." In conjunction with Dysart, Kinghorn, and Burntisland, Kirkcaldy sends one member to parliament. Its harbor is commodious, and has a depth of 15½ ft. at entrance and alongside at ordinary spring tides. Its manufactures are spinning flax, tow, and jute, and bleaching and weaving linen yarns, which are extensively carried on, the products being the usual varieties of linen cloth, mechanical (including marine) engineering on a great scale, and iron founding. Large quantities of salt were formerly made here. There are also several potteries. The manufacture of floor-cloth and wax-cloth ("linoleum") has been recently developed into a great trade, and Kirkcaldy is the chief seat of this growing and important manufacture. There is a very ample supply of water by gravitation. Pop. of parliamentary burgh in '91, 27,200. Kirkcaldy is the birthplace of Adam Smith, the author of the *Wealth of Nations*; and more recently, Edward Irving and Thomas Carlyle were teachers here.

KIRKCUDBRIGHTSHIRE, more properly the stewartry of Kirkcudbright, a county in Scotland, comprehending the eastern district of Galloway, is bounded on the n. and n.e. by the counties of Ayr and Dumfries, on the e. and s. by the Solway firth and the Irish sea, and on the w. by the county of Wigton. Its length from e. to w. is from 45 to 50 m., and its breadth is about 40 miles. Its area is 574,588 acres, of which a large part is under rotation of crops and grass. The rest is composed of hilly and mossy ground, and lakes, of which there is one in almost every parish. Some of the hills, one-fourth of which are of granite, are of considerable altitude; among which are Merriek, 2,764 ft.; Cairnmore, 2,612 ft.; and Criffel, 1,867 feet. There are several considerable rivers, the principal of which are the Fleet and the Dee; the latter of which is navigable for 2 m. above Kirkcudbright.

The valued rent for 1674 was £9,549. The valuation for 1878-79 (exclusive of royal burghs) was £364,647; that of railways was £28,898. In the year 1893 the total acreage under all kinds of crops, bare and fallow grass, was 191,000; under corn crops, 50,000; under green crops, 20,000. Of the total area, 886,000 acres are under cultivation by tenants, and 114,000 by owners. The soil of the county is principally composed of a thin mold, or a brownish loam mixed with sand, lying above rock and gravel. The condition of the rural inhabitants, and the state of agriculture of this county, up to almost the end of last century, were very primitive; the principal food of the people in the early part of the century was kale, and oats ground in querns turned by the hand and dried in a pot; but arable husbandry has been improved of late, while great attention is being paid to the rearing of cattle. The principal towns are Kirkcudbright, the county town, with a pop., 1891, less than 3000, Maxwelltown, Dalbeattie, Castle Douglas, etc. Before the reformation the stewartry possessed more monasteries than any other county of Scotland. There have been a few eminent men of letters connected with this county, of whom the most celebrated were Dr. Alexander Murray, the linguist, and Dr. Thomas Brown. Pop., '91, 39,385. The constituency numbered, in '82, 2,248, who return one member to parliament.

KIRKDALE CAVE, near Kirkdale church, in the vale of Pickering, Yorkshire, is famous for the numerous remains of tertiary mammals which have been found in it. It was discovered in 1821, in the cutting back of an oolitic limestone rock in which it is situated. It was examined by Buckland, and fully described by him in his *Reliquiæ Diluvianæ*. Its greatest length is stated at 245 ft., and its height generally to be so inconsiderable that there are only two or three places where a man can stand erect. The fossil bones are contained in a deposit of mud that lies on the floor of the cave: this is covered by stalagmite formed by the water, highly charged with carbonate of lime, dropping from the roof. The remains of the following animals have been discovered: hyena, tiger, bear, wolf, weasel, elephant, rhinoceros, hippopotamus, horse, ox, deer, hare, rabbit, water-rat, raven, pigeon, lark, and duck.

KIRKE, Sir DAVID, 1596-1656; b. in France, where he engaged in business as a wine merchant till the persecution of the Huguenots drove him back to England, whither his father had emigrated. In 1627 he was placed at the head of an expedition sent out from England to attack the French settlements in Canada. In the discharge of this duty he blockaded Quebec, and took a French squadron prisoner. He again laid siege to Quebec in 1629, and forced it to surrender. For these services he was knighted and received a grant of lands in Newfoundland of which he was dispossessed in the time of Cromwell.

KIRKES, WILLIAM SENHOUSE, 1820-64. He was physician and lecturer to St. Bartholomew's hospital, London. He published in 1848 a *Handbook of Physiology*, and from time to time a series of papers on the *Detachment of Fibrinous Deposits from the Interior of the Heart*. These papers contain a valuable contribution in regard to what is known by pathologists as embolism.

KIRKINTILLOCH, a burgh of barony and market-town in Dumbartonshire, Scotland, is situated on the Firth of Clyde canal, about 7 m. n.e. of Glasgow. It had its origin in a fort on Antoninus's Wall, and is said to have been called at first *Caerpentulach* (the fort at the end of the ridge), of which its present name is supposed to be a corruption. It became a burgh of barony in the time of William the Lion. It contains chemical works, iron foundries, steam saw mills, and there are bleaching and printing works, collieries, iron-stone mines, and quarries. Pop. '91, 10,312.

KIRK-KILISS'IA (the "forty churches"), a t. of European Turkey, 35 m. n.e. of Adrianople. The pop. is estimated at about 16,000, and consists chiefly of a mixed race of Bulgarians, Greeks, and Turks.

KIRKLAND, CAROLINE MATILDA, 1801-64; b. N. Y.; wife of prof. William Kirkland of Hamilton college, with whom she emigrated to Michigan in 1839, that state having been admitted to the union only two years before. Here she doubtless obtained the inspiration for her first writings: *A New Home; Who'll Follow?*; *Forest Life*; and *Western Clearings*. These works were published under the pseudonym of "Mary Clavers." In 1843 prof. Kirkland removed his family to New York, where Mrs. Kirkland established a private school for young ladies, which met with success. In 1849, after her return from Europe, she published *Holidays Abroad, or Europe from the West*; and, at intervals thereafter, *The Evening Book, or Fireside Talk on Morals and Manners*; *A Book for the Home Circle*; *The Book of Home Beauty*, to accompany a series of engraved portraits of American women; and *Personal Memoirs of George Washington*.

KIRKLAND, JAMES HAMPTON; b. in Spartanburg, S. C., Sept. 9, 1859. Was graduated from Wofford College in 1877, where, after obtaining the degree of A.M. he was tutor in Greek and Latin from 1878 to 1881, as well as assistant professor 1881-2; and professor of German and Greek 1882-3. Studying abroad, he took in 1885 his Ph.D. degree at Leipsic. On his return he became professor of Latin in Vanderbilt University in 1886, and its chancellor in 1893.

KIRKLAND, JOHN THORNTON, D.D., LL.D., 1770-1840; son of Samuel Kirkland, missionary to the Indians; b. N. Y.; graduated at Harvard college, 1789; ordained pastor of the Congregational church, Summer street, Boston, in 1794; was elected president of Harvard college in 1810, and retained the office until 1828, when he was stricken with paralysis. The college was very prosperous under his administration. He was distinguished for vigor of intellect, practical sagacity, and great energy. He published several pamphlets and some biographies. His *Life of Fisher Ames* is valuable.

KIRKLAND, SAMUEL, 1741-1808; b. Conn.; graduated at Princeton in 1765; ordained a Congregational minister in 1766. He was for some time a missionary among the Six Nations, and in 1775 was employed by the state of Massachusetts as an agent to secure their favor or neutrality in the revolutionary war, in which attempt he did not fully succeed. He was an army chaplain during the revolution. He founded the academy in which Hamilton college had its origin. In 1789 the government gave him a tract of land 2 m. square in what is now known as the township of Kirkland, Oneida co., N. Y.

KIRK-SESSION, in Scotland, etc., the lowest court in Presbyterian churches; being the governing body of a particular congregation, and composed of the "minister" and "elders" of the congregation. An appeal may be taken from the kirk-session to the presbytery, and thence to the higher courts of the church. Subject to this appeal, the kirk-session exercises discipline in regard to all members of the congregation, suspending from or restoring to the *privileges* of the church; and questions of this kind must originate in the kirk-session, and be primarily determined there. The functions of the kirk-session were, in former times, too often inquisitorially exercised; but this is now less frequently attempted, and the danger of it is continually diminishing through the growth of an enlightened public opinion. In former times, also, the kirk-session in Scotland often imposed fines, chiefly for offenses against the seventh commandment; but this practice had no recognition in civil nor even in ecclesiastical law, and is now wholly relinquished. The kirk-session of the established church in each parish is fully recognized in Scottish law as having certain rights and duties with respect to the poor, but recent legislation has very much deprived it of its former importance in this relation.

KIRKWALL, a royal and parliamentary burgh, seaport, and market t. of Scotland, capital of the co. of Orkney, is situated on the n.e. coast of Mainland, about 26 m. n.e. of John o' Groat's House. Its chief building is the cathedral of St. Magnus, a fine cruciform structure, in mixed Norman and Gothic, dating from about the year 1138. In the choir of this cathedral, service is still held. Around it are the ruins of the king's castle, the earl's palace, and the bishop's palace. The town has been greatly improved within recent years. Numerous shops have been established, so that the commercial transactions are now not confined to the annual fair in Aug., as they were formerly.

K. is now chiefly important for its shipping trade and as a distributing centre, besides being the seat of the superior courts of law for Orkney. Kirkwall unites with the Wick burghs in sending a member to parliament. Pop. '91, 3926.

KIRKWOOD, DANIEL, LL.D., b. Md., 1814. He was teacher of mathematics in the academy of York co., Penn., from 1838 to 1843, when he was appointed principal of the Lancaster high school, where he remained until 1848, resigning then to accept a position in the Pottsville academy. In 1849 he brought to the notice of the American association for the advancement of science at Cambridge, and the American philosophical society at Philadelphia, his then recently discovered analogy between the periods of rotation of the primary planets. In 1851 he was appointed professor of mathematics in Delaware college, and in 1854 he was chosen president of the same institution. He served in this capacity until 1856, when he resigned to take the chair of mathematics in the university of Indiana at Bloomington. His researches in regard to the nebular hypothesis have attracted wide attention among scientific men. Prof. R. A. Proctor says: "I believe they will inaugurate new and important processes of thought, by means of which the noble and hitherto intractable problems connected with the formation of the solar system may be found capable of solution." Prof. Kirkwood has published *Comets and Meteors: their Phenomena in all Ages, and their Mutual Relations and the Theory of their Origin*, and a most valuable paper on *The Nebular Hypothesis*.

KIRKWOOD, SAMUEL JORDAN, 1813-1894; educated at Washington, admitted to the bar in Ohio in 1843. He served four years as prosecuting attorney of Richland co., and was a member of the state constitutional convention of 1850. In 1855 he removed to Iowa, where he was elected to the state senate in 1856. From 1860 to 1863 he was governor of the state, distinguishing himself by his efforts to support the national government in the time of the late civil war, and to provide for the comfort of the soldiers of Iowa in the union armies. In 1867 he was elected to the U. S. Senate, and in 1875 was again elected governor. He was Sec. of the Interior under Pres. Garfield.

KIRMESS. See KERMESSE.

KIRSANOFF', a t. of great Russia, in the government of Tambov, 60 m. by rail e. of Tambov. Horses and fine-fleeced sheep are reared here, common cloth is manufactured, and there are two annual fairs. Pop. 8100.

KIRSCHWASSER (Ger. cherry-water) is a liquor made from cherries, and highly esteemed in Germany. The cherries, gathered when quite ripe, and freed from their stalks, are pounded in a wooden vessel, but so that the stones are not broken. They are then left to ferment, and when fermentation has begun, the mass is stirred two or three times a day. The stones are afterwards broken, and the kernels broken and thrown in. By distillation, kirschwasser is obtained. Kirschwasser is sometimes called *cherry brandy*, but the common cherry brandy is made by mixing brandy with the juice of cherries. See LIQUEURS.

KIRTLE, is a Scottish garment worn by women. It was originally an upper garment that might have the form of a mantle, a jacket, or a petticoat. It has undergone various alterations in form at different periods, but is still worn by the peasants in the form of a petticoat.

KIRTLAND, JARED POTTER, LL.D., 1793-1877; b. Conn. Educated by his uncle, a distinguished physician, he early showed a disposition for analytical research. When a boy of 16 his study of botany led him to experiments in the cross-fertilization of flowers for the artificial production of new varieties of fruit, and his study of insect life was so minute that he was one of the first to discover the hermaphrodite character of the female silkworm, which led to the study of the metamorphosis of insects. In 1810 his father moved to Ohio and these studies were interrupted; but he taught school, and became an accomplished botanist. In 1811, his uncle having bequeathed him his library in Wallingford, and money to complete an education, young Kirtland went to the medical school of Edinburgh, Scotland, in 1815. In 1818 he removed to Ohio to practice his profession, taking a high position in it, but always better known by his scientific attainments. In 1828, in the Ohio legislature, he led the reform movement that changed the discipline of penitentiaries. From 1837 to 1842 he was professor of medicine in the Ohio medical college of Cincinnati, and afterwards for many years filled similar positions in the Willoughby and Western Reserve medical colleges of northern Ohio. In the first geological survey of Ohio in 1848 he was engaged on the natural history department. The range of Dr. Kirtland's investigations was great, though he has not left by authorship such monuments of his scientific industry as might have been expected. In 1834 he discovered and announced the existence of distinct sexes among the *naiades*.

KIRWAN, RICHARD, an eminent chemist of Ireland; b. probably within the first quarter of the 18th century. At an early age he was sent to a Jesuit college in France to study law or medicine. While there he came into possession of the family estate by the death of his elder brother. He then devoted himself to his favorite studies of chemistry and geology. In 1779 he removed to England, settled in London, and was admitted to the royal society, before which he read many important papers, for which he received in 1781 the Copley gold medal. In 1789 he returned to Ireland, was made

president of the royal Irish academy and of the Dublin society, and published several essays on his own special branches, and on logic and metaphysics. He was regarded as the Nestor of English chemistry. He died at an advanced age in 1812. In one of his earliest works, *Essay on Phlogiston and the Composition of Acids*, he attempted to reconcile the old chemistry with modern discoveries. It was answered by the French chemists, and Kirwan abandoned his views of phlogiston and adopted those of his opponents. His other works were *Elements of Mineralogy*; *Geological Essays*; *Essay on the Analysis of Mineral Waters*.

KIRWAN, WALTER BLAKE, 1754-1805; b. Galway, Ireland; was educated at the college of the English Jesuits at Saint Omer; ordained priest; appointed professor of natural and moral philosophy at Louvain; became a Protestant in 1787, and was minister of St. Peter's church, Dublin; prebendary of Howth; dean of Killala in 1800. Was a man of uncommon eloquence.

KIRWAN'S LETTERS. See MURRAY, NICHOLAS.

KISCHINEFF', or KISCHENAW. See KISHENAU.

KISFALUDY, KÁROLY (CHARLES), younger brother of Alexander, was b. Feb. 6, 1788. He is of greater importance in connection with the development of the Hungarian theater than his brother, being regarded as the founder of the national drama. In 1817 he took up his residence in Pesth, and published in rapid succession a series of poems, tales, dramas, and comedies, which secured for him the highest popularity as an author. Of these, his comedies are by far the most valuable. The best of them were translated into German by Gaal (*Theater der Magyaren*, Bonn, 1820). Kisfaludy died at Pesth, Nov. 21, 1830.—The *Kisfaludy society*, so named in honor of the brothers, was established in 1836, and has rendered important services to Hungarian literature.

KISFALUDY, SANDOR (ALEXANDER), a Hungarian poet, who exercised a great influence on the development of the language and literature of his native country, was b. at Sümegh (co. of Szalad), Sept. 22, 1772. He studied at Raab and Presburg, and after serving for several years in the Austrian army, retired to his paternal estate, to devote himself to literature and farming. The first part of his lyrical masterpiece, *Himfy Szerelmei* (Himfy's Love), which appeared anonymously in 1801, was received with unbounded applause. Kisfaludy was spoken of as the "great unknown." On the publication of the second part in 1807, the author threw aside his mask. In the same year he published his *Regék a Magyar Előidőből* (Legends of the Olden Time in Hungary), which are marked by depth of feeling, and by elegance and simplicity of style. Kisfaludy now attempted tragedy, and took Schiller as his model. Some of his historical dramas are worthy of mention, for example his *János Hunyadi*, and *Ladislaus the Cumanian*. Some of his pieces, illustrating the family life of his countrymen, are among the best on the Hungarian stage. A complete edition of his writings appeared at Pesth, in 8 vols., 1833-38, 7th ed. 1893. He died at Sümegh, Oct. 30, 1844.

KISHENAU', or KICHENEV, a t. of Russia, capital of the government of Bessarabia, 125 m. by rail n.w. of Odessa. Until 1812, when it came into the possession of Russia, it was a place of no consequence; since then, however, it has rapidly increased in size and prosperity. Pop. 1838, 13,000; '58, 85,547; '97, 108,506; chief centre of Bessarabia for trade in grain, tallow, wool, hides, and tobacco.

KISHM (the ancient *Oaracta*), an island of Persia, in the strait of Ormuz, 16 m. s. of Bender Abbas, is situated at the mouth of the Persian gulf, and is about 70 m. in length by 12 in average breadth. It is separated from the mainland by a deep and dangerous strait, in which are several small wooded islets. Kishm is very arid; at its w. end is a range of salt hills from which rock salt is quarried. At its eastern extremity is a town of the same name, the capital of the island. Pop. about 12,000, chiefly Arabs.

KISH'ON, a river or winter stream of central Palestine, which rises in the valley of Jezreel, near the foot of Mt. Tabor, and, after running westward with many windings through the plain of Esdraelon, falls into the Mediterranean at the s.e. corner of the bay of Acre. It is noted in Scripture as the scene of two remarkable events—the overthrow of the host of Sisera in its waters, and the destruction of the prophets of Baal. Its upper portion is dry most of the year, the perennial stream forming but a small part of the river, and confined to a few miles near the sea. In the rainy season the water which falls on the eastern side of the mountain empties into the Kishon in torrents, when it overflows its banks, acquires a wonderful rapidity, and sweeps all before it. Such was, no doubt, its condition when Sisera's host was overwhelmed in it. The modern representative of this river is *Nahr Mukättä*, a drain which carries to the Mediterranean the waters of the plain of Esdraelon and of the mountains inclosing it.

KISMET (Arabic, "it is decreed"), is a Mohammedan expression, denoting entire resignation to what is decreed to be one's fate or destiny.

KISS, AUGUST, a distinguished German sculptor, was b. at Pless, in upper Silesia, Oct. 11, 1802. He studied under Rauch at Berlin, and gradually acquired a high reputation, which was greatly increased on the completion, in 1839, of the model of his celebrated colossal group of the "Amazon attacked by a Panther," for the execution of which in bronze, now the ornament of the museum stairs in Berlin, the sum of 40,000

thalers was subscribed with the greatest enthusiasm on the part of the public. Among his other works are "St. Michael overthrowing the Dragon," "A Tiger destroying a Serpent," and a statue of Frederick the Great. He died in 1865.

KISSINGEN, a t. of Bavaria, in lower Franconia, celebrated for its mineral waters, is situated in the valley of the Saale, 29 m. n.e. of Würzburg. Of its three mineral springs, the *Rukocz* and the *Pandur* furnish saline and chalybeate waters, the *Marbrunnen* are acidulous and alkaline. A spring called the *Soolen-Sprudal* is remarkable for the periodical ebb and flow of its waters, caused apparently by the accumulation and discharge of carbonic acid gas. The waters are both drunk and used as baths by the patients, and are considered specially efficacious in cases of chronic disease, gout, etc. Mud baths, of the sediment of some of the springs, are also in use. Since 1848, gaming-tables have been forbidden. Pop. '90, 2245. It contains five mineral springs. *Pandur*, discovered in the 16th c. has a temperature of 50°, used for bathing. It is saline and chalybeate. The *Rukocz* spring was discovered in 1737. It has a temperature of 52° and is used for drinking. Liebig's analysis of its waters is as follows: 16 oz. contain 0.242 gr. of carbonate of iron; 0.131 gr. of carbonate of magnesia; 8.148 grs. of carbonate of lime; 0.043 gr. of phosphate of lime; 0.099 gr. of silica; 2.990 grs. of sulphate of lime, or gypsum; 44.713 grs. of chloride of sodium, or common salt; 4.500 grs. of sulphate of magnesia, or Epsom salts; 2.203 grs. of chloride of potassium; 2.333 grs. of chloride of magnesium; 0.064 gr. of bromide of sodium; 0.071 gr. of nitrate of soda; 0.153 gr. of chloride of lithium; 0.007 gr. of carbonate of ammonia; and 41.77 cubic in. of carbonic acid gas. Total solid mineral ingredients, 65.706 grs. The objectionable ingredient in this water is sulphate of lime, which constitutes nearly one-fifteenth of all the mineral matter held in solution. A little to the n. of the town there is an artesian well 2,000 ft. deep, from which, by the action of carbonic acid gas, a column of water 5 in. in diameter can be thrown 70 ft. high. This water is forced down into a bed of rock salt, from which it issues into a reservoir which flows into the salt-pans in the boiling house, where a beautiful fine white salt is manufactured. Kissingen has from 10,000 to 12,000 visitors every year. The Prussians, in 1866, gained a victory over the Bavarians at this place, and it was here also that an attempt upon the life of Bismarck was made by a cooper named Kullmann, July 13, 1874.

KIST'NAH, or **KRISH'NA**, a river of the peninsula of Hindustan, rises within 40 m. of the Arabian sea, at a height of 4,500 ft., in lat. 18° 1' n., and flowing eastward, falls into the bay of Bengal, after a course of 800 miles. It forms a considerable delta at its mouth.

KIT, in military language, the equipment in necessaries, such as shirts, boots, brushes, etc., of a soldier, but not applicable to his uniform, arms, or accouterments. Formerly, a high bounty was given, and then severely encroached upon, by making the recruit pay for his kit. The fairer principle is now adopted of issuing a free kit to each recruit, with a smaller bounty. The soldier has still to replace necessaries, worn out or lost, at his own expense, but he obtains the articles at wholesale, and very low prices. As these necessaries are so cheaply procured, it is held a very heavy military offense to make away with them.

KIT, a small, narrow-bodied violin, about 16 in. long, capable of being carried in the coat-pocket, and used chiefly by teachers of dancing.

KIT CARSON, a co. in eastern Col., on the Kansas border, formed 1890 from part of Elbert; about 2150 sq.m.; pop. '90, 2472. It is drained by the south fork of Republican river and other streams, and crossed by the Union Pacific railroad. Co. seat, Burlington.

KIT-CAT CLUB, an association instituted in London in 1703, consisting of noblemen and gentlemen favorable to the succession of the house of Hanover, and whose ostensible object was the encouragement of literature and the fine arts. Jacob Tonson, an eminent publisher, was founder and secretary. The club derived its name from having met for some time in the house of Christopher Cat, a pastry cook. The club was dissolved about 1720, previous to which each of the members presented his portrait (half-length figure) to Tonson, painted a uniform size by sir Godfrey Kneller. These interesting portraits, 42 in number, are now in possession of Mr. W. R. Baker, Hertfordshire.

KITCHENER, **SIR HORATIO HERBERT**; English general, b. in 1850. Educated at the Royal Military Academy, Woolwich, he entered the Royal Engineers in 1871, and took part in the Palestine survey 1874-78. Serving in the Soudan campaign of 1883-85, he became governor of Suakim in 1886, and commander of the Anglo-Egyptian expedition of 1896-97.

KITCHEN-GARDEN, a garden devoted to the cultivation of culinary vegetables, or that part of a large garden which is specially appropriated to this use. As the crops of the kitchen-garden are not generally very pleasing to the eye, care is taken, if possible, that it may not be within view of the principal windows of a mansion-house, or otherwise obtruded on notice. But regard must also be had, in the selection of a situation for the kitchen-garden, to exposure, shelter, etc., in which it needs and deserves every

advantage that can be obtained. Nor, in order to hide it from view, ought it to be so surrounded with trees as to deprive it either of sunshine or of free access of air.

The general remarks made in the article GARDENING as to soil and the preparation of it, manuring, water, gardening operations, etc., are all applicable to the kitchen-garden; a part of which, or a place close beside it, is always allotted to compost heaps and the processes connected with them. The successful cultivation of a kitchen-garden requires constant care and labor. Many crops require frequent digging and hoeing during the period of their growth, and the ground must be kept free of weeds as perfectly as in the flower-garden itself. A rotation of crops is of as much importance in the kitchen-garden as in the farm; cabbages and their congeners, potatoes, leguminous crops, etc., must not from year to year be grown on the same ground. But there are some perennial plants which occupy the same ground for years, as artichoke, asparagus, and sea-kale, and attention must be paid to this in laying out the garden.

The crops cultivated depend, of course, on climate. It will be enough to enumerate here the most important kitchen-garden crops of America, referring for further information to each as a separate head. The capitals indicate those most generally cultivated. The varieties of *brassica oleracea*: KALE, CABBAGE, COLEWORTS, SAVOYS, BRUSSELS SPROUTS, CAULIFLOWER, BROCCOLI, Kohl, etc. POTATO, JERUSALEM ARTICHOKE, TURNIP, CARROT, PARSNIP, RADISH, RED BEET, SKIRRET, SALSIFY, SCORZONERA, BEAN, PEA, KIDNEY-BEAN, SCARLET RUNNER, ONION, LEEK, GARLIC, SHALLOT, ROCAMBOLE, WELSH ONION, SPINACH, WHITE BEET, ASPARAGUS, SEA KALE, ARTICHOKE, LETTUCE, CRESS, MUSTARD, SORREL, CORN SALAD, ENDIVE, CELERY, PARSLEY, HORSE-RADISH, RHUBARB.

KITCHEN-MIDDENS (Danish, *kjökken-mödding*), or moldering shell mounds, the vestiges of feasts of prehistoric men of the neolithic age. They are found in northern Europe, more particularly in the Danish islands of the Baltic. They are supposed to be the accumulated refuse of annual or periodical tribal feasts. It is thought that the early races of men in all countries were in the habit, at stated times, of gathering in large numbers on the sea-shore and feasting on mollusks, fishes, and other animals, leaving the shells, bones, and some of the utensils, deposited in some order to mark the place of assemblage. Many of the implements found in the Danish mounds are carefully shaped and polished, and there are no remains of extinct animals, only those of living species; moreover, the remains of one domestic animal are found in the mounds, those of the dog, but no agricultural implements or anything to indicate the culture of the soil. Some of these mounds are 1000 ft. long, 200 ft. wide, and 10 ft. high. Other remains of the same era occur in the lower part of Danish peat formation, such as log canoes, which are supposed to have been used by the men who made the shell-mounds. It is said that the shells found in these remains are rather larger than those of the same species found at the present time on the Danish shores, and that the mounds somewhat resemble those made by the American Indians near the sea-shore.

KITE, *Milvus*, a genus of *falconide*, or a sub-family including elanets, etc., of which only one species is a common native of Britain, and another is amongst its rarest visitants. The kites have much weaker bill and talons than the falcons and hawks, but the wings are much longer, and the tail is rather long and forked. Their legs are short. They are remarkable for their gracefulness of flight, and power of sailing and wheeling about, or gliding in the air. A Scotch and local English name of the COMMON KITE (*M. vulgaris*), GLEAD or GLED, is believed to be from the same root with *glide*. The common kite is found in almost all parts of Europe, the n. and center of Asia, and the n. of Africa. It is fully 2 ft. in length, from the tip of the bill to the tip of the tail, the plumage mostly brown, of various shades, in some parts mixed with gray. It feeds on reptiles, mice, moles, and other small quadrupeds, and the young of gallinaceous birds, searching for its prey on the ground, and often from no small elevation in the air. It sometimes catches fish. In former times, when it was much more plentiful in Britain than now, it was the scourge of poultry-yards, pouncing on young chickens. It was also the scavenger of London and other English towns, devouring the offal, as it still does in some of the towns of eastern Europe.

KITE, a frame-work of wood or other material, shaped according to the fancy of the maker, a favorite form being that of an isosceles triangle, the base of which becomes the top, and is surmounted by a piece of cane or bamboo, bent in the shape of a semi-circle. Over this frame-work is stretched paper, silk, or muslin; a tail of string, to which twisted strips of paper are fastened, acts as a steering apparatus; and a cord attached to the body of the kite, near the top, completes the mechanism and controls its movements. Kites are also round, square, oval, diamond-shaped, oblong, etc. The origin of this toy is not traced, but it is known to have existed from remote antiquity. Etymology may possibly give a clue to the origin of its name, but it fails to signify the period of its invention. It is derived from the Welsh *cûd* and the Anglo-Saxon *cyta*, while the Gaelic *kyta*, meaning belly, may not improbably have been the root of the English word kite, from the signification of filling with wind which it indicates, as "the belying sail." But while the kite is thus accounted for in the northern tongues, the article is found in use in many southern and even tropical countries. In China, notably, it has been a favorite toy from time immemorial; the same fact exists with regard to Japan;

and in these two countries the form of the article is more diversified than elsewhere; owls, bats, dragons, and other creatures are usually copied, the material employed being silk or paper covered with painted designs in ornamentation. But besides its use as a toy, the kite has frequently been employed practically for important purposes. It has been used in engineering to carry lines to inaccessible points; and, in cases of shipwreck, has been made a medium of communication with the shore, and even to establish means of transportation, thus becoming an agency in saving life. The most important scientific use of a kite was probably that of Dr. Benjamin Franklin, who gained through its instrumentality a solution of the problem of the identity of electricity and lightning. With a design to establish the theory to this effect which he had formulated, Dr. Franklin constructed a kite. The frame-work consisted of a cross made of two light strips of cedar; over this was stretched a silk handkerchief, tied to the four extremities; a sharp-pointed wire extended a foot from the top of the upright stick of the cross, a silk ribbon was tied to the end of the string which held the kite, the end next the hand, and a key suspended at the junction of the twine and silk.

The kite was raised by Franklin, assisted by his son, during a thunder-storm in June, 1752, and almost immediately he had the satisfaction of experiencing a spark on applying his knuckles to the key; and when the string had become wet by the passing shower, the electricity became abundant. A Leyden jar was charged at the key, and by the electric fire thus obtained spirits were inflamed, and all the customary experiments performed. This important testimony to the truth of Franklin's deductions aroused the scientific minds of Europe to consideration of the question. He was highly honored by scientific bodies, and the Royal Society awarded him the Copley medal in 1753.

KITEFLYING, or **KITING**, (Americanism), is a method practiced among business men for the purpose of raising funds, or of sustaining credit when their bank account is low. This practice consists in presenting, in lieu of cash, a draft upon their bank, and before this shall have had time to mature, in forwarding a draft made on a second bank to meet the payment of draft number one; in this way the matter may have passed through several banks, until sufficient time has been gained to make a deposit which shall serve to cash the last draft. Another method is that by which parties make an agreement to exchange checks with each other which are deposited in lieu of money, taking care to make their bank accounts good before the check shall be presented.

KITSAP, a small co. situated in the w. part of Washington, being a peninsula bounded e. by Admiralty inlet, s. and s.e. by Puget sound, and n.w. by Hood's canal; pop. '90, 4624. These waters are navigable for large vessels, and afford excellent facilities for trade and commerce. The surface is mostly in forest, and lumber is the chief article of export. Area, 392 sq. m. Co. seat, Port Orchard.

KIT'S COTY-HOUSE. See **CROMLECH**.

KITTANNING, borough and co. seat of Armstrong co., Pa.; on the Allegheny river and the Allegheny Valley railroad; 44 miles n. of Pittsburg. It contains large iron and steel works, flour and lumber mills, china pottery, brick, lime, and clay plants, mirror and type-writer factories, electric lights, national and state banks, and several churches and weekly newspapers, and has a large supply of natural gas. Pop. '90, 3095.

KITTATIN'NY, or **BLUE MOUNTAIN**, a chain about 800 m. in length, and averaging in height from 1000 to 2000 ft., whose northern point is in Ulster co., N. Y. Trending to the s.w., it is pierced by the Delaware at the water-gap, by the Susquehanna near Harrisburg, and by the Potomac in the neighborhood of Berkeley Springs, W. Va., and thence extends through North Carolina and Tennessee to Alabama, in which state its elevation lessens and it is finally lost.

KITTERY, a town in York co., Me., on the Piscataqua river, opposite Portsmouth, N. H., and on the Boston and Maine railroad, about four miles from the ocean. It contains what is known as the Portsmouth navy yard, high school, Rice public library, the mansion and tomb of sir William Pepperell, and many summer hotels. Pop. '90, 2864.

KITTITAS, a co. situated in central Washington; e. of King and Pierce cos.; 2245 sq. m. It is in a remarkably rich agricultural and grazing region; timothy, wheat, hops, and hay are raised in abundance. Gold, silver, copper, iron, and coal are found in the mountainous districts. Pop. '90, 8777. Co. seat, Ellensburg.

KIT'TIWAKE, *Larus tridactylus* or *L. rissa*, a species of gull (q.v.), interesting on account of its abundance in very northern regions, and its importance to their inhabitants. In addition to what is stated in the article **GULL**, it may be mentioned that the young of the kittiwake has dark markings in its plumage which disappear in the adult, is known on some parts of the British coasts as the **TARROCK**, and was for some time regarded by naturalists as a distinct species; also that the flesh of the kittiwake is much more pleasant than that of most gulls, and its eggs very good; that it lays usually three eggs, which are fully 2 in. in length. It is found plentifully in all the northern parts of the world, wherever the coast is high and rocky, migrating southwards in winter, and extending its range as far south as the Mediterranean and Madeira. It is found on the Caspian sea.

KITTO, Dr. JOHN, a most industrious and respectable writer on biblical subjects, was b. at Plymouth, Dec. 4, 1804. In his 13th year he lost his power of hearing in consequence of a fall from a height of 35 feet. His father's circumstances were at this time so wretched that young Kitto was soon after sent to the workhouse. Here he learned the trade of shoemaking, and was also enabled to indulge that taste for reading which had marked him from his earliest years. In 1824 he went to Exeter to learn dentistry with a Mr. Grove, who had known him in Plymouth, and who took a warm interest in the unfortunate youth. Mr. Grove encouraged Kitto in his literary aspirations, and in 1825 he published *Essays and Letters by John Kitto*. In the same year, he was sent by the kindness of various friends, to the missionary college at Islington, to be trained for some useful employment abroad. In May, 1829, he accompanied Mr. Grove and family on a tour to the east, visiting in the course of his travels St. Petersburg, Astrakhan, the Kalmuck Tartars, the Caucasus, Armenia, Persia, and Bagdad. He returned to England in 1833. The rest of his life was spent in the service of the booksellers, chiefly in that of Mr. Charles Knight, by whom he was liberally treated. He died at Cannstadt, in Würtemberg, whither he had gone for the benefit of his health, Nov. 25, 1854. His principal works are: *The Pictorial Bible* (1838; new edition by W. & R. Chambers, 1855); *Pictorial History of Palestine* (1839-40); *History of Palestine* (1843); *The Lost Senses—Deafness and Blindness* (1845); *Journal of Sacred Literature* (1848-53); and *Daily Bible Illustrations* (1849-53). He also edited the *Cyclopædia of Biblical Literature* (published by A. & C. Black). Kitto's biography has been written by Dr. J. E. Ryland (1856); a later and better biography is that by prof. Eadie of Glasgow. In 1844 the university of Giessen conferred on him the title of D.D.

KITTREDGE, THOMAS, 1746-1818; b. in Andover, Mass., in 1746; studied at Byfield academy under Samuel Moody, and at Newburyport with Dr. Sawyer; was surgeon in the battle of Bunker Hill, and received the degree of M.D. from Harvard college in 1811. He entered into practice in Andover in 1768, and died there after a residence of 50 years.

KIU-KIANG, a Chinese city in the province of Kiangsi, on the right bank of the Yangtsi Kiang, about 445 geographical miles from Shanghai. It is one of the treaty ports opened for trade since 1861 and its commerce is extensive. It is surrounded by walls, and in 1890 had a population of about 53,000, but before the Taiping rebellion the population was greatly in excess of this, some estimates placing it at 800,000. It has a large trade in tea and numerous manufactories, exporting glass, porcelain, tobacco, rice, paper etc.

KIUN, KEN, or **CHIUN**, a goddess in the Egyptian mythology, answering to the Roman Venus. She is represented standing on a lion's back, and holding in one hand a flower, and in the other two serpents. Reference to this deity is made in Amos v. 26, — "But ye have borne the tabernacle of your Moloch and Chium your images, the star of your god, which ye made to yourselves."

KIU'SHIU', or **KIUSIU**, or **KIMO**, the third largest island of the Japan archipelago. The name comes from *kiu*, nine, and *shiu*, provinces. In the Jesuits' letters and in old books it is called *Ximo*, a corruption of *shima*, "island." The nine provinces of Kiushiu are Satsuma, Ōzumi, Hiuga, Higo, Hizen, Bungo, Buzen, Chikugo, and Chikuzen. Together they form the Saikaido, or western sea region (see JAPAN). Since 1874 Kiushiu has been governmentally divided into ken, or prefectures, having their seats and receiving their names, with one exception, from the chief large cities of the island, viz.: Kagoshima, Nagasaki, Kumamoto, Fukuoka, and Oita. The area of Kiushiu by official computation is 16,840 sq. m.; and that of the outlying islands near the coast, Tsu, Goto, Yakushima, Tané etc., is 1513 sq. miles. Pop. 6,271,000. See titles of cities and provinces.

KIZLIAR', a t. in the s. of Russian Caucasasia, in the district of Terek, is situated about 40 m. from the mouth of the river Terek, on a low often inundated plain. It contains a fortress, many vineyards, tanneries, and silk-worm nurseries, and carries on an extensive trade in wine, brandy, and fish. A model vineyard and a school for instruction in wine-making have been established here. The climate is unhealthy. Pop. 6,000.

KLACZKO, JULIAN; b. Nov. 6, 1828, in Poland. Going to Paris in 1849 he brought out a number of essays of a semi-historical character, whose theme was the restoration of Poland. Resigning from the Austrian Ministry of Foreign Affairs in 1870, he traveled in Italy, and returned to Paris in 1875. Among his writings are *Die Deutschen Hegemonen* (1849); *O Skole Polskiej* (1854); *L'Union de la Pologne et de la Lithuanie* (1869).

KLAGENFURTH, a t. of Austria, capital of the duchy of Carinthia, is situated on the river Glau, 2 m. e. of the *Wörthsee*, with which it is connected by means of a canal, and about 80 m. n.e. of Trieste. It is the seat of the prince-bishop of Gurk, and has a library of 50,000 vols. Klagenfurth has a white-lead factory, and manufactures woolen, silk, and cotton fabrics, and machinery and arms. An active transit trade is here carried on. Pop. '90, 19,756. Here the Hungarian gen. Görgei was confined for some years after his surrender to the Russians at Világos in 1849.

KLAM'ATH, a river in n.w. California, rising in Klamath co., in the southern extremity of Oregon, flows through the upper and lower Klamath lakes, and crosses the frontier

line into California. It runs southwestward through Siskiyou, Del Norte, and Humboldt counties, to the mouth of the Trinity river in the n.e. part of Humboldt county. After watering a greater part of Humboldt co. it flows n.w. from the mouth of Trinity river, and empties into the Pacific ocean between the counties of Humboldt and Del Norte in lat. $41^{\circ} 30'$ north. It is 275 m. in length. At low water a bar in the harbor impedes the progress of any but the lightest boats; at high water there is sufficient depth for ships of the line. It is navigable for 40 m. by steamers of light draught. It is a rapid river, flowing through deep and narrow cañons, where, among the mountains, gold has been found in considerable quantities. The adjacent country is well covered with forests of redwood, fir, and cedar. A few miles from its mouth is the town of Klamath.

KLAMATH, a co. in s.w. Oregon, bounded on the s. by the California state line, and mainly on the w. by the Cascade range; formed in 1882 from Lake co.; area, 5520 sq. m.; pop. 1890, 2444. The altitude is about 4000 ft. above sea level; the surface almost equally divided between timber and prairie lands; the climate cold and dry. The co. is watered by Klamath, Sprague, and Lost rivers, and contains upper and lower Klamath, and other lakes. The valleys, especially the Klamath basin, are large. The soil generally is fertile, and good water is plentiful. Link river, the outlet of Klamath lake, falls 72 ft. in one and one half miles, affording fine water power for manufactures. Stock-raising is the chief occupation, but grain, vegetables, and fruit are produced in abundance. Co. seat, Klamath Falls.

KLAM'ATHS, a group of Indian tribes, scattered along the course of the Klamath river, which rises in southern Oregon, and flows s.w. and n.w. until it empties into the Pacific ocean in lat. $41^{\circ} 30'$ north. These tribes include the Shastas, Modocs, Cahrocs, Eurocs, Pitt river Indians, Hoopahs, Wallies—all of these being collectively and contemptuously called "Digger Indians." Of the same family, but characterized by much finer qualities than the other tribes, are the Klamaths proper, known also as Hamati or Clamets, but designated among themselves by the name Luterami; they live near the upper and lower Klamath lakes. These Indians are well made, with good features, the women sometimes quite handsome. They make baskets, hammocks, mats, hats, and other useful articles. Since 1864 the Klamaths have been collected on reservations by treaty with the United States, but have dwindled in numbers until only a few hundred of them remain. Of the Klamath groups the Modocs became familiar to us in 1872-73 by the war occasioned by a portion of them, under the chief capt. Jack, leaving the reservation—a breach of the treaty with the U. S. government. Latterly the Klamaths have devoted themselves to cutting lumber; creating quite an industry.

KLAPKA, GYÖRGY (GEORGE), one of the most heroic and skillful generals of the Hungarian war, was the son of the burgomaster of Temesvar, and was b. April 7, 1820. In 1837 he entered the Austrian army, and had attained the rank of lieutenant-col. when the revolution of 1848 burst out. Klapka instantly placed himself at the service of the Hungarian government, and took a prominent part throughout the struggle. The plan of the Hungarian campaign in the opening of 1849, which was carried out with such great success, was Klapka's work. In several of the battles, the fortune of the day was decided by the troops under his command. But the crowning glory of his patriotic career was his defense of Comorn (q.v.), at the close of the revolution. His famous sally on Aug. 5, was perhaps the most splendid deed of arms in the whole war. The Austrian army besieging the fortress was utterly routed, losing 30 pieces of artillery, 3,000 muskets, vast quantities of provisions, and about 2,000 head of cattle. Klapka was prepared to carry the war into Austria or Styria, but the news of the surrender of Görgei and the flight of Kossuth paralyzed his action. He held out, however, until Sept. 27, when he capitulated to Gen. Haynau, on condition that the garrison should retain their lives and liberties. Klapka then proceeded to England, but afterwards to Genoa. In 1859 he was requested by the Sardinian government to form a Hungarian legion, to be used in the war against Austria, but the peace of Villafranca destroyed his hopes of active service. Klapka has written, among other works, *The National War in Hungary and Transylvania* (1851), one of the best works on the subject; and *The War in the East*, etc. (1855). Klapka's judicious proclamation in 1862, when Garibaldi made a rash and unfortunate attempt on Rome, kept Hungarian fighters at home. In 1866, after the defeat of Austria at Königgrätz, he endeavored to effect a revolution in Hungary; but failed, and fled to Oderberg. In 1873 he undertook the reorganization of the Turkish army. He died May 17, 1892.

KLAPROTH, HEINRICH JULIUS VON, was the son of Martin Heinrich Klaproth, an eminent chemist, and was b. at Berlin, Oct. 11, 1783. He betook himself to the study of the Chinese language when only a boy of fourteen. In 1801 he entered the university of Halle. Here he published his *Asiatischer Magazin*, which gave him a high reputation. Having gone to Russia in 1805 he was appointed interpreter to the Russian embassy to China. The embassy proceeding nearly 200 m. into Mongolia, was ordered by the Chinese emperor to return, but Klaproth took the opportunity of exploring Siberia. He was soon after dispatched on a scientific mission to the Caucasus; the results of his valuable explorations are contained in his *Reise in den Kaukasus und*

Georgien in den J. 1807 und 1808 (2 vols. Halle, 1812-14; French, with numerous additions, Paris, 1823). While in Russia he received many honors. In 1812 he left the Russian service, and returned to Germany; but finally settled at Paris in 1815, where he died Aug. 20, 1835. Klaproth's literary activity, especially after 1815, was something prodigious; yet, strange to say, it was accompanied by an excessive love of pleasure, for the gratification of which Paris afforded him only too many facilities. His writings relate to the languages and history of the east, more particularly of China, and to the geography of the Russian empire; they are marked by immense learning and extraordinary acuteness, but unfortunately they also contain the most virulent attacks on other scholars. Among his works we may mention *Geographisch-historische Beschreibung des Oestlichen Kaukasus* (Weim. 1814); *Beschreibung der Russ. Provinzen zwischen dem Kaspischen und Schwarzen Meere* (Berl. 1814); *Verzeichniss der Chines. und Mandchuischen Bücher und Manuscripte der Königl. Bibliothek in Berlin* (Paris, 1822); *Asia Polyglotta* (with tables, 1823; 2d edit., Paris, 1829, with a life of Buddha according to the Mongolian legends), a work in which the various Asiatic nations are classified according to the affinities of their languages, and the beginning of their authentic history determined; *Tableaux historiques de l'Asie depuis la Monarchie de Cyrus jusqu'à nos jours* (4 vols. Paris, 1824-26, with 24 maps); *Mémoires relatifs à l'Asie* (Paris, 1834); *Collections d'Antiquités Egyptiennes* (Paris, 1829); *Examen Critique des Travaux de M. Champollion jeune sur les Hiéroglyphes* (Paris, 1832); *Notice d'une Mappemonde et d'une Cosmographie Chinoises publiées en Chine, l'une en 1730, l'autre en 1793* (Paris, 1833).

KLAPROTH, MARTIN HEINRICH, 1743-1817; b. Saxony; an analytical chemist of distinction and ability. The value of the improvements which he introduced into practical analysis can hardly be overrated, as he completely revolutionized the science of mineralogy through his discoveries in this direction. He is noted among scientists as the discoverer of tellurium, titanium, zirconium, uranium and strontium among metals. He was a faithful and earnest advocate of Lavoisier, as to the latter's theories and discoveries. Klaproth received many honors, being a member of the institute and professor of chemistry in the university of Berlin, besides being a member of the royal academy of arts and of the royal Berlin academy of sciences.

KLATTAU, a t. of Bohemia, in a fertile district, 68 m. s.w. of Prague. It contains a castle and gymnasium, and carries on manufactures of woolen cloth and machinery. Pop. 10,100.

KLAUSENBURG (Hungarian, *Kolosvár*), one of the chief cities in Transylvania, is situated on the little Szamos, 80 m. e.s.e. of Grosswardein. It is surrounded by old walls, and is divided into the old and the new town. Among its public buildings are a university, a lyceum, a gymnasium, several hospitals and other institutions, benevolent and educational. Woolens, earthenware, and machinery are manufactured. Birthplace of Matthias Corvinus, king of Hungary. Pop. '90, 32,800.

KLAUS THAL, a celebrated mining t. of Hanover, on a bleak plateau of the upper Harz, 25 m. n.e. of Göttingen. Situated 1792 ft. above sea-level, so that the potato is the chief crop that can be cultivated with success, the inhabitants find their principal employment in the mines and foundries. The ores raised are silver, lead, zinc, copper, and iron. It is reached by a road from Goslar on the north. Zellerfeld, divided from Klausthal by a brook, is also a mining center. The arrangements and appointments of the mines are very complete, comprising a mining academy, silver refining works, etc. They have all become the property of the Prussian government, and are managed for it. Pop. '85, including Zellerfeld, 13,278.

KLÉBER, JEAN BAPTISTE, a distinguished general of the French republic, b. Mar. 6, 1753, at Strasburg, where his father was a stone-mason. Having received a good education, he entered the Austrian army, but returned to France, and, embracing the cause of the revolution, rapidly rose to high military rank. He accompanied Bonaparte to Egypt as a general of division, was dangerously wounded at the capture of Alexandria, but recovered so as to take part in the expedition to Syria, and won the battle of Mt. Tabor. When Bonaparte left Egypt he intrusted the chief command there to Kléber, who concluded a convention with commodore Sidney Smith for its evacuation; but on admiral Keith's refusal to ratify this convention, Kléber adopted the bold resolution of reconquering it, and destroyed the Turkish army at Heliopolis. During an attempt to conclude a treaty with the Turks, Kléber was assassinated by a Turkish fanatic at Cairo, June 14, 1800.

KLEIN, BRUNO OSCAR, musician, b. in Osnabrück, Hanover, June 6, 1856. He studied at the Munich Conservatorium, and in 1873 published some compositions, which attracted the attention of Liszt. In 1881 he settled in New York, where, in 1884-94, he was organist of the College and Church of St. Francis Xavier. In 1888 he was made professor of counterpoint and composition in the National Conservatory. His compositions include: *Liebeslied* and *Hochzeit-Klänge* for orchestra, op. 29; concertos, romances, and sonatas; and the opera *Kenilworth* (1895).

KLEIST, HEINRICH VON, 1777-1811; b. Frankfort-on-the-Oder; a poet and novelist. Abandoning the study of law, he engaged in the Prussian civil service, which he relinquished for literature. He fought in the Prussian army against France, and was imprisoned during the French occupation of Berlin. Disappointed in his hopes and

plans he committed suicide in 1811. He was one of the most original of German poets, Gervinus placing him above all the dramatists of his time. Among his works, including dramas, lyric poems, novels, and tales, the most important are: *The Prince of Homburg*; *The Battle of Hermann*; *Michael Kohlhaas*.

KLEMM, FRIEDRICH GUSTAV, 1802-67; educated at the university of Jena, appointed assistant librarian at Dresden, 1814, and chief librarian in 1852. He published *The History of Bavaria*; *Women*; *Fifty Years Ago*, etc.

KLENZE, LEO CHEVALIER VON, a distinguished German architect, was b. in 1784, in the principality of Hildesheim, and having studied architecture in Berlin and Paris, was appointed architect to king Jerome of Westphalia in 1808; held a similar position at the court of Bavaria from 1815 to 1839, and in 1833 was raised to the rank of hereditary nobility in that kingdom. In 1834 he was sent to Athens, to superintend the reconstruction of that capital, and in 1839 went to St. Petersburg, to execute some works for the emperor of Russia. Many of the finest buildings recently erected on the continent of Europe are monuments of Klenze's genius, such as the Glyptothek, the Pinakothek, the Walhalla, and many other structures in Munich, the imperial museum at St. Petersburg, and several buildings in Athens. Klenze is the author of several works, chiefly on the subject of architecture. He died in 1864.

KLEPTOMANIA (Gr. *klepto*, to steal). Among the ordinary phenomena of minds that are not regarded as insane or criminal are observed inordinate tendencies to acquire, to collect, to hoard. So long as such an impulse does not interfere with the rights and property of others, or involve a flagrant breach of law, it is readily admitted as an indication of disease, or as an absurdity and eccentricity which may fairly consign the individual to an asylum or to contempt, but concerns no one else. But whenever the amount of the object appropriated, or the circumstances under which it is purloined, bring the matter into a court of law, the act is treated as a theft, and punished. In many cases, however, such conduct is the obvious result of disease. The inclination to steal is a premonitory indication of many forms of mental disorder: it is a characteristic symptom of many others, where violence, or delusions, or incoherence, leave no doubt as to the source from which it springs. But there are other cases in which the morbid origin cannot be so clearly demonstrated—where the mind is clear and cogent, the morals pure, and where theft is the only proof of insanity. There is evidence, however, in favor of the opinion, that the propensity to acquire may become so irresistible, and the will so impotent, that the appropriation is involuntary, and the perpetrator irresponsible. The gratification of the impulse is found associated with physical changes and conditions which may be regarded as incompatible with the healthy discharge of the functions of the nervous system; but the connection is not invariable, and the best mode of establishing the reality of such a disease is to consider marked cases in relation to the character, interests, and previous deportment of the individual—to the nature of the articles taken—and to the motives which seem to have determined the action. A baronet of large fortune stole, while on the continent, pieces of old iron and of broken crockery, and in such quantities that tons of these collections were presented to the custom-house officers. A clergyman of respectable bearing and great usefulness abstracted from book-shops and stalls hundreds of copies of the Bible, perhaps with the intention of distribution. A physician pocketed some small object whenever he entered the apartment of a patient; another member of this profession stole nothing but table-cloths. The incongruities in such narratives point to the existence of deep-seated unhealth. Although each case must be tested on its own merits, there are various features, common to a number of even doubtful cases, which should be embraced wherever a judgment is formed. The objects are often stolen ostentatiously, or without any adequate precautions to conceal the attempt; they are of no value in themselves, or useless to the thief; the act is solitary, independent, without motive, and promptly and spontaneously avowed, and, if overlooked, repeated. The article acquired is restored, or altogether disregarded; and although money is rarely taken, bright and colored objects most generally excite cupidity. It is observed in extreme youth; it is associated with pregnancy; it is hereditary; and often follows affections of the brain, and those critical and crucial changes in disposition which are only explicable on the supposition of corresponding alterations in the organization.—See Clouston, *Clinical Lectures on Mental Diseases* (2d ed., 1887).

KLIAZ'MA, a river of Russia, an affluent of the Oka, rises in the government of Moscow, and flows e. through those of Vladimir and Nijni-Novgorod, joining the main stream near the town of Gorbatof after a course of 327 m., for the last 150 of which it is navigable. Passing through the most industrial governments of Russia, it is one of the principal commercial arteries of the empire.

KLICKI'TAT, a co. situated in s. Washington, having the Columbia river for its southern and eastern boundary, separating it from Oregon, 2176 sq. m., pop. 1890, 5167.

KLICKI'TATS, or **KLIKITATS**, a native American Indian word signifying *robbers*, and applied as the name of a tribe of Indians living in Washington, distinguished for their predatory habits. This tribe, allied by blood to the Nez Percés and Walla Wallas, are distinguished only by habitat from the Yakimas, with whom they were con-

solidated in 1855 by the U. S. government, and placed on a reservation about Fort Simcoe, on the Columbia.

KLIEFOTH, THEODOR FRIEDRICH DETLEY, b. at Kөрchow, Mecklenburg, Jan. 18, 1810; studied in Berlin and Rostock, in 1840 became preacher in Ludwigslust, and since 1886 has been president of the ecclesiastical *Ober-behörde* in Mecklenburg-Schwerin. From 1854 to 1859, Kliefoth was co-editor of the *Kirchliche Zeitschrift*. Among his writings are *Einleitung in die Dogmengeschichte* (1839); *Theorie des Kultus der Evangelischen Kirche* (1844); *Liturgische Abhandlungen* (2d ed. 1858-69; an elaborate work on eschatology (1895); and numerous commentaries on the Old Testament prophets.

KLING'ER, FRIEDRICH MAXIMILIAN VON, 1753-1831; b. Frankfort, Germany; studied at the university of Giessen, and at an early age began to write plays. He served as a volunteer through the war of the Bavarian succession, and in 1780 entered the Russian service, in which he remained for 40 years, and attained the rank of lieutenant. He wrote a number of works, of which his drama, *Sturm und Drang* (Storm and Stress), is alone noteworthy as having given its name to that period of literary agitation and uncertainty which preceded the appearance of Goethe and Schiller.

KLONDIKE, a river in the northwest territory of the dominion of Canada, fed principally by the Bonanza and Eldorado rivers and Hunter creek, and emptying into the Yukon river. The name also applies to the region bordering it, near the Alaska boundary line, in which a remarkable gold strike was made in the autumn of 1896, which led to great excitement and an unprecedented rush thither from all parts of the United States and Canada in 1897. The mining region is reached by way of Juneau and the Chilkout pass, and by St. Michael's island and the Yukon river. At the time of the great discovery, the principal places in the region were Dawson City, at the mouth of the river, Circle City, Forty Mile, Sixty Mile, and Fort Selkirk. The discoveries led the Canadian government in 1897 to adopt new customs and mining regulations, and to secure the co-operation of the U. S. government in establishing joint postal and telegraph services for the region.

KLOPSTOCK, FRIEDRICH GOTTLIEB, a German poet, was b. July 2, 1724, at Quedlinburg, and went to Jena in 1745 to study theology. He had already formed the resolution to write a great epic poem, and thought of Henry the Fowler as a good subject for one; and at Jena he composed the first cantos of his *Messiah*. In 1746 he passed to Leipsic, and there became acquainted with the editors of the *Bremische Beiträge*, in which the first three cantos of the *Messiah* appeared in 1748. They attracted great attention: the author was pronounced a religious poet of the highest order. He was now invited to Copenhagen, upon the recommendation of the minister Bernstorff, and introduced to the king, whom he accompanied on his travels. In 1771 Klopstock settled in Hamburg, with a sinecure appointment and a pension from the Danish government, and subsequently received an honorary title and a pension from the markgraf, afterwards grand duke of Baden. In 1773 the last five cantos of his *Messiah* were published at Halle. He died Mar. 14, 1803. Klopstock's name has (or rather perhaps had) a very high place in German literature. Whatever may be thought of the intrinsic value of his poetry, it cannot be denied that he exercised a very important and beneficial influence on the national taste. The greatest of his successors, Goethe, acknowledged this, though he also expressed the opinion, that Klopstock had become rather obsolete, or at least that his conception of poetry had become so. When Klopstock first began to write, the literature and social life of Germany were penetrated by French influences. A cold, correct, unimaginative spirit tyrannized over the thought and habits of the people. Klopstock broke loose at once from this shallow despotism, and breathed the air of freedom into German poetry. Odes, tragedies—in which he introduces Hermann (q.v.), the Cheruscan as a national hero—and biblical dramas, with some hymns, which still find a place in collections, constitute the remainder of Klopstock's poetry. His works were collected and published in 12 vols. (Leip. 1799-1817), in 18 vols. (1823-29), in 9 vols. (1839), in 6 vols. Berlin (1879). Consult also Strauss, *Klopstocks Jugendgeschichte*, etc. (1878); Muncker, K., *Geschichte seines Lebens u. seiner Schriften* (1888). The *Messiah* has been translated both into verse and prose in English.

KLOTZ, a family of violin-makers, who lived in the Bavarian Alps. Tradition says that the first Egidius Klotz learned his trade from Jakob Stainer in Absam. His son, Matthias, built his violins on the Stainer model; and his sons, Sebastian and Joseph, continued the trade. George Klotz, whose instruments date from 1750 to 1770, gained an Italian style. Many of the violins supposed to be Stainers were made by the Klotz family. They have merit as regards sonority and tone.

KNAPP, ALBERT, a German poet, author of many of the best modern German hymns, was a native of Württemberg, and was b. in 1798. He studied for the church, and became the principal clergyman in Stuttgart. Knapp breathed a new life into that long-neglected branch of poetry—the religious hymn. Many of his effusions are to be found in the *Christoterpe*, a periodical edited by him since 1833. His *Christliche Gedichte*, in 2 vols. (Stuttg. 1829; 3d edit., Basel, 1843), to which a third was added under the title of *Neuere Gedichte* (Stuttg. 1834), were published by his friends. His later hymns are contained in his *Gedichte* (Stuttg. 1843). Knapp was equally distinguished as a hymnologist. His *Evang. Liederschatz für Kirche und Haus* (2 vols. 1837) is a valuable collection of Christian hymns of all ages, to which his *Christenlieder* (Stuttg. 1841) forms a splendid sup-

plement. The *Bilder der Vorwelt* appeared in 1862. His *Hohenstaufen* (Stuttg. 1839) is a cycle of religious poems. He died in 1864.

KNAPP, GEORG CHRISTIAN, D.D., 1750-1825; studied at Halle and Göttingen, and in 1782 became ordinary professor of theology at Halle. The system of theology which he adopted was what is known as rational supernaturalism. His *Vorlesungen über die Christliche Glaubenslehre* (Lectures on Christian Theology) was translated by the late Dr. Leonard Woods of Bowdoin college.

KNAPP, JACOB HERMANN, b. at Danborn, Prussia, 17 March, 1832; studied at Berlin, Paris and London; resigning his professorship of ophthalmology in the university of Heidelberg, he settled in New York in 1868, where he founded the Ophthalmic and Aural Institute; at present he is professor of ophthalmology in the College of Physicians and Surgeons.

KNAPP, SAMUEL LORENZO, LL.D., 1784-1838; graduated at Dartmouth college, 1804, and became a member of the Massachusetts bar. He was connected with various newspapers in Boston from 1824 to 1827, when he removed to New York. Among his works may be mentioned *Travels of Ali Bey* (1818); *Biographical Sketches of Eminent Lawyers, Statesmen, and Men of Letters* (1821); *Lectures on American Literature* (1829); *American Biography* (1833); and *Life of Aaron Burr* (1835).

KNAPP, WILLIAM IRELAND, was born at Greenport, Long Island, in 1835, and studied modern languages in Europe, graduating from Madison University in 1860, when he was appointed to the chair of German and French there. From 1865 to 1867 he held position at Vassar, and spent the next eleven years in Europe, of which eight were spent in Spain; on his return he was invited to the Street professorship of Modern Languages in Yale College, which he accepted. From Spain he brought a valuable library on the literature, especially the religious history, of that country, with many copies of MSS. made by him from documents of the Inquisition. The sources for the history of the Reformation is very complete, embracing the wholly unknown Bulla of Innocent VIII. against the press (Rome, 1847), a chronological collection of the Imperial, Papal, and Royal Edicts against the Reformation from 1520, and of the Index Librorum Prohibitorium from 1544 to 1887, being the completest extant in any one library. At Madrid he published several works in Spanish, among them critical editions of the poets Boscau and Diego de Mendoza. In this country his principal works are the Spanish Grammar and Reader, and other works for Spanish and French students, beside articles in the *Nation*, *New Englander*, and in the Madrid journals. In 1877 he was made by King Alfonso, Knight Commander of the Royal Order of Isabella Catolica. He received his degree of PH.D. from the University of New York, and LL.D. from Madison in 1889. In 1892 he accepted a chair in the Chicago University.

KNAPSACK, a bag of canvas or skin, containing a soldier's necessities, and worn suspended by straps between his shoulders. Those used in the British army are ordinarily of black painted canvas; but some other nations, as the Swiss, make them of thick goat-skin, dressed with the hair on. The knapsack affords by far the easiest way of carrying light personal luggage during a march or walking tour.

KNARESBOROUGH, a parliamentary borough and market t. of England, in the West Riding of Yorkshire, on the left bank of the Nidd, 18 m. w.n.w. of York. St. Robert's cave in the vicinity, is well known for the murder committed there by Eugene Aram in 1745. Manufactures of linen and cotton goods are carried on here. Returns one member to parliament. Pop. about 5,000.

KNAUS, LUDWIG, b. Wiesbaden, 1829; studied at Düsseldorf and Paris. He is a *genre* painter of considerable merit, excelling particularly in the delineation of rustic scenes. His *Holy Family*, and other works are in the United States.

KNEE, in shipbuilding, an angular piece of wood or iron used to connect the deck-beams with the ribs of the vessel's sides.

KNEE-JOINT, THE, is the articulation between the femur or thigh-bone, above, and the tibia or shin-bone below. A third bone, the patella, or knee-cap—one of the sesamoid bones (q.v.), and not a true bone of the skeleton—also enters into the structure of this joint anteriorly. The articular surfaces of these bones are covered with cartilage, lined by a synovial membrane or sac, which is the largest and most extensive in the body, and connected together by ligaments, some of which lie external to the joint, while others occupy its interior.

The most important of the external ligaments are the anterior or *ligamentum patellæ*, which is in reality that portion of the *quadriceps extensor cruris* which is continued from the knee-cap to the tubercle of the tibia; one internal, and two external lateral ligaments; a posterior ligament; and a capsular ligament, which surrounds the joint in the intervals left by the preceding ligaments. The positions of these ligaments are sufficiently indicated by their names. Of the internal ligaments, the two crucial, so called because they cross one another, are the most important. The external and internal semi-lunar cartilages are usually placed amongst the internal ligaments; they are two crescentric plates of cartilage. The outer part of each cartilage is thick; the inner free border thin. Each cartilage covers nearly the outer two-thirds of the corresponding articular surface of the tibia, and by its form deepens these surfaces for firmer articulation with the condyles of the femur.

The chief movements of this joint are those of a hinge-joint—namely, flexion and extension, but it is also capable of slight rotatory motion when the knee is half flexed. During flexion the articular surfaces of the tibia glide backwards upon the condyles of the femur; while in extension they glide forwards. The whole range of motion of this joint, from extreme flexion to extreme extension, is about 150°. Judging from its articular surfaces, which have comparatively little adaptation for each other, it might be inferred that this was a weak and insecure joint; and yet it is very rarely dislocated.

KNEELAND, ABNER, 1774-1844; was first a Baptist preacher, then a Universalist, and finally a Deist. From 1821 to 1823 he edited a periodical in Philadelphia; in 1828 he edited the *Olive Branch* in New York; and in 1830 founded in Boston the *Investigator*, a weekly expositor of his deistical views, and which is still in existence. He was also for several years in Boston the instructor of a deistical society meeting in Julien hall; and in 1830, when William Lloyd Garrison had sought in vain for a church or hall in which to speak upon slavery and was about to resort to the common, Mr. Kneeland and his friends offered him the use of the hall under their control, and there his lectures were delivered. In 1836 he was tried in the supreme court of Massachusetts for blasphemy, uttered in his own paper. The words chiefly relied upon to support the charge were: "He believes in a God, which I do not," the words being taken as a denial of God's existence. Mr. Kneeland, in his defense, declared that the comma after the word God was erroneously inserted, and that all he meant to affirm was that he did not believe in the same God that his opponent did. At the first trial the jury stood 11 for conviction and 1 for acquittal, the dissentient being Charles Gordon Greene of the *Morning Post* which had been but lately established. A second trial resulted in conviction, and Mr. Kneeland was sentenced to imprisonment for a short term in the Boston jail. His conviction was disapproved by many earnest Christian men, who thought it an infraction of the true liberty of speech and calculated to bring Christianity into reproach. The rev. Dr. Channing and other eminent citizens united in a public protest against the prosecution. There has been no prosecution under the statute since that day, though hundreds of men have avowed their disbelief in God in terms far more offensive than those used by Mr. Kneeland. Public opinion upon the just limitations of the freedom of the press has greatly changed since that day. Mr. Kneeland died at Salubria, Ind. Among his publications were: *The Deist*; *Lectures on Universal Salvation*; *A Translation of the New Testament*; and *A Review of the Evidences of Christianity*.

KNEELAND, SAMUEL, b. Mass., 1821; studied at Harvard university, graduating from the medical school in 1843; studied medicine two years in Paris. Returning, he commenced the practice of medicine in Boston, also lecturing on anatomy in Harvard university. He contributed at that time to the *American Journal of Medical Science* and *Boston Medical and Surgical Journal*, and translated Audry's *Diagnosis of Diseases of the Heart*. He was five years secretary of the Boston historical society, and for two years in the same capacity in the American academy of arts and sciences. In 1866 he became secretary of the Massachusetts institute of technology, and a professor there. He has traveled extensively in Brazil, has visited Iceland, the Hawaiian islands, and the copper region around lake Superior, besides exploring other interesting regions—California, upper Mississippi, and Colorado. In the war of the rebellion he went out, in 1862, as a regimental surgeon under gen. Burnside, and also served in New Orleans and Mobile. In 1866 he accepted the position of secretary of the Massachusetts institute of technology, and also the chair of professor of zoology and physiology, which he now fills. He edited, with an introduction, Smith's *History of the Human Species*, 1851, and the *Annual of Scientific Discovery*, 1866-69, and contributed to the scientific periodicals. He was one of the writers on zoological and medical subjects in the *American Cyclopædia* and the *New American Cyclopædia*, furnishing over 800 articles. He published the *Wonders of the Yosemite Valley and of California* in 1871.

KNEIPE. See **COMMERS**.

KNEIPP, SEBASTIAN; 1822-97. German priest, founder of the modern water cure, of whose institutions over 350 now exist in the German Empire. By this treatment patients were compelled to walk barefooted in the snow in winter and barefooted on the wet grass in summer.

KNELLER, Sir GODFREY, an eminent portrait painter was b. at Lübeck in 1648, and studied painting under Rembrandt and Ferdinand Bol. He at first chose historical subjects, but afterwards gave himself entirely to portrait painting. In 1674 he went to London, and, on the death of sir Peter Lely in 1680, was appointed court painter to Charles II. In 1684 he visited Paris, at the invitation of Louis XIV., and painted portraits of the king and royal family. He retained his office at the English court during the reign of James II., and continued to fill it after the revolution. In 1692 William III. bestowed on him the honor of knighthood, which he afterwards received also from the emperor Joseph I.; and in 1715 George I. made him a baronet. He died in 1723 at Twickenham, on the Thames, and a monument was erected to him in Westminster abbey, with a highly laudatory inscription by Pope. Kneller's best-known productions are the "Beauties of Hampton Court" (painted by order of William III.), and his portraits of the "Kit-Cat Club."

KNAZ-NIN, FRANCISZEK DYONIZY, 1750-1807; educated in the Jesuit school at Vitebsk, in Russia, and for a time secretary to prince Adam Czartoryski. He was a poet of decided merit, many of his verses showing a refined sentiment, and remarkable skill in versification. He translated the Latin poets, and even ventured on a translation into Russian of Macpherson's *Ossian*. The latter years of his life were clouded by mental derangement.

KNICKERBACKER, DAVID BUEL, S.T.D., b. 1833; graduated at Trinity coll., 1853; at General theol. sem., 1856; ordained priest in the Prot. Epis. church, 1857; was rector of Gethsemane church, Minneapolis; consecrated bp. of Ind., 1883. He d. 1894.

KNIGHT, CHARLES, an eminent English publisher and author, was b. in 1791 at Windsor, where his father carried on the business of a bookseller. Knight was brought up to the same profession, but early turned his attention to publishing. Among his first attempts in this department was *The Etonian*, a periodical supported by the Eton boys, and which, in spite of its juvenility, obtained a considerable reputation. He next started (1823) *Knight's Quarterly Magazine*, and continued it for some time in London, to which he removed in the following year. The whole of his honorable career was devoted to popular literature, of which he was one of the earliest and most accomplished advocates. He died Mar. 9, 1873. Among the works which Knight published or edited are the *Penny Magazine* (1832-45), which was started only a month or two after *Chambers's Edinburgh Journal*, and at one time enjoyed a circulation of nearly 200,000 copies weekly; the *British Almanac*, and *Companion to the Almanac*; *Penny Cyclopædia* (30 vols. 1833-56); *Library of Entertaining Knowledge*—the volume on the elephant (1831) being written by himself; *Pictorial History of England*; *Pictorial Bible* (1838), now the property of Messrs. Chambers; *Pictorial Book of Common Prayer* (1838); *London Pictorially Illustrated* (6 vols. 1841-44); *Old England, a Pictorial Museum of National Antiquities* (2 vols. 1845); *Half-hours with the Best Authors* (4 vols. 1847-48); *The Land We Live In* (4 vols. 1848); *Cyclopædia of the Industry of all Nations* (1851); and *The English Cyclopædia* (22 vols. 1854-61), based on the *Penny Cyclopædia*; *Pictorial Shakespeare* (8 vols. 1839-41); library edition (12 vols. 1842-44); national edition, with "biography" and "studies" (8 vols. 1851-53); *Life of Caxton* (1844); *Plays and Poems, with Glossarial Notes* (7th ed. 1857); *Knowledge is Power* (1855); and above all, by his *Popular History of England, an Illustrated History of Society and Government from the Earliest Period to our own Times* (1856-62).

KNIGHT, CYRUS FREDERICK, b. Boston, 1831; educated at Burlington coll., N. J., and at Harvard univ.; graduated at gen. Episcopal theological seminary in New York city; was rector of St. Mark's Boston; St. James', Hartford, Conn., and St. James', Lancaster, Pa.; consecrated bishop of Milwaukee, 1888. Died June, 1891.

KNIGHT, EDWARD HENRY, 1824-83; d. Bellefontaine, Ohio. He applied himself to the study of mechanics and civil engineering, and for some years was examiner, and in charge of the classification and publications, at the U. S. patent office, Washington. He was a U. S. commissioner to the Paris exposition, 1878, and was made a chevalier of the legion of honor. He published the *American Mechanical Dictionary*, 1874-78; and the *New Mechanical Dictionary*, 1882.

KNIGHT, RICHARD PAYNE, 1750-1824; b. England; being a weak and sickly child, received no education until he was 14 years of age, when he was sent to school, and soon made marked progress in Greek and Latin. He visited Italy for his health, where he interested himself in the study of art and of classical antiquities, which with him became a passion. Having inherited large wealth, he was returned to parliament, and served from 1780 to 1806, when he retired, devoting the remainder of his life to study and authorship in the direction of recondite classical subjects. From 1814 he represented the Townley family as a trustee of the British museum. To this institution he bequeathed his splendid collection of ancient bronzes and Greek coins, valued at £50,000. He published *An Account of the Remains of the Worship of Priapus lately existing at Isernia, in the Kingdom of Naples, etc.*; *An Analytical Essay on the Greek Alphabet*; *An Analytical Inquiry into the Principles of Taste*; and an edition of Homer's *Iliad* and *Odyssey*, with prolegomena.

KNIGHT, THOMAS ANDREW, 1758-1838; b. Herefordsire, England; graduated at Balliol college, Oxford; devoted himself to researches into vegetable and animal physiology. In 1795 he communicated to the royal society suggestions upon the inheritance of disease among fruit-trees, which attracted much attention.

KNIGHT, WILLIAM ANGUS, professor of philosophy in the University of St. Andrews, Scotland; b. at Mordington, Scotland, Feb. 22, 1836. Was examiner in his university (1870-3), to the University of London (1887-92), and to the Victoria University since 1893. Among his works are *Poems from the Dawn of English Literature to the year 1699*; *Studies in Philosophy and Literature* (1879); *Hume in Classics for English Readers, Aspects of Theism* (1894).

KNIGHTS (Saxon, *Cniht*, a servant or attendant), originally men-at-arms bound to the performance of certain duties, among others to attend their sovereign or feudal superior on horseback in time of war. The institution of knighthood, as conferred by investiture, and with certain oaths and ceremonies, arose gradually throughout Europe as an

adjunct of the feudal system (see FEUDAL SYSTEM; CHIVALRY). The character of the knight was at once military and religious. The defense and recovery of the holy sepulcher, and the protection of pilgrims, were the objects to which, in the early times of the institution, he especially devoted himself. The system of knight-service, introduced into England by William the conqueror, empowered the king, or even a superior lord who was a subject, to compel every holder of a certain extent of land, called a knight's fee, to become a member of the knightly order; his investiture being accounted proof that he possessed the requisite knightly arms, and was sufficiently trained in their use. The "statute of knights," of the first year of Edward II., regulating the causes that were to be held valid to excuse a man from knightly service, shows that in the 14th c. the knightly office was not always eagerly coveted; yet its social dignity was very considerable, for even dukes, if not admitted into the order, were obliged to yield precedence in any royal pageant or public ceremony. In time of war, each knight was bound to attend the king for 40 days, computed from the day when the enemy arrived in the country. After the long war between France and England, it became the practice for the sovereign to receive money compensations from subjects who were unwilling to receive knighthood, a system out of which grew a series of grievances, leading eventually to the total abolition of knight-service in the reign of Charles II.

Knighthood, originally a military distinction, came, in the 16th c., to be occasionally conferred on civilians as a reward for valuable services rendered to the crown or community. The first civil knight in England was sir William Walworth, lord-mayor of London, who won that distinction by slaying the rebel Wat Tyler in presence of the king. Since the abolition of knight-service, knighthood has been conferred without any regard to property, as a mark of the sovereign's esteem, or a reward for services of any kind, civil or military. In recent times it has been bestowed at least as often on scholars, lawyers, artists, or citizens, as on soldiers, and in many cases for no weightier service than carrying a congratulatory address to court.

The ceremonies practiced in conferring knighthood have varied at different periods. In general, fasting and bathing were in early times necessary preparatives. In the 11th c. the creation of a knight was preceded by solemn confession, and a midnight vigil in the church, and followed by the reception of the eucharist. The new knight offered his sword on the altar, to signify his devotion to the church, and determination to lead a holy life. The sword was redeemed in a sum of money, had a benediction pronounced over it, and was girded on by the highest ecclesiastic present. The title was conferred by binding the sword and spurs on the candidate, after which a blow was dealt him on the cheek or shoulder, as the last affront which he was to receive unrequited. He then took an oath to protect the distressed, maintain right against might, and never by word or deed to stain his character as a knight or a Christian. A knight might be degraded for the infringement of any part of his oath (an event of very rare occurrence), in which case his spurs were chopped off with a hatchet, his sword broken, his escutcheon reversed, and some religious observances were added, during which each piece of armor was taken off in succession, and cast from the recreant knight.

It has been said that knighthood could originally be conferred by any person of knightly condition, but if so, the right to bestow it was early restricted to persons of rank, and afterwards to the sovereign or his representative, as the commander of an army. In England the sovereign now bestows knighthood by a verbal declaration, accompanied with a simple ceremony of imposition of the sword, and without any patent or written instrument. In some few instances, knighthood has been conferred by patent, when the persons knighted could not conveniently come into the presence of royalty, as in the case of governors of colonies, or other persons occupying prominent situations abroad. The lord-lieutenant of Ireland also occasionally, but rarely, exercises a delegated power of conferring knighthood. The monosyllable "sir" is prefixed to the Christian names of knights and baronets, and their wives have the legal designation of "dame," which in common intercourse becomes "lady."

Persons who are simply knights without belonging to any order are called in England knights *bachelors* (for the origin of this word, see BACHELOR). Knighthood of this kind is now only conferred in Great Britain. A degree of knighthood called *banneret* formerly existed in England and France, which was given on the field of battle in reward for the performance of some heroic act. For the mode in which that dignity was conferred, see BANNERET. No knight-banneret has been created in the field since the time of Charles I., when that honor was bestowed on one Sir John Smith, for rescuing the royal standard from the hands of the rebels. George III. twice conferred the title on occasion of a review, but the proceeding was considered irregular, and the rank of the knights not generally recognized.

The form of helmet which the requirements of the later heraldry have appropriated to knights, entitling them to place it over their arms, is full-faced, of steel, decorated with bars, and with the visor a little open.

According to the account given by Tacitus, the origin of knighthood was among the ancient German tribes, and consisted in conferring upon selected persons the privilege of citizenship, under the direct supervision of the authority of the state. The ceremony included the investiture of the candidate with a buckler and javelin, and appears to have

implied that, whereas he was before only a member of his immediate family, he now became a servant, or *enicht* (Saxon), of the state. But both the institution and the ceremony have been traced back as far as the foundation of Rome, when Romulus is said to have created the rank, the *curiæ* electing 300 *equites*, as they were called, from *equus*, a horse. In England king Alfred is said to have been the first to create a knight with the sword of state, in the case of Atheistane, A.D. 900. In the time of Henry III. of England the institution seems to have been based on a property qualification, since all persons possessed of ten pounds yearly income were forced to be knighted under penalty of a fine. The institution of knighthood as an order was, generally speaking, an event of the middle ages, and grew out of the disturbed condition of society, and the necessity for the weak to be protected by the strong. The feudal barons were at this time mostly marauding robbers, whose hands were against all men, and who particularly devoted themselves to plundering their neighbors of their women and their wealth. The church being specially the object of their predatory excursions, that institution, with a view to the protection of its enormous and increasing riches, turned the warlike spirit of the age to its advantage, and, by introducing the religious element into the investiture of knighthood, brought to the ceremony a specific character of solemnity which created a tenacious bond of attachment between the two. With that keen shrewdness which has always characterized the Roman Catholic church, the latent spirit of respect for woman which existed in the middle ages, even among the rude and savage populations of central Europe, was made a powerful element in the foundation of the new order. The virgin Mary became the special tutelary divinity of knighthood, and by parity of reasoning, the sex was added to the church, in the esteem of the order, as being under its protection.

This deference to woman and the church became thereafter the chief impelling motive, under whose impulse the knights of the middle ages were incited to deeds requiring the greatest daring, self-denial, and tenacity of purpose. Not unnaturally, and particularly among the rash and the young, abuses crept into the system, and wild and foolish exploits brought the order into such disrepute that it became possible for Miguel Cervantes, at the close of the 16th c., to compose his wonderful burlesque of knighthood, the immortal *Don Quixote*, and for that work to meet with public acceptance. Yet it is to be remembered that in no other instance, save perhaps those of the Roman Catholic church and the masonic order, has any merely human institution survived so long and accomplished so much of material good to mankind—on a basis of purely abstract qualities. The institution of the later orders of knighthood was occasioned by a desire to construct a reputable system of recognition of merit. Some of these were distinctively charitable in their nature, others simply orders of merit. Of these the names of 240 have been preserved in history.

KNIGHTS HOSPITALERS. See HOSPITALERS.

KNIGHTS OF LABOR. See LABOR, KNIGHTS OF.

KNIGHTS OF PYTHIAS. See ASSOCIATIONS, SECRET AND BENEVOLENT.

KNIGHTS OF THE SHIRE, otherwise called in England knights of parliament. They were knights formerly chosen by the freeholders of every county to represent the county in parliament, and were originally inhabitants of the places for which they were chosen. See PARLIAMENT.

KNIGHTS TEMPLARS. See TEMPLARS, KNIGHTS.

KNIPPERDOLLING, BERNARD, a noted leader of the fanatical Anabaptists of the 16th century. See ANABAPTISTS.

KNITTING, an art allied to weaving, but of comparatively modern date. The time and place of its invention are disputed. Some historians insist upon Scotland having the honor, at a date somewhat before the year 1500; others assert that it came from Spain, in the time of Henry VIII.; but there is no proof that the silk stockings which were worn by that monarch were knitted, and in the absence of such proof the weight of evidence remains in favor of Scotland. Knitting consists in using a single thread, and with it forming a continual series of loops across the whole fabric; the next row passes through these, and they in their turn receive another set, until the whole is completed. Knitting is only employed to make small articles, such as stockings, gloves, etc.; and as it furnishes an easy and amusing employment for the hands, without engaging the attention much, it forms a useful and desirable occupation for ladies and others who do not require knitted articles as necessities, for the knitting-machines have now rendered it impossible for hand-work to compete with them in point of economy or beauty of workmanship. See HOSIERY.

KNOBEL, KARL AUGUST, D.D., 1807-63; b. near Sorau, Silesia; an eminent German theologian and archæologist. He studied in Sorau under Principal Scharbe. In 1831 he began lecturing, and by his freshness and power drew numerous hearers. In 1837 he received from Breslau the degree of doctor in theology for his able work on prophecy, and soon after the offer of a professorship in Göttingen, in Ewald's place, and of one in Giessen, which he accepted. He was a learned rationalist, and published during his 24

years at Giessen numerous works, among which were several commentaries on *Genesis*, *Exodus*, *Ecclesiastes*, etc.

KNOBELSDORFF, HANS GEORG WENZESLAUS VON, Baron, 1699-1753; b. Brandenburg, Prussia. After serving in the army he studied architecture, and in 1740 was appointed director of royal buildings in Prussia by Frederic II., who, when crown-prince, had been his patron. He drew the plans for the Thiergarten and opera-house in Berlin, and for the famous Sans Souci palace at Potsdam.

KNOLLYS, HANSERD, 1598-1691; b. in Lincolnshire, England. He was educated at Cambridge university, and ordained a priest of the church of England, but, having changed his views of church government and of baptism, he was deposed for non-conformity, and compelled to flee to New England, where his stout attacks on infant baptism speedily involved him in controversy with the authorities. Cotton Mather nicknamed him "Mr. Absurd Knowless." He was the first minister at Dover, N. H., where he preached, 1638-41. In the latter year, after a short stay on Long Island, he returned to London, where he died. He was an accomplished scholar.

KNOBSTICK is a name used in the manufacturing districts in England to denote a non-union man, i.e., one who belongs to a trades-union, but who refuses to take part in strikes (q.v.).

KNOT, a twist or loop in a rope or cord, so made that the motion of one piece of the line over the other shall be stopped. The knot owes its power of passive resistance to the friction of the rope. The uses of knots are infinite; in the commonest occasions of life one or two simple knots are indispensable; in building, mining, and almost every land occupation, knots of curious form are employed; while on shipboard, knots may be almost numbered by the dozen, and each is appropriated to a specific duty.

The simplest knot is the "overhand." Its use is to form a knob in a rope to stay it from slipping. By a slight alteration, the "single sling," or slip knot, is obtained, always in the middle of the rope. More complicated, but still more useful, is the "double sling," for suspending a beam or bar horizontally. The bow-line knot serves to give a tight grasp round a pole or beam, which would occupy the loop, or, drawn close on the rope, it forms a large knob, to prevent the rope passing a hole. The sheep-shank affords a means of shortening a rope temporarily, without diminishing its power of rectilinear tension. All the foregoing have been at the double or middle parts of the rope.

For modes of joining two ropes, the weaver's or fisherman's knot may be adduced as strong and neat. The sailor's knot has the advantage, when properly made, of resisting all separating strain on the two ropes, and at the same time of being loosened immediately by a pull at one of the short ends. For an interlacing of two doubled ropes, the "Carrick bend" has no superior; the point of junction cannot slip, and the moment the tension ceases, the two ropes are again free from each other. Knots have many technical names, such as bight, hitch, etc.

KNOT. The velocity of a ship is estimated in knots and tenths of a knot, and the distance on the log-line between two successive knots or marks is obtained by the following proportion: As the number of seconds in an hour is to the number of seconds in the sand glass (usually 28), so is the length of a sea-mile to the length of a knot. This gives 47 feet 4 inches. Previous to marking the log-line it is soaked in water for a few days, to get it in the condition it is when in use; about fifteen or twenty fathoms of "stray-line" is marked off by a piece of colored bunting, and each length of 47 feet 4 inches after that by a piece of fish-line with one, two, or three, etc., knots in it, as may be required; each division is subdivided into five equal parts, and a small piece of rag or bunting marks the two-tenths divisions thus formed. The knot or sea-mile is 6083 feet or 1.15 statute mile.

KNOT. See SANDPIPER.

KNOT-GRASS. See POLYGONÆ.

KNOTS of different kinds are borne by different families as heraldic badges, and are occasionally introduced as charges in shields. The forms of some of them appear to be suggested by the initial letter of the name or title of the bearer. In the Wake and Ormonde knot it is not difficult to trace a *W* and two *O*s. The Bouchier knot, as seen on the tomb of archbishop Bouchier, at Canterbury, bears a resemblance to two *B*s, and the Stafford knot to two *S*s. The Lacy knot contains within it a rebus on the four letters of the name Lacy.

KNOTT, a co. in eastern Kentucky, formed 1884 from parts of Floyd, Letcher, Perry, and Breathitt; about 365 sq.m.; pop. '90, 6489. It is bounded on the e. by the Kentucky ridge of mountains, and drained by branches of the Kentucky river. Co. seat, Hindman.

KNOTT, JAMES PROCTOR, b. Ky., 1830. After studying law he removed to Missouri in 1850, and ten years afterwards was attorney-general of that state. In 1862 he returned to Kentucky, and was elected to congress by the democratic party in 1866, 1868, and 1870, and from 1874 to 1880 inclusive. He earned notoriety by several humorous speeches, especially by one in which he ridiculed the town of Duluth, Minn., which

at that time was just rising into importance and demanding large appropriations from the government. He was gov. of Kentucky, 1883-87.

KNOWLES, JAMES DAVIS, 1798-1838; b. Providence, R. I.; graduated at Columbian college, D. C., in 1824. In 1825 he became pastor of the Second Baptist church in Boston, where he remained until 1832, when he accepted an appointment as professor of sacred rhetoric in the Newton (Mass.) theological institute. He published memoirs of the first Mrs. Adoniram Judson (Ann Hasseltine), missionary to Burmah, India, and of Roger Williams, and was for some time editor of the *Christian Review*.

KNOUT, properly *knut*, a scourge composed of many thongs of skin, plaited, and interwoven with wire, which was formerly the favorite instrument of punishment in Russia for all classes and degrees of criminals. The offender was tied to two stakes, stripped, and received on the back the specified number of lashes; 100 or 120 were equivalent to sentence of death, but in many cases the victim died under the operation long before this number was completed. If a culprit survived this punishment he was banished for life to Siberia. The whipping was inflicted by a criminal, who preferred this office to exile to Siberia, and who was constantly kept in prison, except when his services were required. The nobility were legally exempt from the knout, but this privilege was not always respected. In earlier times the nose was slit, the ears were cut off, and the letter V for *vor* (rogue) was branded on the forehead; but this aggravation was abolished by Alexander I. The knout was abolished by the emperor Nicholas, who substituted the *pleti*, a kind of lash. The word is pronounced *kénoot*.

KNOWLEDGE. This term of common use is associated with the greatest problems and controversies of philosophy. The perception of the external or material world (see COMMON SENSE; PERCEPTION), the nature of belief (see BELIEF), the ultimate analysis of a proposition or judgment (see JUDGMENT), are all involved in the discussion of what is meant by knowledge. Moreover, we may, in connection with this word, take up the consideration of thought or intelligence on the whole, in contrast to the feelings and volitions (see INTELLECT). In a still different phase of meaning, we may be led to consider the nature of science or philosophy, which is a species of knowledge distinguished by the two features of being *generalized*, as distinct from individual or particular facts, and being *verified* or attested by careful evidence, in contrast to the loose assertions that satisfy the ordinary run of mankind.

A distinction, considered by sir W. Hamilton and others to be of great importance in metaphysical philosophy, is that of immediate or presentative, and mediate or representative knowledge. The one is the knowledge or cognizance that we have of the modifications of our own minds, so to speak, without inferring anything beyond, as in our various sensations and emotions. When we are affected by cold or heat, hunger, thirst, odor, or sound, we are conscious of a something, which may be said to be wholly contained in our own minds; but when a present modification of the mind is looked upon not for its own sake, but as bodying forth something more than itself, as in memory, our knowledge is then said to be mediate. Thus, an actual sensation is immediate, but a recollection, or idea, or imagination is mediate and representative. Mr. Mansel makes this distinction the basis of his division of the mind. "Consciousness," he says, "in its relation to the person conscious, is of two kinds; or rather, is composed of two elements—the presentative, or intuitive, and the representative, or reflective. The phenomena of the former class may be distinguished by the general name of *intuitions*; those of the latter, by that of *thoughts*."

It will appear from the above remarks that there is no question connected with knowledge that does not fall to be discussed under some other head; and as a general rule, it is best to take up the difficult problems of the philosophy of mind under those names that severally suggest each in its singleness, instead of confusing a multitude together.

KNOWLES, JAMES SHERIDAN, an English dramatist, was the son of James Knowles, an eminent teacher of elocution, and author of a *Dictionary of the English Language*. He was born at Cork in 1784. The family removed to London in 1792, and here young Knowles received his education. After holding for some time a commission in the army, he became an actor, and made his first appearance at the Crow Street theater, Dublin; but he never attained much eminence in this profession. Subsequently, he lived for several years in Belfast and Glasgow, as a teacher of elocution, and it was at this time he laid the foundation of his fame as a dramatist. His *Caius Gracchus* was first performed at Belfast in 1815. It was followed by *Virginus*, his most effective piece, afterwards recast for the London stage, where Macready took the principal part. He wrote thirteen other plays, but none of his productions exhibit great genius; they are, however, unquestionably the best "acting plays" produced by an Englishman in modern times. About the year 1845 he relinquished the stage from religious scruples, and in 1852 joined the Baptist body. He latterly distinguished himself by his religious zeal. In 1851 he published a little controversial work, displaying considerable acuteness, *The Idol Demolished by its own Priest*, in answer to cardinal Wiseman's lectures on transubstantiation. Knowles died at Torquay in 1862. A publication of his *Lectures on Dramatic Literature* began in 1876.

KNOWLTONIA, a genus of south African plants, of the natural order *ranunculaceae*, with flowers resembling those of *Adonis*, and succulent fruit. *K. vesicatoria*, which has bi-ternate leathery leaves, and flowers in few-flowered umbels, is remarkable for its acidity and blistering power. The bruised leaves are used at the cape of Good Hope instead of cantharides; they raise a blister in half an hour, and it keeps open a long time. The sliced root seems to be still more powerful.

KNOW-NOTHINGS, a secret political society, organized in the United States in 1853, which rapidly gained the ascendancy in several states, and then as rapidly declined. Its principles and objects as set forth in a convention of the party in New York in 1855, were as follows: "The Americans shall rule America; the union of these states; no north, no south, no east, no west; the United States of America, as they are, one and inseparable; no sectarian interferences in our legislation, or in the administration of American law; hostility to the assumption of the pope, through the bishops, etc., in a republic sanctified by Protestant blood; thorough reform in the naturalization laws (requiring 21 years' residence of all foreigners previous to voting); free and liberal educational institutions for all sorts and classes, with the Bible, God's holy word, as a universal text-book." Strenuous efforts were made, by means of the new excitement created by this society, to supersede the antislavery agitation, which was then rapidly increasing; but in 1856 the latter swallowed up the former, and the larger portion of the know-nothings united with the republicans in nominating John C. Fremont for president, a minority presenting Millard Fillmore as their candidate. This division was fatal to the organization, which soon afterwards fell to pieces and has never been renewed. In 1855 a society called "know-somethings" was formed to oppose the one herein described, but it shared the fate of the earlier association.

KNOX, a co. in n.w. Illinois; 720 sq.m.; pop. '90, 38,752. It contains considerable deposits of coal, and has a fertile soil. Agriculture is the chief occupation, but there is much manufacturing of carriages, saddlery, brick, and hardware. The Atchison, Topeka and Santa Fé and other railroads pass through. Co. seat, Galesburg.

KNOX, a co. in s.w. Indiana, bordering on Illinois; 510 sq. m.; pop. '90, 28,044. Agriculture is the principal pursuit. The surface is level and fertile. Co. seat, Vincennes.

KNOX, a co. in s.e. Kentucky, on both sides of the Cumberland river; 350 sq. m.; pop. '90, 13,762. It is mountainous, with deposits of iron, coal, and salt. The chief products, besides live stock, are corn, oats, wheat, and potatoes. Co. seat, Barbourville.

KNOX, a co. in s. Maine, bounded e. by Penobscot bay, s. by the Atlantic; intersected by the Medomac river, and comprises several islands; 328 sq. m.; pop. '90, 31,473. The surface is uneven, the soil fertile. The staples are potatoes, hay, and butter. A part of the population are engaged in navigation and the fisheries. The county has extensive quarries of limestone, and much lime is exported. There are numerous manufacturing for carriages, saddlery, and woolen goods, many tanneries, and flour and saw mills. The Maine Central railroad connects Bath with Rockland, the co. seat.

KNOX, a co. in n.e. Missouri; traversed by the Quincy, Omaha and Kansas City railroad; 510 sq. m.; pop. '90, 13,510. The surface is nearly level, with considerable timber. The soil is very fertile, and much wool, tobacco, and grain are raised. Brick and carriages are made. Co. seat, Edina.

KNOX, a co. in n.e. Nebraska, on the Missouri and Niobrara rivers; 1100 sq. m.; pop. '90, 8582. The soil is adapted to grazing and raising of grain. Co. seat, Niobrara.

KNOX, a co. in central Ohio, drained by the Vernon, Walhonding and north fork of the Licking rivers; traversed by the Baltimore and Ohio and the Cleveland, Akron and Columbus railroads; 527 sq. m.; pop. '90, 27,600. It has an undulating surface and fertile soil. The chief products are wheat, oats, maize, potatoes, tobacco, wool, butter, and pork. A large quantity of maple-sugar is made. There are numerous factories for carriages, sash, blinds and doors, tin, copper, and sheet-iron ware, and woolen goods; also tanneries, and flour and saw mills. Co. seat, Mount Vernon.

KNOX, a co. in e. Tennessee; traversed by the Holston river, whose valley is exceedingly fertile; 520 sq. m.; pop. '90, 59,557. The surface is diversified by several mountain ridges; and iron and marble abound. The raising of cattle is an important industry, and grain, wool, and tobacco are largely produced. It is intersected by the railroads which run into Knoxville. Co. seat, Knoxville.

KNOX, a co. in n. Texas, drained by the Brazos river; 900 sq. miles. The surface is uneven, with some prairie. Pop. '90, 1134. Co. seat, Benjamin.

KNOX, HENRY, 1750-1806; b. Boston, where he was engaged in business as a book-seller up to the outbreak of the revolutionary war. He was present at the battle of Bunker Hill as an aid to Gen. Artemas Ward, and soon afterwards joined a regiment of artillery. He was soon placed in charge of artillery in New York, upon whose evacuation he took part in the campaign in New Jersey, where by his skillful handling of the artillery he prevented Cornwallis from passing the Assumpink river, and the next day, Jan. 3, 1777, he took part in the engagement at Princeton. He was promoted to a brig-

adier-generalship, and took a prominent part in the battles at Brandywine, Germantown, and Monmouth, and at the siege of Yorktown. He was made a maj.gen., and after hostilities had ceased he superintended the disbandment of the army. He was secretary of war (which office included at that time the supervision of the navy) from 1785 to Dec., 1794. Upon his retirement from office he settled on his estates in Maine.

KNOX, JOHN, the great Scottish reformer, was b. in the year 1505, in a suburb of Haddington called Gifford Gate, where a small field still goes by the name of "Knox's Croft." The social position of his parents is not very clearly ascertained. His own statement is that "his great-grandfather, gudesire, and father served under the earls of Bothwell." He is supposed to have come of an old and respectable family, the Knoxes of Ranfurly, in Renfrewshire. He received his early education at the grammar-school of Haddington, and in the year 1521 went to the university of Glasgow. He was there a pupil under Major, and soon proved himself an apt and distinguished disputant in the scholastic theology. He was considered as likely to rival his master in the subtleties of the dialectic art. From the same teacher he no doubt derived his first impulse to that freedom of political opinion and independence of thought that afterwards characterized him. He is said to have been ordained before the year 1530, about which time, or shortly afterwards, he went to St. Andrews and began to teach there. There is, however, at this stage of his life a gap of 12 years, or nearly so, which the most careful research has hitherto failed to fill up. His attachment to the Romish church is supposed to have been shaken chiefly by the study of the fathers, about 1535; but he did not openly profess himself a Protestant till 1542. He was degraded from his orders, and being even in danger of assassination, took refuge with Douglas of Longniddry, and there remained till the end of 1545.

Cardinal Beaton was at this time in the height of his power; after seizing George Wishart at Ormiston he had him brought to St. Andrews, and burned there, in front of his castle, Mar., 1546. Knox first clearly appears upon the scene of the reformation as the companion of Wishart. While the latter prosecuted his career as a preacher in Lothian, Knox waited upon him, bearing before him, he tells us, a "two-handed sword." He already coveted the post of danger, and, full of enthusiasm, was ready to defend his zealous friend at the peril of his own life. After Wishart's seizure and death he withdrew for awhile again into retirement. He would fain have clung to the martyr, and shared his fate, but the latter would not have it so. "Nay," he said; "return to your bairnes, and God bless you: ane is sufficient for a sacrifice." Knox's "bairnes" were his pupils, the sons of the lairds of Longniddry and Ormiston. He continued in charge of them for some years, till the great event which ere long followed the martyrdom of Wishart opened up a more prominent career for him. On the morning of May 29, 1546, cardinal Beaton was murdered in his castle, from the windows of which he had contemplated the sufferings of the martyr. Taken possession of by the band of nobles and others who had successfully accomplished so audacious a design, the castle at St. Andrews became the temporary stronghold of the reforming interest. Knox took refuge in it with his two pupils. Here his great gifts as a preacher were first discovered; and having found the secret of his influence the parish church of St. Andrews soon resounded with his indignant voice, denouncing the errors of popery. His career at this time, however, was soon cut short by the surrender of the fortress, and his imprisonment in the French galleys.

For two years he remained a prisoner, and underwent, in the course of this time, many privations. He was then liberated and allowed to depart to England, where he resided for four years, from 1549 to the beginning of 1554, a time of great and fruitful activity to him. He was appointed one of Edwards VI.'s chaplains, and lived on terms of intimate intercourse with Cranmer and others of the English reformers. He is supposed to have had considerable influence on the course of the English reformation, especially in regard to the liberal changes introduced into the service and prayer book of the church of England in the close of Edward's reign. He was much engaged in preaching, especially in the north, in Newcastle and Berwick; and at the latter place he fell in love and married.

The accession of Mary drove him and others to the continent. He was reluctant to flee, but "partly by advice and partly by tears" he was compelled to consult his safety. He settled temporarily at Dieppe, whence we hear of him writing an *Admonition to the Professors of God's Faith in England*. He then went into Switzerland, and, returning, settled for some time at Frankfort-on-the-Main, where he is notable in connection with what are known as the "Frankfort troubles," certain disputes as to the use of king Edward's service-book in the congregation of English Protestants there. Towards the end of 1555 he made a rapid visit to Scotland, where he did much to encourage the cause of the reformation. Convinced, however, that the "time of deliverance" was not yet come for his country, he retired once more to Geneva, where he settled as pastor of a congregation for nearly three years, which were among the quietest, and probably the happiest years of his life.

Recalled to Scotland in May, 1559, he then entered upon his triumphant course as a reformer. Political necessities had driven the queen-regent to temporize with the "lords of the congregation," or the reforming nobles. Having somewhat re-established

her power she wished to withdraw her concessions; but the reforming impulse had gathered a strength that could no longer be resisted. The heads of the party assembling at Dundee, under Erskine of Dun, proceeded to Perth. There the pent-up enthusiasm which had been long collecting was roused into furious action by a sermon of Knox on the idolatry of the mass and of image-worship. A riot ensued. The "rascal multitude," as Knox himself called them, broke all bounds and destroyed the churches and monasteries. Similar disturbances followed at Stirling, Lindores, St. Andrews, and elsewhere. The flame of religious revolution was kindled throughout the country, aggravating the civil war already raging. At length the assistance of Elizabeth and the death of the queen-regent brought matters to a crisis; a truce was proclaimed, and a free parliament summoned to settle differences. The result of the parliament, which met in Aug., 1560, was the overthrow of the old religion, and the establishment of the reformed kirk in Scotland. In all this Knox was not only an active agent, but *the* agent above all others. The original *Confession of Faith* of the reformed kirk and the *First Book of Discipline* bear the impress of his mind. He was far from attaining all his wishes, especially as to the provision for the support of the church and of education throughout the country; he soon found that many of the nobles were far more zealous for destruction than for reformation; still he accomplished a great and radical work, which was only destined to be consolidated after many years.

The arrival of the youthful queen Mary, in the course of 1561, brought many forebodings to the reformer; he apprehended great dangers to the reformed cause from her character and her well-known devotion to the Romish church. The reformer's apprehensions scarcely permitted him to be a fair, certainly not a tolerant, judge of Mary's conduct. Misunderstandings very soon sprung up between them, and he relates, with a somewhat harsh bitterness, his several interviews with her. At length he came to an open rupture with the queen's party, including Murray and Maitland, and many of his former friends. He took up an attitude of unyielding opposition to the court, and in his sermons and prayers indulged freely in the expression of his feelings. The result was his temporary alienation from the more moderate Protestant party, who tried to govern the country in the queen's name. For a while, from 1563 to 1565, he retired into comparative privacy.

The rapid series of events which followed Mary's marriage with Darnley—the revolt of the dissatisfied nobles, with Murray at their head, the murder of Rizzio, and then the murder of Darnley (1567), the queen's marriage with Bothwell, her defeat and imprisonment, served once more to bring Knox into the field. He was reconciled with Murray, and strongly abetted him in all his schemes of policy during his regency. Further reforms were effected by the parliament which convened under his sway in the close of 1567. It was thought that the sovereign was bound to be taken as a Protestant, and some provision, although still an imperfect one, was made for the support of the Protestant clergy. Knox seemed at length to see his great work accomplished, and is said to have entertained the idea of retiring to Geneva. But the bright prospect on which he gazed for a little was soon overcast—Murray's assassination, and the confusion and discord which sprang out of it, plunged the reformer into profound grief. He once more became an object of suspicion and hostility to the dominant nobles, and misunderstandings even sprung up between him and some of his brethren in the general assembly. He retired to St. Andrews, for a while, to escape the danger of assassination with which he had been threatened. There, although suffering from extreme debility, he roused himself to preach once more, and in the parish church where he had begun his ministry, made his voice to be heard again with something of its old power. Assisted by his servant, the "good, godly Richard Ballenden," into the pulpit, "he behoved to lean upon it at his first entry; but ere he was done with his sermon, he was so active and vigorous that *he was lyke to ding the pulpit in blads and fie out of it.*"

In the end of 1572 he returned to Edinburgh to die; his strength was exhausted; he was "weary of the world," he said; and on Nov. 24 he quietly fell asleep.

Knox's character is distinguished by firmness and decision, and a plain, somewhat harsh sense of reality. He was a man of strong, and even stern convictions, and he felt no scruples, and recognized no dangers in carrying out his convictions. He was shrewd, penetrating, inevitable in his perceptions and purposes. No outward show or conventional pretense deceived him; he went straight to the heart of everything; and consistently with this clear and rough shrewdness of perception, his language is always plain, homely, and many will say harsh. He had learned, he himself says, "to call wickedness by its own terms—a fig, a fig; a spade, a spade." Above all, he was fearless; nothing daunted him; his spirit rose high in the midst of danger. The earl of Morton said of him truly as they laid him in the old churchyard of St. Giles: "He never feared the face of man." In Scotland Knox, no doubt, accomplished a great work. Whether the work would not have been better if it had been less violently done, if the spirit of love and moderation, as well as the spirit of power, had presided over it, is a question regarding which there may be much division. But even if we should take exception to some things he did or encouraged, we may admire the consistent boldness, the deep earnestness, and the self-denying, unflinching zeal of the great reformer.

KNOX, JOHN JAY, 1828-92; b. Knoxboro, N. Y.; graduated at Hamilton coll., 1849; made a study of finance, and was an early advocate of the national banking system.

He was sent by Sec. McCullough to San Francisco to make an examination of the branch mint in that city. He codified the mint and coinage laws of the U. S., 1870, and succeeded in bringing about the discontinuance of the coinage of the silver dollar. He acted as asst. treasurer of the U. S. in New Orleans, and rendered valuable services to the government by his discovery of the enormous defalcation of \$1,100,000 in the previous management of that office. Mr. K. was appointed deputy controller of the currency, and was elevated to the controllership under Pres. Grant. As the result of his endeavors, the asst. treasurer of the U. S. has been admitted to the clearing house; and legal tender notes are received in the clearing house on an equality with coin. He was also successful in negotiating U. S. bonds to expedite the resumption of specie payments. He retired from office, 1884, to accept the presidency of the First National Bank, New York.

KNOX, VICESIMUS, D.D., 1752-1821; b. Middlesex; graduated at Oxford; master of Tunbridge school, Kent, for 33 years, and for a long time rector of several parishes. He was admired as a preacher. His chief works were: *Essays, Moral and Literary; Liberal Education; Considerations on the Lord's Supper; Christian Philosophy*, which passed through numerous editions; *Sermons; Elegant Extracts in Prose and Verse*. His complete works were published in 7 volumes.

KNOX COLLEGE, at Galesburg, Knox co., Ill., was chartered in 1837, organized in 1841. In 1897 it had 34 instructors, over 700 students, and a library of 8000 volumes. It admits students of both sexes. The college celebrated Oct. 7, 1896, with exercises of national interest, the 38th anniversary of the Lincoln-Dayles Debate, held on its grounds in 1858. The Abraham Lincoln school of science and practical arts has been established in connection with the college, under the special patronage of S. S. McClure. President, 1897, John H. Finley, A.M.

KNOXVILLE, city and co. seat of Knox co., Tenn.; on the Tennessee river and the Atlanta, Knoxville and Northern, the Knoxville and Augusta, the Knoxville, Cumberland Gap and Louisville, and the Southern railroads; 111 miles n.e. of Chattanooga. It was founded in 1792; was the State capital in 1796-1811; received its city charter in 1816; and was enlarged by the incorporation of West Knoxville in 1888 and North Knoxville in 1889. The city contains a U. S. government building, the State university with agricultural experiment station, Eastern State insane asylum, State deaf and dumb institution, several public parks, of which Lake Ottosee and Fountain City are the most noteworthy, Knoxville college for colored students (Unit. Pres.), East Tennessee institute, the Austin (colored), Girls', East and West high schools, the Lawson McGhee Memorial, Southern, County, and college libraries, Tennessee medical college, and electric light, electric street railroad, water, and sewerage plants. The manufacturing industries employ over 5,000 persons, and include the principal shops of the Southern railroad, woolen mill, several marble works, brick, lime, and cement works, foundry, boiler, machine, and engine shops, knitting mills, etc. The associated business interests are represented by the chamber of commerce and the commercial club. There are about 50 churches, several national and state banks, national and confederate cemeteries, and daily, weekly, and monthly periodicals. Pop. '90, 22,535.

KNYPHAUSEN, WILHELM, Baron, 1716-1800; b. Lützberg; a German soldier, distinguished in the wars of Frederick the Great against Austria. In the American revolution he received command of Hessian and Waldeck troops, participating in the battles of Long Island, White Plains, Fort Washington, Monmouth, and Brandywine. In the absence of sir Henry Clinton in 1780 he had command of the British troops in New York, and made two raids into New Jersey with 5,000 men, accomplishing, however, little more than the sacking of Connecticut Farms and the burning of Springfield, N. J.

KO'ALA (*Phascogaleos cinereus*), a marsupial quadruped, commonly referred to the family *phalangistidae* and pretty nearly resembling the phalangiers in dentition, but having the molar teeth much larger. The toes of the fore-feet are in two opposable groups, of two and three, a character not found in any other quadruped, but well adapted to grasping the branches of trees, on which the koala often hangs with its back undermost, like the sloth. There is scarcely any rudiment of a tail. The general form is not unlike that of a young bear. The female carries her young on her back for a long time after it is capable of leaving her pouch.

KO'B'E, a t. of central Africa. See DARFUR.

KOBOLDS. See GOBLINS AND BOGLES.

KO'BRIN, or KOBYRN, a t. of Russian Poland, in the government of Grodno, 139 m. e. from Warsaw, on the right bank of the Mukhavets, a tributary of the Northern Bug. It is favorably situated for commerce—the Mukhavets, and along with it the Bug and Vistula, being here connected by a canal with the Pripet, and thus with the Dnieper. There is a Greek abbey here. Pop. 9,900.

KOCH, KARL HEINRICH EMMANUEL, a celebrated traveler and naturalist, was born at Weimar in 1809. He studied at the universities of Würzburg and Jena, and in 1836 undertook a scientific journey to southern Russia, completing his researches in a second journey, which he performed in 1843, this time visiting also Turkey, Armenia, Pontus, the Caspian sea, and the range of the Caucasus. In 1836 he was appointed professor of botany in the university of Jena. The most important of his works are: *Monographia generis Veronica* (Würzburg, 1833); *Reise durch Russland nach dem Kaukasischen Isthmus* (Journey through Russia as far as the Isthmus of the Caucasus, Stuttgart, 1842-43). His second journey supplied the materials for *Wanderungen im Oriente* (Wanderings in the East, Weimar, 1846-47), the third volume of which was reprinted in 1854 under the title

of *The Crimea and Odessa*. Besides these he wrote about nine other works on geography, botany, and topography. He d. 1879.

KOCH, ROBERT, M.D., born 1843; discoverer of the *contagium* of splenic fever. He held a small appointment at Wollstein, an obscure village in Germany, till 1880, when he accepted a position on the board of health of Berlin. As the chief of the Sanitary Institute of Berlin, he prosecuted his studies in the *contagia* of consumption and cholera. He succeeded in cultivating the tubercle bacillus removed from the diseased lung; and produced tuberculosis in animals by inoculation. Koch and his supporters claim that each disease is caused by a specific micro-organism; while other equally able physicians contend that these organisms are merely illustrative phenomena, and wholly without causative functions. In experiments upon mice and rabbits, Koch discovered that the injection of diseased blood produced traumatic septicemia only upon house-mice, finding also that the micrococci in the blood of these animals were identical in form and character with those in the blood used for injection. A certain form of bacillus was found to destroy the tissues of the organs. The subcutaneous tissues of rabbits injected with the infected fluid were covered with abscesses which eventually brought death. The matter of these abscesses, which were full of the *zooglæa* micrococci, when given in a diluted form to healthy subjects, invariably produced the disease. Koch produced erysipelas in the same way. The infectious character of consumption had been known for a long time before the birth of Koch; but to him belongs the credit of discovering its specific germ. The tubercle bacilli are distinguished from others by marked characteristics; and they are said to be invariably present in the early stages of the disease. Koch finds these bacteria in the sputum of those suffering from phthisical maladies, and claims that they are thus inhaled into the lung. He was the chief of the German commission in India. His government awarded him 100,000 marks for his discovery of the microbe. In November, 1890, it became generally known that Dr. Koch had discovered and tested by a series of careful experiments, a compound substance which, administered by injection hypodermatically, was destructive of the tubercle bacilli, and hence presumably a swift and certain cure for tuberculosis. The excitement throughout the world attendant upon this announcement was very great. Physicians from all countries flocked to Berlin; consumptive patients traveled thither in the hope of a certain cure. Dr. Koch and his assistants were importuned for phials of the "lymph," as the substance was called. The German government proposed to establish a great hospital for the treatment of consumption by the new method, under the direction of its discoverer. Amid all this clamor, Koch remained for a long time silent as to the method of preparing the "lymph," and singularly conservative in the claims that he made of its efficacy. In January, 1891, he put forth a statement concerning the nature of his lymph, which, while not giving all the details of its preparation, made it evident that it was itself prepared from the bacilli. The essential parts of his statement will be found in the article **TUBERCULIN**. The lymph, or, as he preferred to call it, the paratoloid, is a poison and must be used with great caution. The reaction consequent upon its use is so marked as to lead many physicians to doubt its ultimate advantages. Prof. Billroth stated (Dec., 1890) that with three patients the reaction seemed so dangerous as to force him to discontinue the treatment. Dr. Schroetter of Vienna (Jan., 1891) and Dr. Crocq of Brussels confirm this statement from their own experience. The value of the discovery must, therefore, be regarded as yet in doubt, though the German government began erecting the Koch Institute for Consumptives with an immense laboratory and 150 beds. See **BACILLUS TUBERCLE**; **GERM THEORY OF DISEASE**; **LYMPH**; **MICROBE**; **TUBERCULIN**.

KOCK, CHARLES PAUL DE, French novelist and dramatic author, was born at Passy in 1794 and died at Paris, 1871. His father was a Dutch banker who died upon the scaffold during the Reign of Terror, having been denounced as a foreigner unfriendly to the republic. His brother remained a subject of Holland, and at the time of his death was Minister of the Interior at the Hague. Paul de Kock, however, remained all his life a French citizen; and beginning life as a banker's clerk, soon abandoned this occupation for literature in which he won speedy success as an accurate delineator of certain phases of Parisian life. His earliest work was the novel *L'Enfant de ma Femme*, published in 1813. This was followed by an unbroken succession of stories, tales, romances, and vaudevilles, of which the titles of more than one hundred are given by La Rousse, and in the production of which he continued until the last year of his long life. His first marked success was won by his novel *Georgette* (1820), and this success was repeated and emphasized in the following works which are among the most popular of his writings: *André le Savoyard* (1825); *Le Barbier de Paris* (1826), a novel that has been translated into every European language; *La Femme, le Mari, et l'Amant* (1829); *Le Cocu* (1831); *Zizine* (1836); *Physiologie de l'Homme Marié* (1841); *La Jolie Femme du Boulevard* (1841); *Sans Cravate* (1844); *L'Amour qui passe et l'Amour qui vient* (1849); *L'Enfant du Boulevard* (1863); *La Femme, le Jeu et le Vin* (1864); *Le Sentier aux Prunes* (1865). Of his vaudevilles, most of which were adapted from his novels, the best known are *Une Nuit au Château* (1818); *M. Mouton* (1820); *Époux de quinze Ans* (1821); *Le Jour de Noces* (1821); *Le Commis et la Grisette* (1834); *La Femme à deux Maris* (1847). In 1865, he published a volume of *chansonnettes* entitled *Flon, Flon, Flon*. His earliest dramatic work was a formal play in three acts, *Madame Valvoir* (1814). He collaborated occasionally with Camouchar, Guérault, and others.

The very titles of de Kock's productions are suggestive of his tone and literary motive. He is essentially a *genre* painter of the peculiar Parisian life that is familiar to the inhabitants of the Quartier Latin, and which to-day centres about the Boulevard St. Michel, the Chat Noir, and the Moulin Rouge, so that he has been well styled the Charles de Bernard of low life. Clerks, students, *petits bourgeois*, commercial travelers, and grisettes, move through his pages as in life, with all the true French *abandon* and vivacity. He is not nice; he allows himself a license of language and a freedom of innuendo that seem at first acquaintance evidence to the Anglo-Saxon mind of utter moral depravity. Yet the drollery and rich humor of some of the scenes go far to redeem them from condemnation, and there is none of the cynical pessimism that renders the works of modern writers like de Maupassant and Mendès so corrupting. Making due allowance for the difference in national temperament and manners, it is doubtful whether de Kock is morally more censurable than Fielding and Smollet to whose school of literary portraiture he belongs.

His weak point is his style, which is very faulty, though perhaps from its very defects characteristic of the writer, in that the language is the French of the boulevards and cafés rather than of literature. In his *Moustache*, he has described the criticism of this sin in the following words: "Because I make a workman speak like a workman, and a grisette like a grisette, they say that I do not know how to write." But his critics reply that their objection is not to this, but rather that when the author speaks in his own person his language is that of a workman or a grisette. In spite of this criticism, however, de Kock remains a writer whose works will always possess much value to the student of Parisian life in the nineteenth century; and he has in fact been so closely identified with Paris, that his biographers always repeat the story of how a famous monarch on receiving a French ambassador, commenced the conversation with, "So you are just from Paris and must be informed about the novelists. How is M. Paul de Kock?"

KOCK, HENRI DE, author, son of the preceding, was b. in Paris in 1819. In addition to editing a number of minor literary journals he has written many novels, among them *Le Roi des Étudiants*; *La Belle Créole*; *Les Amants de ma Maîtresse*; and *Minette*. He is joint author of several dramas: *Histoire de Paris*; *Les Grands Siècles*; *Les Frères de la Côte*; *Ratée* (1884); *Les Douze Travaux d'Ursule* (1885). He d. in 1892.

KOEK KOEK, BERNARD CORNELIS, 1803-62; b. in the Netherlands; studied painting under his father and at Amsterdam. In 1841 he went to reside at Cleves in Rhenish Prussia. He was a landscape painter and his work holds high rank.

KOENIG, GEORGE AUGUSTUS, chemist, b. in Willstedt, Baden, Germany about 1845. Studied engineering in Karlsruhe, Heidelberg and Berlin. Coming to the U. S. in 1868 he took up industrial chemistry, and in 1886 was appointed professor of mineralogy and metallurgy in the university of Pennsylvania.

KOH-I-NŪR (Mountain of Light), the name of a large diamond now in the possession of her majesty queen Victoria. According to Hindu legend it was found in a Golconda mine, and its possessors have, with few exceptions, been the rulers of Hindustan. After belonging successively to the Bahmani, Khilji, Lodi, and Mogul kings, it came, in 1739, into the hands of Nadir Shah, who gave it its present designation. From him it went to the Abdāli monarchs of Afghanistan, the last of whom, Shah Sujah, gave it to Runjeet Singh, the ruler of the Punjab. On the abdication of the maharajah Dhuleep Singh, and the annexation of the Punjab in 1849, it was surrendered to the sovereign of Great Britain. It is said to have weighed originally 900 carats, but, after being cut, was reduced to 279 carats. It was reduced by recutting to 186 carats, and in this state was shown at the great exhibition of 1851; since which time it was again recut in 1852, and now weighs about 106 carats, and has been valued at \$600,000. The Koh-i-nūr is rose-cut. See Streeter's *Precious Stones and Gems*. See illus., DIAMONDS, vol. IV.

KOHL-RABI, or, more properly, KOHL-RÜBE (Germ. Kale-turnip, similarly called *Chou Rave* by the French), a cultivated variety of the kale or cabbage (*brassica oleracea*), distinguished by the swelling of the stem just above the ground, in a globular form, to the size of a man's fist or larger, leaf-stalks springing from the swollen part, and adding to the peculiarity of its appearance. This is the part which is used, and its uses are similar to those of the turnip. In quality it more nearly resembles the Swedish than the common turnip, and the use of it for feeding cows does not give their milk a disagreeable flavor, as when they are fed on turnips. Kohl-rabi is very hardy, its leaves, as well as its stem and root, enduring the most severe winters, although in Britain its cultivation has hitherto been chiefly in the s. of England. It is a common field-crop in Sweden. In the cultivation of kohl-rabi, it is usual to sow it on seed-beds, and to transplant by dibbling into fields; but this is perhaps not the best mode. It ought, however, to be sown earlier than even Swedish turnip; and raised drills are unsuitable for it, owing to the effect of winds. It is more solid and more nutritious than any kind of turnip of the same size. There are numerous sub-varieties. Kohl-rabi, like all the varieties of *brassica oleracea*, delights in a strong rich soil and abundant manure.

KO'KOMO, a city and co. seat of Howard co., Ind.; on the Wildcat river and the Pittsburg, Cincinnati, Chicago and St. Louis, the Toledo, St. Louis and Kansas City, and the Lake Erie and Western railroads; 54 m. n. of Indianapolis. It contains a high school, public library, city park of 38 acres, electric light and street railroad plants, waterworks supplied from driven wells, and national banks, and has manufactories of

glass, pottery, wood pulp, paper, furniture, foundry and machine shop products, planed lumber, etc. Pop. '90, 8,261.

KOKRA WOOD, or **COCUS WOOD**, the wood of an Indian tree, *lepidostachys roxburghii*, which belongs to a very small natural order, *scapaceæ*, remarkably allied at once to *euphorbiaceæ* and to *amentaceæ*. Kokra wood is imported into Britain in logs of 6 or 8 in. in diameter, having the heart wood of a rich deep brown color and very hard. It is much used in the manufacture of flutes and other musical instruments. The kokra tree has leathery, alternate leaves.

KOL'A, a place of only (1885) 765 inhabitants, but worthy of notice as the most northern t. of European Russia, and except Hammerfest, in Norway, the most northern in Europe. It is situated between the Kola and its tributary, the Tuloma, not far from the icy sea, and has a secure and capacious harbor. The inhabitants are Russians, Lapps, and Finns, and are chiefly occupied with walrus, whale, and cod fishery.

KOLA NUT. See **COLA NUT**.

KOLAPUR' is the principal t. of the tributary state of the same name within the presidency of Bombay, 130 m. to the s. of Poona. The pop. in '91 was 45,800. The raj, or state, has an area of 2,816 sq. m., and contains 913,000 inhabitants, composed of Mah-rattas and Ramusis. Since 1844, when the East India company virtually took possession, Kolapur has considerably advanced in prosperity.

KOLB, **GEORG FRIEDRICH**, b. Sept. 14, 1808, at Spires, in Rhenish Bavaria, where, at 22 years of age, he established a liberal journal, which he conducted for more than 20 years, encountering many obstacles from the government. It was by his influence as a member of the Bavarian diet that king Louis I., in 1849, was compelled to reimburse the state treasury for the money which had been lent to his son, king Otho, of Greece. Soon after this the reactionary party came into power, and Kolb took up his residence in Zurich to escape from the persecutions of the Bavarian government. He returned in 1860 and again became the editor of a liberal journal. He was eminent, not only as a politician and journalist, but also as a statistician. He d. 1884.

KOLBE, **ADOLF WILHELM HERMAN**; 1818-84, b. Ellichausen, Göttingen, Germany. He graduated at the univ. of Göttingen, and studied chemistry under Wöhler, 1838-42; was assistant first to Bunsen, afterwards to Sir Lyon Playfair; prof. of chemistry at the univ. of Marburg, 1851-65; and at the univ. of Leipsic from 1865 until his death. He made many original researches in the field of organic chemistry, edited the *Handwörterbuch der Chemie* and the *Journal für praktische Chemie*, and published *A Manual of Organic Chemistry*, 3 vols., 1854-78; *A Short Text-book of Inorganic Chemistry*, 1877; *A Short Text-book of Organic Chemistry*, 1883; etc.

KÖLCSEY, **FERENCZ**, 1790-1838; b. Transylvania. He studied law, but his tastes drew him away to the literary profession. Identifying himself with the movement led by Kazinczy, he exercised a wide influence as a critic, and wrote tales and poems which gained him no little popularity. In 1826 he founded the journal called *Life and Literature*. He was a member of the Hungarian diet from 1832 to 1836, and took rank as one of the most brilliant orators of the country.

KOLLÁR, **JOHN**, one of the most conspicuous Slavic poets and scholars, was b. in 1793 at Mosovce, in the n.w. of Hungary, studied at Presburg and Jena, and in 1819 became pastor of a Protestant congregation at Pesth. His first work was a volume of songs and poems entitled *Basne* (Poems, Prague, 1821); this was followed by his *Slavý Dcera* (The Daughter of Glory, Buda, 1824; 3d ed., Pesth, 1832), regarded by his countrymen as his greatest work; and *Rozprawy o Imenách*, etc. (Treatises on the Name and Antiquities of the Slavic People and their Ramifications, Buda, 1830). Kollar's fame, however, rests more on his being one of the earliest and most zealous advocates of Panslavism (q. v.). The work in which this tendency first appears was written in German, and is entitled *Ueber die literarische Wechselseitigkeit zwischen den Stämmen und Mundarten der Slav.-Nation* (Pesth, 1831). The revolution in Hungary compelled him to abandon his country. He withdrew to Vienna, where he was made professor of archæology in 1849. He died Jan. 29, 1852.

KÖLLIKER, **ALBRECHT**, a German physiologist, was b. 1817, and, 1847, became professor of anatomy and physiology in the university at Würzburg. He is principally distinguished by his labors in the department of microscopic anatomy, and on the development of the embryo; but his contributions to natural history generally are by no means unimportant. Among his principal works must be named his *Mikroskopische Anatomie*; *Handbuch der Gewebelehre des Menschen* (which has been translated for the Sydenham society by Busk and Huxley, under the title of *A Manual of Human Histology*, in two volumes); *Die Siphonophora oder Schwimmpolypen von Messina*; and *Entwicklungsgeschichte des Menschen u. d. höheren Thiere*. In association with Von Siebold, he is also the editor of *Zeitschrift für wissenschaftliche Zoologie*, the most important scientific natural history journal of Germany.

KOLLIN', or **NEU-KOLIN**, a t. of Bohemia, on the Elbe, about 35 m. e. of Prague, with a pop. of, '90, 13,566, is noted for the great battle fought June 18, 1757, in its vicinity, between 54,000 Austrians under marshal Daun, and 30,000 Prussians under

Frederick II. The latter were defeated in spite of the obstinate valor of their monarch, who charged at the head of his cavalry seven times in succession.

KOLLOCK, MARY; artist, b. in Norfolk, Va., in 1840. Studied under Robert Wylie in the Philadelphia Academy of Fine Arts, and also under John B. Bristol. Her paintings "On the Road to Mt. Marcy," "A Glimpse of the Catskills," etc., were exhibited at the National Academy, and "Midsummer in the Mountains" at the Centennial Exhibition of 1876.

KOLOME'A, a t. of Austrian Galicia, is situated on the Pruth, at the base of the Carpathian mountains, 45 m. w.n.w. of Czernowitz. It is a very old town, and formerly carried on an extensive trade. Pottery is still largely manufactured. Pop. '90, 30,235, about half of whom are Jews.

KOLOM'NA, a district t. of Great Russia, in the government of Moscow, is situated 62 m. s.e. of the city of that name, on the river Moskva. It contains 1891, 30,200 inhabitants. There are communications by water between it and Nijni-Novgorod; and a railway passes the town in the direct line through Riazan, from Moscow to the sea of Azov, which has very greatly increased the trade of the district. Weaving, silk-spinning, and cotton-printing are carried on, with manufactures of cotton and leather.

KOLOSHES. See **KADIAKS**.

KOLYMA', a river in eastern Siberia, flowing from the Stanovoy mountains, among which it takes its rise in lat. 61° 5' n. After a n. e. course of 1000 m., it falls into the Arctic ocean in lat. 69° 40' n.

KOLZÓW, ALEXEI VASSILSEVICH, a Russian poet; was the son of a cattle dealer, and was b. in Voronezh in 1809. After a merely rudimentary education, he was employed by his father in feeding cattle on the steppes in summer, and in winter in attending the markets. His familiarity with the scenes of the steppes appears in all his poetry. His love of poetry was early developed, and the talent displayed in some of his earlier effusions, obtained for him the patronage of some of the most zealous cultivators of Russian literature. He was just about to settle in St. Petersburg, and to devote himself exclusively to literary pursuits, when he suddenly died in 1842. A complete edition of his poems, with a biography of the author, was published by Belinsky, in 1846. Consult *The Fortnightly Review* (Sept. 15, 1866); *Westminster Review* (July, 1880). An excellent German translation of his poems appeared in 1885.

KÓMORN, a co. in Hungary. See **COMORN**.

KOMORN, or **COMORN**, a Hungarian city, and contains a famous fortress. The city proper is situated on an island at the point of union of the Waag and Danube rivers, 85 m. from Vienna; pop. '90, 13,076. It has a number of important public buildings, including seven churches, of which four are Roman Catholic, and a synagogue. The manufacture of cannon and small arms is conducted on an extensive scale. The fortress of Komorn dates back to the 15th c., when it was built by the orders of Matthias I. (Corvinus), king of Hungary. The original fortress, however, was afterwards greatly strengthened by the construction of works on both sides of the Danube, têtes-de-pont, and other defenses, rendering it nearly impregnable. Komorn was besieged and captured many times and retaken as many, during the wars between the Ottoman Turks and the Hungarians. Here, too, in 1848-49, occurred the final conflict of the Hungarian war against Austrian domination. Here, after Russian intervention had turned the scale in favor of the house of Hapsburg, Klapka and his gallant comrades resisted during several weeks the Austrian army under Haynau, and only finally capitulated and retired from Komorn when granted all the "honors of war."

KONIAGAS. See **KADIAKS**.

KONG, a name applied to a mountain range, a district and a town, all of which are situated northward from the coast district, in the w. of northern Africa.—The mountains extend from w. to e. at the distance of about 200 m. from the shore of the gulf of Guinea, and are said to be an offset from the high table-land of Senegambia. Little is known regarding them. The highest known summits reach an elevation of only 2,500 feet.—Regarding the Kong district, all we know is, that it is remarkable for the industry of its inhabitants, and for the gold trade which is there carried on.—The town of Kong, in lat. 8° 53' n., and long. 3° 30' w., is situated among hills 540 m. s. of Timbuctoo. It is a large town, and is the center of numerous converging caravan routes. Cotton cloths are extensively manufactured. The French captain Binger, in 1888, was the first European to visit it.

KONGSBERG, a t. of Norway, 47 m. by rail s.s.w. of Christiania, on the river Lauwen; pop. 4,800. A silver mine, discovered here in 1623, has lately been extensively worked. The town has a school of mines, a royal manufactory of arms and powder, and smelting-works for silver and cobalt.

KONIEH, a large t. of Asiatic Turkey, capital of a vilayet of its own name, situated in a rich, well-watered plain, in lat. 37° 54' n., and long. 32° 40' e. It is surrounded by walls from 2 to 3 m. in circuit, built from the ruins of ancient Seljuk edifices, and surmounted by square towers. Its numerous minarets, and its mosques and other public buildings, give it an imposing appearance, but like most of the towns of Asia Minor, it is now in a sadly ruinous condition. Many interesting remains of Saracenic architecture, however, are still to be met with. Konieh is the chief emporium for the products of

the interior. Carpets, gloves, stockings, and colored morocco leather are manufactured. Pop. estimated at from 30,000 to 40,000.

Konieh, the ancient *Iconium*, was famous in ancient times as the capital of Lycaonia. From 1087 to 1299 it was the seat of a Seljuk sultanate. On Dec. 20, 1832, a battle was fought here, in which Ibrahim Pasha completely defeated the Turkish army.

KÖNIG, FRIEDRICH, the inventor of the steam-press, was the son of a respectable citizen of Eisleben, and was b. there April 17, 1774. He became a printer and was also for a short time a bookseller, but was unsuccessful in this business. He eagerly prosecuted literary and scientific studies. Having devoted himself to the invention of means of printing by machinery, he applied in vain for the necessary pecuniary assistance in various quarters, his schemes being rejected as impracticable; but at last Thomas Bensley, a printer in London, came forward to his support, a company was formed, and a patent was obtained on Mar. 29, 1810, for a press which printed like the hand-press by two flat plates, and in 1811 it was first used to print part of the *Annual Register*. A second patent was obtained on Oct. 30, 1811, for a cylinder-press, a third in 1813 for improvements upon it. This improved machine was soon adopted by the proprietors of the *Times*. In the latter part of his life, König was a partner in a company for making steam printing-presses at Oberzell, near Würzburg, in Bavaria. He died Jan. 17, 1833.

KÖNIGGRÄTZ, a t. and fortress of Bohemia, on the left bank of the Elbe, at the confluence of the Adler with that river, 64 m. e.n.e. of Prague. It is the seat of a bishop, and has a beautiful cathedral. The immediate neighborhood can in any emergency be covered with water. Cloth, musical instruments, shoes, and wax-candles are the staple articles of manufacture. This town has become famous in history on account of the signal victory gained by the Prussians over the Austrians in 1866. Pop. '90, 7,816.

KÖNIGINHOF, a small manufacturing t. of Bohemia, on the left bank of the Elbe, 16 m. n. of Königgrätz. Linen and jute weaving, and manufactures of cotton goods are the principal branches of industry. Pop. '90, 8,600.

KÖNIGSBERG, a small t. of Prussia, in the province of Brandenburg, on the Rörke, 45 m. n. of Frankfort-on-the-Oder. Tanning and distilling are the chief branches of industry. Pop. '90, 5,864. Numerous other places in Germany bear this name.

KÖNIGSBERG, an important t. and fortress of Prussia, in the province of Prussia, is situated on both banks of the Pregel, and on an island in that river, 4 m. from its entrance into the Frisches Haff. It consists of the old town and the Löbenicht on the n. bank (the latter of which, in its 7-storied and gabled houses and steep side-lanes, still presents a completely Hanseatic appearance), the Kneiphof on the island (also one of the oldest parts), and numerous suburbs. The Pregel is here crossed by seven bridges. The origin of the town dates from the erection of a castle by Ottokar, king of Bohemia, in 1256. Königsberg became a member of the Hanseatic league in 1365, and was the residence of the grand-master of the Teutonic order from 1457 to 1528. In 1701 Frederick, elector of Brandenburg, was crowned here, with the title of Frederick I., king of Prussia. Its chief buildings are the cathedral, containing the tomb of Kant; the university, founded in 1544, and attended now by about 700 students; the united royal and university library, with 220,000 volumes; and the observatory. There are also three gymnasia, with numerous other educational and benevolent institutions. Important manufactures of woollens, silk, leather, and tobacco are carried on. Wine, fruits, coal, salt, and sugar are imported; grain is the chief article of export. Pop. '90, 161,149.

KÖNIGSHÜTTE, a t. of Prussia, in Silesia, 35 m. e.n.e. of Ratibor; pop. '90, 36,502. It is celebrated for its copper smelters, and has large iron and zinc works and coal mines.

KÖNIGSMARK, MARIA AURORA, Countess, 1670-1728; b. Sweden; daughter of a Swedish general, and granddaughter of a field-marshal in the Swedish service of the name of Wrangel. She was mother of Maurice of Saxony (marshal Saxe), and an ancestress of Mme. Dudevant (George Sand). She was celebrated for her charms both of person and mind. Previous to 1694 much of her time was passed at the courts of Stockholm, Hanover, and Brunswick, receiving a thorough education for that period, and becoming an accomplished linguist. She was the author of a number of unpublished poetical and dramatic pieces, among them verses upon Charles XII. of Sweden. In 1694, as countess of Königsmark, she went, in consequence of some financial difficulty with her bankers at Hamburg, to the court of Augustus II., elector of Saxony, surnamed the strong, hoping for his intervention in her favor. She found the licentious monarch living in greater luxury and magnificence than any sovereign of Europe, excepting Louis XIV. Won by her beauty and accomplishments, Augustus first made her his mistress, and, in 1702, ambassadress to her royal countryman, Charles XII. of Sweden, with whom she failed to make terms, not succeeding in gaining an audience. Her historian, Voltaire, however, who esteemed her "the most famous woman of two centuries," has recorded that "she returned with the satisfaction of believing that she was the only person feared by the king of Sweden." Her life was ended at Quedlinburg, a town of Prussia, at the foot of the Hartz mountains, in the province of Saxony, on the river Bode. She was buried in the church which contains the graves of emperor Henry I. and his wife Matilda and the abbesses of the convent of St. Wipertus.

KÖNIGSMARK, PHILIP CHRISTOPHER, Count; b. about 1650, assassinated in 1694; a Swedish adventurer. He entered the Swedish army, in which he attained the rank of colonel. His cousin, Sophia Dorothea, a beautiful princess, daughter of the duke of Calle, was married to the prince-elector of Hanover (afterwards George I. of England). He went to the court of Hanover in 1692, and, finding his cousin alienated from her husband on account of his gloomy and jealous character, he entered into an arrangement with her to flee with him to France, but, the intrigue being suspected, he was assassinated by order of the elector. The correspondence of the cousins, published in 1847, shows that a guilty love existed between them.

KÖNIGSTEIN, a small t. of Saxony, on the Elbe, 17 m. s.e. of Dresden; pop. '90, 3,988; noted for its impregnable fortress on a rock 1180 ft. above sea level. Its strength is due to its lofty and insulated position on the solid and precipitous rock. The Saxon monarchs have used it in times of danger for themselves and their treasures. The high gateway is approached by a slanting passage cut through the rock, and by a wooden drawbridge. This passage is strongly defended. Two years' provisions for 1200 men are stored in time of war in vast bomb-proof casemates hollowed out of the rock. There is a well 1172 ft. deep bored in the rock, and the land surrounding the fortress supplies vegetables for the garrison and pasturage for one or two cows. This is one of the few fortresses in Europe that has never been taken. The last time it became a royal asylum was in 1849, when the king lived here three months. Packing-boxes are kept ready for conveying thither the valuable treasures of Dresden in case of danger. The garrison is now but a small one as the place has ceased to be of any military importance.

KÖNIGSWART, a t. of Bohemia, on a feeder of the Beraun, a branch of the Elbe, 79 m. w.s.w. from Prague. It is situated in a romantic valley, has a fine castle, belonging to prince Metternich, mineral springs, and a bathing establishment. The old fortress was destroyed by the Swedes in the thirty years' war, and the site having been purchased by the imperial general, count Metternich, in 1618, he built a castle in the Italian style, surrounded it with a fine park, and collected in it a fine library, with great treasures of paintings, antiquities, and objects of natural history. The altar of the richly adorned chapel of the castle possesses many bones and other relics of saints to which pilgrimages are made. Pop. 2120.

KONRAD, or **CONRAD I.**, King of the Germans (a title identical with the subsequent one of "emperor of Germany"), was the son of Konrad of Fritslar, count of Franconia, and the nephew of the emperor Arnulf. On the extinction of the direct line of the Carolingians the Germans resolved to make the sovereign dignity elective, and preferring to choose one who was related to the late imperial family, offered the crown to Otho the illustrious, duke of Saxony, who refused it, but recommended Konrad, who was accordingly elected in 911. The new monarch gradually re-established the imperial authority over most of the German princes, carried on an unsuccessful war with France, and at last fell mortally wounded at Quedlinburg (918) in a battle with the Hungarians, who had repeatedly invaded his dominions. He lies buried at Fulda. On his death-bed he enjoined his brother Eberhard to carry the imperial insignia to his mortal enemy, duke Henry of Saxony, son of Otho the illustrious, with whom he had been continually at war since 912 A.D., and accompanied the gift with the chivalrous message that he wished to render to the son what he had received from the father. Konrad's reign was a remarkable epoch in the history of Germany; sovereignty by hereditary right was introduced into the German duchies and markgrafsdoms; the minor lords of the soil became vassals, not to the king, as formerly, but to their dukes; and finally the crownlands in each duchy were taken possession of by the dukes themselves, who thus totally destroyed the sovereign's local jurisdiction.

KONRAD II., King of the Germans and Roman emperor, was elected after the extinction of the Saxon imperial family in 1024. He was the son of Henry duke of Franconia, and is by many considered as the founder of the Franconian dynasty. Immediately after his election he commenced a tour through Germany to administer justice and acquaint himself with, and, if necessary, to ameliorate the condition of his subjects. With a view to this last he instituted the *God's Truce* (q.v.). In 1026 he crossed the Alps, chastised the rebellious Italians, was crowned at Milan as king of Italy, and he and his wife, Gisela, were anointed emperor and empress of the Romans by the pope. He was soon recalled to Germany to put down four formidable revolts, in which he succeeded so well that by 1033 peace was restored. In 1032 he had succeeded to the kingdom of Burgundy, which he annexed to the empire. In 1036 a rebellion in Italy again compelled him to cross the Alps; but his efforts to restore his authority were this time unsuccessful, and he was forced to grant various privileges to his Italian subjects. Shortly after his return he died at Utrecht, June 4, 1039. Konrad was one of the most remarkable of the earlier monarchs of Germany. He repressed the more obnoxious features of the feudal system, and by conferring the great duchies of Bavaria, Swabia, and Carinthia on his son, reduced the dangerous power of the great dukes of the empire.

KONRAD III., King of the Germans, the founder of the Hohenstaufen (q.v.) dynasty, was the son of Frederick of Swabia, and was b. in 1093. While under 20 years of age Konrad, with his elder brother Frederick, had bravely supported Henry V. against his

numerous enemies, and in return that monarch granted Konrad the investiture of the duchy of Franconia. He subsequently contested the crown of Italy with the emperor Lothaire of Saxony, but was compelled to resign his pretensions. On the death of Lothaire the princes of Germany, fearing the increasing preponderance of the Guelph party, and attracted by his brilliant courage, moderation, and goodness, offered Konrad the crown, and he was accordingly formally elected at Aix-la-Chapelle, Feb. 21, 1138. He was immediately involved in a quarrel with Henry the Proud, duke of Bavaria and Saxony, and head of the Guelph party in Germany; and the struggle was continued under Henry's son and successor, Henry the Lion (q.v.). While Germany was thus convulsed the state of Italy was not a whit more peaceable. The several belligerents besought Konrad's assistance, but he well knew the natural inconstancy of the Italians, and determined to stand aloof. Soon after this, St. Bernard of Clairvaux commenced to preach a new crusade, and Konrad, seized with the general infatuation, set out for Palestine at the head of a large army (see CRUSADES) in company with his old enemy, Guelph of Bavaria. Guelph returned to Germany before Konrad, and with his nephew, Henry the Lion, immediately renewed the attempt to gain possession of Bavaria, but their army being defeated at Flochberg, they were compelled to sue for peace. Konrad was now called upon to aid the duke of Poland against his rebellious subjects, and the pope and the northern Italians against Roger of Sicily; but while preparing for this latter expedition he was poisoned, Feb. 15, 1152, at Bamberg. Konrad was largely endowed with the virtues necessary for a great monarch, and, though himself unlearned, was a warm patron of science and letters. His marriage with a Greek princess was symbolized by the two-headed eagle which figured on the arms of the emperor of Germany, and now appears on the arms of the sovereign of Austria, as heir to the German emperors.

KONRAD IV., 1228-54; b. in Apulia; son of Frederick II., emperor of Germany; crowned king of the Romans in 1237, and upon the death of his father, in 1250, assumed the title of emperor. He contended against the intrigues and usurpations of the pope, and repulsed the Mongol invaders. He had a competitor in William of Holland, by whom he was defeated. He kept himself on the throne until, embarrassed by the increasing anarchy of Germany, he retired to Italy in 1251 and conquered Naples. He was foiled in his plans, however, by the pope, and died of a lingering disease, supposed to have been induced by poison.

KONRADIN OF SWABIA, the last descendant of the imperial house of Hohenstaufen (q.v.), was the son of Konrad IV., and was b. in 1252, two years before his father's death. Innocent IV. immediately seized upon the young prince's Italian possessions on the plea that the son of a prince who dies excommunicated has no hereditary rights; and the other enemies of the house of Hohenstaufen rejoiced to follow the pope's example. Konradin was not left, however, totally friendless. His uncle Manfred took up arms in his behalf, drove the pope from Naples and Sicily, and in order to consolidate his nephew's authority declared himself king till the young prince came of age. The pope's inveterate hatred of the Hohenstaufens induced him to offer the crown of the two Sicilies to Charles of Anjou, a consummate warrior and able politician. Charles immediately invaded Italy, met his antagonist in the plain of Grandella, where the defeat and death of Manfred, in 1266, gave him undisturbed possession of the kingdom. But the Neapolitans, detesting their new master, sent deputies to Bavaria to invite Konradin, then in his 16th year, to come and assert his hereditary rights. Konradin accordingly made his appearance in Italy at the head of 10,000 men, and being joined by the Neapolitans in large numbers gained several victories over the French, but was finally defeated, and along with his relative, Frederick of Austria, taken prisoner near Tagliacozzo, Aug. 22, 1268. The two unfortunate princes were, with the consent of the pope, executed in the market-place of Naples on Oct. 20. A few minutes before his execution, Konradin, on the scaffold, took off his glove, and threw it into the midst of the crowd as a gage of vengeance, requesting that it might be carried to his heir, Peter of Aragon. This duty was undertaken by the chevalier de Waldburg, who, after many hair-breadth escapes, succeeded in fulfilling his prince's last command. See SICILIAN VESPER.

KONRAD VON WÜRZBURG, one of the most celebrated poets of the middle ages, d. at Basel in 1287. Konrad is fertile in imagination, learned, and—although marking the decline of mediæval high-German poetry by his prolix and artificial style—probably the most perfect master of German versification that had appeared up to his own day. His last poem, which he left in an unfinished condition, has for its subject *The Trojan War*, and is printed (in part) in Müller's *Sammlung altdeutscher Gedichte*. But Konrad appears to most advantage in his smaller narrative poems, of which the best is *Engelhard* (reprinted by Haupt at Leipsic in 1844 from an old and scarce impression). Next to this may be ranked his *Otto mit dem Bart* (reprinted by Hahn at Quedlinb. and Leip. 1838); *Der Welt Lohn* (by Roth, Flr. 1843); *The Legends of Sylvester* (by W. Grimm, Gött. 1841) and of *Alexius* (by Massmann, Quedlinb. and Leip. 1843); *Die Goldene Schmiede* (by W. Grimm, Berl. 1840). His songs and proverbs are to be found in Hagen's *Minnesinger*.

KONX OMPAX, words employed in the dismissal ceremonies of the Eleusinian mysteries, which were held by the Athenians at Eleusis every fourth year in honor of

Ceres. Their signification appears to have been "amen," or "the ceremonies are concluded."

KOODOO, *Antelope strepsiceros*, or *strepsiceros koodoo*, one of the largest species of antelope. The general form is not so light and elegant as that of many of the antelopes. The height is about 4 ft., and the length fully 8 ft., exclusive of the tail, which is moderately long, and terminates in a tuft like that of an ox. The male is furnished with great horns, nearly 4 ft. long and beautifully twisted in a wide spiral of two turns and a half, very thick at the base, and there wrinkled and ringed. The female is smaller than the male, and hornless. The general color is grayish-brown, with a narrow white stripe along the middle of the back, and eight or ten similar stripes proceeding from it down the sides. The koodoo lives in small families of four or five, inhabiting chiefly the wooded parts of south Africa. It is easily domesticated, and is one of the animals which, probably, man has not yet done enough to reduce to his service.

KOOFA, or **KUFA**. See **KUFIC WRITING**.

KOOM, or **KUM**, a t. of Persia, in the province of Irak-Ajemi, 80 m. s.w. of Teheran; pop. about 7,000. It was built by the Saracens at the beginning of the 9th c.; became one of the finest cities of Persia, and was long noted for the manufacture of silks. The Afghans took and nearly destroyed it on their invasion of Persia in 1722. Though partly rebuilt, it is still mostly in ruins. The only industry at present is the manufacture of porous vases. It has a beautiful mosque to the memory of Fatima, the daughter of imâm Reza, containing the tombs of Sofi I. and shah Abbas II.

KOOMASSIE. See **COOMASSIE**.

KOOM'RAH, *Equus hippagrus*, an alleged distinct species of the family *equidae*, a native of north Africa, and inhabiting mountain woods. It is 10 or 10½ hands high, with a broad deep head; no forelock, but long woolly hair down to the eyes; long black mane; tail more like that of a horse than of an ass; the color a uniform reddish bay, without mark or streak. Col. Hamilton Smith supposes that it may be the *boryes* of Herodotus, and *hippagrus* of Oppian.

KOOR, or **KUR**. See **KURA**.

KOORDISTAN'. See **KURDISTAN**.

KOO'RIA MOO'RIA ISLANDS, a group of five islands, on the s. coast of Arabia, are situated about 21 m. from the coast, about lat. 17° 33' n., and long. 56° 6' e. The surface of these islands is sterile, and the only one which is inhabited supports only from 20 to 30 fishermen. They were ceded to England in 1854 as a landing place for the Red Sea telegraph cable.

KOORILE ISLANDS. See **KURILE ISLANDS**.

KOORSK. See **KURSK**.

KOOSSO, or **KOSSO**. See **CÜSSO**.

KOO'TENAI, **KITUNAH**, or **FLATBOWS**, a tribe of Indians in the n.w. part of the United States, long allied to the Flatheads, but forming a distinct family. They are amiable and inoffensive, but cowardly, and indisposed to abandon a nomadic life. They are poor, subsisting on fish, roots, grain, berries, etc. Formerly they roamed about the head waters of the Clark and McGilvray rivers, where they hunted elk, deer, Rocky mountain sheep, birds, and fish, but seldom molested buffalo. Though they welcomed father De Smet, and built a chapel for him, the tribe as such has not made any marked advance toward civilization. In 1883, 615 of the tribe were in Montana, 400 in Idaho, 400 in British Columbia, and a few in Washington. Those in Idaho live upon a reservation set apart for them, to which they were removed in conformity with an executive order of June 14, 1867.

KOO'TENAI, a co. in n. Idaho, bounded n. by British Columbia, e. by Montana and Shoshone co., s. by Nez Perces co., and w. by the state of Washington. It contains several large lakes, and is drained by Clark's river. Its surface is partly mountainous and partly prairie; 5600 sq.m. It has deposits of gold. Pop. '90, 4108. Co. seat, Rathdrum.

KO'PEK, a Russian money of account, the one-hundredth part of a ruble (q.v.) and equivalent to about half a cent.

KOPP, **JOSEPH EUTYCHUS**, 1793-1866; b. in the canton of Lucerne, Switzerland; taught Greek at the lyceum of Lucerne, 1819-41, and was president of the board of education, 1841-45, retiring on account of the opposition excited by his hostility to the Jesuits. He devoted much labor to the study of the history of the Swiss federation, and was the first to demonstrate, in his *Urkunde zur Beleuchtung der Geschichte der eidgenössischen Bünde*, the legendary character of the story of William Tell. His *History of the Swiss Federation (Geschichte der eidgenössischen Bünde)* is a valuable work showing much research of early documentary sources.

KOPPARBERG, a district of Sweden, situated on both sides of the Dal river, and embracing the territory formerly celebrated under the name of Delarne; pop. '90, 197,449. It is a mountainous region, covered with forests of birch and fir, rich in copper and porphyry, but not well adapted for agriculture. The inhabitants are Scandinavians of the finest type, hardy, brave, and honest, and exceedingly fond of their native vales.

The country is too poor to yield them a support, and multitudes are compelled to go elsewhere for work, but they invariably return sooner or later with the fruits of their industry, to live and die in the places where they were born. Capital, Falun.

KÖPPEN, PETER VON, 1793–1864; b. at Kharkow, Russia; educated at the university of his native city, and devoted his life to investigations concerning the ethnology, archaeology, and history of Russia. His writings on these subjects are of great value. The Russian government presented him with an estate in the Crimea.

KORÄES, DIAMANTES. See CORAY, ADAMANTIUS.

KORÂN (Arab., from *kavaa*, to read), [= Hebr. *Mikra*, the written book, or that which can and ought to be read: the Old Testament, in contradistinction to *Mishnah*, or the code of the oral law], *The Reading*, by way of eminence; a term first applied to every single portion of Mohammed's "Revelations;" at a later period used for a greater number of these; and finally for their whole body, gathered together into the one book, which forms the religious, social, civil, commercial, military, and legal code of Islam. The Koran is also known under the name of *Forkan* (Chald. salvation, not from Hebr. *Perek*, division, as erroneously supposed); further, of Al-Moshaf (*the volume*), or Al-Kitab (*the book*, in the sense of "Bible"), or Al-Dhikr ("the reminder," or "the admonition"). The Korân is, according to the Moslem creed, coeval with God, uncreated, eternal. Its first transcript was written from the beginning in rays of light upon a gigantic tablet resting by the throne of the Almighty; and upon this tablet are also found the divine decrees relating to things past and future. A copy of it, in a book bound in white silk, jewels, and gold, was brought down to the lowest heaven by the angel Gabriel, in the blissful and mysterious night of Al-Khadr, in the month of Ramadân. Portions of it were, during a space of 23 years, communicated to Mohammed, both at Mecca and Medina, either by Gabriel in human shape, "with the sound of bells," or through inspirations from the Holy Ghost, "in the prophet's breast," or by God himself, "veiled and unveiled, in waking or in the dreams of night." Traditions vary with respect to the length of the individual portions revealed at a time, between single letters, verses, and entire chapters or surahs (from Hebr. *shurah*, line). The first revelation forms, in the present arrangement of the book, verses 1 to 5 of surah xvi., and begins with the words: "Read [preach], in the name of thy Lord, who has created all things!"

Mohammed dictated his inspirations to a scribe, not, indeed, in broken verses, but in finished chapters, and from this copy the followers of the prophet procured other copies—unless they preferred learning the oracles by heart from the master's own mouth. The original fragments were, without any attempt at a chronological or other arrangement, promiscuously thrown into a box and a certain number were entirely lost. A year after the death of Mohammed, the scattered portions were, at the instance of Abu Bekr, collected by Zaid Ibn Thâbit of Medina, "from date-leaves and tablets of white stone, bones, and parchment-leaves, and the breasts of men," and faithfully copied, without the slightest attempt at molding them into shape or sequence, together with all the variants, the repetitions, and the gaps. This volume was intrusted to the keeping of Hafsa, one of the prophet's wives, the daughter of Omar. A second redaction was instituted in the thirtieth year of the Hedjrah, by caliph Othman, not for the sake of arranging and correcting the text, but in order to restore its unity: many different readings being current among the believers. He ordered new copies to be made from the original fragments, in which all the variants were to be expunged, without, however, any further alteration, such as the suppression of certain passages, etc., being introduced; and the old copies were all consigned to the flames. With respect to the succession of the single chapters, 114 in number, no attempt was made at establishing continuity, but they were placed side by side according to their respective lengths; so that, immediately after the introductory fathah or exordium, follows the longest chapter, and the others are ranged after it in decreasing size. They are not numbered in the manuscripts, but bear distinctive, often strange-sounding headings, as: the cow, congealed blood, the fig, the star, the towers, saba, the poets, etc., taken from a particular matter or person treated of in the respective chapters. Every chapter or surah begins with the introductory formula: "In the name of God, the Merciful, the Compassionate." It is further stated at the beginning whether the surah was revealed at Mecca or at Medina. Every chapter is subdivided into smaller portions (*Ayath*, Hebr. *Oth*, sign, letter), varying in the ancient "seven editions" or primitive copies [of Medina (two), Mecca, Kufa, Basra, Syria, and the "vulgar edition"]—reduced by Nöldeke to four editions—between 6,000 and 6,036. The number of words in the whole book is 77,639, and an enumeration of the letters shows an amount of 323,015 of these. Other, encyclical, divisions of the book are: into 30 ajzâ and into 60 ahzâb, for the use of devotional readings in and out of the mosque. Twenty-nine surahs commence with certain letters of the alphabet, supposed to be of mystical purport.

The contents of the Koran as the basis of Mohammedanism will be considered under that head, while for questions more closely connected with authorship and chronology, we must refer to MOHAMMED. Briefly, it may be stated here, that the chief doctrine laid down in it is the unity of God, and the existence of but one true religion, with changeable ceremonies. When mankind turned from it at different times, God sent

prophets to lead them back to truth: Moses, Christ, and Mohammed being the most distinguished. Both punishments for the sinner and rewards for the pious are depicted with great diffuseness, and exemplified chiefly by stories taken from the Bible, the apocryphal writings, and the Midrash. Special laws and directions, admonitions to moral and divine virtues, more particularly to a complete and unconditional resignation to God's will (see ISLAM), legends, principally relating to the patriarchs, and, almost without exception, borrowed from the Jewish writings (known to Mohammed by oral communication only, a circumstance which accounts for their often odd confusion), form the bulk of the book, which throughout bears the most palpable traces of Jewish influence. Thus, of ideas and notions taken bodily, with their Arabicized designations, from Judaism, we may mention—Koran = mikrah (reading); forkan (salvation); the introductory formula, Bismillah (in the name of God); Torah (book of law); Gan Eden (paradise); gehinnom (hell); haber (master); darash (to search the scriptures); rabbi (teacher); Sabbath (day of rest); Shechinah (majesty of God); mishnah (repetition, or oral law), etc. The general tendency and aim of the Koran is found pretty clearly indicated in the beginning of the second chapter: "This is the book in which there is no doubt; a guidance for the pious, who believe in the *mysteries of faith*, who perform their *prayers*, give *alms* from what we have bestowed upon them, who believe in the *revelation* which we made unto thee, which was sent down to the *prophets before thee*, and who believe in the *future life*, etc. To unite the three principal religious forms which he found in his time and country—viz., Judaism, Christianity, and heathenism—into one, was Mohammed's ideal, and the Koran, properly read, discloses constantly the alternate flatteries and threats aimed at each of the three parties. No less are certain abrogations on the part of the prophet himself, of special passages in the Koran, due to the vacillating relation in which he at first stood to the different creeds, and the concessions first made, and then revoked. Witness the "Kiblah," or the place where the believer was to turn in his prayer, first being Jerusalem; fasting, being at first instituted in the ancient manner; forbearance to idolaters forming one of the original precepts, etc.

The language of the Koran is of surpassing elegance and purity, so much so that it has become the ideal of Arabic classicality, and no human pen is supposed to be capable of producing anything similar:—a circumstance adduced by Mohammed himself as a clear proof of his mission. The style varies considerably; sometimes concise and bold, sublime and majestic, impassionate, fluent, and harmonious; it at other times becomes verbose, sententious, obscure, tame, and prosy; and on this difference modern investigators have endeavored to form a chronological arrangement of the Koran, wherever other dates fail. But none of these attempts can ever be successful. Full manhood, approaching age, and declining vigor, are not things so easily traced in the writings of a man like Mohammed. The Koran is written in prose, yet the two or more links of which generally a sentence is composed, rhyme with each other, a peculiarity of speech used by the ancient soothsayers (kuhân = cohen) of Arabia:—only that Mohammed used his own discretion in remodeling its form, and freeing it from conventional fetters; and thus the rhyme of the Koran became an entirely distinctive rhyme. Refrains are introduced in some surahs; and plays upon words are not disdained.

The outward reverence in which the Koran is held throughout Mohammedanism is exceedingly great. It is never held below the girdle, never touched without previous purification; and an injunction to that effect is generally found on the cover which overlaps the boards, according to eastern binding. It is consulted on weighty matters; sentences from it are inscribed on banners, doors, etc. Great lavishness is also displayed upon the material and the binding of the sacred volume. The copies for the wealthy are sometimes written in gold, and the covers blaze with gold and precious stones. Nothing also is more hateful in the eyes of a Moslem than to see the book in the hands of an unbeliever.

The Koran has been commented upon so often that the names of the commentators alone would fill volumes. Thus, the library of Tripoli, in Syria, is reported to have once contained no less than 20,000 different commentaries. The most renowned are those of Samachshari (died 539 H.), Beidhavi (died 685 or 716 H.), Mahalli (died 870 H.), and Soyuti (died 911 H.). The principal editions are those of Hinkelmann (Hamburg, 1694); Maracci (Padua, 1698); Flügel (3d ed. 1838), besides many editions (of small critical value) printed in St. Petersburg, Kasan, Teheran, Calcutta, Cawnpore, Serampore, and the many newly erected Indian presses. The first, but very imperfect, Latin version of the Koran was made by Robertus Retensis, an Englishman, in 1143 (ed. Basle, 1543). The principal translations are those of Maracci, into Latin (1698); Sale (1st ed. 1734); and Palmer (1880), into English; Savary (1783), Garcin de Tassy (1829), Kasimirski (1840), into French; Megerlin (1772), Wahl (1828), Ullmann (1840), into German; besides the great number of Persian, Turkish, Malay, Hindustanee, and other translations made for the benefit of the various eastern Moslems. Of concordances to the Koran may be mentioned that of Flügel (Leip. 1842), and the Noojoom-ool-Foorkan (Calcutta, 1811). Of authorities whose works may be consulted on the Koran, we will chiefly name Maracci, Sale, Savary, Wahl, Geiger, Amari, Sprenger, Muir, Weil, Nöldeke, and Palmer.

KORAT, a dependency of Siam, between that country and Cambodia. It is situated on a high table-land, and its capital, which bears the same name, is a stronghold nearly

inaccessible on account of the approaches to it being through a dense and dangerous jungle. The inhabitants of Korat, 7,000 in number, are chiefly engaged in agriculture, sugar being a staple product. Copper mining is also an important industry.

KORDOFAN, or the White Land, a province of the Egyptian territories in the Sudan, is bounded on the e. by the White Nile, which separates it from Sennaar, and is separated on the w. from Darfur by a strip of desert. It extends in lat. from 12° to 16° n., and the area of its more or less cultivated portion has been estimated at 40,000 sq. m., and its population at 280,000. The province is traversed by no rivers; wells, however, abound, water being found almost everywhere at a comparatively small depth. In the s. the surface is undulating, and the soil argillaceous and productive; and here dukhu and maize are grown. In the n. and w. the surface is an elevated plateau, and the soil sandy, but peculiarly fitted for the cultivation of millet, which is the staple article of food. The employments of the people are chiefly agricultural. In the s., horned cattle and horses are extensively reared, but in the n. and w. the nomad inhabitants depend for support entirely upon their large herds of camels, which are hired out for the transport of produce and merchandise. The chief products are gum, ostrich feathers, ivory, and ox hides. Iron ore is obtained and wrought in the country. Slavery, which had formerly been general, and had formed an important branch of trade in Kordofan, was abolished in 1857 by Saïd pasha, the Egyptian viceroy. The people are Mohammedans.

The inhabitants are partly Arabs, partly a mixed Arab and negro race. The capital is Lobeid or Il-Obeid (q.v.). In 1770 Adlân, king of Sennaar, made a conquest of Kordofan, and about six years after, the sultan of Darfur overran the province and annexed it to his territories. Under the sultan, the inhabitants were but lightly taxed; trade was opened up with the Sudan and Arabia; and the markets of Il-Obeid and Bara, the chief towns, were stored with the produce of Arabia, India, and Abyssinia. This period of prosperity, however, was brought to a close by the invasion of Kordofan, in 1821, by an Egyptian army. Until 1883 K. was included in the Egyptian Sudan, now it belongs to Mahdi possessions.

KORNEGAL/LE, or **KORNEGAL**, a t. of Ceylon, 24 m. n.w. of Kandy; pop. less than 5,000; beautifully situated in the shade of an immense rock and in the midst of dense woods. It was anciently one of the capitals of Ceylon. It is a great resort for pilgrims on account of an ancient temple on a rock, in which is hollowed, as the legend relates, the footprint of Buddha.

KÖRNER, KARL THEODOR, a patriotic German poet, was b. at Dresden, Sept. 23, 1791, and after the publication of a collection of immature verses in 1810, betook himself to the university of Leipsic. Here the young author, who had no aptitude for serious and solid studies, was led into several irregularities, which necessitated his leaving the university. After a short residence in Berlin, he went to Vienna, and began to write for the stage. His *Der Grüne Domino* (The Green Domino); *Die Braut* (The Bride); and *Der Nachtwächter* (The Night-watchman), are among the best German comedies. His two most important dramas, *Zriny* and *Rosamunde*, though destitute of that sagacity of thought and knowledge of mankind which are essential to the permanent success of such works, are full of noble enthusiasm. The uprising of the German nation against the despotism of Napoleon inspired Körner with patriotic ardor. He joined the army of liberation, and displayed heroic courage in many encounters. The songs which he now wrote—several of them in the camp—and published under the title of *Leier und Schwert* (Lyre and Sword), stirred his countrymen mightily. Their chief power, however, probably lies in their impassioned nationality; foreigners at least fail to recognize in them much more, yet the Germans regard them with a kind of sacred admiration that forbids criticism. The most famous of these pieces is his *Schwert-Lied* (Sword-Song). Körner was killed in battle near Rosenberg, Aug. 26, 1813. A collected edition of his works (*Sämmtliche Werke*, 1 vol. Berl. 1834; 4 vols. 1842; 4th edit. 1853) was published by Streckfuss. A biography of the poet, written by his father, has been translated into English, "with selections from his poems, tales, and dramas," by G. F. Richardson (Lond. 2 vols. (1845), and there is another in German by Bauer (1883).

KÖRÖS, NAGY, or GREAT KÖRÖS, an important market t. of Hungary, in the county of Pesth, is situated in a sandy district, 49 m. s.e. of the city of that name. Black cattle and sheep are here extensively reared, and an excellent red wine is grown. Pop. '90, 24,000.—KISS KÖRÖS, or Little Körös, is a small t., situated 38 m. s.w. of the foregoing, and also engaged in the production of wine. Pop. '90, 4092.

KOROTCHA, or **KAROTCHA**, a t. of Russia, on a small river of the same name, in the government of Kursk, 77 m. s.e. of the town of Kursk. The town is well built and has several churches, besides factories for leather and tallow. Pop. 9,750.

KORTETZ, or **CORTITZ**, a Russian island in the Dnieper river, rising to a height of 165 ft. above the level of the water; and formerly a Cossack stronghold. In 1784 the empress Catharine II. removed the Cossacks, and replaced them with a colony of German Mennonites. In 1875, owing to the conscription practiced in Russia, many of the Mennonites emigrated to America, whereupon the emperor modified the stringency of

the laws. Kortetz contains a number of villages, whose inhabitants are chiefly devoted to agriculture, though there are manufactures of cotton and wool.

KORVEL. See CORVEL.

KOSCIUSKO, a co. in n. Indiana, intersected by the Tippecanoe river, and by the Cleveland, Cincinnati, Chicago and St. Louis, and the Pennsylvania Co.'s railroads; 556 sq. m.; pop. '90, 28,645. The productions are wheat, maize, oats, hay, wood, dairy products, cattle, and lumber. There are but few manufactures. Co. seat, Warsaw.

KOSCIUSKO, MOUNT, the highest elevation of the Australian Alps, being 7,176 ft. high, and situated nearly in lat. 36° 30' s., and long. 134° 30' w., on the boundary between the provinces of New South Wales and Victoria. The head-waters of the Murray and Murrumbidgee rivers are nearly at the base of the mount.

KOSCIUSKO, THADDEUS, a great Polish gen. and patriot, b. Feb. 12, 1746, in Lithuania, Poland, was descended from an ancient and noble but not wealthy Lithuanian family. He became a capt. in the Polish army, went to America and served in the war of independence. He returned to Poland in 1786 with the rank of gen. of brigade. In the campaign of 1792 he held a position at Dubjenka for five days with 4,000 men against 16,000 Russians, although he had had only 24 hours to fortify it, and finally withdrew his troops without much loss. This brilliant feat of arms laid the foundation of his military reputation. When king Stanislaus submitted to the will of the empress Catharine, Kosciusko resigned his command, and retired to Leipsic, but returned in 1794, and put himself at the head of the national movement in Cracow, and afterwards in Warsaw. With 20,000 regular troops and 40,000 ill-armed peasants he resisted for months the united Russian and Prussian army of 150,000 men. He was proof also against the most tempting proposals on the part of the Prussian king. He was at last overpowered by superior numbers in the battle of Maciejowice, Oct. 10, 1794. The words "*Finit Polonia*," attributed to Kosciusko at this crisis, he himself denied. He was kept a prisoner till after the accession of the emperor Paul, who restored him to liberty, gave him an estate with 1500 peasants, and handed to him his sword, which Kosciusko declined to receive, saying: "I have no more need of a sword, as I have no longer a country." He afterwards resigned the estate, and sent back from London the money which he had received from the emperor. He spent the remainder of his life chiefly in France, and his chief enjoyment was in agricultural pursuits. When Napoleon, in 1806, formed a plan for the restoration of Poland, Kosciusko felt himself restrained from taking an active part in it by his promise to the emperor Paul. The address to the Poles, published in his name in the *Moniteur*, was a fabrication. In 1814 he wrote to the emperor Alexander entreating him to grant an amnesty to the Poles in foreign countries, and to make himself constitutional king of Poland. He released from servitude, in 1817, the peasants on his own estate in Poland. His death took place on Oct. 15, 1817, in consequence of his horse falling over a precipice. His remains were removed to Cracow by the emperor Alexander, and were laid side by side with those of John Sobieski. See the biographies by Falkenstein (1834), Chodzko (1837), Paszkowski (Cracow, 1872), and Zychlinski (1876).

KOSLIN, a manufacturing town of Prussia, in the province of Pomerania, situated on the Mühlenbach, 7 miles from the Baltic sea, and 24 miles east of Kolberg. There are iron-foundries, and manufactures of paper, silk, etc. Pop. '90, 17,810.

KOSMOS. See COSMOGONY.

KOSSUTH, a co. in the n. part of Iowa; 984 sq.m.; pop. '90, 13,120. It is drained by the e. fork of Des Moines river, which divides it into two nearly equal parts. A large portion of the surface is prairie, and the soil is fertile. Wheat, corn, oats, and hay are the chief products. Co. seat, Algona.

KOSSUTH, LAJOS (Louis), the leader of the Hungarian revolution, was b. in 1802 at Monok, in the county of Zemplin, in Hungary. His family was of noble rank, but his parents were poor. He studied law at the Protestant college of Sarospatak, and practiced first in his native county, and afterwards in Pesh. In 1832 he commenced his political career at the diet of Presburg as editor of a liberal paper, which, owing to the state of the law, was not printed, but transcribed and circulated. The subsequent publication of a lithographed paper led, in May, 1837, to Kossuth's imprisonment. He was liberated in 1840, and became again the editor of a paper, in which he advocated views too extreme for many of the liberal party amongst the nobles, but which took strong hold of the people in general, especially of the youth of the country. In Nov., 1847, he was sent by the county of Pesh as deputy to the diet, and soon distinguished himself as a speaker, and became the leader of the opposition. He advocated the emancipation of the peasants, the elevation of the citizen class, the freedom of the press, etc., and after the French revolution of 1848 openly demanded an independent government for Hungary, and constitutional government in the Austrian hereditary territories. To his speeches must in great part be ascribed not only the Hungarian revolution, but the insurrection in Vienna in Mar., 1848. On the dissolution of the ministry in Sept., 1848, he found himself at the head of the committee of national defense, and now prosecuted

with extraordinary energy the measures necessary for carrying on the war. To put an end to all the hopes and schemes of the moderate party, he induced the national assembly at Debreczin, in April, 1849, to declare the independence of Hungary, and that the Hapsburg dynasty had forfeited the throne. He was now appointed provisional governor of Hungary; but being disappointed in his hopes for the intervention of the western powers, and finding the national cause jeopardized by the arrival of Russia on the scene of action, he endeavored to arouse the people to a more desperate effort. The attempt was vain. Finding that the dissensions between himself and Görgei (q.v.) were damaging the national cause, he resigned his dictatorship in favor of the latter. After the defeat at Temesvar on Aug. 9, 1849, he found himself compelled to abandon his position, and to flee into Turkey, where, however, he was made a prisoner; but though his extradition was demanded both by Austria and Russia, the porte, true to the principle of hospitality, resisted all their demands. In Sept., 1851, he was liberated, and the government of France refusing him a passage through their territory, he sailed in an American frigate to England, where he was received with every demonstration of public respect and sympathy. In Dec. of the same year he landed in the United States, where he met with a most enthusiastic reception. He returned in June, 1852, to England, and there he chiefly resided until the Italian war broke out against Austria, when almost the whole of the Hungarian emigrants left for Italy with Kossuth. He long resided in Turin, where he died March 20, 1894. See his *Memories of My Exile* (London, 1880-90).

KOSZTA, MARTIN. See INGRAHAM, DUNCAN NATHANIEL.

KOSTROMA, a government of Middle Russia, is bounded on the w. by the government of Jaroslav, and on the e. by the district of Wjatka. Area, 32,702 sq. m.; pop. '90, 1,381,700. The surface is generally flat, marshy, interspersed with lakes, and, especially in the n. and e., with extensive and dense forests. The greater part of the soil is uncultivated. The chief rivers are the Volga, with its tributaries the Kostroma, the Unja and the Vetluga. The climate is severe. Agriculture is the principal occupation of the inhabitants, but the crops are not equal to the wants of the population.

KOSTROMA, capital of the government of that name, in European Russia, is situated near the junction of the Kostroma with the Volga, and 564 m. from St. Petersburg. It was founded in the middle of the 12th c., and suffered much from the invasions, first of the Tartars, afterwards of the Poles. Kostroma has considerable manufactures, chiefly of linen, and trades in corn, leather, timber, pitch and tar. Pop. '89, 31,981.

KÖSZEGH. See GÜNS.

KOTAH, the chief t. of a protected state of the same name, is situated in Rajpootana, 120 miles south of Jaipur. It is on the right bank of the Chumbul, and is fortified with a rampart and a ditch. The town is tolerably wealthy, being, moreover, of considerable size and of some architectural pretensions. In 1857, notwithstanding the fidelity of the rajah to the British government, Kotah fell under the power of the mutineers, remaining in their possession until March 30, 1858, when it was stormed by gen. Roberts. The principality contains 3803 sq. m., with an estimated population of '91, 38,600.

KÖTHEN, a thriving manufacturing t. in the duchy of Anhalt, in Germany; pop. '90, 18,215; situated about 30 m. from Leipsic; is the meeting-place of three lines of railroad; the Aschersleben and Köthen, Dessau and Köthen, and Halle and Wittenberg. It has a number of public buildings, excellent educational facilities, and a considerable trade, in which metal goods are the most important factor. Formerly it was the capital of the duchy of Anhalt-Köthen, but in 1863 this became a part of the united duchy of Anhalt.

KOTTBUS. See COTTBUS.

KOTZEBUE, AUGUST FRIEDRICH FERDINAND VON, a most prolific German dramatist, was b. at Weimar, on May 3, 1761, studied law at Jena and Duisburg, and finally went to Russia where he entered the civil service and wrote a large number of plays. After the death of the Czar Paul he left the Russian service and returned to Weimar. But in 1816 he was called to the position of counselor in the department of foreign affairs at St. Petersburg. Returning to Germany in 1817, he took up his abode in Weimar and later in Mannheim where he published a literary weekly, which bitterly attacked the Burschenschaft. These attacks aroused the wrath of a young member of the Burschenschaft, K. L. Sand (q.v.), who in his fanaticism dedicated himself to the work of assassinating the author. Sand regarded him as a Russian spy and the chief foe of German liberty. He carried out his mission successfully and killed K. March 23rd, 1819. This deed of Sand's was used by Metternich and the German governments as a justification of the policy of repression illustrated by the Carlsbad Decrees (q.v.). Among his dramatic performances (the chief merit of which consists in their superior knowledge of stage-effect) may be mentioned *Die Indianer in England* (The Indians in England); *Menschenhass und Reue* (Misanthropy and Repentance)—the latter, under the title of *The Stranger*, being well known on the English boards; *Die beiden Klingsberg* (The Two Klingsbergs); *Die Spanier in Peru*, etc. Kotzebue wrote no fewer than 98 dramas, which have been collected in editions of 28 vols. (Leip. 1797-1823), of 44 vols. (1827-29), and of 10 vols. (1868). Several of them have been translated into English.

KOUBAN, a river in the s. of Russia, rises on the declivity of Mount Elburz, and flows first n., then w., separating the governments of Stavropol and the Cossacks of the Black sea from Circassia. It is about 400 m. in length, exclusive of its windings, and it falls partly into the Black sea, partly into the sea of Azov.

KOULI KHAN. See **NADIR SHAH.**

KOU'MISS, or **KU'MISS**, an intoxicating beverage much esteemed by the Kalmucks. It is made from the soured and fermented milk of mares. It has an acidulous taste. A spirit is obtained from it by distillation. The tribes which use koumiss are free from pulmonary phthisis, and the observation of this fact has led to the beneficial use of an artificial koumiss, made of ass's and cow's milk, in cases of consumption.

KOUTOW, or **KOWTOW** is a Chinese ceremony performed on entering the imperial presence. It consists in prostrating one's self, and striking the earth three times with the forehead. None of the ambassadors of foreign powers have been willing to perform such a humiliating act, except those of Holland and Portugal, consequently those are the only powers whose representatives are received by the emperor. The representatives of other powers are obliged to confer with him through his ministers. The late emperor made an exception to the rule in 1873, when he believed a war with France, Russia and Japan to be imminent, and received the representatives of the United States, Great Britain, Russia, Germany, France and Japan with the usual obeisance customary among civilized nations in place of the Oriental Koutow. He died shortly after this, and the vast majority of his subjects attributed his death to the anger of heaven at his undignified concession to the "foreign devils."

KOVNO, a government of n.w. Russia, lies immediately s. of the province of Courland, and is bounded on the s.w. by Prussia and Poland. Area, 15,692 sq. m., nearly two-thirds of which is cultivated, and about one-fifth under wood. Grain and potatoes are important products. Pop. '94, 1,639,400. The surface is flat and marshy, and there are numerous lakes. It is well watered by the Niemen, Wilija, Dubissa, Mitwa, Memel-Aa and other streams. Plica Polonica (q. v.) is common among the peasantry. Previous to 1843, this government formed a part of that of Wilna.

KOV'NO, capital of the government of the same name, in European Russia, near the confluence of the Vilia and the Niemen, was founded in the 10th c., and was the scene of many bloody conflicts between the Teutonic knights and the Poles during the 14th and 15th centuries. Its commerce is now recovering, since it is not only near the confluence of two navigable rivers, but also on the great railway from St. Petersburg to Berlin. Pop. '97, 73,543.

KOZELSK', a district t. of Great Russia, in the government of Kaluga, and 43 m. s.w. of the town of that name, stands on the right bank of the river Thizdra. Pop. abt. 6,700. It carries on a great trade in hemp, and an extensive manufacture of sail-cloth.

KBAAL, is a term in general use among the Dutch Boers (q.v.) in South Africa to denote a village, or a collection of huts in an inclosure, or sometimes a single hut in a stockade. The word probably comes from the Hottentot language.

KRA'KEN, a fabulous animal, first described by Pontoppidan in his *Natural History of Norway*, and from time to time said to have been seen in the Norwegian seas. Enormous magnitude is ascribed to it; it is said to rise from the sea like an island, to stretch out mast-like arms, by which ships are readily drawn down, and, when it sinks again into the deep, to cause a whirlpool, in which large vessels are involved to their destruction. The fable of the kraken has considerable analogy to the more recent stories of the great sea serpent (q.v.). It is not, however, to be summarily rejected as mere unmingled fable. There may, perhaps, be some foundation for it in the occasional appearance of huge cephalopods, to the general characters of which the description given of its form and monstrous arms sufficiently agrees, great exaggeration as to size being of course allowed for. Large as are some of the cephalopods known to exist in some seas, there are reasons for supposing that creatures of this kind do exist much larger than any that have been accurately described; and stories, similar to the Norwegian ones recorded by Pontoppidan and others, are current in different parts of the world. Such is the story told by Pliny concerning a vast animal with prodigious arms which impeded the navigation of the strait of Gibraltar. See **POULPE**.

KRAME'RIA. See **RATTANY.**

KRANACH, **LUCAS.** See **CRANACH.**

KRANTZ, **ALBERT**, 1450-1517; b. Germany; having studied philosophy and theology at Hamburg and Rostock, and having made the tour of Europe, he returned to receive his degree at Rostock, and to fill the office of rector in the university. In 1489, having been elected syndic of Hamburg, he was present at the assembly of Wismar, taking a prominent part in the discussion relative to the interests of the Hanseatic towns, and was sent by them as ambassador to France in 1497, and to England in 1499, for the purpose of securing them as allies against the pirates of the North sea. In 1500 he was chosen arbitrator by John, king of Denmark, and Frederick, duke of Holstein, to settle their difference on the subject of the province of Ditmarsen. In 1508 he was appointed dean of his chapter, and labored diligently to eradicate the evils that had crept into ecclesiastical discipline. He, however, condemned the first attack of Luther on the Romish church. His principal works are *Chronicles of the Kingdoms of Sweden, Denmark, and Norway*, in the Latin tongue, and *Ecclesiastical History of Saxony*. He was approved by Cisner as an author of the first rank among contemporaneous writers.

KRAPOTKIN, PRINCE, b. Moscow, 1842; a Russian socialistic aristocrat, descendant from the family of Rurik. At first devoted to science, he visited Siberia for scientific research; on his return he was elected sec. of the Russian geographical soc. In 1872, on a trip to Switzerland, he joined the "International," and on his return to St. Petersburg, became one of the leaders of the revolutionary circle; was arrested and placed in prison, from which he escaped. In 1883 he was tried at Lyons, France, for being connected with the anarchists, and was condemned to five years' imprisonment; but was released in 1886.

KRASIC KI, IGNAZY, 1734-1801; born in the province of Galicia, Poland. His family, which was of the highest distinction, destined him for the church. He completed his studies for the priesthood at Rome, was made a canon, and, in 1767, bishop of Ermeland. His diocese, by annexation, passed under the rule of Frederick the Great, with whom Krasicki's talents for satire soon made him a favorite. He was promoted to the archbishopric of Gnesen, 1795. He wrote much in verse, chiefly satires and fables. Besides his version of the old story of the king of Poland devoured by mice, we may mention his *Monachomachia*, or *War of Monks*, both of which are translated into English. He also translated *Ossian* into Polish.

KRASINSKI, Count VALERIAN, a scion of an illustrious Polish family that had early adopted the Protestant religion, was b. about 1780. Being possessed of great natural abilities, which were improved and matured by a thorough education, he was appointed one of the chief officials in the bureau of public instruction for Poland. He strenuously exerted himself to promote education among the various classes of dissenters, and with a view to this, introduced, at great expense to himself, the process of stereotyping. When the Poles rebelled in 1830, and set up an independent government, Krasinski was sent as their representative to London, where, from 1831, he remained as an exile for 20 years, and then removed to Edinburgh, where he died Dec. 22, 1855. Being a man of extensive learning, and possessing a profound knowledge of the history and literature of the Slavonic nations, his works are of considerable authority. The chief are: *The Rise, Progress, and Decline of the Reformation in Poland* (Lond. 2 vols. 1840); *Lectures on the Religious History of the Slavonic Nations* (Lond. 1849); *Montenegro and the Slavonians in Turkey* (Edin. 1853), together with some translations, religious works, and political pamphlets on the subject of Poland.

KRASINSKI, ZYGMUNT NAPOLEON, Count, 1812-59; b. in Poland. He was led by his enthusiasm for the restoration of Polish autonomy to refuse to enter the Russian service, in which his father held a high position. He celebrated in verses of considerable power, especially the lyrical portion, the aspirations of his countrymen, and more generally of the Slavic races. His *Nieboska Komedya* (Undivine Comedy) has been imitated by the present lord Lytton (Owen Meredith) in his *Fool of Time*.

KRASNOIARSK', chief t. of the Siberian government of Yeniseisk, is situated on the great road from Europe to e. Siberia, at a distance of 3,197 m. from St. Petersburg. It contained, in '92, 18,425 inhabitants, chiefly Cossacks, some of whom possess numerous herds of cattle and horses. It has a natural history museum and residences of many owners of gold washings.

KRASNOVODSK', a Russian fortress on the s.e. shore of the Caspian sea, on the bay of Krasnovodsk, a place of both military and scientific importance. It was from this point that Peter the Great moved upon Khiva, and it has been the starting-place of several important exploring expeditions. After the time of Peter the Great it was neglected, but was restored to use in 1869. One of the three Russian columns that advanced upon Khiva in 1873 started from this point. Pop. about 400.

KRASZEWSKI, JOSEF IGNAZY, b. Warsaw, 1812; was educated at the university of Wilna, and in 1837 married and settled in Volhynia. The revolutionary period of 1830 aroused his sympathy and secured his practical aid, and in 1831 he was arrested and not released until 1834. For five years, between 1853 and 1858, he was curator of schools in Volhynia. In 1860 he was an editor in Warsaw, and three years later settled in Dresden, and delivered lectures. He was a versatile writer, and published as many as 400 volumes of fiction, travels, history, and poetry. He d. in 1887.

KRAUSE, KARL CHRISTIAN FRIEDRICH, 1781-1832; b. Germany; having been educated at the university of Jena, and having filled the office of tutor for two years, resided for the next 20 years at Rudolstadt, Berlin, and Dresden, pursuing philosophical studies and making occasional journeys into the s. of Germany, visiting France and Italy. In 1824 he returned to Göttingen, lecturing there on philosophy until 1831, when he went to live as a private citizen at Munich. He had socialistic views of an original type, anticipatory of a millennium of harmony and unity, in which all mankind should be associated in a common labor for universal development; finding in freemasonry, as he thought, the first principles of such an organization. Among his works on this subject were published in 1810: *Die drei ältesten Kunsturkunden der Freimaurerbruderschaft*; *Höhere Vergeistigung der echt überlieferten Grund-symbole der Freimaurerei*; and *Urbild der Menschheit*. In 1828-29 he published two works on philosophy.

KRAUTH, CHARLES PHILIP, theologian, b. in Montgomery co., Pa., May 7, 1797. Educated at home, he began to study medicine, but ultimately entered the ministry of the Lutheran Church. After pastorates in Martinsburg, Va., and in Philadelphia, he became, in 1834, president of Pennsylvania College, holding likewise until 1867, the professorship of Biblical and Oriental Literature in the Theological Seminary of the General Synod of Gettysburg. He died May 30, 1867.

KRAUTH, CHARLES PORTERFIELD, S.T.D., LL.D., b. 1823; graduated at Pennsylvania college, Gettysburg, 1839; was ordained to the ministry of the Lutheran church, and was pastor of churches in Virginia, Maryland, and Pennsylvania. In 1864 he was appointed professor of systematic theology in the Lutheran theological seminary at Philadelphia, and in 1868 he accepted the professorship of intellectual and moral philosophy at the university of Pennsylvania. He was an authority on the history, doctrines, and liturgy of the Lutheran church, his chief work being *The Conservative Reformation and its Theology*. He d. 1883.

KREASOTE. See CREASOTE.

KREATINE. See CREATINE.

KREFELD, an important manufacturing t. of Rhenish Prussia, 13 m. n.w. of Düsseldorf. It owes its importance to the settlement here, in the 17th and 18th centuries, of numerous refugees, who were driven from the neighboring countries by religious persecution, and who established here the silk and velvet manufactures for which Krefeld is now the most noted town in Prussia. It is next to Lyons, France, in silk and velvet manufactures, and has lately grown with rapidity, for here the printing, dyeing, and finishing of silk are also carried on. The number of hands employed in these manufactures is very great. Krefeld also carries on manufactures of woolen cloth and yarn, cotton goods, machinery, and chemicals. Pop. '71, 57,128; 1890, 105,376, four-fifths of whom are Roman Catholics.

KREHBIEL, HENRY EDWARD, musical critic, b. in Ann Arbor, Mich., 10 March, 1854. Educated at home, and began studying law in Cincinnati in 1872. He was musical critic on the *Cincinnati Gazette* until 1880, when he came to New York to assume a similar position on the *Tribune*. Among his writings are *Technics of Violin Playing* (1880); *Review of the New York Musical Season 1885-6*, and 1886-7; *How to Listen to Music* (1896).

KRELING, AUGUST VON, 1819-76; b. Germany; studied sculpture and painting; was appointed director of the Art industrial school at Nuremberg, 1853. He restored and decorated the old castle at Nuremberg; and the large fountain in Cincinnati, one of the finest in the world, is his work. His best known painting is "Erwin von Steinbach."

KREMENCHUG', a district t. of Little Russia, in the government of Poltava, on the left bank of the Dnieper, 70 miles by rail s.w. of Poltava. It was founded in the 16th c. by Segismundus-Augustus, king of Poland, as a barrier against the Tartars. During the reign of Catharine II. it was the chief town of New Russia, and it is now the seat of great commercial and industrial enterprise, containing factories, chiefly for tanning and tobacco. Pop. '97, 57,879.

KREMENTZ', a district t. of w. Russia, in the government of Volyn (Volhynia), is situated 128 m. w. of Jitomir, and about 20 m. from the frontier of Austrian Galicia. It had (1889) 11,398 inhabitants, and contains an old Polish fortress.

KREMLIN. See Moscow.

KREMSIER, one of the prettiest towns of Moravia, 21 m. s.s.e. of Olmütz, on the March. It is the summer residence of the archbishop of Olmütz, who has here a fine palace, containing a picture-gallery and a library of 30,000 volumes. During the revolutionary disturbances at Vienna in 1849, Kremsier was the seat of the Austrian government and imperial councils. Pop. '90, 12,480.

KREUZER—from the cross (*kreuz*) formerly conspicuous upon it—a small copper coin current till 1876 in southern Germany, the 60th part of the gulden or florin (q.v.).

KREUZ'NACH, a t. in the province of Rhenish Prussia, on the Nahe, a few miles from its junction with the Rhine, and 9 m. s.w. of Bingen. It has crooked narrow streets, and old-fashioned houses, with a pop. in '90, 18,143. It dates its existence from about the 9th century. It is chiefly notable, however, for its salt springs, which were discovered in 1478, and which, containing iodine and bromine, are serviceable in many diseases. It is therefore much frequented. The springs range from 45½° to 84° F.

KRILOF, IVAN. See KRYLOV.

KRIEMHILD. See NIBELUNGENLIED.

KRIS, a dagger or poniard, the universal weapon of the inhabitants of the Malayan archipelago. It is made of many different forms, short or long, straight or crooked. The hilt and scabbard are often much ornamented. Men of all ranks wear this weapon; and those of high rank, when in full dress, sometimes carry three or four. In Java, women sometimes wear it.

KRISH'NA, the eighth Avatâra or incarnation of the Hindu god Vishnu. See VISHNU.

KRISH'NA RIVER. See KISTNAH.

KRISS KRINGLE. See NICHOLAS, SAINT.

KROEGER, ADOLPH ERNST, b. near Friedrichstadt, Germany, 1837. His father was a minister, and in 1848 the whole family came to America and settled at Davenport, Iowa, where young Kroeger some years afterwards entered a banking-house as clerk. During the three years preceding the rebellion he was engaged upon the *New York Times* as a translator. During the war he served upon Gen. Fremont's staff. His writings and translations have contributed not a little toward bringing German literature into notice in the United States. In 1873 he published *The Minnesingers of Germany*. He d. 1882.

KROLOWEZ, a t. of Little Russia, in the government of Tchernigov, is situated 87 m. e. of the town of that name. A famous annual market is held here. Pop. '89, 12,706.

KRONENBERG, a t. of Rhenish Prussia, 3 m. s.e. from Elberfeld, in the industrial activity and prosperity of which it has partaken. Manufactures of linen and cotton are carried on, also of articles of iron and steel. Pop. '90, 8,702.

KRONSTADT, a seaport in Russia. See CRONSTADT.

KRONSTADT, a city in Transylvania. See CRONSTADT.

KROO, or KRU, an idolatrous negro race, supposed to have originated in central Africa, and to have been driven thence by the Mandingoes and Foolahs to Liberia. At present they are settled on the St. Paul river, their country reaching from cape Mesurado to St. Andreas. They are a powerful tribe, known as Kroomen, and are particularly fond of the sea. They are very black, woolly-headed, stout and active, and are much employed on the coast as sailors and boat-builders. They occupy a tract of land about 70 m. in length, extending inland only a few miles. They are polygamous, devoting their earnings chiefly to buying wives, who take care of them when they become old and infirm. Missionaries have made efforts to convert the Kroomen, but without success.

KROS'SEN, a walled t. of Prussia, on the left bank of the Oder, 31 m. s.e. of Frankfurt. There are manufactures of woolen, linen, and brass. Pop. '90, 6,657.

KROZET ISLANDS. See CROZET.

KRÜDENER, JULIANE VON, a religious visionary and enthusiast, daughter of baron von Vietinghoff, was b. at Riga in 1764. When she was but 14 she married the baron von Krüdener, a Livonian nobleman, who held the post of Russian ambassador at Venice. Her married life, however, was unhappy, and after the birth of a son and daughter, she was divorced from her husband. The succeeding incidents of her stormy career are supposed to form the groundwork of the novel of *Valerie*, which she published in 1803. After many adventures, M. von Krüdener came to Berlin, where she was admitted to the close intimacy of the queen, Louisa, of all whose projects M. von Krüdener was the confidante and sharer. The shock occasioned by the death of this princess is said to have disturbed the balance of M. von Krüdener's mind; and from that date she became a zealous disciple of the celebrated pietist, Jung Stelling, and ultimately gave herself up to religious mysticism in its most exaggerated form. From Berlin she moved to Paris, where she appeared as a prophetess, and the herald of a new religious era; and she attracted such notice by the fulfillment of certain of her predictions of public events, as of the fall of Napoleon, his return from Elba, and the final crisis of Waterloo, as to obtain access to the emperor Alexander, and eventually to acquire much influence over him. Her gigantic schemes for the elevation of the social and moral condition of the world, caused her to appear a dangerous character in the eyes of persons in authority, and she was obliged to withdraw from France and other countries in succession. In consequence, she retired to one of her paternal estates near Riga, where she entered into relations with the Herrnhüter or Moravian brethren; but her restless disposition soon carried her into fresh enterprises, the latest of which was the formation of a great correctional establishment in the Crimea for the reformation of criminals and persons of evil life. In the midst of her efforts for this object, she died at Kara-su-bazar, Dec. 13, 1824. Besides the novel already named, her only other work was a pamphlet entitled *Le Camp des Vertus* (Paris, 1815); but many curious details of her conversation and opinions are preserved in Krug's *Conversations with Madame von Krüdener*, published at Leipsic in 1818.

KRUELL, GUSTAV, wood-engraver; b. Düsseldorf, Germany, 1843. He received his art training at Düsseldorf; removed to the U. S., 1873, and has taken high rank in his department. His work appears regularly in the best illustrated books and magazines.

KRUG, WILHELM TRAUOGOTT, 1770-1842; a follower of Kant, whom he succeeded in 1804 as professor of metaphysics at Königsberg. He became professor of philosophy at Leipsic in 1809. In his *Fundamental Philosophie* he attempted to harmonize realism and idealism.

KRUGER (originally spelled in the Dutch fashion **KROEGER**), PAUL, an able statesman of the South African or Transvaal Republic, where he was born in 1826. He was one of the leaders of the Boers (q.v.) in opening up the country, and was, in his early days, famous as a hard fighter and cunning leader in the contests with the natives. After the regular organization of the Republic, he took a leading part in the politics of

the country, and was elected president for a third term, 1893. In 1884, when he visited Europe, he met Prince Bismarck, who is said to have pronounced him the ablest natural diplomat he had ever seen. This quality of mind was well shown in 1896, in his negotiations with the English government, at the time of an English raid of filibusters from Cape Colony into the Transvaal. Kruger's forces defeated and captured them, and in the subsequent diplomatic duel with the English home authorities, President Kruger showed himself more than a match for them. He is called by his own people "Oom Paul" (Uncle Paul).

KRU/MAU, a small t. of Bohemia, on the Moldau, 14 m. s.s.w. of Budweis. Its castle, a fine structure placed on a rock, contains five separate courts, and is surmounted by numerous towers and pinnacles. There are some manufactures. Pop. '90, 8,831.

KRUMMACHER, FRIEDRICH ADOLF, 1768-1845; b. Prussia; having been educated for the church, was appointed professor of theology in a university in Duisburg, which in 1818 was transferred to Düsseldorf. In 1819 he was a member of the consistorial council, and court preacher at Bernburg subsequent to his pastoral labors in Crefeld and Kettwich. In 1824 he was pastor of the Reformed congregation at Bremen. He was the eldest of a family who were distinguished among the German clergy. He was a believer in evangelical religion, and most widely known by his *Parables*, published in 1805, which passed through many editions, were illustrated, translated into English (1824), and attained great popularity in Germany and other countries. He wrote besides a drama of *Johannes and Hymn of Love*, a large number of religious and poetical works, among them *Die Kinderwelt*, sacred poems for children; *The Suffering, Death, and Resurrection of our Lord Jesus Christ*; *Cornelius the Centurion*; and *The Life of St. John*.

KRUMMHORN (Ital. *cormorne*) is the name of a very old wind-instrument made of wood, the under part of which is bent outwards in a circular arc.—Krummhorn is also the name of an organ-stop, found in almost all German organs, and generally of 8 ft. pitch. The pipes are made of tin, the body or sounding part being cylindrical, and partly shut at the upper end. The Italian name of *cormorne* has been corrupted by English organ-builders into *cremona*, which is the same stop in English organs. The sound of the krummhorn as an organ-stop is soft and quiet; but it is defective in not keeping in tune so well as other reed-stops.

KRUPP, ALFRED, 1812-87; b. Essen, Prussia; son and successor of Friedrich (d. 1826), founder of the steel works at Essen. His brother Hermann was associated with him until 1848, when Alfred assumed entire control, and by persistent study and great sacrifices continued his father's efforts to improve the manufacture of steel. His exhibit at London in 1851 first drew the attention of the world to him, and in 1852 the invention of a method of manufacturing weldless railroad tires enabled him, by its pecuniary profit, to enlarge his establishment. His breech-loading rifle was adopted by the Prussian army in 1861, and the war of 1870-71 established its superiority. His son, Friedrich Alfred, continues the business.

KRUPP, FRIEDRICH, was born at Essen, Rhenish Prussia, in 1787. Losing his father, he was brought up by his grandmother who had, in 1800, purchased the Sterkrade works. Here Friedrich first imbibed the idea of attempting to acquire the art of making cast-steel, the secret of which was carefully guarded in England. With Gottlob Jacobs, an engineer, Krupp made his first experiments at the Sterkrade works, and after the sale of the plant in 1808, continued his attempts independently at Essen. In 1810 he founded a small forging plant near Essen, and in 1815 formed a partnership with Friedrich Nicolai for the production of cast-steel. The partnership was soon dissolved, and Krupp never enjoyed the substantial fruits of his labors. His product was found excellent for certain purposes, such as mint dies, stamps for buttons, etc. Yet the demand was not sufficient to keep the works in operation; and soon after 1820, Krupp was obliged to give up his house to occupy a small one-story laborer's cottage near his plant. The hut is still preserved in the midst of the present gigantic establishment. Broken down by health and fortune, Krupp died October 8, 1826. Shortly before his death he confided to his son Alfred the secret of making cast-steel, which the latter has since developed successfully.

KRUPP'S STEEL. The widespread reputation of the steel produced in the great works of Herr Krupp, at Essen, in Prussia, has induced us to give it a brief notice. His manufactory, always a large one, has been gradually increasing in size during the last half century, until it now covers nearly 1000 acres, and gives employment to some 20,000 persons. For large metallurgical works, Essen is favorably situated, being in the center of a coal-bearing area, where coal of the purest kind can be comparatively cheaply procured. There are also at hand the manganiferous iron ores of Prussia, which have been found so excellently adapted for the manufacture of steel; but it is believed that the admirable organization of every part of his manufactory has conducted, as much as anything, to the great success of Krupp. With laborers and mechanics who have passed the regulation-time in the Prussian army, overseers trained in the German technical schools, and a small staff of experienced analytical chemists, he has obviously a great advantage in conducting operations where order, system, and skill are of paramount importance. But even with these benefits, Krupp's productions would not have gained their celebrity, were it not for the scrupulous care with which he performs every manipulation.

In the article IRON we have described the manufacture of steel by the *cementation* and *Bessemer* processes, but there are several other methods of making it, and one of these is by the decarburization of cast-iron in the puddling furnace. This is the process by which Krupp makes his steel, in the first instance; and the material he most largely employs is *spiegeleisen*, or specular cast-iron, a highly crystalline variety, usually containing about 4 per cent of manganese. This iron is admirably suited for conversion into steel. The puddling process for steel is similar to that employed for iron (q.v.), except that the former is conducted at a lower temperature, and requires nicer management; but in the case of steel, the cast-iron to be operated upon is never previously refined. Cast-iron to the extent of about 4 cwts. is melted in the puddling furnace, mixed with a quantity of slag or cinder (chiefly silicate of iron), and stirred with a rabble. During this operation, the carbon in the cast-iron (usually about 5 per cent) is gradually oxidized by the oxygen present in the cinder; carbonic oxide is produced, and as it escapes, what is technically termed "boiling" takes place. When the ebullition becomes active, the temperature is raised until the appearance of incipient solidification occurs; the heat is then lowered, and the ordinary process of balling proceeded with. Steel thus produced usually contains from 0.5 to 1 per cent of carbon; but if the temperature is not skillfully regulated, the carbon becomes wholly burned away, and malleable iron instead of steel is produced.

Puddled steel, although useful for most purposes in the arts (except cutlery), nevertheless wants homogeneity, on account of a certain intermixture of cinder, which is difficult to get rid of without fusion—a defect which is apt to prevent it from welding perfectly. In Krupp's works the puddled steel is remelted in crucibles, in order to convert it into cast-steel; and it is the wonderful uniformity of quality with which he manufactures this in very large masses, that constitutes the superiority of, and gives so great an interest to, his productions. The crucibles employed are made with extreme care, mainly from fire-clay, to which a little plumbago is added; their capacity varies from 50 to 100 lbs., and it is reported that as many as 100,000 are kept drying at the same time. After being once used, the crucibles are broken up, and mixed with other material, to make new ones.

In the casting-house, where the large ingots are run, the furnaces, which contain about 1200 crucibles, are arranged along the sides of the building; and in the central portion the steel molds, varying in capacity from 100 lbs. to 50 tons, are disposed in line between two pair of rails, upon which runs a movable crane. It is in the casting of such an enormous ingot as 120 tons of steel (the largest yet produced) from crucibles of small capacity that the perfect organization of Krupp's establishment becomes most strikingly apparent. At a given signal, one gang of workmen remove the crucibles from the furnaces, while another seize them with tongs for the purpose, and pour their contents into narrow canals of wrought-iron, lined with fire-clay, which converge into the opening by which the mold is filled. This is the critical stage of the operation, the difficulty being to deposit in the mold a continuous stream of melted steel of about the same degree of heat, so as to cool uniformly, and to solidify into a perfectly homogeneous mass. Of such uniform soundness are some of Krupp's large steel ingots, that one—shown in the London exhibition of 1862, 9 ft. high, 44 in. in diameter, and weighing 21 tons—when broken across did not show the slightest flaw, even when examined with a lens.

In order to manipulate these extraordinary masses of steel, there is a steel hammer, weighing 50 tons—the mechanical marvel of the works at Essen—which has a cylinder nearly 6 ft. in diameter. It has a 50-ton crane at each of its four corners, and behind each of these again there are four heating furnaces. A movable bench on low massive wheels serves to remove a large ingot from any of the furnaces, which is then, by means of the powerful cranes, and a system of pulleys and crabs, placed on the anvil, and worked into any desired shape. The anvil-face weighs 185 tons.

The total output of the Essen steel works in 1881 amounted to 260,000 tons, including crucible, open-hearth, Bessemer steel, and homogeneous wrought-iron. The German field, naval, fortress, and sea-coast guns consist exclusively of the constructions of the "cannon king." The armament of the German, Austro-Hungarian, Italian, and Russian field artillery is based on the Krupp system, and the Krupp gun is known throughout the world. In 1883 the "plant" comprised the Essen steel works, the Essen and Bochum coal fields, 547 iron mines in Germany, several ore beds near Bilbao, Spain, 4 smelting works near Duisburg, the Meppen proving ground, 4 steamships, various stone quarries, clay-banks, and sand-pits; and, for its own needs, a chemical laboratory, a printing office, a fire brigade, etc. There were in operation 11 blast furnaces, 1542 furnaces of various kinds, 439 boilers, 82 steam hammers, 21 roll trains, 1622 machine tools. The works consume daily 3100 tons of coal and coke, 5,000,000,000–7,000,000,000 gals. of water, and from 475,000 to 1,500,000 ft. of gas. For internal traffic there are 42 m. of railroad, 71 horses, 40 m. of telegraph lines, and, since 1884, 100 telephones. The commissary department includes a hotel, beer-gardens, a bakery, an abattoir, clothing and shoe-making establishments, and 46 stores of various kinds. There are hospitals, model dwelling-houses, manual training-school, etc. The employes numbered 20,000 in 1889, and the town, which in 1826 had about 4000 inhabitants, had (1890) 78,706.

KRUSENSTERN, ADAM JOHN, Chevalier von, a distinguished Russian voyager, was b. Nov. 19, 1770, at Haggud in Esthonia. He served for some time in the British navy. The emperor Alexander, when he ascended the Russian throne, took up a plan proposed

by Krusenstern for the promotion of the American fur-trade, and consequently intrusted him with the command of an expedition at once for scientific and mercantile objects. Krusenstern sailed from Cronstadt with two ships, Aug. 7, 1803, and returned Aug. 19, 1806, and was the first to conduct a Russian expedition round the world. He failed in one of the objects for which he was sent out—the reopening of the Russian trade with Japan, but made some interesting geographical discoveries; and his careful explorations of coasts made his voyage very important for the progress of geographical science. He published an account of this voyage (3 vols. Petersb. 1810–12, with a volume of maps and plates), which was soon translated into all the principal languages of Europe. The contributions to natural history resulting from the expedition were the subject of a separate work by Tilesius (Petersb. and Leip. 1813); and Krusenstern himself subsequently published a work called *Contributions to the Hydrography of the Pacific Ocean* (1819), and several other works on the same subject. Krusenstern died in 1846 at Asz, in Esthonia, where he had an estate.

KRYLOV, IVAN ANDREYEVITCH, a celebrated Russian fabulist, b. Feb. 13, 1768, at Moscow, was the son of a poor officer in the army, received the elements of his education at Tver from his mother, and learned French from a French tutor who was resident in the house of the governor of Tver. Krylov read indiscriminately all books which fell into his hands. Dramatical works made the greatest impression on him, and in his 15th year he wrote an opera called the *Kafeinitza* (The Coffee Fortune-Teller), which was never represented, but attracted considerable notice in Tver, and procured patrons for him, who got him an appointment, in 1785, in a public office in St. Petersburg. A bookseller gave him 60 roubles for the manuscript of his opera, which he spent in buying the works of Racine, Molière, and Boileau. In 1786 he wrote another tragedy, *Philomela*, which, although never represented, was printed in the collection called *The Russian Theater*. After the death of his mother, 1788, to whom he was much attached, Krylov received a post in the imperial cabinet, which he resigned two years afterwards, in order to devote himself to literary work. For two or three years, beginning in 1789, he occupied himself partly with journalism, but soon gave it up. He now produced a succession of prose comedies, among which were *The Crazy Family* (1793); *The Mocking-bird*; and *The Poet in the Anteroom* (1794), which brought him under the empress Catharine's notice. In 1801 he was appointed secretary to Galitzin, the governor of Riga, who, after a time, invited him to his country-house at Saratov, where he spent some years in entire leisure. He then returned to St. Petersburg in 1806, where he brought several very successful plays on the stage, *The Milliner's Shop*; *The Lesson to Ladies*, etc. It was at this time, when about 40 years of age, that he turned his attention to that kind of writing which was to immortalize him. Krylov having translated some of Lafontaine's fables, the poet Dmitriev was so struck with their felicity that he encouraged him to persevere in that line. In 1809 the first collection of his fables (23 in number) appeared, which met with great success. Others followed in 1811 and in 1816. In 1811 he was made member of the Petersburg academy; in 1812, an official in the imperial library; in 1830, counselor of state; and in course of time he was so overwhelmed with honors and pensions that, in 1841, when he resigned his public office, he drew from the state and the imperial treasury the sum of 11,700 roubles. On the occasion of his 70th birthday, homage flowed in on him from all quarters. Krylov died Nov. 21, 1844. Soon afterwards, a national subscription, to which children eagerly contributed their share, was set on foot to raise a monument to his memory; and towards the end of the reign of the emperor Nicholas, his statue in bronze, by Kloth, was placed in the summer garden at St. Petersburg. Many stories are current of his eccentricities. Owing to the genuine national spirit, the joyousness, simplicity, wit, and good-humor that pervade them, his fables are the most popular of Russian books, and many single sentences of them have become proverbs. They are generally the first reading-book put in the hands of children, and thus many thousand copies, both in dear and cheap editions, are in circulation among all classes. He produced in all nearly 200 fables, of which more than three-fourths are original, and the rest are imitations. Translations have been made by Ralston (English, 1871); Einerling (French, 1845); Torney and Löwe (German, 1842 and 1874), etc. There are numerous Italian and French imitations.

KSHATRYA, the second or military caste in the Brahmanical social system. See **CASTE**.

KUBAN, a territory in s. Russia, at the foot of the Caucasus range of mountains, in Ciscaucasia, 39,277 sq. m.; pop. '93, 1,578,200. It is the land of the Kuban Cossacks, numbering nearly half a million, who are governed by a lieutenant-general, with capital Ekaterinodar, on the Black sea.

KÜBLAI KHAN (called by the Chinese CHI-TSOU), more properly KHŪBILAI KHAN, the khagan or grand khan of the Mongols, and emperor of China, was the grandson of Genghis Khan through his fourth son, Tuly Khan. Being ordered by his brother Mangû, then khagan of the Mongols, to subjugate the Corea and China, Kúblai Khan, availing himself of an application made by Si-Tsong of the Song dynasty to aid him in expelling the Manchûs, entered China (1260) with an immense army, drove out these Tartars (or *Kin* dynasty), and took possession of north China. Kúblai Khan, who was an able and energetic prince, adopted the Chinese mode of civilization, and endeared himself to his

subjects by his attention to men of letters, and the favors which he bestowed on the memory of their former renowned monarchs. In 1279 he completed the ruin of the Song dynasty by invading and subduing southern China, and founding a new dynasty—that of the Yuen (the first foreign race of kings that ever ruled in China). From 1259 Kúblai Khan had been the khagan of the Mongols, so that his dominions now extended from the Frozen ocean to the strait of Malacca, and from the Corea to Asia Minor—an extent of territory the like of which had never before, and has never since, been governed by any one monarch. Marco Polo visited his court. Irritated by the failure of an expedition against Japan, he indemnified himself by the conquest of Mantchuria and other districts; but soon after died at Pekin in 1294. The grand dukes of Russia were among his tributaries.

KUENEN, ABRAHAM, D.D., b. at Haarlem, Holland, 1828; of German descent. He studied at Leyden, where he was called to an adjunct professorship of theology in 1853, becoming full prof. 1855. He became well known for his extremely advanced views in Old Testament criticisms, asserting a far later than the traditional date for many of the books. Among his numerous works are: *Historico-Critical Investigation into the Origin and Collection of the Old Testament Books* (3 vols. 2d ed. 1885-93. Engl. transl. of vol. 1, 1886); *The Religion of Israel* (1874-75); *Prophets and Prophecy in Israel* (1877), and *National Religions and Universal Religions* (1882). Both the latter are also translated into English. Though radical in his criticism (his chief department of study), he may perhaps be classed as not entirely unevangelical in his theology. Died 1891.

KUEN LUN, KÜN LÜN, or KURKUN, is the name of a great mountain-chain of central Asia, running generally e. and w., lying to the n. of Thibet. The Kuen Lun mountains have been little explored; but some of the passes crossed are 18,000 ft. high, and several of the peaks are not less than 22,000. The main chain begins at about 76° e. long, and is supposed to cease at about 95° east.

KUFIC COINS is the name of the earliest Mohammedan coins, inscribed with the Kufic or ancient Arabic character (see the following article). According to Makrizi, the first were struck in the 18th year of the Hedjrah (638 A.D.), under caliph Omar, who, wishing to make Islam entirely independent of foreign, chiefly Byzantine and Persian, influence, even in the province of money, caused "Mohammedan" coins to be struck, in the shape of those Persian and Byzantine ones which had been circulating among his subjects till then, and he caused them to be inscribed with koranic passages. According to other Arabic writers, however (Al-Makin, Soyuti, Ibn Koteiba, etc.), the earliest Kufic money dates from the time of caliph Abd Al-Malek (76 H. = 695 A.D.), a period much more probable, considering that no Kufic coins have hitherto been discovered anterior to 77 H. They were first of gold and silver, the former being *dinars* (corrupted from denarius—a name, moreover, wrongly applied), of the value of about 10s. 8d.; the latter, *dirhems* (drachma), worth about 5½d. Not before 116 H. were copper coins, *fels* (follis? obolus?), introduced, and the material for them was taken by the order of caliph Walid from a colossal bronze statue of an idol. Figures, human or otherwise, are rarely met with on these coins. The legend generally runs either around the margin, or is inclosed by a ring. The oldest dinar—of 77 H.—is preserved in the Milan museum (formerly Cav. Millingen's collection). The oldest dirhem found as yet, dated 82 H., is likewise in Milan, in the museo di Stefano di Mainoni. One of the richest collections of Kufic coins is in the Stockholm academy: owing chiefly to the great numbers found on the shores of the Baltic, brought thither probably by Mohammedan traders in the middle ages. Not before the 7th c. H. were the Kufic characters superseded by the modern Neshki, upon coins; while for books, etc., they had long fallen into disuse. The best authorities on this subject are Makrizi, Adler, the Tychsens, Reiske, De Sacy, Castilioni, Cataneo, Frähn, Lindberg, Pietraszewski.

KUFIC WRITING, an ancient form of Arabic characters, which came into use shortly before Mohammed, and was chiefly current among the inhabitants of northern Arabia, while those of the south-western parts employed the Himjaritic or Mosnad (clipped) character. The Kufic is taken from the old Syriac character (Estrangelo), and is said to have been first introduced by Moramer or Morar ben Morra of Anbar. The first copies of the Koran were written in it, and Kufa, a city in Irak-Arabi (pashalic of Bagdad), being the one which contained the most expert and numerous copyists, the writing itself was called after it. The alphabet was arranged like the Hebrew and Syriac (whence its designation, *ABGaD He VeS*), and this order, although now superseded by another, is still used for numerical purposes. The Kufic character, of a somewhat clumsy and ungainly shape, began to fall into disuse after about 1000 A.D., Ebn Morla of Bagdad (d. 938 A.D.) having invented the current or so-called Neshki (*nashak*, to copy) character, which was still further improved by Ebn Bawwab (d. 1031), and which now—deservedly—reigns supreme in east and west. It is only in MSS. of the Koran, and in title pages, that the Kufic is still employed. A peculiar kind of the Kufic is the so-called Karmatian—of a somewhat more slender shape—in which several inscriptions have been met with both in Arabia, and in Dauphiny, Sicily, etc., and which is also found on a coronation mantle preserved in Nuremberg. The Kufic is written with a style, while for the Neshki, slit reeds are employed. Different kinds of the latter character (in which the alphabet is arranged according to the outward similarity of the letters) are the Moresque

or Maghreb (western), the Diváni (royal—only employed for decrees, etc.), the Tâlik (chiefly used in Persian), the Thsoletki (threefold or very large character), Jakuthi, Riháni, etc.

KUGLER, FRANZ THEODOR, a German historian of art, was b. at Stettin, Jan. 19, 1808, and studied at the university of Berlin. After the completion of a very diversified course of study, he devoted himself to the study of the fine arts. In 1833 he became a professor in Berlin, where he died, Mar. 16, 1858. His most valuable works are a *Handbuch der Geschichte der Malerei*, etc. (Manual of the History of Painting from the Time of Constantine the Great to the Present Day, 1837), which has been translated into English—the part relating to Italian art by sir Charles and lady Eastlake, and that relating to the German, Spanish, French, Dutch, and Flemish schools, under the editorship of sir Edmund Head; and a *Handbuch der Kunstgeschichte* (Manual of the History of Art, etc., 1842). He is also favorably known as a poet and as the author of several dramas.

KUH-HORN, sometimes called **ALPHORN**, is a wind-instrument much used by the herdsmen in the mountainous countries of Germany. It consists of a tube about 3 ft. long, and a little bent, and gradually widening out into a kind of bell, like a bassoon. It is made of wood, or of the bark of the willow, wrought together, and bound by a pitched cord. The sound of the kuh-horn is produced by a mouth-piece like that of a trombone. It has generally only five notes, but extending over nearly two octaves—viz., C, G, C, E, G. With these five notes, the herdsmen often play most interesting melodies, which among the mountains have an indescribable charm. The following is a specimen:

KUHN, FRANZ FELIX ADALBERT, b. in Königsberg, Prussia, 1812; was a pupil at Berlin of Böckh and Bopp, under whom he made great progress in comparative philology. In 1841 he began to teach at the Cologne gymnasium in Berlin, where he became full professor in 1856. Besides taking high rank in comparative philology, he was one of the founders of the science of comparative mythology. He wrote several books and conducted periodicals devoted to his favorite subjects. He d. 1881.

KÜHNER, RAPHAEL, 1802-78; b. Gotha; was educated at Göttingen; in 1824 began to teach at the Hanover lyceum. He has written several Greek and Latin text-books, some of which have been translated into English.

KÜHNÖL, OR **KUEHNOEL**, **CHRISTIAN GOTTLIEB**, 1768-1841; b. Leipsic; lectured on biblical exegesis and hermeneutics at the age of 20 in the university of Leipsic; was professor of philosophy in 1790; and in 1809, of theology at Giessen. He was the author of several able works, among which were *Messianic Prophecies*; *Notes on the New Testament*; *The Psalms in Meter*; *Commentary on the Historical Books of the New Testament*, in 4 vols. The last especially was very popular, and republished in England with the Greek text.

KU'ILENBURG. See **CULENBORG**

KUKA, an important t. of central Africa, capital of Bornù, is situated in a level district on the western shore of lake Tsad, in lat. 12° 55' n., and long. 13° 22' w. A great fair or market is held here weekly. The population is estimated at from 50,000 to 60,000.

KU-KLUX KLAN, OR **KU-KLUX**, the title of a secret association which existed in the southern states from 1866 to 1872, and which terrorized that section of the country during the period in question. It was first made known as an active agency in Tennessee, in 1867, when the governor of the state, William G. Brownlow, called upon the U. S. military authorities to suppress violence and public disturbances in the state, which were traced to this organization. The history of the Ku-klux shows that at the close of the war various societies of a political character were formed in the states of Alabama, Arkansas, Georgia, Kentucky, Mississippi, North and South Carolina, Tennessee, and Texas, under the names of the knights of the white camellia, white brotherhood, constitutional union guards, pale-faces, invisible empires, invisible circle, etc., all of which were eventually lost in the broader scope and more powerful and permanent influence of the Ku-klux klan. From the evidence afforded it would appear that the origin of these secret societies, and more particularly of the one we are specially considering, is to be found in the general dislocation of political and social interests in the southern states, consequent to the aggressive influence of a long and devastating condition of warfare. In explanation of their foundation, ex-confederates claim that they were preceded by the organization of loyal leagues, which, as they allege, were formed among the negroes in the south through the efforts of "carpet-baggers," so-called, radical leaders intriguing in the interest of the perpetuation of the power of the republican party in the southern states. It is also claimed in behalf of the southern people that, through the action of the 14th and 15th amendments to the constitution of the United States, the southern white population was endangered in its homes and its social relations, the

emancipated blacks being considered in the light of a race angered by long and bitter servitude, now armed and equipped by law and public sentiment, and only waiting opportunity for an uprising and to grasp the balance of power among the high-spirited people to whom they had been slaves for more than two centuries. This is the southern explanation of the rise of the Ku-klux. Whatever may be the measure of truth contained in it, this in no wise militates against the justness of public condemnation of its acts.—By joint resolution, dated April 20, 1871, the two houses of congress ordered an investigation into the condition of affairs in the states recently in a condition of insurrection. For three years the press had been filled with detailed statements describing acts of atrocity attributed to the secret and terrible Ku-klux klan, which rivaled the worst instances recorded against the Spanish domination in the Netherlands and the bloody scenes of the French revolution. In every southern state except Virginia, West Virginia, Delaware, Maryland, and Florida, assassinations of negroes and white republicans were of daily occurrence. The gift of suffrage to the colored man had been nullified in its outcome as a political influence through the system of terrorizing which utterly precluded the free suffrage of the emancipated blacks. Besides instances of special massacres covering large numbers, and of which there occurred many in South Carolina, Louisiana, Mississippi, Texas, and Tennessee, the daily and nightly assassinations, whippings, burnings, and other outrages were innumerable, and were never recorded. In reporting the state of society in Texas, the evidence given is to the effect that the negroes were murdered with such frequency that there was no possibility of keeping an accurate record of the details. On the basis of reports of this nature and stimulated, doubtless, by the intense public feeling in the north, created by the gradually spreading conviction of the lamentable deficiency in the power of the law as applied in the south, congress, through its committee, proceeded to the investigation ordered by the joint resolution to which we have already referred. The result of this investigation appears in the 12 octavo volumes reporting the testimony taken and published among the official documents (senate) of the year 1872. An immense mass of evidence displays the nature and acts of the Ku-klux, and fully justifies the title "conspiracy," which congress bestowed upon that organization. While the Ku-klux may have originated for a minor purpose, it is difficult to believe that this tremendous association of men sworn to fidelity; having its ramifications in every southern state, and the power of life and death in most of them; with a ritual, oath, grips, pass-words, and all the other secret and systematic machinery necessary to the carrying out of the most hidden and dangerous purposes—it is difficult to believe that the real motive and intention of the order were not the subversion of the government of the United States, and the rehabilitation of the leaders of the rebellion. To this end, the negation of the suffrage in the south, and the efforts to defeat reconstruction, may reasonably be supposed to have tended. And whatever diverse opinions may be held regarding the good sense, judgment, and patriotism displayed in the reconstruction acts and the methods adopted to carry them into effect, it is impossible to view without the severest censure the nature of the opposition to them, as conducted by a bloody and revengeful association of cruel and implacable men, crazed by the facility with which murder and incendiarism could be made to do duty for what its members chose to consider retributive justice. Following is the oath of the Ku-klux klan, as it was offered in evidence before the investigating committee of congress: "I (name), before the great immaculate Judge of heaven and earth, and upon the holy evangelists of Almighty God, do, of my own free will and accord, subscribe to the following sacred, binding obligation. I. I am on the side of justice and humanity and constitutional liberty, as bequeathed to us by our forefathers. II. I reject and oppose the principles of the radical party. III. I pledge aid to a brother of the Ku-klux klan in sickness, distress, or pecuniary embarrassment. Females, friends, widows, and their households shall be the special object of my care and protection. IV. Should I ever divulge, or cause to be divulged, any of the secrets of this order, or any of the foregoing obligations, I must meet with the fearful punishment of death and traitors' doom, which is death, death, death, at the hands of the brethren." This sufficiently theatrical obligation becomes impressive when one reflects that its various sections were carried out with absolute rigor, and that disobedience of the orders of the chief of a klan was actually visited with instant death. Thus were the customs of the *carbonari* paralleled among so prosaic and conventional a people as the Americans so late as 1871. The members of the order were obliged to deny their membership, even when answering as witnesses in a court of law, and were obligated to clear each other by their testimony in such cases or when acting as jurors. The Ku-klux gradually died out as an active organization after the investigation of 1871; and although certain of their methods continued to obtain during the progress of elections in the south, the return to sounder sense and better feeling on the part of the people of that section, and the improving condition of the relations between the north and the south, gradually did away with the passions in which the organization originated. It is reported that there were at one time 550,000 members of the Ku-klux klan in the south, of which number 40,000 are said to have been in Tennessee.

KULA, a t. of Austria, in the Servian Woiwodschaft, on the Franzens or Bacs canal, 26 m. n.w. of Neusatz. Pop. '90, 8480.

KUL'DJA, **KUL'JA**, **KOOL'DJA**, **KUL'DSHA**, or **GUL'DSCHA**, a province in the government of Turkistan; 25,500 sq.m.; pop. abt. 12,000; was formerly a part of Soongaria, the extreme n.w. province of China, which country conquered it in 1754 from the Kal-mucks. Some years ago this province declared its independence of China under a native sultan, but in 1871 the Russian government, by agreement with China, annexed Kuldja to its dominions, and this remained its status until 1879, the czar having promised to restore it to the Chinese whenever the latter should occupy the province with a sufficient force to keep it in order and subjection, as against the wild tribes that inhabited it. The defeat of YakooB Beg afforded to China the desired opportunity to regain this territory, and a demand was made upon the czar for the performance of his promise. A Russian commission was accordingly appointed, and in Sept., 1879, this commission reported a treaty, which was accepted by China. This treaty restored to the latter power four-fifths of the province of Kuldja, the remaining strip of territory being retained by Russia to afford a foot-hold and hold a certain degree of influence in that country.

KUL'DJA, also called **ILI**, an important t., capital of a large territory in Dzungaria, central Asia, near the frontiers of Russia and China. It stands on the right bank of the Ili, a considerable river, which, rising in the Tian-Shan mountains, flows westward into lake Balkash, after a course of about 300 miles. The town, which till lately had a very brisk and growing trade, has still a population of near 20,000, composed of Dzungarians, Bokharans, Tajiks, and Chinese, and in religion mostly Mohammedans. The region in which Kuldja stands revolted against China in 1865, and was occupied and taken possession of by Russia in 1871. The demands of China for the restoration of Kuldja were not acceded to by Russia till 1881.

KULM, a small village of Bohemia, 23 m. n.e. of Bromberg, was the scene of two bloody conflicts between the French and allies on Aug. 29 and 30, 1813. The French, numbering 40,000 men, were commanded by gen. Vandamme; the Russians, during the first day's conflict, were 17,000, and were commanded by gen. Ostermann-Tolstoi. During the night the latter were heavily reinforced, and on the second day Barclay de Tolly assumed the command with 60,000 troops. The result was the complete wreck of the French army, which lost in these two days little short of 20,000 men, while the allies did not lose half of that number.

KULM, or **CULM**, a co. of w. Prussia; pop. '90, 9762; one of the four dioceses into which Prussia was divided early in the 13th century. From 1466 to 1772 it formed a part of Poland, but on the first partition of the latter kingdom was restored to Prussia. Its trade is sufficient for the necessities of the people, without being important. Besides an Evangelical church its principal institutions are educational, viz., a cadet school, and a Roman Catholic gymnasium or high school.

KULTUR KAMPF. See **CULTUR KAMPF**.

KUMA'NIA. See **CUMANIA**.

KUMAON' is a district of British India, in the Kumaon division of the North-west Provinces, in lat. 29° to 31° n., and long. 78° to 81° e. It lies chiefly on the s. slope of the Himalayas, comprising upwards of 30 summits in that range, which vary in altitude from about 18,000 ft. to nearly 26,000. With the exception of a belt on its southern frontier, which is from 2 m. to 15 m. broad, the whole country is one mass of mountains and forests. It contains mines of gold, copper, and lead, which, however, have never yet been profitably worked. Throughout the southern belt above mentioned, it produces, generally in two crops a year, wheat, barley, oats, millet, peas, beans, etc., with rice, cotton, indigo, sugar, ginger, turmeric, etc. Near the end of the 18th century Kumaon was seized by the tribe of Gürkhas, who frequently raiding the neighboring territory, it was decided to wrest it from them and annex it to the British dominion. Area, 7,151 sq. m.; pop. '91, 563,000. The principal town is Almora (7,800). Kumaon is also spelt *Kamaun*.

KUMĀRASAMBHAVA is the name of one of the most celebrated poems of the Hindus. Its reputed author is Kālidāsa (see **KĀLIDĀSA**), and its subject is the legendary history connected with the birth of Kumāra, or Kārttikeya, the Hindu god of war. See **KĀRTTIKEYA**. It consists of 22 cantos, but only 8 have hitherto been published in the original Sanskrit. The first seven have been elegantly rendered in English verse by Mr. R. T. H. Griffith, principal of the Benares government college.

KUMBUK' (*Pentaptera tomentosa*), a tree of the natural order *combretaceæ*, a native of the East Indies. It is a noble tree, and produces durable timber. Sir James E. Tennent describes a kumbuk tree in Ceylon, 45 ft. in circumference, close to the ground, and 21 ft. at 12 ft. above the ground, which serves as a landmark for boatmen, towering high above forests of cocoa-palm, and discernible at a distance of 20 miles. The bark of the kumbuk yields a black dye, and contains so much lime that its ashes are used as lime for chewing with betel.

KUMISS, or **KUMISH**. See **KOUMISS**.

KÜMMEI. See **LIQUEUR**.

KUMQUAT (*Citrus Japonica*), a small species of orange, a native of China and Japan, and much cultivated in these countries. It has been introduced into Australia. It endures more frost than any other of the genus, and will probably prove a valuable acquisition to many parts of Europe and America. The plant is a shrub sometimes 6 ft. high, but in cultivation it is not allowed to exceed the height of a gooseberry-bush. The fruit is oval, and about the size of a large gooseberry; the rind is sweet, and the juice acid. It is very delicious and refreshing. The Chinese make an excellent sweet-meat by preserving it in sugar.

KUNERSDORF, a village of Brandenburg, in Prussia, nearly $4\frac{1}{2}$ m. n.e. of Frankfort-on-the-Oder, was the scene of one of the most remarkable battles of the Seven Years' war, fought on Aug. 12, 1759, in which Frederick the great was completely defeated by a combined attack of Russians under Soltikof and Austrians under Laudon. The loss on the Prussian side was 18,500 men, with almost all their artillery and baggage, while their opponents lost 16,000 men.

KUNG-TSIN-WANG, Prince, b. China, Jan. 11, 1833; a son of the emperor T'ung-chi, brother of the emperor Hien-Feng, and uncle of the emperor Kwangsu (succeeded 1875). On the accession of his brother, he and his five other brothers were created princes. Princes Kung and Ch'un (1835-91) were active in the administration of the government from the time of the English entry into the capital till about 1889, the former being prime minister in 1861-84. Prince Kung is among the party of progress in China, and has advocated freedom of intercourse with foreign nations, and the adoption of foreign customs and inventions. To his influence chiefly was owing the treaty of peace with the French and English in 1860, and likewise the appointment of Anson Burlingame, a citizen of the United States, as envoy and ambassador to the Christian powers in 1868. He also conducted China through the Formosa difficulty with Japan, concluding a treaty of peace with that country in 1874.

KUNG-CHOW-FOO. See HAINAN.

KUNGUR', a t. in the government of Perm, Russia, and 1416 m. from St. Petersburg, is renowned for its tanneries, in which the best quality of Russia leather is produced. In the neighborhood are several large iron-works. Pop. '89, 12,106.

KUNIGUN DÉ, SAINT, wife of the emperor Henry II., was the daughter of count Siegfried of Luxemburg. Her husband, duke Henry of Bavaria, was crowned king of the Germans in 1002, and emperor in 1014. Her reputation having been unjustly assailed, she vindicated herself by walking barefooted over hot plowshares. After the death of her husband in 1024, she retired into the convent of Kaufungen, near Cassel, which she had founded, spent the remainder of her days in pious works, and died on Mar. 3, 1031. Pope Innocent III. gave her a place amongst the saints in 1200.

KUN'NOJ, or **KUNNOUJ**, a decayed t. of British India, capital of the pergunnah of the same name, in the district of Furrackabad, 65 m. n.w. of Lucknow; on the Kali Nuddi river, about 3 m. from its junction with the Ganges. At present the place is little more than an expanse of ruins, whole mountains of which meet the eye in every direction, upon a space of ground much larger, it is said, than the site of London. The greatest part of the standing buildings are uninhabited, and tottering to decay. The few poor people now in the place live in mud huts built up against the old walls. The present town is about a mile long, and half a mile broad, with a ruinous fort of no great antiquity. The most remarkable buildings are two handsome Mohammedan mausoleums. Kunnoj was formerly one of the greatest of Indian cities; and according to some, ranks second in respect of antiquity. One authority considers the town to have existed before the first introduction of Brahmanism from the west. Until about the 12th c. A.D., it continued to be the chief city of India; but in 1194 it was attacked by Shahabuddin Mohammed, sovereign of Ghoor, who defeated the king of Kunnoj and overthrew that monarchy. After this the history of the place consists only of a succession of disasters, and now this once celebrated place contains only a few thousand inhabitants, living in great indigence.

KUNTH, KARL SIGISMUND, 1788-1850; b. Leipsic; educated in Berlin, through the influence of Alexander von Humboldt. He devoted himself to the study of botany, had charge of the botanical garden in Berlin, and edited Humboldt and Bonpland's *Voyages aux Régions Équinoxiales*, besides assisting in the arrangement and classification of baron Humboldt's splendid herbarium of 5,000 specimens.

KUNZ, GEORGE FREDERICK; mineralogist, b. in New York City, Sept. 29, 1856. U. S. Census special agent in charge of precious stones, in 1883; had charge of the mineral exhibit of the U. S. government at Paris, 1889. He was made honorary special agent for mines and mining at Chicago Exhibition, 1893. Author of *Gems and Precious Stones* (1890).

KUNZE, JOHN CHRISTOPHER, D.D., b. in Saxony, Aug. 4, 1744; was educated at Leipsic and Halle, and became a minister of the Lutheran church. In 1770 he emigrated to Philadelphia to act as associate pastor of the German churches there. During his residence in that city he was for several years a professor in the university of Pennsylvania. In 1784 he accepted a pastoral call to New York, where he resided for the remainder of

his life. He added to his pastoral labors those of professor of oriental literature in Columbia college. He was one of the best Hebrew scholars of his time. Among his published works are a *History of the Christian Religion and of the Lutheran Church*, a *Catechism and Liturgy*, and a *Lutheran Hymn and Prayer Book*. He d. in 1807.

KUOPIO, a län or government of Finland; 16,498 sq. m.; pop. '92, 295,173. It is comprised in an extensive plain, containing a large number of lakes, and lying immediately w. of Russia; lat. 63° n., long. 27° east.

KUP FERSCHIEFER, one of the series of strata which make up the permian rocks. It consists of beds of dark shale with copper ore (hence the name), and containing beautifully preserved fish, of species nearly allied to those of the coal measures.

KUPPERWUNJ', a fortified t. of British India, in the presidency of Bombay, 32 m. e. of Ahmedabad, on a tributary of the river Sabarmuttee. It has some trade, and manufactures of soap and pottery. Pop. 13,000.

KU'RA, or **KUR** (anc. Cyrus), the principal river of the Caucasus, rises in the Sahanlu chain, and after a south-eastern course of 535 m. falls into the Caspian sea by several shallow channels, about 60 m. n. of the Persian boundary. Its chief tributaries are the Aras (anc. *Araxes*), the Alazan, and the Yora. The Kura has so rapid a course and changes its channel so frequently that to bridge it is almost impossible.

KURACHEE. See **KURRACHI**.

KURDISTAN' ("the country of the Kurds"), an extensive region of Western Asia, running n.w. and s.e., between lat. 34° to 40° n., and long. 39° to 40° e., bounded on the n.e. side by Armenia, Azerbaijan, and Irak-Ajemi, and on the s.w. by the Tigris and Aljezira, belongs to the Turkish and Persian monarchies, chiefly to the former, and contains about 74,000 sq. m. The country, with the exception of the tract bordering on the Tigris, is very mountainous, some of the peaks being nearly 13,000 ft. above the sea-level; these mountain-ranges divide the surface of the country into fertile valleys and extensive table-lands. The southern part is for the most part low and flat, parched in summer, and verdant during the wet season. The country is traversed by the Euphrates, Tigris, Zab-Ala, Zab-Asfal, and Diyala or Shirvan, and contains several lakes, the chief of which are Van and Urumiah. Four-fifths of the inhabitants are Kurds (anc. *Carduchi* and *Gordyaei*) a race partly nomad and partly agricultural, who occupy themselves chiefly, however, with the breeding of cattle, sheep, goats, and horses. A great trade is carried on with Turkey and Persia, especially in horses, the Kurdish breed being so famed for its spirit and endurance as to be almost exclusively employed by the Turkish and Persian cavalry. The settled portion of the population consists of Kurds, Turks, and Persians, who are engaged in agricultural employments. A remarkable product of this country is a substance found on the leaves of the tamarisk and other shrubs, which closely corresponds to the description given of "manna" in the Old Testament, and is supposed to result, like oak-galls, from the puncture of the leaf by an insect. The country is deficient in mineral wealth. The inhabitants, with the exception of the Nestorians (q.v.), who inhabit the valley of the Tigris, profess a debased form of Mohammedanism. The chief towns in Turkish Kurdistan are Bitlis (q.v.), Van, Urumiah, Mardin (anc. *Mardein*), Mush, Korkuk, Diarbekir, Malatia, and Marash. The Persian portion of Kurdistan does not form a distinct province, but is included in Azerbaijan, Ardelan, and Irak-Ajemi.

KURDS, a mountain people dwelling in the northern part of Asia and belonging to the Indo-Germanic branch of the Iranian family. They occupy parts of Turkish Asia Minor, Persia, and Russian Transcaucasia; and a few dwell in Afghanistan and Beluchistan. They make up a large part of the population of Kurdistan (q.v.). Agriculture is their main occupation and in character they are brave and liberty-loving. Estimates place their numbers at 1,500,000 in Asiatic Turkey; 750,000 in Persia; and 100,000 in Russia. See Hübschmann, *Iranian Studies* (1878); and the works of Roediger, Pott, Schläfi, Millingen, and Blau.

KURILE ISLANDS, a line of islands in the north Pacific ocean, belonging to Japan, extend between the s. extremity of Kamchatka and the Japanese island of Yezo. The islands are about 25 in number, 19 of which were possessed by Russia until 1875, when they were ceded to Japan in exchange for the half of Saghalien. Area about 3,850 sq. m.; pop. between 200 and 300. Since 1781 no tribute has been collected here. The Kurile islands are all volcanic. The vegetation is poor; the principal productions being the furs of foxes, wolves, seals, and beavers. Navigation near the islands is difficult.

The Kurile Islands are called in Japanese, **CHI-SHIMA** (thousand islands). The name Kurile is Russian, from *kuril*, "to smoke," from the active volcanoes seen from Kamchatka. Those belonging to Russia were transferred to Japan in 1875 in exchange for the southern half of Saghalin, held by Japan.

KU'RISCHÉS HAFF, an extensive lagoon, separated from the Baltic sea by a ridge of sand from 1 to 2 m. in width. It extends nearly 60 m. along the coast of east Prussia from Labiau to Memel, where it enters the Baltic by the "Memel deeps," a channel about 1000 ft. wide and 12 ft. deep. Its greatest breadth at the southern extremity is about 28 m., but its average breadth is not above 14 miles. The waters of the Kurischés Haff are fresh. Its depth is very variable, and hence its navigation, accomplished by means of large flat boats, is both difficult and dangerous. The belt of land is called the "Kurische Neerung," and has a few villages upon it.

KURNUL', the chief t. of a district of the same name, in the presidency of Madras, in lat. $15^{\circ} 50' \text{ n.}$, and long. $78^{\circ} 5' \text{ e.}$ Pop. '91, 24,400. The district itself—separated on the n. by the Krishna from the Nizam's dominions—is 189 m. long. The country possesses considerable works for the purposes of irrigation.

KURO'DA KIYOTA'KA, b. in Satsuma, Japan, and took an active part in the war of 1868, and was intrusted with the task of finishing the war by subduing the rebels in Yezo. After some of the fiercest fighting on record between iron-clads and forts and modern war-vessels, Kuroda secured the surrender of Enomoto, the leader, by a personal pledge that no harm should befall him. Though the government condemned Enomoto to death, Kuroda secured his pardon after three years' imprisonment by the assurance, solemnly given, that if harm befell Enomoto, he (Kuroda) would open his bowels by hari-kari. After the war Kuroda was made chief of the Kai-Taku-Shi, a department organized to colonize and develop the resources of Yezo. In 1871 Kuroda visited Europe and America, and in Washington secured the formation of the staff of American geologists and scientific men who have done more for the development of northern Japan and for our scientific knowledge of Yezo than anything before attempted. Horace Capron, Thomas Antisell, M.D., Stuart Eldredge, M.D., maj. Warfield, Henry S. Munroe, James R. Wasson, Benjamin S. Lyman, lieut. Murray S. Day, U.S.N., and others have served under the Kai-Taku-Shi, and their papers in scientific periodicals are rich mines of exact information on special topics. Out of this enterprise grew up the geological survey of Japan, now being carried on by Prof. B. S. Lyman. In 1874 Kuroda was made imperial counselor, and in 1876 went to Corea in command of the treaty-making expedition. He has greatly assisted in advancing the cause of female education in Japan. In 1889 he resigned from the cabinet to enter the privy council.

KURO SHIWO (Black Current). The gulf stream of the Pacific which rises near Formosa, as the westward-northern branch of the north-equatorial current of the Pacific, and flows upward past Kiushiu, Shikoku, and Hondo, islands of Japan, and past the Kurile chain; thence splitting into two branches, the smaller stream passes up through Behring's straits, the main volume scouring the Aleutian or Fox islands, sending a loop around the Alaskan coast; and thence bending southward to California, whence it bends westward past the Sandwich islands, and pursues its way past Formosa and Japan again. The color of the Kuro is of a deep blue, and its warm waters move at the rate of $\frac{3}{4}$ m. an hour. In addition to its scientific and climatic significance and influence on Japan, Alaska, and California, the problem of the origin of the races of America may receive new light through a study of the Japan current. A tree or junk, set in the Japan current, if left to float, will strand on Alaska or California, or even upon the Hawaii islands. For 20 centuries Japanese fishing-boats have been blown or swept into the Kuro Shiwo, and the arrival or stranding of some of them on the coasts of America is not to be doubted. From 1872 to 1876 a record of no less than 49 Japanese junks wrecked, met with or seen on American and Hawaiian shores was made out, and read by Mr. Chas. Wolcott Brooks before the California academy of sciences, Mar. 1, 1875. Further research has disclosed a much larger number of waifs, all Japanese. See the summary in "The Mikado's Empire," p. 579. The similarity of the flora and fauna of the w. coast of North America will be understood from a further study of the Kuro Shiwo.

KURRA'CHI, an excellent port in Sind for sea-going ships, lies about 12 m. n.w. of the most westerly mouth of the Indus, and 90 w.s.w. of Hyderabad. It was taken by the British in 1839, and has since advanced with rapid strides in the path of improvement. Pop. '91, 98,200. As the mouth of the Indus is barred by sandbanks, Kurrachi is virtually the terminus for the traffic on that river. The anchorage is exposed, but harbor works and other improvements have been executed. It is connected by the Sind railway with Hyderabad, thence, by means of the Indus Steam Flotilla company's vessels, with Sakar and Miltan, and from the latter place by the Punjab railway with Lahore, Amritsir, Peshawur, etc. Since Jan., 1860, it has had direct communication, by submarine telegraph, with Muscat and Alexandria. The exports of Kurrachi are hides, tallow, oil, cotton, wheat and tea; and the imports: metals, hardware, silk, cotton, and woolen goods. Kurrachi has an active inland trade with Cashmere, Turkistan, Afghanistan, and Thibet. It contains an English church and school.

KURSK, one of the governments in middle European Russia, lying s. of Orel, contains 17,937 sq. m., the most of which is arable. The province is watered by feeders of the Dnieper and of the Don. The soil being very fertile, large crops of corn are raised, and even in scanty years Kursk can supply the neighboring provinces. Pop. '91, 2,666,573, of whom the greater part are employed in farm-tillage, though a large number devote themselves to cattle-breeding and orchard-gardening. The principal manufactures are spirits, leather, pottery and sugar, and the products are largely exported. Hemp and tallow also form important items in the export trade of the province.

KURSK, the chief t. of the government of that name, 333 m. s.s.w. of Moscow, dates from the 9th century. It suffered considerably from the ravages of the Tartars and Poles, but is still a flourishing town, numbering '97, 52,908 inhabitants, and carrying

on a considerable trade in tallow-melting, distilling, and tanning. Kursk is also celebrated for its orchards, the fruit of which is in great request. Near the town, a fair is held in July, when about \$5,000,000 worth of commodities are disposed of, the chief being manufactured silk and woolen fabrics, sugar, tea, horses, etc.

KURTZ, BENJAMIN, D.D., LL.D., 1795-1865; b. Penn.; was for several years a teacher of ancient and modern languages; studied theology with the Rev. Dr. George Lochman; was licensed to preach in 1815 by the Lutheran synod of Pennsylvania; was assistant to his uncle, Rev. Dr. J. D. Kurtz, at Baltimore; pastor at Hagerstown and Chambersburg; became editor of the *Lutheran Observer* at Baltimore in 1833, which he conducted with ability for 20 years. Dr. Kurtz took an active part in founding the Lutheran theological seminary at Gettysburg; was the chief founder of the *missionary institute* at Selin's Grove, Penn., and published several theological works.

KURTZ, JOHN NICHOLAS, 1720-94; b. in Germany; studied theology at Giessen and Halle, and in 1745 came as a missionary to the Germans of Pennsylvania and was the first Lutheran minister ordained in the American colonies. He was stationed successively at New Hanover, Tulpehocken, Germantown, and York, but spent much of his time in labors among the frontier settlements, where his life was in constant peril from hostile Indians. During the war of the revolution his patriotism was conspicuous. Died in Baltimore.

KURU, a name of great celebrity in the ancient or legendary history of India. See MAHABHARATA.

KUSH, THE HINDOO. See HINDU KUSH.

KUSKOQUIM RIVER rises in s. central Alaska, in the Chigmit mountains, and, flowing s.w., empties into a bay of Behring's sea of the same name. It is more than 500 m. in length, unexplored, and drains a country inhabited only by Indian tribes and Esquimaux.

KÜSSNACHT, a village of Switzerland, in the canton of Schwytz, on an arm of lake Lucerne, at the foot of the Rigi. It is associated with the myth of William Tell. Pop. about 3000.

KUSTEND'JI, or KISTENDJEK, a fortified seaport of Roumania, in the Dobrudja, on the Black sea, 40 m. e. of Rassova, at the termination of Trajan's wall, of which some traces may still be seen. It has some trade in corn, its harbor is from 18 to 20 ft. deep. The town is connected by rail with Chernavoda, on the Danube. Pop. 8,000.

KÜS'TENLAND (i.e. *Coast Districts*, Ital. *Litorale*), a crown-land of Austria, consisting of the co. of Görz and Gradiska, markgrafdom of Istria, and the town of Trieste with its territory. It lies between the crown-land of Carniola on the n.e. and the gulf of Venice on the s.w. Area, 3,076 sq. m.; pop. '90, 695,384. Together with the crown-lands of Carinthia and Carniola, it constituted in former times the kingdom of Illyria. The surface is mountainous. The chief rivers are the Isonzo and the Rieka. The soil in general is fruitful, but agriculture is in a very backward condition. In the mountainous districts in the n. and n.e. the breeding of cattle is the chief branch of industry. Commerce is extensively carried on at the various seaports.

KÜSTRIN', a t. of Prussia, and a fortress of the third rank, is situated in the midst of extensive morasses, at the confluence of the Warthe with the Oder, 19 m. n.e. of Frankfort. Pop. '90, 16,672.

KUTAIEH, KUTAHIA, or KUTAYA (the ancient *Cotiaëum*), an important t. of Asiatic Turkey, in Brusa, capital of the eyalet in which it is situated, stands 70 m. s.e. of Brusa, on the Pursuk, a tributary of the Sakaria—the ancient Sangarius. It has a large fortress, and a population of about 6,000.

KUTAI'S. See TRANSCAUCASIA.

KUTTENBERG, a mining t. of Bohemia, about 31 m. s.w. of Königgrätz. Here, in 1237, silver was found, and the silver mines were first worked. The first silver *groschen* were struck here in 1300. The silver-mines have not been worked for about 300 years, the chief mineral products of the district being now copper and lead. Cotton-spinning, cotton-printing, and bleaching are also carried on. Pop. '90, 13,563.

KUTUSOW, MICHAEL ILARIONOWITSCH GOLENISCHTSCHEW, Prince of Smolensk, a Russian field-marshal, b. in 1745, early entered the Russian army, and in 1787 was appointed gov-gen. of the Crimea. He distinguished himself in the Turkish war, and after various other services, was appointed in 1805 to the command of the first *corps d'armée* against the French. On Nov. 18 and 19 of that year he was victorious over marshal Mortier at Dürrenstein. He was second in command of the allied army, of which the emperor Alexander himself was commander-in-chief, at Austerlitz. In 1811-12 he commanded the Russian army in the war against the Turks, and notwithstanding his advanced age, he succeeded Barclay de Tolly in 1812 as commander-in-chief of the army against the French, and obtained a great victory over Davoust and Ney at Smolensk. He carried on the campaign to its successful termination; but his strength was exhausted, and he died at Bunzlau, April 28, 1813.

KÜTZING, FRIEDRICH TRAUGOTT, b. at Ritteburg, in Thüringen, 1807; studied at Halle, and visited s. Europe, especially exploring the flora of the Adriatic coasts. In 1835 he was appointed professor of natural science at Nordhausen. His researches have led him to the same fundamental ideas as those of Darwin. His works are highly esteemed.

KUVERA, the Hindu Plutus, or god of wealth. He owes his name—which literally means “having a wretched (*ku*) body (*vera*)”—to the deformities with which he is invested by Hindu mythology. He is represented as having three heads, three legs, and but eight teeth; his eyes are green, and in the place of one he has a yellow mark; he wears an earring, but only in one ear; and though he is properly of a black color, his belly is whitened by a leprous taint. He is seated in a car (*pushpaka*), which is drawn by hobgoblins. His residence, *Alaká*, is situated in the mines of mount Kailása, and he is attended by the Yakshas, Mâyus, Kinnaras, and other imps, anxiously guarding the entrance to his garden, Chaitraratha, the abode of all riches. Nine treasures—apparently precious gems—are especially intrusted to his care.—His wife is a hobgoblin, *Yakshi*, or *Yakshini*, and their children are two sons and a daughter. As one of the divinities that preside over the regions, he is considered also to be the protector of the north.

KUYP. See **CUYP**.

KVASS (Quass). A native Russian home-brewed beer; also called mahkoolak, after a Russian brewer. It is the product of flour, dried apples, sugar, and water fermented in a cask for a given period. Finer kinds are made from apples, raspberries, or other fruit, without malt. It takes the place of the beer of other countries, and is used to such an excess by the natives of Alaska, on holidays especially, as to produce the “mahkoolak” intemperance. See **BEER**.

KWANG-TUNG, or **QUANGTUNG**, the most south-easterly province of China, contains the important ports of Sevaton, Canton, and Hong-Kong. It lies on the gulf of Tonquin and the China sea, contains a pop. estimated at 27,700,000 and covers an area of 86,873 sq. miles. While the country bordering on the sea-coast is level and productive, the northern part is mountainous. Sugar, tea, rice, tobacco, and fruits are grown in large quantities, and the manufacture of silk, cotton, and lacquered ware is extensive.

KWEI-CHU, or **QUEICHOW**, a province in the s.w. part of China; 67,812 sq. m.; pop., estimated '90, 7,700,000. The capital is Kwei-yang-fu. It is a rough, mountainous region, with mines of copper, iron, lead, and quicksilver, the latter little worked.

KWICKPAK RIVER, the name of one of the outlets or delta arms of the Yukon, the great river of Alaska. It is wide and shallow, and has a length of about 50 miles. The Russians often give this name to the Yukon itself, which rises in British Columbia, enters Alaska near the Arctic circle, and flows with a s.w. trend across the entire width of the territory, more than 1800 m., into Behring sea.

KYANITE (see **CYANITE**), called also *disthene*, *rhætzite*, *monrolite*, a native silicate of alumina, crystallizing generally in long-bladed forms, though sometimes in short prisms, of the triclinic system; hardness 6 to 7½; luster vitreous and pearly; color blue, white, gray, green, and black; translucent, transparent; but the most common color is pale blue, deeper along the middle of the prisms. Analysis of a specimen from Norway by Arfvedson gave: silica 36.4, alumina 63.8 = 100.2. A specimen from St. Gothard by the same analyst gave: silica 34.33, alumina 64.89 = 99.22; another from the same mountain gave: silica 36.9, alumina 64.7 = 101.6. Another specimen from the Tyrol, analyzed by Erdmann, gave: silica 37.36, alumina 62.09, iron 0.71 = 100.16. A specimen from Lincoln co., N. C., analyzed by Smith and Brush, gave: silica 37.6, alumina 60.4, iron 1.6. This mineral occurs principally in gneiss and mica slate. Transparent crystals are found at St. Gothard in the Tyrol; in Bohemia; at Pontivy, France; and Villa Rica, S. A. Kyanite also occurs in Massachusetts, at Chesterfield, associated with garnet, in mica slate; at Litchfield, Conn., in large rolled masses with corundum and massive apatite; in New York at Monroe, Orange co.; in Pennsylvania, in fine specimens on the Schuylkill road near Philadelphia, and near the Schuylkill on the Blue Ridge road, back of Robin Hood Tavern; in Maryland at Scott's Mills 18 m. n. of Baltimore; in North Carolina near Crowder's Mountain; and in short crystals at Bellows Falls, Vt. A black variety, associated with rutile, is found in North Carolina. Fine specimens of kyanite are used as gems, and have some resemblance to sapphire (q.v.).

KYANIZING, the most efficacious method of preserving ships from dry rot (q.v.), by injecting into the pores of the wood a solution of corrosive sublimate, was invented by John H. Kyan, who was born in Dublin, Nov. 27, 1774, and died in 1850.

KYLE, a district of Ayrshire (q.v.).

KYRIÉ ELEISON (Gr. *Kyrie eleison*, Lord have mercy), a form of prayer which occurs in all the ancient Greek liturgies, and is retained in the Roman Catholic mass. It follows immediately after the introit, and forms the introduction to the hymn of praise, “Gloria in excelsis Deo” (Glory to God on high). The retention of the Greek language in this prayer is one of many evidences of the predominance of the Greek element in the early Roman church (Milman's *Latin Christianity*, i. 10). The same peculiarity occurs in a few others of the Roman services, especially those of the holy week.

KYTHUL, or **KAITHAL**, a t. in the Delhi division of the Punjab, about 46 m. s.w. of Arubala. Pop. 15,800. It is substantially built of brick, having a lofty palace, which looks down from a beautiful grove on a spacious sheet of water. It was only in 1843 that the territory fell to the English East India company, having lapsed through the failure of heirs. It then comprised more than 500 villages, with a large revenue.

L

L, **THE** twelfth letter of our alphabet, was called *Lamed*, i.e., "ox-goad," by the Hebrews, doubtless from its resemblance to that implement—a resemblance still traceable in the Phœnician. L belongs to the order of consonants called liquids, and has the closest affinity to R. In some languages there is only one sign for both, as in Pehlwi; and in others, the one or the other sound is altogether wanting. Hence, the numerous substitutions of the one sound for the other in the Aryan languages. Thus, Eng. *plum*, Ger. *pflaume*, from Lat. *prunus*; Eng. *pilgrim*, Lat. *peregrinus*; Gr. or Lat. *epistola*, Fr. *épître*; the Swiss peasants pronounce *Kirche*, *Kölche*; and the Lat. termination *alis* becomes, after *l*, *aris*—as, *materi-alis*, *famili-aris*. L is also interchangeable with *n*—as, Gr. *pneumon*, Lat. *pulmo*; and, rather strangely, with *D* (q.v.). In certain combinations, the *l* of Latin words has become *i* in Italian—as, *planus*, *piano*; *Florentia*, *Firenze*. In Eng. *l* is often mute, as in *calm*, *yolk*, *should*. In the Scottish dialect, it is mostly mute in the end of words—as, *fa', fu', a'*, for *fall, full, all*. Similar to this is the frequent melting of *l* into *u* in modern French—thus, *à le* has become *au*; *chevals*, *chevaux*.

LA. See **SOLFEGGIO**.

LAAGER, is a term used by the Dutch Boers (q.v.) in South Africa to designate an enclosure formed of wagons, for temporary defense.

LAA LAND, or **LOLLAND** (i.e. *low land*), a Danish island in the Baltic, at the southern entrance to the Great Belt. Area, 444 sq. m.; pop. '90, 67,913. The surface is remarkably flat, and the soil exceedingly fruitful, bearing corn, hemp, and timber. The chief town is Naskov, with a pop. (1890), of 6722.

LABADIE', **JEAN DE**, 1610-74; b. at Bourg-en-Guienne; educated in the Jesuits' college at Bordeaux, he entered their order and distinguished himself as a preacher. He exposed the abuses in the Roman church and urged reform; but finding no encouragement in his order, he left it and joined the Fathers of the Oratory in 1639, and soon after the Jansenists. In 1640, appointed canon of Amiens, he introduced reforms, holding meetings for the reading of the Bible, and administering the Lord's supper in both kinds to the people. Persecuted by the Jesuits, he became in 1650 a Protestant, and was for eight years pastor of the church at Montauban. In 1657 he was pastor in Orange, and in 1659 in Geneva. Here he exerted himself with great zeal to restore apostolic religion, and by his earnestness, sanctity, and austerity gained many followers. In 1666 he became pastor of a Walloon church in Middleburg, Holland; but still persecuted by his enemies, he left it, and went in 1669 to Amsterdam, where his followers soon formed a distinct sect called Labadists. It included many of rank and education, among whom were two ladies, the learned Anna Marie von Schurmann, and the authoress, Antoinette Bourignon. Expelled from the country as a separatist he went in 1670 to Erfurt, where he was protected by the princess Elizabeth, who, through the influence of Anna Marie von Schurmann, became a disciple. Driven from this place in 1674, he went to Bremen and then to Altona, where he died. He left numerous works. The Labadists did not differ entirely from the Reformed church, but adhered to its doctrinal symbols. They were a sect of mystics who sought reform of life rather than of doctrine. They supported themselves by manual labor; and, after the example of the primitive church, held property in common; laid great stress on the internal light as indispensable for the understanding of the Bible; rejected infant baptism and the observance of holy days. They have been charged with immorality by some Roman Catholic writers, but without reason. They honored the institution of marriage. After Labadie's death his followers settled at Wiewert, but made few converts, and in the beginning of the 18th c. the sect became extinct. A few of them came to the United States and settled on the Hudson, but gained no permanence as a sect.

LABAGH, **PETER**, D.D., 1773-1858; b. N. Y.; descended from French and Dutch ancestry, received a classical education under the direction of Dr. Peter Wilson of Hackensack, N. J., afterwards professor of Greek and Latin in Columbia college. In 1796, having studied theology with John H. Livingston, D.D.,—who had studied at Utrecht, Holland, and was afterwards president of Rutgers college, New Brunswick, N. J., and was considered the father of the Reformed Dutch church in America,—he continued his studies with Prof. Froeligh of the same denomination. Subsequently he went as a licensed missionary to the western part of New York state, and from thence to Mercer co., Ky., where he established a church. Soon after, on returning to his

native state, he was installed as pastor of a church in Greenbush, near Albany, remaining there until 1809, when he was given the charge of the church in Harlingen, which he held 35 years. He was distinguished for the soundness, accuracy, and acuteness of his judgment, and the celerity with which his mind arrived at sound conclusions; also for a cheerful and happy disposition, rendered sweet by the pure spirit of habitual piety that pervaded his daily life. He was prominent in all the conventions of his denomination, carrying conviction to the mind of his hearer in controversial argument, as well as in seasons of religious interest; the revival of 1831 especially sustaining the popular estimate of his powers as a convincing expounder of the Word. He was successful in raising funds for the endowment of the theological seminary of the Reformed Dutch church, at New Brunswick, N. J. In 1860 a memoir of him by John A. Todd was published.

LABARRAQUE'S SOLUTION, or **LABARRAQUE'S DISINFECTING LIQUID**, or **SOLUTION OF CHLORINATED SODA**, a disinfecting liquid first brought into notice by Labarraque, a Paris apothecary. It is prepared by mixing solutions of chlorinated lime, commonly called chloride of lime, and of carbonate of soda (sal soda). Twelve ounces of chloride of lime, 24 of sal soda, and 24 pints of water are the proportions used. The sal soda is dissolved in 3 pints of water, and the chloride of lime is triturated in a mortar with a portion of the water, a little being added from time to time, until the mixture is homogeneous. The remainder of the water is then added to this mixture, which is set aside for 24 hours. The upper portion will be clear; this is to be decanted off, and the residue passed through a muslin strainer until with the decanted portion there are 8 pints. This quantity is then thoroughly mingled with the solution of sal soda, and passed through a muslin strainer, and, if necessary, water added sufficient to make $11\frac{1}{2}$ pints of liquid, which is to be kept in glass-stoppered bottles. Its specific gravity should be 1.045. It has been recommended to use bicarbonate of soda instead of common carbonate, or sal soda, because the precipitate of carbonate of lime is rendered thereby more crystalline, and therefore more readily precipitated, rendering the filtration more easy. It is also advised to have the bicarbonate of soda somewhat in excess. Labarraque's solution is a transparent liquid of a greenish yellow color, having a sharp, bitterish taste and an alkaline reaction. If lime-water be added a precipitate of carbonate of lime will be produced. It is a powerful disinfectant and bleaching agent, rapidly destroying the color of sulphate of indigo. There has been a good deal of discussion in regard to the precise constitution of this liquid, but it is generally regarded as a mixture of hypochlorite of soda, chloride of sodium, and bicarbonate of soda (using the more common names). According to Millon, the solution contains oxychloride of sodium NaCl_2O . Its use in medicine is as a gargle in putrid sore-throat (or diphtheria, q.v.) and in certain cases of scarlet fever, and also as a dressing or wash to gangrenous wounds. In such cases it must be diluted. It is also sprinkled over the floors of sick rooms or hospital wards, or exposed in shallow vessels. It is sometimes administered internally in zymotic diseases, in doses of from 20 to 30 drops, diluted in half a tumbler of water. It is a convenient and agreeable form of chlorine for the housekeeper in bleaching small articles, such as handkerchiefs, which may be readily bleached by adding half a teacupful of the solution to 4 or 5 quarts of water in an earthen wash-bowl, immersing the articles, and exposing them in immersion for a short time to the sunlight or at an open window, stirring from time to time, and afterwards thoroughly and repeatedly rinsing them in clear water.

LA BARUM (derivation uncertain), the famous standard of the Roman emperor Constantine, designed to commemorate the miraculous vision of the cross in the sky, which is said to have appeared to him on his way to attack Maxentius, and to have been the moving cause of his conversion to Christianity. It was a long pipe or lance, with a short transverse bar of wood attached near its extremity, so as to form something like a cross. On the point of the lance was a golden crown sparkling with gems, and in its center the mysterious monogram of the cross and the initial letters of the name of Christ, with the occasional addition of the Greek letters Λ and Ω . From the cross-beam depended a square purple banner, decorated with precious stones, and surrounded by a rich border of gold embroidery. The cross was substituted for the eagle, formerly depicted on the Roman standards, and there were sometimes other emblems of the Savior. Between the crown and the cross were heads of the emperor and his family, and sometimes a figure of Christ woven in gold.

LABAT, JEAN BAPTISTE, 1663-1738; b. Paris; entered the order of the Dominicans in 1685; was appointed professor of mathematics and philosophy at Nancy in 1687; went in 1694 as a missionary, first to Martinique, then to Guadaloupe, where he remained till 1705, distinguishing himself as an engineer and agriculturist. On returning to Martinique he was appointed *procureur-général* of the mission, and by successive governors highly esteemed for his scientific and diplomatic labors. He founded in 1703 the city of Basse-Terre, and took an active part in defending the island of Guadaloupe against the English. He organized a company of 60 negroes, who, it is reported, distinguished themselves by their efficiency and bravery. He returned to Europe in 1705, to obtain recruits for his order, but was detained by his superiors at Rome until 1709, and at Civita Vecchia till 1716. The remainder of his life was passed at Paris, where he died.

LABEDOYÈRE, CHARLES ANGELIQUE HUCHET, Count de, a victim of the reaction of 1815 in France, was descended from an ancient family in Bretagne, and was b. in Paris on April 17, 1786. He early entered the army; was adjutant to marshal Lannes in Spain in 1808, and received a severe wound at Tudela; joined the army in Germany after his recovery; distinguished himself at the capture of Ratisbon, and was Murat's adjutant at the battle of Esslingen. On the evening before the battle of Lützen, Napoleon promoted him to the command of a regiment of infantry. Returning to France again severely wounded, in the autumn of 1813, he married a lady of a family very much attached to the Bourbons; and receiving the command of a regiment, was posted near Vizelle when Napoleon returned from Elba. He immediately joined him, and was made a lieut.gen. and peer of France. He fought with great gallantry at Waterloo; and after the battle hastened to Paris, when he spoke with great violence against the Bourbons in the stormy sitting of the chamber of peers, on June 22, 1815. After the capitulation, he thought to have escaped to America, but was taken prisoner, condemned to death, and notwithstanding every effort that could be made on his behalf, shot on Aug. 19, 1815. He was a man of a chivalrous character, and devotedly attached to the emperor.

LABEL. See DRIPSTONE.

LABEL (Fr. *lambeau*, a strip or shred), the ribbon pendent at the sides of a mitre or coronet.

LABEL, **LAMBEL**, or **FILE**, in heraldry, the mark of cadency which distinguishes the eldest son in his father's lifetime, familiar to us from its entering into the composition of the arms of the prince of Wales and other members of the royal family. It consists of a horizontal stripe or fillet, with three points depending from it. When the mark of cadency itself is designated a *file*, its points are called *labels*. It is said that the eldest son's eldest son should wear a label of five points in his grandfather's lifetime, and, similarly, the great-grandson a label of seven points, two points being added for each generation. The label extended originally quite across the shield, and sometimes occupied the upper, though now it is always placed in the lower part of the chief: the points, at first rectangular, assumed in later times the form called *pattée*, dovetailed, or wedge-shaped; and more recently, the label ceased to be connected with the edges of the shield. Edward I., in his father's lifetime, bore the arms of England within a label not of three, but of five points azure, joined to the head of the shield, and interlaced with the tail of the uppermost lion; Edward II., when prince of Wales, used indifferently the label of three or of five points, as also did Edward III.; but from the time of the Black Prince downwards, the eldest son of the king of England has invariably differed his arms with a label of three points argent, and the practice has been for the younger sons also to bear labels, which are sometimes of other colors and more points.

LABEL, a term which signifies at once an inscription identifying or defining the article to which it is affixed, and the medium which bears or conveys the same. Thus, a label may not necessarily bear any inscription, and still sustain one definition of the term. Labels are employed for identification, and also to signify the destination of packages to be transported from one place to another; as book-labels, to assist in cataloguing libraries in the one instance, and express-labels in the other. The etymology of the word exhibits its derivation from the Latin *labellum*, a diminutive, signifying "a little lip," and referring, in this use of it, to the "tag," or slip of parchment by which leaden seals were attached to documents, in ancient times. In law, the term label has a specific significance gained from its connection with proprietary rights; for which see **TRADE-MARKS**.

LABERIUS DECIMUS. A celebrated Roman writer of mimes, who flourished about 50 B.C. Having, as it is thought, offended Julius Cæsar, he was by him ordered to appear in person on the stage, at the age of sixty, and act in one of his own mimes, a great indignity to a Roman. In delivering the prologue and again in parts of the play, Laberius boldly inserted verses expressing his sense of the insult. Cæsar, partly in retaliation, awarded the dramatic prize to Publius Syrus, the rival of Laberius. The fragments of Laberius are collected by Otto Ribbeck in the second volume of his *Comicorum Romanorum Fragmenta* (Leipsic, 1873).

LABETTE, a co. in the s.e. part of Kansas, bordering on the Indian territory; drained partly by the Neosho, partly by the Labette, and partly by affluents of the Verdigris; 649 sq.m.; pop. '90, 27,586. Co. seat, Oswego.

LABIALS. Letters are called labials when it is necessary to close the lips to articulate the sounds they represent. P, B, F, V, M, is the list given by most phonetists. A few would add the semi-vowel w, and the vowels o, oo, because they require a rounding of the lips.

LABIATÆ (*Lamiaceæ* of Lindley), a natural order of exogenous plants, containing almost 2500 known species, mostly natives of temperate climates. They are herbaceous, or more rarely half-shrubby, and have 4-cornered stems and opposite branches; and

opposite leaves, without stipules, abounding in receptacles of volatile oil. The flowers are often in cymes or heads, or in whorls; sometimes solitary. The calyx is inferior, with 5 or 10 teeth, or 2-lipped. The corolla is hypogynous, 2-lipped, the lower lip 3-lobed. The stamens are four, two long and two short, or by abortion only two, inserted into the corolla. The ovary is deeply 4-lobed, seated in a fleshy disk, each lobe containing a single ovule; there is a single style with a bifid stigma. The fruit consists of 1 to 4 achenia, inclosed within the persistent calyx.—A general characteristic of this order is an aromatic fragrance, which in many species is very agreeable, and makes them favorites in our gardens. Some are weeds with an unpleasant odor. Many are natives of America. Some are used in medicine, and others in cookery for flavoring. Mint, marjoram, rosemary, lavender, sage, basil, savory, thyme, horehound, balm, patchouli, germander, and dead nettle, are examples of this order.

LABICHE, EUGÈNE MARIN, French dramatic writer, was born in Paris, May 5, 1815. He studied at the Collège Bourbon and the law school, and soon began contributing to the press. His first work was a novel "La Clef des Champs," published in 1838, in which year, in collaboration with Michel and Lefranc, he wrote "M. de Coyllin, ou l'Homme infiniment poli" for the Palais Royal theatre. The play was a doubtful success, but Labiche continued to devote himself to the production of comedies and farces, full of droll and extravagant situations. He delights in throwing his characters into an apparently inextricable confusion, from which they are released by some unexpected incident. In 1861 he received the cross of the Legion of Honor, of which he was made an officer in 1870. In 1880 he was elected to the French Academy. He has produced more than 100 pieces, chiefly in collaboration with other authors, among them, Delacour, Dumanoir, Lefranc, Martin, Michel, Varin, and others, which have been performed principally at the Palais Royal, Vaudeville, Variétés, and Gymnase theatres. Among the best known of his plays are: *Le Chapeau de paille d'Italie*, 1851; *Le Voyage de M. Perrichon* (with Martin), one of the best and drollest of his pieces, played at the Gymnase, in 1860, and revived with great success at the Odéon in 1879; *La Poudre aux Yeux*, 1861, *Les Petits Oiseaux*, 1862; *Le Fils du Brigadier*, 1867, a comic opera in three acts; *Vingt-neuf degrés à l'ombre*, 1873; *Les trente millions de Gladiator*, 1875. A complete edition of his works was published in 1878–1879, (10 vols.). He died in Paris, January 23, 1888.

LABIENUS, TITUS, B.C. 98–45; was tribune in 63, when Cicero was consul; lieutenant of Cæsar in the Gallic war, and afterwards prætor. In 54 B.C. he twice defeated the Treveri, and in 52 distinguished himself in the campaign against Vercingetorix. When the civil war broke out he sided with Pompey, and treated with cruelty Cæsar's soldiers who fell into his hands at Dyrrhachium. After the defeat at Pharsalia he went to Africa, and thence, after the defeat at Thapsus, to Spain, where he fought against Cæsar at Munda, where in a panic his troops were routed and he fell.

LABILLARDIÈRE, JACQUES JULIEN HOUTON DE, 1755–1834. He became famous for his researches in botany, natural history, geology, zoology, and anthropology at a time when all these studies were in their infancy. Among his valued works is: *The Account of the Voyage in Search of Lapeyrouse in the Arctic Sea north of Asia and Europe*. (P. commanded a scientific expedition sent out by France in 1785 to discover a northwest passage, and never heard of after it entered that fatal sea.) This report of Billardière contained a great mass of facts in natural history. *The Flora of New Holland and New Caledonia* was the fruit of another voyage, and a work of the highest value in its day.

LABIS, a Greek word meaning "a spoon." An implement employed in the Greek church in the administration of the elements in the Lord's supper; the bread being mingled with the wine, and both administered together.

LABLACHE, LUIGI, a celebrated operatic singer, was b. in Naples in 1794, whither his father and mother, who were French, had fled from Paris during the horrors of the revolution. His first engagement as a singer was at the San Carlino theater at Naples, in 1813; he afterwards sang, with much success, in La Scala, Milan, and in Vienna; singing also at the San Carlo, at Naples, during the intervals of the Vienna season. On his first appearance in London in 1830, he created a great public sensation; and for a number of years he resided alternately in the French and English capitals, singing both in the Paris and London seasons. He died at Naples in 1858. His voice, a deep bass, has hardly ever been equaled either in volume or quality; and his acting, particularly in the characters of "Figaro" and "Leporello," was almost as remarkable as his singing. See the *Biographie de Lablache*, by M. Castil-Blaze.

LABOR, in political economy, a term so dependent for its meaning on the circumstances in which it is used, that any scientific definition of it would lead to misunderstanding. The best service, in fact, towards rendering it intelligible, is to clear away some attempts that have been made to subject it to scientific analysis and definition. It has been separated into productive and unproductive, but no such division can be fixed. A turner who puts a piece of wood on his lathe and makes a top is of course a productive laborer. The same quality cannot be denied to the man who beams a web for the loom; but if he shares in the production of the cloth, so does the overseer who walks about and adjusts the industrial arrangements of the manufactory.

Having included him, we cannot well say that the policeman, who keeps order in the district, and enables its manufactures to go on, should be excluded. Again, the man who contributes to make a book, of course appears as a productive laborer; but what the author contributes is not matter, but intellect; and it would be difficult to maintain that he ceases to be productive if he deliver such matter in an oration or a sermon. We can hardly count the distiller, who makes a glass of whisky, a productive laborer, and exclude the musician, who produces another and less dangerous excitement. It is equally impossible to draw the line between bodily and intellectual labor, since there is scarcely a work to which man can put his hand which does not require some amount of thought. A distinction between capital and labor has often been attempted to be established, with very fallacious and dangerous results. Capital in active operation infers that its owner labors. If the capital is not labored the owner must be content to let it lie at ordinary interest. If he want profit from it, he must labor, and often severely. In a large manufactory, where the proprietor is supposed to be a gentleman at large, drawing his fortune from the sweat of the brow of his fellow-men, he is often the most anxious and the hardest-worked man in the whole establishment. We may also with equal correctness divide all human labor into two kinds, mental and physical; and concede that without the one there could hardly be the other. It is only among the most laborious and industrious races that we find the most comprehensive and productive mental effort. That is, where the physical labor is the most varied and inventive. The Esquimaux are perhaps the most severely tasked by the necessity for arduous physical effort, of any race; and they are doubtless among the lowest in the order of mental accomplishment; but these facts do not disturb the proposition, since the labor of the Esquimaux extends but in one direction—the protection and perpetuation of life. So far as the history of man has been traced, there has been found no condition of existence unaccompanied by labor, both physical and mental, the latter, certainly, in the earlier periods, devoted simply to the direction of the former towards the only absolute necessity, the sustenance of life. This brings us by way of a circle to our beginning, that mental labor must precede physical labor, while it can only increase and extend with the increase and extension of the latter. Which is to say that while a mental impression of the condition of hunger, and mental inquiry as to the existing means for allaying it, must precede the physical effort to procure such means—mental effort will not proceed beyond this point, except correlatively with the progress and extension of physical labor. It should then be borne in mind that in considering one kind of labor we are including the other, so intimate is the relation between them; and that the ratio of mental activity is in proportion to the multiplication of the varieties of physical labor. Such knowledge as we possess of prehistoric races has been derived from existing results of their labor, naturally of the most primitive character, rough-hewn implements and weapons of stone giving that period of human existence the distinctive title of the “stone age.” This period was followed by the *neolithic* or new stone age, in which these implements and weapons were more highly finished and polished, and better adapted to their purpose. After this came the discovery of the metals and what is termed the “bronze” age, since which time there has appeared to be no possible limit to the extension of human labor, or to its resources in ways and means. As implements multiplied, wants increased, and the history of the human race is in fact a record of the wants of man and his devices for supplying them. One such device made its appearance very early in history, that of a division of labor, by which one individual became the fisherman, another the hunter, and a third the tailor of a settlement or group—such groups having originated in the instinct of self-preservation by numbers, and in the law of the value of numbers as a factor in labor. On this principle, too, originated the soldier, or guard, whose duty it was to watch while others worked; and the messenger, or carrier, inefficient to originate, but useful to carry out the designs of those better qualified. The exercise of labor, and particularly after this had become comparatively skillful, involved the accumulation of wealth—in stores of food, arms, clothing, or building material, which in turn aroused the sentiment of cupidity in contiguous groups of men; and this being carried to the extent of a forcible attempt at possession, resistance followed, and war, with its attendant elements of killed, wounded, and prisoners, ensued. The accumulation of prisoners must soon have become an irksome product of success, and primitive ingenuity cast about for relief from this very positive and threatening burden; and it could not have been long before the idea of the enforced labor of prisoners dawned on the minds of the conquerors in battle. From this idea, in part at least, arose the institution of slavery.

The tendency to organize, out of which springs all system, found expression in slavery from its very beginning. The earliest records and the most ancient inscriptions and mural paintings tell of slave-gangs and task-masters, and at length of the classification of slaves by their duties. This was at once a simplification of labor by co-ordination of its processes; and a necessity to the existence of the slave-holders themselves, since the prevalence of a condition of war produced slaves in such numbers that they could not possibly have been controlled without rigid system and discipline. The time and place of the origin of slavery are unknown. Nearly all the ancient races practiced it, and we may well believe that it grew out of an inherent impulse in human nature, and was spontaneous among different races, whenever the conditions existed rendering

it practicable. It can be traced by internal evidence to a period 3,000 years before the Christian era, though it was not until the time of the greatest prosperity of the Phenicians that the custom of buying and selling slaves was originated—and by that remarkable people. Probably in no other country did slavery reach the same condition of development as in Rome. Obtaining the institution from Carthage, Rome soon outdid its teacher in the numerous and systematic methods by which the system was applied for the supply of real and imaginary wants. To Carthage the world was indebted for the displacement of the existing system of yeomanry farming, and the substitution of slave-labor in agriculture. Carthage had received the system from Phenicia, a commercial and manufacturing country, and had adapted it readily to the conduct of agriculture on an enormous scale by wealthy landholders. Rome adopted the same practice, but added to it an organization of slave-labor for the performance of official and domestic duties, on a scale so comprehensive as never to have been since equaled in this particular. The Roman slave-holding system comprised two classes, public and private, the former including the slaves of the state, the latter those of individuals. The former were employed in public works—building, road-making, as rowers in the galleys, etc.; the latter were divided into two kinds—rustic, and urban or domestic. The whole number of these slaves were divided into as many as 250 different classes, each representing some specific duty or employment. In the time of Sylla there are said to have been 13,000,000 slaves in Italy. The fall of the Roman empire brought about the establishment of the feudal system in Europe, while the advance of Christianity gradually did away with the institution of slavery. Meanwhile, it was not extraordinary that out of the old order of things there should have grown into existence conditions, modified, but similar to those which preceded them, which should, in turn, have exercised their just influence upon civilization. Thus, in the institution of guilds, which began to be prevalent about the 12th c., we see the influence of the slave classification of ancient Rome and Carthage, and the distributed labor education which resulted from the division of labor. The institution of the guild was the protest of the laboring class against feudalism. Originating in the Anglo-Saxon family system, it became intrenched behind the growing strength of Christianity, and gradually assimilated with it all the forces that were inimical to the control of the laboring class by the feudal barons and other potentates. Through the influence of the guild hand-labor became a power, hand-laborers were artists, and the golden age of manual skill arrived. In the work of the loom, in metal-working and wood-carving, in the manufacture of pottery and glass, this period has never been equaled. Artists like the Della Robbias, Ghiberti, Andrea del Sarto, and Benvenuto Cellini ennobled labor. But the age became luxurious, and the masterpieces of art labor centered in a few hands. As has ever been the case in history, interests conflicted, wealth tended to centralize and consolidate itself, the guilds divided among themselves into plodders and those who accumulated the results of their toil, vast operations in trade became possible to those who possessed the necessary enterprise and skill, and so *capital* was born as a new factor in the utilization of labor, and a new enemy for the laborer to confront and to antagonize. The influence of the new force was speedily felt, and the tendency to exclusiveness and monopoly on the part of the wealthy awakened in the workers the idea of organization, and there grew up an independent *working-class* for the first time in history. Now, too, for the first time in its application to large and organized bodies of laborers, the wage question took prominence. This arose primarily from the effect upon population of the terrible plagues and famines, which, beginning about the middle of the 14th c., began to devastate Europe. The depopulation of countries resulted in a scarcity of laborers, but every attempt on the part of the latter to insure the adoption of a higher rate of wages on this account met with strenuous and persistent opposition from employers. The introduction of the factory system, and the application of power to machinery, in the manufactures, strengthened the hands of the employers, and correspondingly weakened the employed. Meanwhile, warfare was unceasing between the two, and the necessities of the case brought about the conception of the *trade-union*, in the latter part of the 18th c., and this institution has continued to thrive and to combat capital ever since. The history of labor in the United States has been mainly influenced by questions of wages and hours of service, by immigration, by the introduction of the trade-union, and by the institution of negro slavery. The enormous displacement of human by machine labor, and the practical abolition of the apprentice system through foreign influence, have also largely complicated the labor question in America. For further information on these points, see TRADE-UNIONS; SLAVERY; MACHINERY; GUILDS; SOCIALISM; INTERNATIONAL WORKING MEN'S ASSOCIATION. See also publications of the United States Labor Bureau, Washington, D.C.

LABOR, AMERICAN FEDERATION OF. See AMERICAN FEDERATION OF LABOR.

LABORATORY. This term is generally applied to establishments for conducting chemical or physical investigations, or for chemical manufacture. Chemical laboratories may be for purposes of instruction, as are those which are attached to colleges or other high schools. These institutions also sometimes have special laboratories for research. All large private manufacturing establishments where chemical processes are employed to a considerable extent have laboratories attached to them in which investiga-

tions are carried on; many of them in the nature of preparatory trials of processes, to facilitate the process of manufacture. A government manufactory is sometimes called a laboratory, and so are many smaller private establishments, as pharmaceutical laboratories, metallurgical laboratories, telegraph laboratories, etc. The workshop of a taxidermist is often, and properly, called a laboratory. It is interesting in studying the history of chemistry to observe the great change that has gradually taken place in the appliances and apparatus used in the laboratories, and also in some cases the similarity of process. Much of the old apparatus was very complicated, a natural result of the complex manner of thought resulting from newly-formed theories or speculations; it was apparatus made for the trial of things which seemed extremely occult. Heat, however, performed a very important part in the old alchemist's operations, as well as in those of the modern chemist, and furnaces of various kinds have, therefore, always formed a part of laboratory furniture; but the modern forms of furnace or heating apparatus are much more efficient than the old, on account of the employment of elementary factors of combustion, whose more widely separated electro-chemical properties cause more intense union, and therefore greater evolution of heat. The oxy-hydrogen blowpipe was not used until Priestley's discovery of oxygen, the previously-known hydrogen, phlogiston, or inflammable air, being until then a comparatively inert body. See *illus.*, **CHEMISTRY**, vol. III.

LABOR DAY is a day set apart as a holiday for the laboring classes. It was first observed in Colorado, Connecticut, Iowa, Massachusetts, Nebraska, New Jersey, New York, Ohio, and Pennsylvania. It occurs the first Monday in September, and was first observed in 1887. In 1894 it was made a holiday in the D. C.

LABORERS. See **MASTER AND SERVANT**.

LABORDE, ALEXANDRE LOUIS JOSEPH, Comte de, 1774-1842, b. France; son of Jean Joseph, author of an elaborately illustrated work on the history and scenery of Spain: the monuments of France; pictorial travels in Austria, etc. At times he was in the French legislative assembly, where he gave a firm and consistent support to the liberal side in politics, known as the left center.

LABOR, KNIGHTS OF. In 1869, Uriah S. Stevens, a clothing cutter in Philadelphia, started a society as the beginning of a national association for the protection of working-people. It was regularly organized in 1871; adopted a ritual and called itself the Noble Order of the Knights of Labor, though this name was kept secret until 1881. The society soon included nearly all the trades in the city; assemblies were formed in other places; and in 1878, a general assembly of North America was formed, with a supreme office of general master workman, first held by Terence V. Powderly. The executive board consists of a president and three members, chosen annually by delegates from the district assemblies. Local assemblies are each made up, as a rule, of workers in the same trade, and said assemblies have the power to boycott any person or persons within their local precincts. This order demands from the state, among other things, that public lands be held for actual settlers; that laws bearing unequally on capital and labor be repealed; that workmen have a first lien on the product of their labor to the extent of their full wages; that the contract system on national, state, and municipal works be abolished; that laws be enacted providing for arbitration between employers and employed; and that a graduated income tax be levied. From the national government it demands that the importation of foreign labor under contract be prohibited; that the government control all telegraphs, telephones, and railroads, and that no charter or license be issued to any corporation; that the government shall not recognize or guarantee any private banks, or create any banking corporations; that silver be issued to the full extent of the present legal limit, etc. It claims to ignore distinctions of trade, race, sex, creed, and color, but debars from membership bankers, brokers, lawyers, and liquor-sellers. It aims to establish co-operative institutions, to secure suffrage for women, and for both sexes equal pay for equal work, and to shorten the hours of labor to eight. The Knights of Labor number about 500,000.

The power of this organization became apparent during the winter of 1885-6 and the following spring, when a general system of boycotting was attempted throughout the country. A strike on the railroads of the southwest ordered, of such magnitude that many thousands were released from work; and collisions occurred in five states between the knights and the militia. The anarchist tendencies manifested in some quarters have been denounced by the leading men in this organization, as opposed to their methods.

LABOUCHERE, HENRY, b. London, 1831; son of John L., of Dorking, Surrey. His uncle was the late Henry Labouchère, first Lord Taunton, an "advanced" liberal. His grandfather, Peter Caesar L., of French ancestry, was a native of Holland, and settled in England as a banker; marrying a daughter of Sir Francis Baring. Mr. L. was educated at Eton; was in the diplomatic service 1854-64, part of the time as a member of the British legation at Washington. From 1865, July, to 1866, Apr., he was in parliament for Windsor, till he was ousted on petition. From 1867, Apr., to 1868, Dec., he sat for Middlesex. He has represented Northampton since 1880, Apr. Under the signature "the Besieged Resident" his letters from Paris during the siege, 1870-71, to the London *Daily News* drew attention. In 1876 he established *Truth*, a society and political journal, with which he still maintains his connection. He has a versatile mind, and holds to the most advanced Republican ideas. Since 1886 he has been an earnest advocate of the

Home Rule cause, but in 1890 refused to follow Parnell in his attacks upon the English wing of the party.

LABOUCHÈRE, HENRY, Baron TAUNTON, 1798-1869; b. England; of French descent, his ancestors having left their country at the time of the revocation of the edict of Nantes. They settled in Holland, where the father of Henry was a partner in the banking-house of Hope & Co., of Amsterdam. The latter was educated at Oxford, settled in England, and married a daughter of sir Thomas Baring. In 1826 he was elected to parliament from St. Michael's, and about the same time made a visit to America to observe the peculiarities of life in the United States, and to study the working of its institutions. He became a strong liberal in English politics, and for many years was identified with the support of the measures and the initiation of the policy of the party of progress. He retained his seat in parliament by successive re-elections until 1859, when the title was conferred upon him which made him a peer. From 1832 to 1838 he occupied continuously offices of high responsibility in the English government, closing with that of secretary of state for the colonies. He had no heir, and his title is extinct.

LABOUCHÈRE, PIERRE ANTOINE, born Nantes, 1807; educated in Germany and England for a commercial life, but ardent with desire to become a painter. He visited the United States in 1827 as secretary of an American banker, and soon after made a voyage to China on a merchant ship. Afterwards, enabled to cultivate his taste for painting, he studied in Italy, then in Paris, and completed his pupilage under Delaroche. Protestant in religion, the subjects of his works were largely drawn from the actors and history of the reformation. He d. 1873.

LABOULAYÉ, ÉDOUARD RENÉ LEFÉBVRE, b. Paris, Jan. 18, 1811. Considered in the versatility of his genius, and the noble directions in which his learning, industry, and wit were employed, L. was one of the eminent men of his time. He was a student of law, early in life devoting himself to the history of continental laws with singular energy and intelligence. At the age of 28 he became known by an elaborate work entitled *History of Landed Property in Europe from the Time of Constantine to Our Day*, 8 vols. (Paris, 1839). In 1842 he published an essay on the life and doctrines of Frederic Charles de Sevigny, and became an advocate in the royal court of Paris. He was engaged at this time on an elaborate work, which appeared in 1843, entitled *Researches on the Civil and Political Condition of Women from the Times of the Romans to the Present*. In 1845 he published the *Essay on the Criminal Laws of the Romans Concerning the Responsibilities of Magistrates*. Each of these works was crowned on its appearance by the academy of inscriptions, and the same year he was elected a member of that institution. All these works attracted great attention among the learned, and contributed to revive in France the study of the history of law. To erudition he joined original views, and great simplicity and clearness of expression, forming a style at once concise, quaint, and elegant. These qualities grew to be still more remarkable in his later and more imaginative and satirical works. In 1849 he became professor of comparative legislation in the college of France. Under the empire of Napoleon III. he associated with the men who endeavored to revive public spirit in France. He wrote with enthusiasm and intelligence on the institutions of free America to induce his countrymen to adopt the progressive spirit of its people. His lectures on this country, during and after the war for the preservation of the union, were extremely popular in Paris, and served to keep a sufficient weight of French sentiment on the side of the union and against slavery to prevent Napoleon from throwing the weight of his power openly against our government. M. L. had the advantage of handsome personal presence and winning address. His lectures on law had attraction even to those who had no interest in its study.

In 1863 M. Laboulaye published one of the first of the imaginative and satirical works which afterward made him, for the time being, quite as famous a satirist as jurist. This was a little volume, entitled *Paris in America*, in which he humorously employs a supernatural agency to transport a Frenchman with his family into the midst of American family life and town excitements at a period when disaster had come to the national arms during the war for the union. The veiled drollery of the situations by which he lampoons some of the peculiarities of the Napoleonic government, making them ridiculous while defending them with all the ardor of French patriotism, is among the best specimens of irony extant. This book went through upwards of 30 editions in Paris, and was admirably translated into English by Mary L. Booth, of New York. In a similar vein of political satire were his tales of Bluebeard, *The New Bluebeard* and *The Poodle Prince*, *Prince Caniche*, published subsequently. The latter appeared in 1868, ran through many editions, and did much to pave the way to the easy dropping out of the Napoleonic dynasty two years later.

The following list of M. Laboulaye's works, in addition to those already referred to, exhibits the intellectual activity and scope of his life, viz.: *History of the United States*, 8 vols. (1854); *Contemporaneous Studies of Germany and the Slavic States*, 12 vols. (1854); *The Tables of Bronze of Malaga and Salpeusa* (1856); *Souvenirs of a Traveler* (1857); *Religious Liberty* (1858); *Studies upon Literary Property in France and England* (1858); *Introduction to Fleury's French Law* (1858); *Abdallah, an Arabian Romance* (1859); *The United States and France* (1862); *The State and Its Limits* (1863); *Essays on the Politics of*

M. de Tocqueville (1863); *The Liberal Party, Its Programme* (1864); *Constitutional Republic* (1871). A new edition of his *Fairy Tales* for children was published 1883.

M. Laboulaye likewise translated from English into French, Walter *On the Law Proceedings of the Romans*; Channing's social works, and Channing *On Slavery in the United States*, with an essay on his life and doctrines; also, Franklin's *Memoirs and Correspondence*, with an introduction. His contributions to French reviews, legal and political, and to the journals of Paris, were very numerous and have had great influence. D. 1883.

LABOURDONNAIS, OR LABOURDONNAIE, BERTRAND FRANÇOIS MAHÉ DE, 1699-1753; b. in St. Malo; a French naval officer, who entered the service of the French East India company as a lieutenant in 1718, and was promoted to the position of captain in 1723. In 1734 he became gov.gen. of the isles of France and Bourbon, and received command of a squadron in 1741. In the war between England and France he gained a splendid victory over an English fleet, near Madras, and captured that town in 1746. He was recalled to France in 1848 and imprisoned in the Bastille for 3 years, owing to unjust accusations which were brought against him by Dupleix, gov.gen. of the French Indies, who was jealous of his success. In 1751 he was tried by a commission appointed by the council of state, and acquitted. He was restored to liberty, but his spirit was crushed and he died in poverty in 1753. His life has been written by his grandson, the actor Bertrand François Mahé, and his talents and virtues are praised by Saint-Pierre in the preface to *Paul and Virginia*.

LABRADOR (Port. *terra laborador*, "cultivable land"), the name given by certain Portuguese discoverers to the continental coast of America near Newfoundland; a name as inappropriate as that of Greenland! The name gradually came to be extended from the strait of Belle Isle to Hudson's strait, being sometimes carried as far westward as the eastern shores of Hudson's bay. More properly, however, Labrador embraces only such portions of that vast peninsula as do not fall within what were formerly the chartered territories of the Hudson's Bay company (q. v.), i. e. the watershed of the rivers flowing into Hudson's Bay. In this sense the country stretches in n. lat. from about 50° to about 60°, and in w. long. from about 55° to 79°; area, 530,000 sq. m.; pop. 10,400. Of this extensive country the interior is little known, but is understood to be mostly an impenetrable wilderness of swamps and forests. The maritime border, however, (although its shores are wild and precipitous, reaching a height of from 400 to 600 ft., and on the n. from 1000 to 1500 ft.), is not without its value. The sea is here far less subject to fogs than it is in the neighborhood of Newfoundland, where the warm waters of the Gulf stream meet the cold currents from the n.; and as it is constantly supplied from the polar ice, its temperature is remarkably favorable both to the quantity and the quality of its fish. Of the entire population of Labrador, the most are Esquimaux, who are settled on the gulfs and creeks of the coast, and who subsist chiefly by fishing. Many European establishments also have sprung up on the coast, some of them, such as the Moravian settlements, blending commercial pursuits with missionary labors. The unexplored interior is probably a table-land about 2,000 ft. high. The fisheries employ, in the season, a large fleet of vessels, belonging partly to the British provinces, principally Newfoundland, and partly to the United States. Besides a few furs and feathers, the exports consist of cod and salmon, with cod-oil and seal-oil, and some iron and copper. The climate, like that of North America generally, is subject to great vicissitudes. In summer, the thermometer ranges as high as 85° Fahr.; in winter, the temperature, and that in nearly the same latitude as the British isles, falls 30° below the freezing-point. Labrador is a dependency of the United Kingdom, but it has never had a separate government of its own. Part of it is under the jurisdiction of Canada, and part under that of Newfoundland. It is supposed to have been visited by the Northmen about the 9th century.

LABRADORITE, or LABRADOR STONE, a variety of feldspar (q. v.), common as a constituent of dolerite, greenstone, the gabbro, and hypersthene rocks. It consists of about 53 per cent of silica, and 29 alumina, with 12 lime, and a little soda and peroxide of iron. It is cut into snuff-boxes and other articles; taking a fine polish, and often exhibiting rich colors, not unfrequently several in the same piece, when the light falls on it in particular directions; the general color being gray. It was first discovered by the Moravian missionaries in the island of St. Paul, on the coast of Labrador. It has been found in meteoric stones.

LABRADOR TEA, a low evergreen shrub, belonging to the heath family, found in moist places from Pennsylvania northward. The leaves when crushed are fragrant, and are used by the people of Labrador as a substitute for tea. It is also found in the n. parts of Europe, and it is reported that the leaves are used in Russia for tanning leather, and as a substitute for hops in brewing. The plant is said to possess narcotic properties.

LABRIDÆ, a family of osseous fishes, ranked by Cuvier in the order *acanthopterygii* (q. v.), by Müller in his new order, *pharyngognathi* (q. v.). They are divided by Müller into two families, *cteno-labridæ* and *cyclo-labridæ*, the former having ctenoid, the latter cycloid scales; the former comparatively a small, the latter a very numerous family. They are generally oval or oblong, and more or less compressed, with a single dorsal fin,

spinous in front, and the jaws covered by fleshy lips. Their colors are generally brilliant. They abound chiefly in tropical seas, but 12 or 13 species are found on the British coasts, none of them large, nor esteemed for food. The most valuable of the family is the tautog (q. v.) of North America. To this family belong the wrasses and the parrot-fishes, one of which is the celebrated *scarus* of the ancients.

LABROUSTE, PIERRE FRANÇOIS HENRI; b. France, 1801. Admitted in 1819 to the *école de beaux arts*, he won the first prize in architecture. He designed the picturesque façade of the new *palais de beaux arts*. In 1837 he designed the hospital of Lausanne; the following year the library of St. Geneviève. He was one of the first architects to make artistic use of iron carpentry, and in the reconstruction of the library of St. Geneviève his work of that kind was original enough to be both greatly ridiculed and greatly admired. From 1843 to 1867 he was constantly engaged on public works in the government service. He was an officer of the Legion of Honor and a member of the Institute. He d. 1875.

LABRUYÈRE, JEAN DE, a French author of celebrity, particularly noted for his nice and delicate delineations of character. He was born in Paris in 1645, was brought to the French court at the recommendation of Bossuet, and became one of the tutors of the dauphin, whose education Fénelon superintended. He spent the whole remainder of his life at court, in the enjoyment of a pension, and in the most intimate intercourse with the most accomplished men of his time. The work on which his high reputation rests, *Les Caractères de Théophraste, traduits du Grec, avec les Caractères ou les Mœurs de ce Siècle* (Par. 1687), has gone through many editions, some of them annotated, and has been translated into several languages. He died at Versailles in 1696.

LABUAN, an island of the Malayan archipelago, lies about 6 m. off the n.w. coast of Borneo. Its area is 30 sq. m., and the latitude and longitude of its center are 5° 16' n., and 115° 14' e. Small as it is, it is peculiarly valuable. Besides possessing a good harbor, it contains an extensive bed of excellent coal, which is worked by a company of British capitalists formed in 1862. It became, in 1846, a British crown possession, but in 1890 was transferred to the British North Borneo Company. Pop. (1891), 5853.

LABURNUM [*Cytisus* (q. v.) *laburnum*], a small tree, a native of the Alps and other mountains of the s. of Europe, much planted in shrubberies and pleasure-grounds in Britain, on account of its glossy foliage and its large pendulous racemes of yellow flowers, which are produced in great abundance in May and June. It is often mixed with lilac, and when the latter preponderates, the combination has a fine effect. In favorable circumstances, laburnum sometimes attains a height of 20, or even 40 feet. It is very hardy, and nowhere flourishes better than in the n. of Scotland. It is of rapid growth, yet its wood is hard, fine-grained, and very heavy, of a dark-brown or dark-green color, and much valued for cabinet-work, inlaying, and turnery, and for making knife-handles, musical instruments, etc. The leaves, bark, etc., and particularly the seeds, are nauseous and poisonous, containing *cytisine*, an emetic, purgative, and narcotic principle, which is also found in many allied plants. Accidents from laburnum seeds are not unfrequent to children; but to hares and rabbits laburnum is wholesome food, and they are so fond of it that the safety of other trees in a young plantation may be insured by introducing laburnum plants in great number, which spring again from the roots when eaten down. —A fine variety of laburnum, called SCOTCH LABURNUM, by some botanists regarded as a distinct species (*C. alpinus*), is distinguished by broader leaves and darker yellow flowers, which are produced later in the season than those of the common or *English* laburnum.

LABYRINTH (a word of unknown origin, derived by some from Labaris, the name of an Egyptian monarch of the twelfth dynasty), the name of some celebrated buildings of antiquity, consisting of many chambers or passages difficult to pass through without a guide, and the name hence applied to a confused mass of constructions. In the hieroglyphics, the word *mera* signifies a "labyrinth." The principal labyrinths of antiquity were the Egyptian, the Cretan, and the Samian. The first, or Egyptian, of which the others seem to have been imitations, was situated at Crocodilopolis, close to the lake *Mæris*, in the vicinity of the present pyramid of Biakhmu. According to the classical authors, it was built by an Egyptian monarch named Petesuchis, Tithoes, Imandes, Ismandes, Maindes, or Mendes. The recent discovery of the remains of this building by Lepsius has, however, shown that the city was founded by Amenemha I., of the 12th Egyptian dynasty, about 1800 B.C., and that this monarch was probably buried in it, while the pyramid and south temple were erected by Amenemha III. and IV., whose prænomens resemble the name of Mæris, and their sister, Sebeknefru or Scemiophris, appears to have been the last sovereign of the 12th dynasty. Great confusion prevails in the ancient authorities as to the object of the building, which contained 12 palaces under one roof, supposed to have been inhabited by the dodecarchy, or 12 kings who conjointly reigned over Egypt before Psammetichus I.; while, according to other authorities, it was the place of assembly of the governors of the nomes or districts, 12 in number according to Herodotus, 16 according to Pliny, and 27 according to Strabo. It was built of polished stone,

with many chambers and passages, said to be vaulted, having a peristyle court with 3,000 chambers, half of which were under the earth, and the others above ground, which formed another story. The upper chambers were decorated with reliefs; the lower were plain, and contained, according to tradition, the bodies of the 12 founders of the building, and the mummies of the sacred crocodiles, conferring on the building the character of a mausoleum, probably conjoined with a temple, that of Sebak, the crocodile-god, and so resembling the Serapeum. Herodotus and Strabo both visited this edifice, which was difficult to pass through without the aid of a guide. It stood in the midst of a great square. Part was constructed of Parian marble—probably rather arragonite—and of Syenitic granite pillars; had a staircase of 90 steps, and columns of porphyry; and the opening of the doors echoed like the reverberation of thunder. For a long time great doubt prevailed whether any remains of the building existed, and it was supposed to have been overwhelmed by the waters of the lake Mæris; and although P. Lucas and Letronne thought they had discovered the site, its rediscovery is due to Lepsius, who found part of the foundations or lower chambers close to the site of the old Mæris lake, or modern Birket-el-Keroun. According to Pliny, it was 3,600 years old in his days.

The second, or next in renown to the Egyptian, was the labyrinth of Crete, supposed to have been built by Dædalus for the Cretan monarch Minos, in which the Minotaur was imprisoned by his orders. Although represented on the Cretan coins of Cnossus sometimes of a square, and at other times of a circular form, no remains of it were to be found even in times of antiquity, and its existence was supposed to be fabulous. The only mode of finding the way out of it was by means of a hank or skein of linen thread, which gave the clue to the dwelling of the Minotaur. The tradition is supposed to have been based on the existence of certain natural caves or grottoes, perhaps the remains of quarries, and it has been supposed to have existed n.w. of the island, near Cnossus, while a kind of natural labyrinth still remains close to Gortyna. The idea is supposed to have been derived from the Egyptian.

The third of the labyrinths of antiquity was the Samian, constructed by Theodorus and artists of his school, in the age of Polycrates (540 B.C.), supposed to be a work of nature embellished by art, having 150 columns erected by a clever mechanical contrivance.—Other inferior labyrinths existed at Nauplia, at Sipontum in Italy, at Val d'Isipica in Sicily, and elsewhere; and the name of labyrinth was applied to the subterraneous chambers of the tomb of Porsena, supposed to be that now existing as the Poggio Gazella, near Chiusi. Labyrinths called mazes were at one time fashionable in gardening, being imitations, by hedges or borders, of the Cretan; the best known in modern times being the Maze at Hampton court.

Herodotus, ii. 148; Diodorus, i. 61, 97; iv. 60, 77; Pausanias, i. 27; Strabo, x. 477, xviii. 111; Plutarch, *Theseus*, 15; Pliny, *N. H.*, xxvi. 19, 3, 83; Isidorus, *Orig.*, xv. 2, 6; Höck, *Creta*, i. 447; Prokesch, *Denkw.*, i. 606; Duc de Luynes, *Annali*, 1829, 364; Lepsius, *Einleit.*, p. 268.

LABYRINTHODON, a genus of gigantic sauroid batrachians, found in the new red sandstone measures of Great Britain and the continent. The remains of several species have been described, but all so fragmentary that no certain restoration of the genus can yet be made. The head was triangular, having a crocodilian appearance both in the shape and in the external sculpturing of the cranial bones, but with well-marked structural modifications in the vomer, and in the mode of attachment of the head to the atlas, that stamp it with a batrachian character, conspicuous above the more apparent saurian resemblances. The mouth was furnished with a series of remarkable teeth, numerous and small in the lateral rows, and with six great laniary teeth in front. The bases of the teeth were ankylosed to distinct shallow sockets. Externally they were marked by a series of longitudinal grooves, which correspond to the inflected folds of the cement. The peculiar and characteristic internal structure of the teeth is very remarkable, and to it these fossils owe their generally accepted generic name of labyrinthodon (labyrinth-tooth). The few and fragmentary bones of the body of the animal exhibit a combination of batrachian and crocodilian characters, leaning, however, on the whole, more to the first type. In the same deposits there have been long noticed the prints of feet, which so much resembled the form of the human hand that Kaup, their original describer, gave the generic name of cheirotherium to the great unknown animals which produced them. From the fore being much smaller than the hind foot, he considered that they were the impressions of a marsupial; but this relative difference in the feet exists also in the modern batrachians; and the discovery of the remains of so many huge animals belonging to this order, in these very strata, the different sizes of which answer to the different footprints leave little doubt that the cheirotherian footprints were produced by labyrinthodont reptiles.

LAC, in the East Indies, signifies a sum of 100,000 rupees. A lac of government rupees is equal to 46,350 dollars; a lac of *Sicca* rupees, which in some places are also in very general use, is equal to \$49,490. One hundred lacs, or ten millions of rupees, make a *crore*.

LAC, the general name under which the various products of the lac insect (*coccus lacca*) are known. The curious hemipterous insect which yields these valuable contributions to commerce is in many respects like its congener the cochineal insect (*coccus cacti*), but

it also differs essentially from it: the males alone, and those only in their last stage of development, have wings, therefore the whole life of the creature is spent almost on the same spot. They live upon the twigs of trees, chiefly species of *butea*, *ficus*, and *croton*, and soon entomb themselves in a mass of matter, which oozes from small punctures made in the twigs of the tree, and which thus furnishes them with both food and shelter. It is said that to each male there are at least 5,000 females, and the winged males are at least twice as large as the females. When a colony, consisting of a few adult females and one or two males, find their way to a new branch, they attach themselves to the bark, and having pierced it with holes, through which they draw up the resinous juices upon which they feed, they become fixed or glued by the superfluous excretion, and after a time die, forming by their dead bodies little domes or tents over the myriads of minute eggs which they have laid. In a short time the eggs burst into life, and the young, which are very minute, eat their way through the dead bodies of their parents, and swarm all over the twig or small young branch of the tree in such countless numbers as to give it the appearance of being covered with a blood-red dust. They soon spread to all parts of the tree where the bark is tender enough to afford them food, and generation after generation dwells upon the same twig until it is enveloped in a coating, often half an inch in thickness, of the resinous exudation, which is very cellular throughout, the cells being the casts of the bodies of the dead females. During their lifetime they secrete a beautiful purple coloring matter, which does not perish with them, but remains shut up in the cells with the other results of decomposition.

The small twigs, when well covered, are gathered by the natives, and are placed in hot water, which melts the resinous matter, liberates the pieces of wood and the remains of the insects, and also dissolves the coloring matter. This is facilitated by kneading the melted resin whilst in the hot water; it is then taken out and dried, and is afterwards put into strong and very coarse cotton bags, which are held near enough to charcoal fires to melt the resin without burning the bags. By twisting the bags, the melted resin is then forced through the fabric, and received in thin curtain-like films upon strips of wood. This hardens as its surface becomes acted upon by the air, and being broken off in fragments, constitutes the shell-lac of commerce. The best shell-lac is that which is most completely freed from impurities, and approaches most to a light orange-brown color. If the coloring matter has not been well washed out, the resin is often very dark, consequently we find the following varieties in commerce—orange, garnet, and liver. Much that is squeezed through the bags falls to the ground without touching the sticks placed to catch it; small quantities falling form button-like drops, which constitute the *button-lac*; whilst larger ones, from 1 in. to 2 or 3 in. in diameter, constitute the *plate-lac* of commerce. That known as *stick-lac* is the twigs as they are gathered, but broken short for the convenience of packing.

Below the lac-bearing trees there is always a very considerable quantity of the resin in small particles, which have been detached by the wind shaking and chafing the branches; this also is collected, and constitutes the seed-lac of our merchants.

The water in which the stick-lac is first softened contains, as before mentioned, the coloring matter of the dead insect. This is strained and evaporated until the residue is a purple sediment, which, when sufficiently dried, is cut in small cakes about 2 in. square, and stamped with certain trade-marks, indicating its quality. These are then fully dried, and packed for sale as *lac-dye*, of which large quantities are used in the production of scarlet cloth, such as that worn by our soldiers; for this purpose, lac-dye is found very suitable.

The lac insect is a native of Siam, Assam, Burmah, Bengal, and Malabar; the lacs and lac-dye come chiefly from Bombay, Pegu, and Siam. During the year 1876 nearly 5,000 tons of the different kinds of lac were exported into Great Britain. The annual consumption of lac-dye amounts to about 1,200,000 lbs.

As we have no strictly analogous resin from the vegetable kingdom, not even from the lac-bearing trees, it may be assumed that the juices of the trees are somewhat altered by the insects. The best analyses show that shell-lac contains several peculiar resins. The great value of the lacs is found in their adaptability for the manufacture of varnishes, both in consequence of their easy solubility, and also because of the fine, hard coating, susceptible of high polish, which they give when dry. The well-known "French polish" is little more than shell-lac dissolved in alcohol; and a fine thin varnish made of this material constitutes the lacquer with which brass and other metals are coated, to preserve their polish from atmospheric action.

All the varieties of lac are translucent, and some of the finer kinds, which are in flakes not much thicker than writing-paper, are quite transparent, and all, as before stated, are colored various shades of brown, from orange to liver. Nevertheless, if a quantity of shell-lac be softened by heat, it may, by continually drawing it out into lengths, and twisting it, be made not only quite white, but also opaque; in this state it has a beautiful silky luster; and if melted and mixed with vermilion, or any other coloring matter, it forms some of the fancy kinds of sealing-wax: the more usual kinds are, however, made by merely melting shell-lac with a little turpentine and camphor, and mixing the coloring matter. Shell-lac has the property of being less brittle after the first melting than after subsequent meltings; hence the sealing-wax manufactured in India has always had a high reputation, and hence also the extreme beauty and dura-

bility of those Chinese works of art in lac, some of which are very ancient. These are usually chow-chow boxes, tea-basins, or other small objects made in wood or metal, and covered over with a crust of lac, colored with vermilion, which, whilst soft, is molded into beautiful patterns. So rare and beautiful are some of these works that even in China they cost almost fabulous prices.

LACAILLE, NICOLAS LOUIS, l'Abbé de, 1713-62; b. France. Educated for a priest, he renounced his vocation to devote himself to astronomy. Studying alone and without observatory, at the age of 23 he surprised men of learning by his advancement. In 1736 he became connected with the royal observatory, and continued in distinguished astronomical service till death. In 1750 he was placed in charge of an expedition to the cape of Good Hope to make observations of importance from that point; in connection with which he addressed a circular letter to all the great astronomers of other countries to unite with him on a basis of observations laid down by him. Later, his work traversed nearly every department of astronomical science, and subsequent progress in astronomy has served to show the wonderful accuracy of Lacaille. His published works are numerous and of the highest rank of his time.

LACANDO'NES, an Indian tribe of Central America. Their territory formerly embraced a large part of n.w. Guatemala, Chiapas, and Tobasco; but they appear now to be confined chiefly to the fastnesses of the Chico mountains. They were formerly aggressive and cruel, and did much to retard the prosperity of the European colonies. They have intermingled with the Choles and Manches, and are now shy and timid. They speak a dialect of the language of the Mayas of Yucatan, of which they are probably an offshoot. They are subject to the laws of Guatemala, but preserve the religion and habits of their forefathers; and their territory, the full extent of which is somewhat uncertain, remains in its ancient condition. The story which the cura of Quiché told Mr. Stephens, that they had large cities and towns and great temples, is incredible.

LAC'CADIVES (Sanskrit, *Lakesha Dvīpa*, "the hundred thousand islands") a group of islands in the Arabian sea, discovered by Vasco da Gama in 1499, lie about 200 m. to the w. of the Malabar coast of the peninsula of Hindustan. They extend in n. lat. between 10° and 14°, and in e. long. between 72° and 74°, and are 14 in number. Being of coral formation, they are generally low, with deep water immediately around them, and are therefore all the more dangerous to navigators. Pop. '91, 14,400; area, 780 sq. m.; chief productions, coir, jaggery, rice, cocoa, and betel nuts, sweet potatoes, and cattle of a small breed. The inhabitants are of Arabian origin, and in religion follow a sort of Mohammedanism. Since 1875 the islands are dependencies of Great Britain, having been then annexed to the province of Madras.

LACE, an ornamental fabric of linen, cotton, or silk thread, made either by the hands, somewhat after the manner of embroidery, or with machinery. The manufacture of lace by hand is an operation of exceeding nicety, and requires both skill and patience of no ordinary kind, and the best productions of this fabric surpass all other applications of textile materials in costliness and beauty.

Whether the ancients really had any knowledge of lace-making, excepting gold-lace, which will be mentioned at the end of this article, is not known, nor is it known with any certainty when this art came into practice in Europe; but there is good reason to suppose that *point-lace*, the oldest variety known, was the work of nuns during the latter half of the 14th and the beginning of the 15th centuries. This point-lace is very characteristic, and is truly an art production. The artistic character of the patterns, and the wonderful patience and labor shown in carrying them out, places them, as female productions, on a parallel with the decorative works in stone, wood, and metal of the monks. They indicate no tiresome efforts to copy natural objects, but masterly conceptions of graceful forms and tasteful combinations. The exact figures of the pattern were cut out of linen, and over these foundation-pieces, as they may be called, the actual lace-work was wrought by the needle, with thread of marvelous fineness, and with such consummate art that the material of the foundation is quite undiscoverable under the fairy-like web which has been woven over it. These portions of the fabric were then joined together by connecting threads, each of which, like the broader parts, consists of a foundation and lace-work covering; the former being a mere thread, often of exceedingly fine yarn; the latter being a sort of loop-work like the modern crochet. The wonderful durability of point-lace is attested by the fact that it is not uncommon in our most choice collections, although the art is supposed to have been lost about the beginning of the 16th c., when a more easily made, and consequently cheaper, style of point-lace, displaced the older and more artistic kind.

The point-lace of the second period, though always very beautiful, was deficient in solidity and in purity of design; moreover, it bears indications of having been copied from patterns, whilst the older kind was evidently the carrying out of artistic thoughts, as they were conceived, in the original material, the worker and the designer being the same person. It was during this period that the pillow was first used, and it is most probable that the use of patterns led to the application of the pillow. First, the lace would be worked on the pattern, to insure correctness, where the worker was merely a copyist; then it would soon become evident that if the pattern were so arranged as to

avoid shifting, the facilities of working would be greatly increased; and it has been suggested that the pattern pinned to the pillow, and the thread twisted round the pins, to prevent raveling when not in use, suggested the net-work which afterwards became a leading feature in the fabric.

The invention of pillow-lace has been claimed by Beckmann, in his quaint way, for one of his countrywomen. He says: "I will venture to assert that the knitting of lace is a German invention, first known about the middle of the 16th c.; and I shall consider as true, until it be fully contradicted, the account given us that this art was found out before 1561, at St. Annaberg, by Barbara, wife of Christopher Uttmann. This woman died in the 61st year of her age, after she had seen 64 children and grandchildren; and that she was the inventress of this art is unanimously affirmed by all the annalists of Saxony." Whether she invented, or merely introduced the art, cannot now be proved, but certain it is, that it soon became settled in Saxony, and spread thence to the Netherlands and France. Even to the present day, we occasionally hear of "Saxon bone-lace," a name which was given to indicate the use of bone-pins, before the introduction of the common brass ones.

It will readily be supposed that an art depending so much on individual skill and taste, would be likely to vary exceedingly; nevertheless, all the varieties resolve themselves into few well-marked groups, under three distinct classes. The first class is the *guipure*, which comprises all the true needle-worked lace, whether ancient or modern; its varieties are: *rose-point*, in which the figures are in high relief, having a rich embossed appearance; *Venetian-point*, *Portuguese-point*, *Maltese-point*; in all of these the pattern is flatter than in the *rose-point*, *point d'Alençon*, and *Brussels-point*. The last two are still made, the modern point d'Alençon quite equaling in beauty and value that made in the middle of the 17th c., when its manufacture was introduced by the celebrated Colbert, chief minister of Louis XIV. The point d'Alençon has very distinctive characteristics. When the pattern is once designed, each portion may be worked by a separate person, and the various figures are then connected by a groundwork of threads, which are so passed from one figure to another as to represent a web of wonderful delicacy and regularity: small spots or other figures are here and there skillfully worked in where the threads cross each other; these are called *modes*, and not only add much to the strength of the fabric, but greatly increase its richness of effect. In all these varieties, but two kinds of stitches are employed, and these differ chiefly in the greater or less closeness of the threads employed. First, a series of threads are laid down all in one direction, so as to cover the pattern, and then a certain number of these are taken up and covered by loops of the cross-stitches, or are more lightly held together.

The second class is *pillow-lace*, sometimes called cushion or bobbin lace, from the pillow or cushion being used to work the pattern upon, and the various threads of which the figures are made up, each being wound upon a bobbin, usually of an ornamental character, to distinguish one from the other. The pattern, on parchment or paper, being attached to the *pillow* or cushion, pins are stuck in at regular intervals in the lines of the pattern, and the threads of the bobbins are twisted or plaited round them so as to form the net-work arrangement which is characteristic of this class of lace, the patterns, or figured portions, being worked out by a crossing of threads; which, although actually plaiting, gives the effect of weaving. The varieties of this lace are: *Spanish*, *grounded Spanish*, *Saxony Brussels*, *Flemish Brussels*, *Mechlin*, *Valenciennes*, *Dutch*, *Lisle*, *Chantilly*, *silk* and *cotton blonde*, *Limerick*, *Buckinghamshire*, and *Honiton*. The last has of late years become the most beautiful of all the varieties made in Great Britain. The Irish or Limerick lace has also taken a high position.

The third class is machine-made lace, which, by its wonderful improvement and rapid development, has worked a complete revolution in the lace trade, so that the prices formerly obtained for hand-made lace can no longer be commanded, whilst machine lace, of great beauty, has become so cheap and plentiful as to be worn by all classes. It has been mentioned before that the use of the pillow led to the introduction of net as the ground-work for lace figures, and it was to the manufacture of this so-called *bobbin-net* that the machinery was first applied (see BOBBIN-NET). The lace-machine, or *frame*, as it is technically called, is so complicated that it would be hopeless to convey any really intelligible appreciation of it without a voluminous description of all its parts. One or two points of chief importance may, however, remove any difficulty in understanding its general principles. First, then, as in the loom (see LOOM), there is a series of warp-threads, placed, however, perpendicularly instead of horizontally, and not so close as in ordinary weaving, the space between each being sufficiently wide to admit of a shilling passing edgewise between them. Behind these threads, and corresponding to the interspaces, is a row of ingeniously constructed flat bobbins or reels resting in an arrangement called a *comb-bar* or *bolt-bar*. These are so placed that, with the first movement of the machine, each bobbin, which carries its thread with it, passes through two of the parallel and perpendicular threads of the warp, and is lodged in another and similar bolt-bar in front of the warp. But this front bolt-bar, besides an advancing and receding motion, has another movement, called *shogging*—from right to left. When it receives a bobbin by its forward motion, it draws back, bringing the bobbin and thread through two of the upright threads; it then *shogs* or moves to one side, and goes forward again, taking the thread through the next two warp-threads, and lodging the bobbin on the back bolt-

bar again, one distance beyond its last space; this it recovers by the next movement, and it again passes through the first space, to be again received by the front bolt-bar. By these movements the bobbin-thread is twisted quite round one upright thread of the warp; another movement then shifts the bobbin, so that it will pass through the next pair of upright threads, and so carry on its work, the warp-threads moving at the same time, unwinding from the lower beam, and being rolled on the upper one. There being twice as many bobbins as there are threads in the warp, each bolt-bar having a set which it exchanges with the other, and all being regulated with great nicety, a width of lace is made in far less time than has been required to write this short description. The various additions to, and variations upon, these operations, which only apply to bobbin-net, for the production of patterns, are so numerous and complicated—each pattern requiring new complications—that it will be useless attempting to describe them; suffice it to say, they all depend upon the variations which can be given to the movements of the flat, disk-like bobbins.

The history of the lace-machine is not very clear; it is said to have been originally invented by a *frame-work* knitter of Nottingham, from studying the lace on his wife's cap; but it has been continually receiving improvements, amongst which those of Heathcote in 1809 (the first to work successfully), Morley in 1811 and 1824, and those of Leaver and Turton, and of Clark and Marl, all in 1811. The manufacture of lace by machinery is chiefly located in Nottingham, whence it is sent to all parts of the world. See Felkin, *Machine-wrought Hosiery and Lace Manufacture* (1867); Mrs. Bury Palliser, *History of Lace* (latest edition 1875), a work treating the subject in a historical but popular manner; the volume printed by the Arundel Society in 1875; Seguin, *La Dentelle* (1874); Fischer, *Technologische Studien im Sächsischen Erzgebirge* (Leip., 1878); *The Art of Lace Making* (1881); Despierres, *Histoire du Point d'Alençon* (1888); Lefébre, *Embroidery and Lace* (Eng. trans. 1888); Doumert, *La Dentelle* (1889).

Gold-lace and *silver-lace*, properly speaking, are laces woven, either by the hand or by machinery, from exceedingly fine threads of the metals, or from linen, silk, or cotton threads which are coated with still finer threads of gold or silver; but in this country it is too common to designate as gold or silver lace, not only that which is rightly so called, but also fringe made of these materials, and also gold and silver embroidery, such as is seen on state robes and trappings, and upon some ecclesiastical dresses, etc. Gold-lace is made in London, but considerable quantities of that used for decorating uniforms and other dresses, etc., in this country, is obtained from Belgium, where it is an important branch of manufacture. France supplies much of the gold and silver thread used, and excels all other countries in its production, in some of the more artistic varieties of gold and silver lace and embroidery. Italy has lately shown great taste and skill. The works of Luigi Martini of Milan have, in this respect, attained great celebrity, and are said to produce about \$80,000 worth per annum.

LACE-BARK TREE, *Lagetta lintearia*, a tree of the natural order *thymeleaceæ*, a native of the West Indies. It is a lofty tree, with ovate, entire, smooth leaves, and white flowers. It is remarkable for the tenacity of the fibers of its inner bark, and the readiness with which the inner bark may be separated, after maceration in water, into layers resembling lace. A governor of Jamaica is said to have presented to Charles II. a cravat, frill, and ruffles made of it.

LACEDÆMON. See SPARTA.

LACE-LEAF. See LATTICE LEAF.

LACÉPÈDE, BERNARD GERMAIN ÉTIENNE DE LAVILLE, Count de, an eminent naturalist and elegant writer, was b. of a noble family, Dec. 26, 1756, at Agen. Having early devoted himself to the study of natural history, in which he was greatly encouraged by the friendship of Buffon, he was appointed curator of the cabinet of natural history in the royal gardens at Paris. This office he held till the revolution, when he became professor of natural history, and also entered upon a political career, in which he rose to be a senator in 1799, a minister of state in 1809, and, after the return of the Bourbons, a peer of France, although he had previously been one of the most zealous adherents of Bonaparte. He died of small-pox at his mansion of Epinay, near St. Denis, Oct. 6, 1825. A collective edition of his works was published in 1826. Among them are works on the natural history of reptiles, of fishes, and of the cetacea, a work on the natural history of man, and one entitled *Les Ages de la Nature*. His work on fishes (5 vols. 1798–1803) is the greatest of his works, and was long unrivaled in that department of zoology, although it has now been in a great measure superseded. Lacépède, who was a highly accomplished musician, was the author of a work entitled *La Poétique de la Musique* (2 vols. 1785), and of two romances intended to illustrate social and moral principles. He was an amiable man, extremely kind, delighting in domestic life, and very simple, and almost abstemious, in his habits.

LA CERDA, the name of an ancient Spanish family which traced its genealogy to Fernando, eldest son of Alfonso X. of Castile, called *La Cerdá*, or the horse's mane, from a tuft of hair that grew upon his shoulders. This prince married Blanche, a daughter of St. Louis of France, and died in 1275, leaving two sons, Alfonso and Fernando, heirs to the crown. But Sancho, son of Alfonso X., claimed the succession, and procured his proclamation before his father died. Alfonso's wife, Yolande, escaped from Castile with her grandchildren, finding a protector for them in her brother,

Don Pedro, king of Aragon, or in their uncle, Philip the bold of France. These sovereigns conspired to keep the young princes prisoners in Aragon, and their grandmother returned to Castile. Blanche, the mother of the princes, protested in vain against their imprisonment. When Alfonso X. died in 1284 he left a will making Alfonso and Fernando de la Cerda his heirs, and unconditionally disinheriting Sancho, by whom his life had been so much embittered. But Sancho was already on the throne, and the rightful heirs could not dispossess him. At length the king of Aragon, wishing to vex the king of Castile, set the princes of La Cerda at liberty, and they were proclaimed at Badajoz and Talavera; but they were unable to maintain their pretensions and retired into France in the reign of Philip the fair, where they concerted plans to enforce their claims. But their plans failed, and at length a son of Sancho succeeded to the throne. The kings of Portugal and Aragon, being requested to act as mediators, decided in favor of the son of Sancho, but stipulated that three cities should be ceded to Alfonso to enable him to maintain the dignity of his royal birth. Alfonso accepted these hard terms and was thenceforth known as the Disinherited. He died in 1325, leaving two sons, one of whom, Carlos de la Cerda, known also as Charles of Spain, was appointed by king John in 1350 constable of France. But a rivalry springing up between Charles of Spain and Charles the bad, king of Navarre, the former, while on a visit to his young wife in Normandy in 1354, was assassinated by agents in the pay of the latter. In 1425 the house of La Cerda became extinct, but it is still represented in the female line by the dukes of Medina-Cœli.

LACER TA and **LACER TIDÆ**. See **LIZARD**.

LACEY, WILLIAM BRITTAIHAM, D.D., 1781-1866; a missionary of the Protestant Episcopal church in Chenango co., N. Y., in 1818, afterwards for 20 years rector of St. Peter's church at Albany, and professor of theology in the university of Pennsylvania, in Philadelphia. He was the author of several text-books on rhetoric and moral philosophy, for the use of schools. From 1856 to 1866 he revised a *History of the English Church prior to the time of the Monk Augustin*, and some of his most valued essays and sermons, which he intended to publish.

LACHAISE, FRANCIS D'AIX DE, a Jesuit, b. of a noble family, Aug. 25, 1624, in the castle of Aix, now in the department of Loire, was a provincial of his order when Louis XIV. selected him for his confessor on the death of father Ferrier in 1675. His position was one of great difficulty, owing to the different parties of the court, and the strife between Jansenists and Jesuits. In the most important questions of his time, father Lachaise avoided extreme courses. A zealous Jesuit, and of moderate abilities, he yet sustained among his contemporaries the reputation of a man of mild, simple, honorable character. Mme. Maintenon could never forgive him the little zeal with which he opposed the reasons urged against the publication of her marriage with the king; but during the 34 years that he filled his office of confessor, he never lost the favor of the king. He was a man of some learning, and fond of antiquarian pursuits. He died Jan. 20, 1709.—Louis XIV. built him a country house to the w. of Paris, the large garden of which was in 1804 converted into a burial-place, and is known as the *Père-la-Chaise*.

LACHES, in American law, is a word used (from Fr. *lâcher*, to loosen) to denote negligence or undue delay, such as to disentitle a party to a particular remedy, or to relief. In this country the courts will not charge with laches an infant or married woman or insane person, or any party under legal disability. Equity will not, in general, relieve in favor of a party guilty of laches; but it is otherwise where the rights of the party seeking relief were doubtful or he was ignorant of them.

LACHESIS. The second one of the three Fates in Grecian and Roman mythology, daughters of Erebus and Night, or of Zeus and Themis. They presided over all great events in the lives of men, Lachesis being the disposer of destinies, who is represented as twirling the spindle on which was spun the thread of life, while her sister Atropos, the inevitable, cut it when it had reached its proper length.

LACHESIS, a genus of serpents of the rattlesnake family (*crotalidæ*), but differing from rattlesnakes in having the tail terminated with a spine instead of a rattle, and in having the head covered with scales, and not with plates. The species are all natives of the warm parts of America, where some of them are among the most dreaded of venomous serpents. In the homœopathic pharmacopeia the name lachesis is used to denote rattlesnake poison. See **RATTLESNAKE**.

LA CHINE. See **CHINE**, **LA**,

LA CHISH, a city of the Amorites, in s. Palestine. The king of Lachish and four others were routed by Joshua at Bethhoron and Lachish was destroyed. This town was remarkable for its strength. It was rebuilt, fortified, and garrisoned by Rehoboam, and was regarded after that time as one of the strongest fortresses of the kingdom of Judah. It was attacked by Sennacherib on his way from Phenicia to Egypt, and probably taken, though this is not stated in the Bible or Josephus, but its siege is depicted on the slabs found by Layard in one of the chambers of the palace at Kouyunjik. After the captivity it was reoccupied by the Jews. No modern vestige of the site or name has been discovered.

LACHMANN, KARL, a celebrated German critic and philologist, was b. Mar. 4, 1793, at Brunswick, studied at Leipsic and Göttingen, became a professor in the university of Königsberg in 1816, and at Berlin in 1827. He died Mar. 13, 1851. Lachmann's literary activity was extraordinary. He was equally devoted to classical subjects and to those of old German literature, and illustrated both by a profound and sagacious criticism. Among his most important productions are his editions of the *Nibelungenlied*, the works of Walter von der Vogelweide, Propertius, Catullus, Lucretius, and the New Testament (Berl. 1831; 3d edit. 1846), of which a larger edition, with the the Vulgate translation, appeared in 2 vols. (Berl. 1846 and 1850). The design of the last of these works was to restore the Greek text as it existed in the eastern church in the 3d and 4th centuries; and Lachmann thought himself more likely to attain that end by attaching weight only to such MSS. as exist in uncials (q.v.).

LACHNER, FRANZ, musician, b. in Rain, Bavaria, April 2, 1803; d. in Munich, Jan. 30, 1890. He became proficient on the pianoforte, organ, and violoncello, went to Vienna in 1822, and studied composition and counterpoint under Stadler and Sechter, and became intimate with Schubert. In 1836 he became court kapellmeister in Munich, and in 1852 was appointed director-general of music, but retired in 1868. The Munich University gave him the degree of LL.D. in 1872. Lachner is regarded as a classic in southern Germany. His works include: operas; symphonies; chamber-music; pianoforte music; songs; and part-songs. His suites for orchestra are his masterpieces, and show great skill in harmony and counterpoint.

LACH RYMÆ CHRIS TI, a muscatel wine of a sweet but piquant taste, and a most agreeable bouquet, which is produced from the grapes of mt. Somma, near Vesuvius. There are two kinds, the white and the red, the first being generally preferred. The demand for this wine being greater than the supply, large quantities of the produce of Pozzuoli, Istria, and Nola are sold under this name. A similar wine is produced in many islands of the archipelago, as Candia, Cyprus, etc.

LACH RYMAL ORGANS, THE, are sufficiently described in the article EYE. There are, however, certain diseases to which they are liable, which require a brief notice.

There may be a deficient secretion of tears, an affection for which the term *xerophthalmia* has been invented. It may be palliated by keeping the cornea constantly moist with glycerine by means of an eye-cup. Or there may be an over-secretion of tears, so that they *run down the cheeks*. This affection is termed *epiphora*, and must not be confounded with the *stillicidium lachrymarum*, or overflow of tears that arises from an obstruction of the channels through which they pass into the nose. It is common in scrofulous children, and should be treated with gentle aperients, such as rhubarb combined with bicarbonate of soda, and tonics, such as the citrate of iron and quinine.

Obstruction of the nasal duct is generally caused by a thickening of the mucous membrane that lines it, and is a not uncommon affection, especially in scrofulous young persons. There is a feeling of weakness of the eye on the affected side, and tears run down the cheek, while the nostril on that side is unnaturally dry. The lachrymal sac is distended with tears, and forms a small tumor by the side of the root of the nose. On pressing this tumor, tears and mucus can be squeezed backwards through the puncta, or downwards into the nose, if the closure is only partial. This affection often leads to *inflammation of the sac*, or to the formation of a fistulous aperture at the inner corner of the eye, communicating with the lachrymal sac, and known as *fistula lachrymalis*. This fistulous aperture is caused by the bursting of an abscess, arising from inflammation of the sac. It is generally surrounded by fungous granulations (popularly known as *proud flesh*), and the adjacent skin is red and thickened from the irritation caused by the flow of tears. In these cases, the sac must be opened by a puncture, and a style (a silver probe about an inch long, with a head like a nail) should be pushed through the duct into the nose. The retention of this instrument causes the duct to dilate, so that the tears flow by its side. The flat head of the style lies on the cheek, and both keeps the instrument in its place and facilitates its occasional removal for the purpose of cleansing. Sometimes it is necessary that the instrument should be worn for life, but in less severe cases the duct remains permanently dilated, and a cure is effected in a few months.

LACH RYMATORY is the name applied to small bottles found in ancient tombs, and supposed to contain the tears of the deceased's friends. These phials are made of glass or earthenware, with a long neck, and the mouth formed, as was thought, to receive the eye-ball. The figure of one or two eyes has sometimes been found impressed upon them. It is more probable, however, that they contain aromatic balsam.

LACHUTE, a growing Canadian town on the Ottawa River, 44 m. from Montreal. It has large paper mills and wood-working industries, and is an important port of shipping for dairy products. Pop. 1891, 1850.

LACKAWANNA, a co. in n.e. Pennsylvania, partially bounded on the w. by the Susquehanna river, s.e. by Lehigh river; organized 1878; traversed by Delaware, Lackawanna and Western, the Central of New Jersey, the New York, Ontario, and Western and other railroads; 460 sq. m. Pop. '90, 142,088. Co. seat, Scranton.

LACKAWANNA RIVER rises in Susquehanna co., Penn., and flows s. to Carbon-dale, whence it runs s.w. in Lackawanna co., entering the Susquehanna at Pittston.

Rich mines of anthracite coal are found in the valley of this stream. Scranton and Carbondale are the principal towns upon its banks. The s.w. part of the Lackawanna valley opens into that of Wyoming, and the two together form one long, narrow valley nearly coinciding with the Wyoming and Lackawanna coal basin, which is over 50 mi. long, and passes through Lackawanna co. in a n.e. and s.w. direction. Nearly half of all the anthracite mined in the United States is taken from this basin.

LACLEDE, a co. in s. w. central Missouri; drained in part by the Gasconade and its Osage fork, and in part by the Grand Anglaize, which rises in it; about 740 sq. m.; pop. '90, 14,701. The surface is hilly, and extensively covered with forests of hard timber. Wheat, corn, oats, and pork are the chief productions. The county is intersected by the St. Louis and San Francisco railroad. Co. seat, Lebanon.

LACLÉDE, PIERRE LIQUESTE, b. France; resident of New Orleans in 1763; grantee, under a charter from the director-general of the colony of Louisiana, of the exclusive right to trade in furs with the Indians on the Missouri river; organizer under that charter of the Louisiana fur company, and founder of the city of St. Louis, where he located the company's warehouses and stores, laid out a town, and named it in honor of his king, Louis XV., though it was for some years called "Lacledé's village."

LA CONDAMINE, CHARLES MARIE DE, 1701-74; b. Paris; educated at the university of Paris; entered the army in 1719; was present at the siege of Rosas, where he distinguished himself. He soon left the army and joined an expedition to explore the coasts of Asia and Africa. In 1735 he was sent by the academy of sciences, with Bouguer and others, to Peru to measure a meridional arc for the purpose of determining the figure of the earth. He returned to France in 1743, and published accounts of the work of the commission in 1748 and 1749. His account of caoutchouc, published in 1751, was the cause of the introduction of this valuable substance into Europe. He became a member of the Royal Society of London in 1748, and in 1760 of the academy of sciences of Paris. He promoted inoculation for small-pox, and left a number of treatises on physics, natural history, and geography. He discovered the deflection of a plumb-line by the attraction of a mountain near by.

LACONIA, or **LACONICA**. See SPARTA.

LACONIC. The Spartans, or Lacedemonians (whose country was called Laconia), systematically endeavored to confine themselves to a sententious brevity in speaking and writing; hence the term *laconic* has been applied to this style.

LACORDAIRE, JEAN-BAPTISTE HENRI, the most distinguished of the modern pulpitrators of France, was b. at Recey-sur-Ource, in the department Côte-d'Or, Mar. 12, 1802. He was educated at Dijon, where he also entered upon his legal studies; and having taken his degree, he transferred himself in 1821 to Paris, where he began to practice as an advocate in 1824, and rose rapidly to distinction. As his principles at this period were deeply tinged with unbelief, it was a matter of universal surprise in the circle of his acquaintance that he suddenly gave up his profession, entered the college of St. Sulpice, and in 1827 received holy orders. He soon became distinguished as a preacher, and in the college of Juilly, to which he was attached, he formed the acquaintance of the abbé Lamennais, with whom he speedily formed a close and intimate alliance, and in conjunction with whom, after the revolution of July, he published the well-known journal, the *Avenir*, an organ at once of the highest church principles and of the most extreme radicalism. The articles published in this journal, and the proceedings which were adopted in asserting the liberty of education, led to a prosecution in the chamber of peers in 1831; and when the *Avenir* itself was condemned by Gregory XVI., Lacordaire formally submitted, and for a time withdrawing from public affairs, devoted himself to the duties of the pulpit. The brilliancy of his eloquence, and the novel and striking character of his views, excited an interest altogether unprecedented, and attracted unbounded admiration. His courses of sermons at Notre Dame drew to that immense pile crowds such as had never been seen within the memory of the living generation, and had produced an extraordinary sensation even on the non-religious world, when once again Lacordaire fixed the wonder of the public by relinquishing the career of distinction which was open to him and entering the novitiate of the Dominican order in 1840. A short time previously, he had published a memoir on the re-establishment of that order in France, which was followed, after his enrollment in the order, by a life of its founder, St. Dominic; and in 1841 he appeared once again in the pulpit of Notre Dame, in the well-known habit of a Dominican friar. From this date he gave much of his time to preaching in various parts of France. In the first election which succeeded the revolution of 1848, he was chosen one of the representatives of Marseilles, and took part in some of the debates in the assembly; but he resigned in the following May, and withdrew entirely from political life. In 1849, and again in 1850 and 1851, he resumed his courses at Notre Dame, which, together with earlier discourses, have been collected in 3 vols., under the title of *Conférences de Notre Dame de Paris*, 1835-50. His health having begun to decline he withdrew in 1854 to the convent of Sorèze, where he died in 1861. In 1858 he wrote a series of *Letters to a Young Friend*, which have been much admired; and in 1860, having been elected to the academy, he delivered what may be called his last address, a memoir of his predecessor, M. de Tocque-

ville. A collected edition of his works appeared in Paris in 1872; his memoirs by Montalembert in 1862.

LACQUER is a varnish prepared for coating metal-work (see LAC), usually polished brass. The formula usually employed is, for gold color: alcohol, 2 galls.; powdered turmeric, 1 lb.; macerate for a week, and then filter with a covered filter, to prevent waste from evaporation; to this add, of the lightest-colored shell-lac, 12 oz.; gamboge, 4 oz.; gum-sandarach, 3½ lbs. This is put in a warm place until the whole is dissolved, when 1 quart of common turpentine varnish is added. A red lacquer, prepared by substituting 3 lbs. of annotta for the turmeric, and 1 lb. of dragon's blood for the gamboge, is extensively used.

LACQUERING, the art of coating metal with varnish. The term has also a wider signification, and is made to apply to the process by which some varieties of goods in wood and papier-mâché are also coated with layers of varnish, which are polished, and often inlaid with mother-of-pearl, etc. See PAPIER-MÂCHÉ. It would appear, from the very fine specimens from Japan in the international exhibition, that the Japanese excel in the art of producing articles of exquisite thinness and delicacy. The varnish used by the Chinese and Japanese appears to be the same, and is a natural secretion which flows from incisions in the stem of the varnish-tree (q.v.). The Japanese have carried this art so far as to apply it to their delicately beautiful china, some of which is lacquered and inlaid with mother-of-pearl, forming landscapes and other designs.

LAC QUI PARLE, a co. in w. Minnesota, bordering on S. Dakota, bounded on the n.e. by the Minnesota, and intersected by the Lac Qui Parle river; pop. '90, 10,382. The surface is nearly level and the soil fertile. Area, 650 sq. m. Co. seat, Madison.

LACRETELLE, JEAN CHARLES DOMINIQUE DE, b. Sept. 3, 1766, in Metz—historian and journalist. He was educated in the law, and admitted to the bar at eighteen. He was on the staff of the *Moniteur* and the *Débats*; was secretary to the Duc de la Rochefoucauld-Liancourt whom he assisted in promoting the king's attempted escape. He was imprisoned for two years because of his Royalist proclivities. In 1809 he became a professor of history in Paris, and in 1811 a member of the Academy. He died Mar. 26, 1855 at Mâcon. He wrote numerous histories covering the period of the Revolution from the beginning to 1846.

LACRETELLE, PIERRE LOUIS, brother of the above, 1751-1824; b. France; educated for the practice of law he drifted, by the philosophical tendency of his mind, into authorship, and first became known by the humanitarian direction of his essays. In Paris he was made one of the editors of the *Grand Répertoire de Jurisprudence*. In 1784 he published several essays, one of which, a discourse on the prejudices which attach to infamous punishment, was crowned by the academy of Metz. Robespierre was one of the competitors for the same honor. Lacretelle was intimately associated with La Harpe in the publication of the *Mercur de France*, in which his writings attracted the attention and friendship of D'Alembert, Condorcet, Turgot, and Malesherbes. At the beginning of the French revolution he was a member of the national assembly, voted for the new constitution making France a constitutional monarchy, and stubbornly adhered to it through the later developments of the revolution by which it was overturned, adopting for his motto: "The constitution entire, and nothing but the constitution." Voting against the accusation of Lafayette, he was accused of royalism and left Paris to save his head. In 1817 he associated with Benj. Constant and others to establish the *Minerve Française*. This was suppressed by the government of Louis XVIII. His writings exhibit an earnest desire to ameliorate the cruelties of law and to promote education. His complete works were published in Paris in 1824 in 6 vols. quarto.

LA CROIX, APOLLINE BIFFE, wife of Jules; actress and author, whose maiden name was Pauline Derfeuille. She is author of *Fleur de Serres et Fleur des Champs*, 1854; *Falcone*, 1856; and *Madame Berthe*, 1857.

LA CROIX, JULES, brother of Paul, b. in Paris, 1809; a poet, dramatist, and translator of dramatic compositions, and a novelist. Some of his best plays are *Le Testament de César*, *Valéria*, and *Edipus Rex*; the latter a literal translation from Sophocles, receiving the grand prize of the French academy, 10,000 fr., in 1862. He has made a translation of Shakespeare's *King Lear*, which has been successfully played at the théâtre de l'Odéon. In 1872 La Croix published a volume of poems, of great vigor of style, on the episodes in France incident to the German war, entitled *Invasion, Commune, Souvenirs sans Pardon*.

LA CROIX, PAUL, b. Paris, 1806; a French author who published under the name of "Le Bibliophile Jacob," a large number of romances and books of the manners and customs of the middle ages. In 1855 he was appointed keeper of the arsenal library, and he has edited the *Revue Universelle des Arts* since 1854. His work entitled *Histoire du 16e siècle en France* was published in 1834. Among his later historical books are: *Un Mobilier Historique des XVIIe et XVIIIe siècles* (1865); *Arts au Moyen Age et à l'Epoque de la Renaissance* (1868); *Mœurs Usages et Costumes au Moyen Age et à l'Epoque de la Renaissance* (1871); and *La vie Militaire et la vie Religieuse au Moyen Age* (1872). He d. 1884.

LACROIX, SYLVESTRE FRANÇOIS, a French mathematician, was b. in Paris in 1765; and though of poor parentage, succeeded through indomitable zeal in acquiring so great a knowledge of elementary mathematics that, at the age of 17, he obtained, by the

recommendation of Monge (q.v.), the professorship of mathematics in the naval school at Rochefort. He was successively promoted to a corresponding position in the école normale, école polytechnique, the Sorbonne, and the college of France; was chosen member of the academy of sciences in room of Borda in 1799; and throughout his long life zealously pursued his duties as a teacher, widely disseminating a taste for the mathematical sciences by the numerous elementary works which were the fruit of his leisure hours. Lacroix is not remarkable for original discovery in mathematical science; but he deserves to be gratefully remembered for his *Traité du Calcul Différentiel et Intégral* (Paris, 1797), a work on which he spent immense labor, in order to make it a complete and harmonious compilation of the results of all previous research. The value of such a work may be estimated by Laplace's statement, that it cost him 10 years' labor to supply for himself the want of such a work. Lacroix's other writings are treatises on arithmetic, algebra, geography, trigonometry, probabilities, land-surveying; geography, mathematical and physical, etc. He died May 25, 1843.

LA CRÔSSE, a co. in w. Wisconsin, bounded n.w. by Black river, w. by the Mississippi, and intersected by the La Crosse river; about 450 sq. m.; pop. '90, 38,801. The surface is undulating, and diversified with prairie and forest. It has a fertile soil, producing wheat, corn, oats, and hay. Lumber is extensively manufactured. The county is intersected by the Chicago, Milwaukee and St. Paul, the Chicago and Northwestern and other railroads. Co. seat, La Crosse.

LA CRÔSSE, city and co. seat of La Crosse co., Wis.; on the Mississippi river near the mouth of the La Crosse, and on the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, the Chicago, Burlington and Quincy, and the Green Bay, Winona and St. Paul railroads; 18 miles s.e. of Winona. It contains St. Francis hospital, the Washburn public library, U. S. government building, high school, national and state banks, electric light and street railroad plants, waterworks supplied from the Mississippi river, and over 50 churches. There are foundries, machine shops, breweries, manufactories of agricultural implements, and lumber, shingle, and lath mills. According to the state census of 1895 there was nearly \$3,000,000 invested in the real estate, machinery, stock, and fixtures of the manufactories, which had an output valued at \$4,620,432. The city ships large quantities of lumber. Pop. '90, 25,221.

LA CRÔSSE is the name given by the early French explorers of Canada to a field game played with a ball. It was called *Tehontshik Saheks* by the Iroquois, its originators, and *Baggataway* by the Objibways, and stirring accounts of the Indian manner of playing the game may be found in Catlin's *North American Indians* and Parkman's *The Conspiracy of Pontiac*. The game was introduced to Great Britain by 18 Iroquois Indians who came to play it in 1867; and in 1876 teams of Canadian gentlemen and Indians visited England and Scotland for the same purpose.

In what way La Crosse differs from golf, hockey, foot-ball, and other games, may be briefly explained. Every player is provided with a kind of large battledore. This consists of a long stick of light hickory, bent at the top like a bishop's crosier; strings of deer-skin are stretched diagonally across the hooked portion in different directions, forming a net-work—not so tightly as in a regular battledore or racket-bat, nor so loosely as to form a bag. As the battledore, called the *crosse*, is 5 or 6 ft. long, there is great leverage power in handling it. Only one ball is employed, made of india-rubber, and 8 or 9 in. in circumference. Posts or poles about 6 ft. high, with a small flag at the top of each, complete the equipment. The players divide themselves into two parties, the reds and the blues; their number, as well as the size of the play-field, is nearly optional, but usually there are 12 players on each side. Red predominates in the dress of one party, and blue in that of the other, for facility in distinguishing colleagues from opponents. To prepare for the game, a red goal is set up at one end of the field, consisting of two small red flags on posts, about 6 ft. high and 6 ft. apart; a similar goal, but blue in color, is set up at the opposite end of the field. Now, the object of the game is for the blues to drive the ball through the red goal, and the reds to drive it through the blue goal; and each party, of course, strives to frustrate the plan of the other. The ball is not thrown by the hand, but is hooked up from the grass by the bent end of the *crosse* or battledore; it is borne on the netting horizontally, while the player runs, and is dexterously thrown off the *crosse* when the exigencies of the game require such a maneuver. No player is allowed to wear spiked shoes; but a good hold of the ground is obtained by wearing moccasins, which the Indians prefer, for the purpose to regular shoes. Each side has a captain, who does not play, and each goal has an umpire.

In the arrangement of the men on each side, the *goal-keeper* defends the goal; *point* is the first man out from the goal; *cover-point* is a little in advance of point; *center* is in the center of the field; *home* is the player nearest to the opponents' goal; while the *fielders* comprise the rest of the players. Beginning near the center of the field, the players struggle to obtain a mastery over the ball, and convey it to the opponents' goal. When scooped up from the ground, it is carried horizontally on the *crosse*, the player running towards one of the goals, trying to elude the vigilance of his antagonists. If it seems prudent, he pitches the ball off his *crosse* towards a colleague, who may be in a better position to convey it towards the goal. The ball is not touched by the hand, except under special and clearly defined circumstances. If the ball be accidentally driven

through the red goal by one of the reds, the blues win the game; and *vice versa*. The players must not strike, trip up, or grasp one another; nor must any one lay hold of the crosse of another. One player strikes the ball off an opponent's crosse with his own crosse, and not by any other means. Two players on the same side may fling or carry the ball consecutively.

It will thus be seen that there is a little of foot-ball, of hockey, and of racket in la crosse. The goals resemble those of foot-ball and hockey; the occasional struggle for the ball is like the "scrimmage" of foot-ball, though not so rough and dangerous; the general mode of play may be compared to hockey; while the battledore claims some resemblance to the racket-bat. There is nevertheless sufficient originality in the game to render it wholly a distinct one. La Crosse clubs have been established at Richmond, Blackheath, Glasgow, and other places in Great Britain, and in the United States.

LACS D'AMOUR, in heraldry, a cord of running knots used as an external decoration to surround the arms of widows and unmarried women, the *cordelier*, which differs but slightly from it, being used similarly with the shields of married women.

LACTANTIUS, in several MSS. designated **LUCIUS CÆLIUS**, or **CÆCILIUS FIRMIANUS LACTANTIUS**, an eminent Christian author, who flourished in the early part of the 4th century. He was of Italian descent, and studied at Sicca, in Africa, under the rhetorician Arnobius, and in 301 A.D. settled as a teacher of rhetoric in Nicomedia. He was invited to Gaul by Constantine the great (312-18 A.D.), to act as tutor to his son Crispus, and is supposed to have died at Treves about 325 or 330. Lactantius's principal work is his *Divinarum Institutionum*, libri vii., a production both of a polemical and apologetic character. A supposed tendency to Manicheism in his views and his Chiliasm have marred his reputation for pure orthodoxy. He attacks paganism and defends Christianity. Among his other writings are treatises *De Ira Dei* and *De Mortibus Persecutorum*. Some elegies have also been ascribed to him, but erroneously. His style is wonderful, if we consider the late age at which he wrote, and has deservedly earned for him the title of the *Christian Cicero*. He was, besides, a man of very considerable learning, but as he appears not to have become a Christian till he was advanced in years, his religious opinions are often very crude and singular. Lactantius was a great favorite during the middle ages. The *editio princeps* of this writer is one of the oldest extant specimens of typography. It was printed at Subiaco in 1465.

LACTEALS, **THE**, or **CHYLIFEROUS VESSELS**, are the lymphatic (q.v.) vessels of the small intestine. They were discovered in 1622 by Aselli (q.v.), and received their name from conveying the milk-like product of digestion, the chyle (q.v.), during the digestive process, to the thoracic duct (q.v.), by which it is transmitted to the blood. These vessels commence, as has been shown in the article **DIGESTION**, in the intestinal villi, and passing between the layers of the mesentery (q.v.), enter the mesenteric glands, and finally unite to form two or three large trunks, which terminate in the thoracic duct.

LACTHO, a province of Farther India, subject to the ruler of Cochin China; bounded s. by Lars, n. and e. by Tonquin, w. by China. It has been but imperfectly explored by Europeans, but is described by the Tonquinese as mountainous, rocky, and covered with jungle, destitute of navigable rivers, with the air pestilential and the water unwholesome. The numerous tribes of the interior are savages, governed by hereditary chiefs, and constantly at war with each other. The exports to Tonquin are buffaloes and cotton, and the imports from Tonquin are salt, salt-fish, oil, and silk stuffs for the chiefs. The medium of exchange is cowries. This province is said to contain many remarkable natural caves, which the natives used as temples. One is described as a mile across, through a mountain, and another as being entered under ground.

LACTIC ACID $\text{CH}_3 \cdot \text{CH}(\text{OH}) \cdot \text{COOH}$, in its pure state, is a transparent, colorless, or slightly yellow uncrystallizable, syrupy liquid, of specific gravity 1.215. It is devoid of odor, has a sharp, acid taste, and is soluble in all proportions in water, alcohol, and ether.

The best method of obtaining this acid is by dissolving 8 parts of cane-sugar in about 50 parts of water, and then adding 1 part of decaying cheese and 3 parts of chalk. If this mixture be set aside for two or three weeks at a temperature of about 80°, it becomes filled with a mass of crystals of lactate of lime, which must be purified by recrystallization, and treated with about one-third of their weight of sulphuric acid. The residue must be digested in alcohol, which leaves the sulphate of lime, and dissolves the lactic acid, which may be obtained pure on evaporating the solution. The mode in which the acid is produced in this process is described in the article **LACTIC FERMENTATION**.

Lactic acid is also formed in many other ways; thus, it is a frequent product of the acidification of vegetable substances, and in this way is formed in *sauer-kraut*, in malt vinegar, and in the acid fermentation that takes place during the manufacture of wheat-starch. It occurs ready formed in certain plants, and is very largely produced in the animal body. It is found either free or combined, or both, in the gastric juice (although not constantly), in the contents of the small and large intestine, in the chyle (after the use of amylaceous food), in the muscular juice (both of the voluntary and involuntary muscles), in the parenchymatous juices of the spleen, liver, thymus, pancreas, lungs, and brain, and is found as lactate of lime in the urine of the horse. It has been found in certain morbid conditions of the system in the milk, where it is formed from the sugar

by the fermenting action of the caseine; in the blood in leucocythæmia, pyæmia, and puerperal fever; in purulent and other transudations; in the urine when there is disturbance of the digestive and respiratory organs, and in rickets and softening of the bones (and almost always after exposure to the air for some time); in the saliva in diabetes; in the sweat in puerperal fever; and in the scales that form upon the skin in lepra.

The lactic acid occurring in the system may be traced to two distinct sources: that which is found in the intestinal canal is merely the product of the decomposition of the starchy matters of the food; but that which exists in the gastric juice (even when only animal food has been taken), in the muscular juice, and in the juices of the various glands, can only be regarded as a product of the regressive metamorphosis or disintegration of the tissues, and how it is formed is not accurately known.

There is no ready test for lactic acid. The best course to pursue is to obtain it, if it is present, as a lactate of lime, which crystallizes in beautiful tufts of acicular prisms, or as a lactate of zinc, which crystallizes in a very characteristic form in crusts consisting of delicate four-sided prisms.

LACTIC FERMENTATION. Although lactose or sugar-of-milk may, under certain conditions, be made to undergo alcoholic fermentation (as in the preparation of kumiss by the Tartars from mares' milk), it generally yields a very different product, viz., lactic acid, as may be seen in the case of milk turning sour in warm weather. The caseine is usually considered to act as the ferment, but being insoluble in acids, it is thrown down in flakes as soon as the milk becomes sour. In this insoluble form, it exerts little action in converting the milk sugar $C_{12}H_{22}O_{11}$ into lactic acid $C_3H_5O_3$; but if the acid be neutralized by carbonate of soda or by chalk, the curd is redissolved, and the transformation of the sugar into lactic acid is renewed. No evolution of gas or absorption of oxygen takes place during the conversion of the sugar into the acid.

Not only sugar-of-milk, but cane-sugar, starch, dextrine, and gum pass readily into lactic acid under the influence of caseine or other animal matters undergoing decomposition.

Pasteur considers that a specific ferment, the germs of which exist in the atmosphere, is concerned in the production of the lactic fermentation.

LACTIN AND LACTOSE. See LACTIC FERMENTATION; SUGAR (*Milk Sugar*).

LACTOMETER. A special form of hydrometer, designed for determining the specific gravity of milk. As usually constructed, its scale, about 4 in. in length, is divided into 120 equal degrees, the zero being the point to which the instrument sinks in pure water at a temp. of 60° Fahr., while the 100th degree corresponds to a sp. gr. of 1.029 at the same temperature. Long experience has conclusively shown that the sp. gr. of mixed milk from healthy cows (5 or more), when taken at least 12 hours after milking, will never fall below 1.029 (=100° on the lactometer scale) at 60° Fahr., unless water has been added. Cases are extremely rare in which the milk of individual cows will fall below this gravity.

The lactometer thus becomes a valuable agent in detecting the adulteration of milk with water, and as the graduation of the scale is decimal, the percentage of water added can be ascertained by subtracting the lactometer reading from 100. The milk tested must of course have a temp. of exactly 60° Fahr. Should the temp. be above or below this point, an approximate calculation of the true lactometer reading at 60° Fahr. can be made by adding 1° lactometer for every $2\frac{1}{2}$ ° of temperature above 60°, or subtracting 1° for every $2\frac{1}{2}$ ° of temperature below 60°. This calculation, approximate at the best, holds good only for a variation of 15° of temperature above or below 60°. Beyond these points it is unreliable. It must not be forgotten that cream is lighter than milk, and will therefore stand below 100° when tested by lactometer. This does not, however, at all detract from the value of the instrument for detecting the addition of water to milk, as no competent inspector could possibly mistake cream for watered milk.

The lactometer has been constantly employed by the milk inspectors of the New York City Health Department, and to its intelligent use, more than to any other means, must be ascribed the remarkable improvement in the quality of the milk supply of that city. The instrument is now generally recognized as a most valuable aid in determining the purity of milk.

LACTUCARIUM, or LETTUCE OPIUM. See LETTUCE.

LACUNARS, or LACUNARIS, the panels or coffers of ceilings, and also of the soffits of classic cornices. They are much used in the ceilings of porticos and similar classic structures, and are frequently ornamented with pateræ.

LACUSTRIANS AND **LACUSTRINE VILLAGES.** See LAKE DWELLINGS.

LADAKH, otherwise known as MIDDLE THIBET, lies between Great Thibet on the e., and Little Thibet on the w., stretching in n. lat. from 32° 17' to 36° 40', and in e. long. from 75° 40' to 80° 30'. On the s. it is separated from Cashmere by the Himalayas, while on the n. it is divided by the Karakoram mountains from Chinese Turkistan. It contains about 30,000 sq. m., and '91, 28,274 inhabitants. The country was conquered by Gholab Singh, the ruler of Cashmere, in 1835. It lies chiefly within the basin of the Upper Indus, being little better than a mass of mountains with narrow valleys between them. Notwithstanding its great elevation, which is equally unfavorable to soil and climate, the temperature is sometimes singularly high—a phenomenon attributed partly to the tenu-

ity of the atmosphere, and partly to the absence of moisture. Pretty good crops of wheat, barley, and buckwheat are raised; while the mineral products are sulphur, iron, borax, silver, and gold. The transit-trade is extensive, being carried on mostly by mules and sheep. The inhabitants are very peaceful and industrious; they are excellent farmers, and their woolen manufactures are said to be important. The women are fresh and fair, but rather lax in their morals; among the lower classes, polyandry is common. The population is essentially Mongolian, but has intermixed with the Cashmerians. The language is Thibetan, and in the opinion of Klaproth the primitive dialect of the aboriginal people inhabiting the region between Hindustan and Tartary. The religion is Lamaism, a form of Buddhism (q.v.). It is a province of Cashmere, which is under a maharajah, and is a British feudatory. The capital city is Le.

LADAS. A celebrated Greek athlete, a Laconian, so remarkable as a runner that his name became proverbial among the ancients for speed. See Juvenal, *Sat.* xiii., 97.

LADD, GEORGE TRUMBULL, D.D., b. Painesville, O., 1842, graduated at Western Reserve coll., 1864, and Andover theol. sem., 1869; was pastor in Edinburg, O., 1869-71; and in Milwaukee, 1871-79; prof. of philosophy at Bowdoin coll., 1879-81; and at Yale since 1881. He has pub. *Principles of Church Polity*, 1882; *Doctrine of Sacred Scripture*, 1883; *Philosophy of Religion*, 1885; *Practical Philosophy*, 1885; *What is the Bible?* 1888; *Introduction to Philosophy*, 1890; *Outlines of Physiological Psychology*, 1891; *Psychology, Descriptive and Explanatory*, 1894; *Philosophy of Knowledge*, 1897, etc. His discussion of the doctrine concerning the Scriptures is an elaborate historical discussion with a thorough philosophical analysis; and the conclusions reached, though quite within evangelical lines, have caused wide debate, as changing at least the form of the standard doctrine of inspiration.

LADIES OF THE QUEEN'S HOUSEHOLD consist of the mistress of the robes, the ladies of the bedchamber, the bedchamber women, and the maids of honor.

The office of mistress of the robes is of considerable antiquity. It is her duty to regulate the rotation and times of attendance of the rest of the ladies of the household, who are all subordinate to her. She has the superintendence of all duties connected with the bedchamber—within which the lord chamberlain has no authority—and the custody of the robes. On state occasions, she must see that the ceremony of robing the queen is properly performed. In public ceremonials, she accompanies the queen in the same carriage, or walks immediately before her majesty. The *ladies of the bedchamber*, who now number eight, with five extra ladies, and the *bedchamber women*, of whom there are eight, besides one resident and three extra, are personal attendants, ministering to the state of her majesty. The *maids of honor*, of whom there are eight, are immediate attendants on the royal person, and in rotation perform the duty of accompanying the queen on all occasions. They enjoy by courtesy the title "honorable," when not entitled to it by birth, and are then designated the "honorable Miss —."

LADING, BILL OF. See **BILL OF LADING.**

LADINO, the name given throughout Central America, and especially in Nicaragua and Guatemala, to the half-breed descendants of whites and Indians. In this intermixture the white element has usually been represented by the father, there being few white women in the country. The ladinos are generally of a yellowish orange tinge, the European element usually predominating in the males, the Indian characteristics in the females, who, notwithstanding, are said to be the handsomest women in Central America. As a class the ladinos are averse to all manual labor, and desirous of being ranked with the whites. Their equivocal position tends to make them restless and turbulent.

LADISLAS, VLADISLAS, VLADISLAF, ULADISLAS, different forms of a name frequently occurring in the histories of Poland, Hungary, Bohemia, and Servia.—**VLADISLAS I.** of Poland, surnamed Lokietek (the short)—one of those princes who appear to be raised up during a period of intestine confusion and disorganization, for the purpose of showing how powerful is the influence of one great mind—was ruler of the small province of Cracow, at a time when Poland was subdivided into countless small independencies. Vladislas united them in 1319; and the further to increase the stability of the government, he reduced the privileges of the higher nobles, removed the council of prelates and magnates, replacing it by a popular assembly; he greatly improved the administration of justice, and furthered commerce and industry.—**VLADISLAS II.** and **VLADISLAS III.** See **JAGELLONS.**—**VLADISLAS IV.** (1632-48), while yet a youth, was elected czar of Russia in 1610, but was prevented by his father, Sigismund, from accepting the crown. He was a wise and politic prince, yet it was under his reign that Sweden, Russia, and Turkey commenced to nibble at the outlying provinces. He strove manfully to remedy the peculiar defects of the Polish constitution, but they were too deeply rooted; and though he sought to end the oppression of the dissidents, and took the part of the Cossacks against those nobles who had deprived them of their rights, so weak was the royal authority that his support availed them nothing. The Cossacks, maddened by deprivation of their liberties, the imposition of new taxes, and the persecuting zeal of the Roman Catholic clergy, rose in rebellion, annihilated the Polish army, and put themselves under the rule of Russia. At this critical moment, Vladislas died.

LA'DISLAS, or **LADISLAUS**, the name of seven kings of Hungary.—**LADISLAS I., THE SAINT**, about 1041-95; succeeded his brother, Geysa I., in 1077. He was distinguished for his victories in war, for his efforts to promote commerce, for projecting the delivery

of the Holy Land from the Moslems, and for building many churches and monasteries; canonized by pope Celestine III. in 1192.—**LADISLAS II.**, about 1134–62; crowned 1161.—**LADISLAS III.**, about 1185–1205; elected to succeed his father, Emerich, but died.—**LADISLAS IV.**, surnamed **THE CUMAN**, about 1250–90; succeeded his father, Stephen IV., in 1272. He at first made war upon the Cumans and defeated them; but the latter, reinforced by hordes of Tartars, afterwards overran and ravaged all Hungary. He then made terms with them, adopted some of their customs, and put away his wife to marry one of their princesses. He was finally assassinated by them.—**LADISLAS V.**, 1424–44; succeeded his father, Ladislas II., as king of Poland in 1434, and was elected king of Hungary in 1440. He defeated the invading Turks in two great battles in 1442–43; made a ten years' truce with the sultan Amurath II., thus acquiring the sovereignty of Wallachia, but obtained a papal dispensation releasing him from his oath, invaded Bulgaria, and was defeated and killed in battle at Varna.—**LADISLAS VI.**, **THE POSTHUMOUS**, son of Albert of Austria, 1440–57; b. several months after his father's death, when Ladislas V. was already upon the throne; was elected king in 1445, was crowned king of Bohemia Oct. 28, 1453, and d. at Prague. He was cruel in his character, and persecuted the followers of John Huss.—**LADISLAS VII.**, about 1456–1516; eldest son of Casimir IV. of Poland; was crowned king of Bohemia at Prague, Aug. 16, 1471; entered Hungary with an army in 1490, and was crowned king Sept. 21 of that year.

LA'DISLAS, or **LANCELOT**, King of Naples, surnamed "the liberal" and "the victorious," about 1375–1414; succeeded his father, Charles III., under the regency of his mother, in 1387, but was driven from Naples in 1387 by his competitor, Louis II. of Anjou, who was invested with the crown by authority of pope Clement VII. He was reinstated in the same year by Otto of Brunswick, and in 1388 repulsed two invasions made by pope Urban VI. He was crowned at Gaeta in 1390 by a legate of the new pope, Boniface IX. The capital was at this time in possession of his rival, Louis II., and was not recovered until 1399, after a long and bloody contest. He was crowned king of Hungary in 1403, but soon relinquished his pretensions to that crown. In 1405 he made an unsuccessful attempt to seize Rome, in consequence of which he was excommunicated and deprived of his kingdom by the pope. In 1413 he surprised, captured, and plundered the city, and in the following year died at Naples. He conceived the project of the unity of Italy, which waited more than four centuries for its realization.

LADMIRALT, **LOUIS RENÉ PAUL DE**, b. France, 1808; rose rapidly by service in Africa; was general of division at Solferino, where he was wounded; senator in 1866; and commander of the 4th army corps ordered to defend the lines between Metz and Thionville in the war with Germany in 1870. After the defeat of MacMahon's division he retired his corps into Bazaine's command, and was surrendered with Metz, Oct. 27, 1870. After the peace in Mar., 1871, on the breaking out of the civil war between the national assembly at Versailles and the commune of Paris, Ladmiraalt was made commander of the troops charged to take Paris. On May 22 he forced an entrance by the *porte St. Ouen*, the following day gained possession of the heights of Montmartre, and thence, with obstinate fighting on both sides, took possession of the city part by part. July 1, 1871, he was made military governor of Paris, and in the organization of the military service to insure the peace of Paris he used his discretionary power to suppress journals, interdict plays at theaters, etc., in such a way as to suggest to the republican papers that they were unduly honored by his disapproval. He was elected to the senate, 1876, and retired from the governorship of Paris, 1878.

LADOGA (**STARAYA**, or **OLD LADOGA**), an ancient Russian t., in the government of St. Petersburg, on the left bank of the river Wolkhof. It was the residence (862) of Rurik, the founder of the Russian monarchy, and the walls of a fortress erected by him, and a church of the 11th c., still mark its site. Previously to the accession of Peter I., old Ladoga was an important strategic point for the defense of Novgorod. Peter I. built the town of Novo, or New Ladoga, near the entrance of the Wolkhof into lake Ladoga, and now on the site of the old town of Rurik stands the small village of Ouspenskoe.

LADOGA, LAKE, the largest lake of Europe, is situated in the n. w. of Russia, between Finland and the governments of Olonetz and Petersburg. It is 120 m. in length, 70 m. in breadth, and 6,804 sq. m. in area. It receives the waters of lake Onega, lake Saim, and lake Ilmen, and its own waters are carried off to the gulf of Finland by the Neva (q. v.). The depth of lake Ladoga varies from 13 to 1200 ft., and the navigation is exceedingly dangerous, owing to the shallows, sand-banks, and sunken rocks in which it abounds, and to the gusty winds which are created by its steep and rocky banks. Of the several islands of the lake, the principal are the Valaam and Konevets, with monasteries, which attract numbers of pilgrims. Of the 70 rivers which fall into lake Ladoga, the principal are the Wolkhof, the Sias, and the Svir, each of which is a means of communication between the Neva and the Volga. In order to obviate the difficulty of navigation, canals have been constructed along its s. and s. e. shores, the principal being the Ladoga canal (70 ft. wide), which unites the mouth of the Wolkhof with the Neva. Other two canals unite the mouths of the Sias and Svir with the Ladoga canal. This canal-system forms the thoroughfare for a very extensive traffic between the Volga and the

Baltic. Communication by water subsists between lake Ladoga and the White sea as well as the Caspian.

LADRONES, or **MARIANNE ISLANDS**, a group of fifteen islands, the northmost Australasian group, in lat. $13\frac{1}{2}^{\circ}$ to $20\frac{1}{2}^{\circ}$ n., and long. 144° to 146° e. They are disposed in a row almost due n. and s. Their area is 417 sq. miles. They were discovered by Magellan (in 1521), who gave them the name which they still bear, from the thievish propensity displayed by the natives. They were afterwards called the *Lazarus islands*; and the Jesuit missionaries, who settled here in 1667, called them the *Marianne islands*. They are mountainous, well watered and wooded (among the trees are the bread-fruit, the banana, the cocoa-nut), fruitful in rice, maize, cotton, and indigo. European domestic animals are now very common. The inhabitants resemble in physiognomy those of the Philippine islands; pop. 1887, 10,172. The islands are very important to the Spaniards, in a commercial point of view. The largest island is Guajan, 90 m. in circumference; on it is the capital, San Ignacio de Agaña.

LADY, a woman of distinction correlatively to *lord* (q.v.), used in a more extensive sense in common parlance correlatively to *gentleman*. As a title, it belongs to peeresses, the wives of peers and of peers by courtesy, the word lady being in all these cases prefixed to the peerage title. The daughters of dukes, marquises, and earls are by courtesy designated by the title lady prefixed to their Christian name and surname; a title not lost by marriage with a commoner, when the lady only substitutes her husband's surname for her own, and retains her precedence. But a peer's daughter marrying a peer can no longer be designated by her Christian name with lady; she must take her husband's rank and title, even should a loss of precedence be the result, as when the daughter of a duke marries an earl, viscount, or baron. Should her husband, however, be merely a courtesy peer, she may retain her designation by Christian name with lady prefixed, substituting her husband's courtesy title for her surname; this title and precedence being again dropped on her husband's succession to the peerage by his father's death. The daughter-in-law of a duke, marquis, or earl is generally designated by the title lady prefixed to the Christian name and surname of her husband; but if she be the daughter of a peer of a higher rank than her father-in-law, she may, if she pleases, be designated by lady prefixed to her *own* Christian name and her husband's surname, and in that case she retains the precedence which she had when unmarried. The wife of a baronet or knight is generally designated by lady prefixed to her husband's surname; the proper legal designation, however, being dame, followed by her Christian name and surname.

LADYBIRD, *Coccinella*, a genus of coleopterous insects of the section *trimera*, containing a great number of species very similar to each other. They are very pretty little beetles, well known to every one, generally of a brilliant red or yellow color, with black, red, white, or yellow spots, the number and distribution of which is one of the characteristic marks of the different species. The form is nearly hemispherical, the under-surface being very flat, the thorax and head small; the antennæ are short, and terminate in a triangular club; the legs are short. When handled, these insects emit from their joints a yellowish fluid, having a disagreeable smell. They and their larvæ feed chiefly on aphides, in devouring which they are very useful to hop-growers and other agriculturists. They deposit their eggs under the leaves of plants, on which the larvæ are to find their food, and the larvæ run about in pursuit of aphides. Ladybirds are sometimes to be seen in immense numbers, which, from ignorance of their usefulness, have sometimes been regarded with a kind of superstitious dread. Several species are abundant in Britain, and the largest of these (*C. septem punctata*) is found over all Europe, and in parts of Asia and Africa. The name ladybird is perhaps a corruption of *ladybug* (lady, i.e., the virgin Mary). The German name is *marienkäfer*. See illus., BUTTERFLIES, etc., vol. III.

LADY CHAPEL, a chapel dedicated to the virgin Mary ("our lady"), and usually, but not always, placed eastwards from the altar when attached to cathedrals. Henry VII.'s chapel at Westminster is the lady chapel of that cathedral.

LADY-DAY, one of the regular quarter-days in England and Ireland on which rent is generally made payable. It is Mar. 25 in each year.

LADY FERN, *Athyrium filix femina*, or *asplenium filix femina*, a beautiful fern common in moist woods in America, with bipinnate fronds sometimes 2 ft. long. The whole plant has an extremely graceful appearance. It is said to possess the same anthelmintic properties as the male fern. See illus., FERNS, vol. V.

LADY HUNTINGDON'S CONNECTION, OF CALVINISTIC METHODISTS. See HUNTINGDON, SELINA, COUNTESS OF.

LADY OF MERCY, OUR, a Spanish order of knighthood, founded in 1218, by James I. of Aragon, in fulfillment of a vow made to the Virgin during his captivity in France. The object for which the order was instituted was the redemption of Christian captives from among the Moors, each knight at his inauguration vowing that, if necessary for their ransom, he would remain himself a captive in their stead. Within the first six years of the existence of the order, no fewer than 400 captives are said to have been ransomed by its means. On the expulsion of the Moors from Spain, the labors of the

knights were transferred to Africa. Their badge is a shield party per fess gules and or, in chief a cross pattée argent, in base four pallets gules for Aragon, the shield crowned with a ducal coronet. The order was extended to ladies in 1261.

LADY OF MONTESA, OUR, an order of knighthood, founded in 1317, by king James II. of Aragon, who, on the abrogation of the order of the templars, urged pope Clement V. to allow him to employ all their estates within his territory in founding a new knightly order for the protection of the Christians against the Moors. His request was acceded to by the following pope, John XXII., who granted him for this purpose all the estates of the templars and of the knights of St. John situated in Valencia. Out of these was founded the new order, which king James named after the town and castle of Montesa, which he assigned as its head-quarters. The order is now conferred merely as a mark of royal favor, though the provisions of its statutes are still nominally observed on new creations. The badge is a red cross edged with gold, the costume a long white woolen mantle, decorated with a cross on the left breast, and tied with very long white cords.

LADY'S FRIEND, a name given to an officer of the house of commons, who used to take care that a provision was inserted in favor of a wife when the husband applied for an act of parliament to divorce her. The practice is now superseded by the different practice in an ordinary suit in the divorce court.

LADY'S GOWN, a present formerly made in Scotland by a purchaser of an estate to a wife on her renouncing her life-rent over her husband's lands.

LADY'S MANTLE, *Alchemilla*, a genus of herbaceous plants, chiefly natives of temperate and cold climates, of the natural order *rosaceæ*, suborder *sanguisorbeæ*; having small and numerous flowers, an 8-cleft calyx, no corolla, and the fruit surrounded by the persistent calyx. The name lady's mantle, signifying *mantle of Our Lady*—i.e., of the virgin Mary—is derived from the form of the leaves.—The COMMON LADY'S MANTLE (*A. vulgaris*) is abundant on banks and in pastures throughout Britain. Its root-leaves are large, plaited, many-lobed, and serrated; its flowers, in corymbose terminal clusters, are usually of a yellowish-green color.—Still more beautiful is the ALPINE LADY'S MANTLE (*A. Alpina*), which grows on mountains in Scotland, and has digitate serrated leaves, white and satiny beneath.—A common British plant of very humble growth and unpretending appearance is the FIELD LADY'S MANTLE, or PARSLEY PIERT (*A.*—or *aphanes-areensis*), found in pastures, an astringent and diuretic, said to be sometimes useful in cases of stone in the bladder by producing a large secretion of lithic acid.

LADY'S SLIPPER, *Cypripedium*, a genus of plants of the natural order *orchidææ*, of wide distribution. *C. insigne* is a native of Nepal; *C. debile* of Japan; *C. calceolus* of Europe, where it is the only species. In North America there are about ten species, of which *C. spectabile*, the showy lady's slipper, a plant two feet high, is the most conspicuous, and *C. acaule*, the pink lady's slipper, popularly called "moccasin flower," is the most common. See CYPRIPIDIEÆ.

LAEKEN, a village of Belgium, a suburb of Brussels, the site of a royal palace built in 1782 by the Austrian princess, Maria Christina. After passing through one or two other hands, this palace was bought by Napoleon in 1806 for 500,000 francs for Josephine; and in 1811 he resided there for a time with Maria Louisa. In 1812 he exchanged it for the Élysée Bourbon. Afterwards it became the property of Belgium, and served as the residence of the royal family. Malibran is buried in the cemetery of Laeken, and a monument by the sculptor Geefs marks the spot. The tombs of queen Louise and king Leopold I. are in the parish church. In 1890 the palace was destroyed by fire. Pop. '90, 25,289.

LÆLAPS, or DRYPTOSAURUS, a genus of deinosaurian reptiles found in the cretaceous deposits of North America, and closely allied to hadrosaurus (q.v.), megalosaurus (q.v.), and iguanodon (q.v.), in fact being the American representative of megalosaurus, which is a characteristic fossil of the Wealden and Purbeck limestones. Like the above-mentioned relatives, it had very large hind-legs, upon which it is supposed to have walked. It was probably about 25 ft. in length, including the tail, and is supposed to have been, when standing on its hind-legs, about 12 ft. in height. It was, like others of the family, a terrible, carnivorous reptile.

LÆLIUS, SAPIENS, GAIUS, B.C. 186–115; the son of C. Lælius Nepos. In early life he studied philosophy with Diogenes and Panætius; and afterwards law, taking a high rank among the orators of his time. He was the intimate friend and companion of Scipio Africanus the younger, and accompanied him in his expedition into Africa, displaying great valor at the siege of Carthage, 146 B.C. When prætor in Lusitania he made a successful campaign against the powerful chieftain Viriathus. He was consul 140 B.C. At the beginning of his career he favored plans for raising the masses to become landed proprietors, but was repelled by the extravagance of the elder Gracchus. After his political career closed he spent his time in the country, partly in study and partly in rural occupations. The equanimity of his temper is noticed by Horace in the words *mitis sapientia Lælii*. Cicero placed his name at the head of his essay *De Amicitia*.

LAENNEC, RENÉ THEODORE HYACINTHE, a distinguished physician, was b. at Quimper, in lower Brittany, in 1781, and d. there in 1826. He studied medicine in

Paris, where he attended the practice of Corvisart, to whom the medical profession is mainly indebted for the introduction of percussion in the investigation of diseases of the chest, although the original discovery is due to Avenbrugger. In 1804 he took the degree of doctor of medicine, and in the same year he became the chief editor of the *Journal de Médecine*. In 1816 he was appointed chief physician to the Hôpital Neckar, and it was there that he soon after made the discovery of mediate auscultation, or, in other words, of the use of the stethoscope (q.v.). In 1819 he published his *Traité de l'Auscultation Médiate*, which has undoubtedly produced a greater effect, in so far as the advance of *diagnosis* is concerned, than any other single book. His treatise had not long appeared when indications of consumption were discovered in his own chest by means of the art of his own creation, and after a few years of delicate health, during which he continued to practice in Paris, he retired to die in his native province.

LAESA MAJESTAS, leze-majesty, or high treason. The term, which was transferred from the Roman to the common law, denoted an offense against the king in his person or office. See **TREASON**, **LEZE-MAJESTY**.

LÆSTRY'GONES, a fabulous race of giants often mentioned in the Greek mythology. Their name first occurs in the *Odyssey*, where they are described as a pastoral people, governed by a king called Lamus. Tradition places them in Sicily. The common story is that they lived near Leontini in that island, and that hence the plains adjacent to that city were called Campi Læstry-Gonii. At Rome the belief is that they lived on the Latium coast, and that their capital was Formiæ.

LAET, JAN DE, d. Antwerp, 1649; one of the directors of the East India company, and an intimate friend of Salmasius. He was the author of nearly 20 learned geographical works in Latin, several of which were incorporated in the miniature series of *Republiques* issued by the Elzevirs of Leyden. He held a sharp controversy with Grotius as to the origin of the Indian tribes of America. Among his works were *Novus Orbis* and an edition of Piso's *Historia Naturalis Brazilie*.

LÆTARE SUNDAY, called also **MID-LENT**, is the 4th Sunday of Lent. It is so named from the first word of the introit of the mass, which is from Isaiah lxvi. 10. From this name the characteristic of the services of the day is joyousness, and the music of the organ, which throughout the rest of Lent is suspended, is on this day resumed. Lætare Sunday is also the day selected by the pope for the blessing of the golden rose (q.v.).

LA FARGE, JOHN, b. New York, March, 1835. He early won much attention by his expressive and masterly handling of colors, both in water and oil, and was one of the first to undertake the manufacture of stained-glass in the U. S. His frescoes in Trinity Church, Boston, and the soldiers'-memorial window at Harvard college are among his best works. In spite of technical faults, Mr. Lafarge's work is deservedly popular by reason of its high though often subtle merits. His designs for textile fabrics, furniture, etc., are marked by richness of color and boldness of conception. He published *Considerations on Painting*, Metropolitan Museum lectures (1895).

LAFARGE, MARIE CAPPELLE, 1816-52; b. France, of good family; distinguished as the victim of circumstantial evidence, which procured her conviction at the age of 24 for the murder of her husband by poison. The trial was remarkable for the virulence with which the prosecution was conducted, the judge even seeming to be one of the prosecutors; for the contradictions of scientific experts as to the finding of arsenic in the body of the deceased; and yet more by the failure to arrest the only party, a servant of the deceased and a proved knave, who could have profited by the death. Lafarge was sentenced to labor for life in prison, but she was allowed to write her memoirs, published in 1841, in which she reviews with vigorous irony and originality the proceedings of the court. Her sentence was subsequently softened, and she wrote *Heures de Prison*, a little volume of tender and melancholy resignation; also, a little drama entitled *Une Femme Perdue*. She was pardoned out after 12 years' captivity, leaving prison broken in health, in almost a dying condition, and expired at the baths of Ussat a few months after. The case is regarded as one of the worst examples of severe punishment on insufficient evidence.

LA FARINA, an Italian author and politician, b. at Messina in 1815. In the university of Catania the degree of doctor of laws was conferred on him at the age of 19; and in 1837, having taken part in an ineffectual revolutionary movement in Sicily, he sought safety in expatriation. In 1839 he returned to Sicily, was received as a lawyer, and started several political journals, which were all successively suppressed. This led him to remove to Florence, where he published several works, more remarkable for their contents than for the graces of their language. In the rising of 1848 La Farina took a prominent part in the movement of Tuscany, where he edited the first democratic and anti-papal journal, the *Alba*. He soon returned to Sicily, and was elected member of the council of war and member of parliament; and on the deposition of the king by the Sicilians he was dispatched by the provisional government on a mission to Rome, Tuscany, and Turin. On his return to Palermo he discharged the combined duties of minister of public instruction, of public works, and of the interior. After the capture of Messina by the royal troops, La Farina accepted from the king's government the post of minister of war, a step which incurred the severe censure of the party of liberty, but which only led to his renewed banishment from Sicily. In the war of the south, by

which the heroic Garibaldi liberated the kingdom of Naples, La Farina reappeared in Sicily, but his unfortunate differences with Garibaldi led to his ultimate expulsion from the island. He died two years later in 1863. Some of his principal works are: *Souvenirs of Rome and Tuscany; Italy* (1 vol.); *Switzerland* (2 vols.); *China* (4 vols.); *History of the Revolution of Sicily in 1848 and 1849* (2 vols.).

LAFAYETTE, a co. in s.w. Arkansas, bounded on the w. by the Red river, which divides it from Miller county. It is drained by the Red river and the bayou Bodeau. Its s. boundary is the frontier line of Louisiana. It is crossed by the St. Louis, Iron mountain and Southern railroad; 497 sq. m.; pop. '90, 7700. The surface is mostly level prairies, on which are found extensive forests of building timber, as well as ornamental trees. The soil is low and wet, but very prolific. The staple products are cotton, sweet potatoes, corn, pork, and live stock. Co. seat, New Lewisville.

LAFAYETTE, a co. in n. Florida, bounded on the e. and n. by the Suwanee, a navigable river, which, rising in the n. and emptying into the gulf of Mexico, separates it from Suwanee, Alachua, and Levy counties. The gulf of Mexico and a small stream complete its boundaries, with the exception of a small portion in the n.w., which is bounded by the co. of Taylor; 1008 sq. m.; pop. '90, 3686, includ. colored. The surface spreads into broad and level plains, covered with a dense growth of timber. The soil is easily cultivated, and the chief products are Indian corn, sweet potatoes, sugar, and molasses. Cotton is raised to some extent, also cattle, horses, and swine. Fort Macomb is in the eastern section on the banks of the Suwanee. Co. seat, Mayo.

LAFAYETTE, a parish in s. Louisiana, bordered on the n.e. by the Vermillion river, a bayou navigable by steamboats, which passes through it south-westwardly; 264 sq. m.; pop. '90, 15,966, including colored. The surface is low and level, with a rich soil adapted to the cultivation of cotton, sugar-cane, sweet potatoes, rice, corn, and the raising of live stock. Wool is a staple product. It has good water privileges and two saw mills. It is intersected by several branches of the Southern Pacific railroad. Seat of justice, Lafayette.

LAFAYETTE, a co. in n. Mississippi, watered by the Tallahatchie river, forming its n.e. boundary, and the Yockeney or Yocknapatafha branches of the Yazoo river; and intersected by the Illinois Central railroad; 720 sq. m.; pop. '90, 20,553, including colored. The surface is undulating, with occasional groves of magnolia, tulip tree, black walnut, and the timber generally found in the southern states. The soil produces wheat, maize, and sweet potatoes. Cotton is cultivated and cattle are raised to some extent. Pork is a staple product. The industries are represented by several tanneries and currying establishments. Its water power is utilized by several saw-mills and a wool-carding mill. Co. seat, Oxford.

LAFAYETTE, a co. in w. Missouri, bordered on the n. by the Missouri river, which separates it from Ray and Carroll counties. It is watered by confluent of the Missouri, and crossed by the Missouri Pacific and the Atchinson, Topeka and Santa Fé railroads; 622 sq. m.; pop. '90, 30,184, including colored. It has a surface of rolling prairie, with large tracts of arable land, covered with a thick growth of timber; that which is under cultivation bears corn, wheat, oats, and hay. Cattle, horses, sheep, and swine are raised, and tobacco and wool are staple products. Its manufactories are few in number, but it contains inexhaustible beds of bituminous coal and extensive ledges of limestone and sandstone, largely used for building purposes. Co. seat, Lexington.

LAFAYETTE, a co. in s.w. Wisconsin, has for its southern boundary the state line of Illinois. It is watered by the Fevre and Pecatonica rivers, which form a single stream in the s.e. corner. It is traversed by the Chicago, Milwaukee and St. Paul railroad; 630 sq. m.; pop. '90, 20,265. The surface is rolling and mostly without forests. The n.w. section is hilly and rises into what are called the Platte Mounds. It has a large extent of arable land, with mineral-bearing tracts, where lead, copper, zinc, and silurian limestone are found. The soil is adapted to wheat, corn, oats, barley, and potatoes; other products are flax-seed, wool, butter, cheese, and hay. The raising of live stock is a lucrative pursuit. It has excellent water power and several flour-mills. Wagons, carriages, saddlery and harness, and pig lead are manufactured. Co. seat, Darlington.

LAFAYETTE, city and co. seat of Tippecanoe co., Ind.; on the Wabash river and the Cleveland, Cincinnati, Chicago, and St. Louis, the Lake Erie and Western, the Louisville, New Albany and Chicago, and the Wabash railroads; 64 miles n.w. of Indianapolis. It is the seat of Purdue university, the state agricultural college, and contains a high school, public library, several national banks, electric light and street railroad plants, a costly water plant, and a belt line railroad. The city is supplied with natural gas from the Tipton county field, and has abundant water power for manufacturing. In the public square is an artesian well of sulphur water. The industries include large car works, boot and shoe factories, iron works, foundries, breweries, pork-packing houses, cooperage works, flour and woolen mills, marble works, and agricultural implement plant. The principal manufactories are connected with the main railroads by the belt line. Lafayette is 7 m. s. of the field where the famous battle of Tippecanoe was fought, Nov. 7, 1811, — an engagement between Tecumseh's brother Elskwatara, chief of the

Shawnees, with 400 Indians, which he had induced to join him by promises of aid from England, and the American general, Harrison, with 800 men, who attempted to drive them within the limits prescribed by treaty. Elskwatara, making the attack on the American camp, was defeated, the battle resulting in a new accession of territory to the United States. Pop. '90, 16,243.

LAFAYETTE, MARIE JEAN PAUL ROCH YVES GILBERT MOTIER, Marquis de, descended from an ancient family of Auvergne, was b. Sept. 6, 1757, in the castle of Chavagnac, now in the department of upper Loire. He became a soldier at an early age, and in 1777 went to America to take part with the colonists in their war of independence. Lafayette was but nineteen years old when the American colonies threw off their allegiance. "At the first news of this quarrel," he wrote later in his memoirs, "my heart was enrolled in it." The friendship of Washington exercised a great influence over the development of his mind and the formation of his opinions. The declaration of war between France and Britain gave him an opportunity of aiding the new republic effectually, by returning to France, where he was received with honor by the court, and with enthusiasm by the people. He again repaired to America in 1780, and was intrusted by congress with the defense of Virginia, where he rendered important services. On a third visit to North America in 1784, after the conclusion of peace, he was received in such a manner that his tour was a continual triumph.

Lafayette had imbibed liberal principles, and now eagerly sought to promote a thorough reform in his native country. He was called to the assembly of notables in 1787, and was one of those who most earnestly urged the assembly of the states. He took part also in the movements which converted the assembly of the states into the national assembly in 1789. He took a very active part in the proceedings of the assembly, and being appointed to the chief command of the armed citizens, laid the foundation of the national guard, and gave it the tricolor cockade. In these first periods of the revolution it seemed as if Lafayette had the destinies of France in his hands. But he found himself unable to control the excitement which sprung up. The extreme republicans soon came to dislike him, because he advocated a constitutional kingdom; and the court-party, especially the queen, did the same—in spite of the services he rendered them—because of his zeal for the new order of things. Along with Bailly, he founded the club of the Feuillants. After the adoption of the constitution of 1790 he retired to his estate of Lagrange, till he received the command of the army of Ardennes, with which he won the first victories at Philippeville, Maubeuge, and Florennes. Nevertheless, the calumnies of the Jacobins rendered him exceedingly unpopular, and he was accused of treason, but acquitted. After several vain efforts to maintain the cause of rational liberty, he left Paris for Flanders, but was taken prisoner by the Austrians, and remained at Olmütz till Bonaparte obtained his liberation in 1797; but he took no part in public affairs during the ascendancy of Bonaparte. He sat in the chamber of deputies from 1818 to 1824 as one of the extreme left, and from 1825 to 1830 he was again a leader of the opposition. In 1830 he took an active part in the revolution, and commanded the national guards. His life was identified with the history of France for upwards of 40 years, and no stain is known to rest on the purity and disinterestedness of his public service. No private misfortunes or losses incident to the forfeiture of his great estates by the revolution of 1789-93 ever drew from him a revocation of his republican principles, or a sign of regret for the sacrifices which he had made for them. His visit to the United States in 1824, on invitation by Congress, was an event memorable in American annals. He was sought as a public guest in all parts of the country; his course was amid a universal tumult of honor and praise; the nation thronged around him to testify with one voice its gratitude and love, and congress voted him a grant of \$200,000 and a township of land. He died May 20, 1834. At the one hundredth anniversary of the battle of Yorktown, and the surrender of the British army, celebrated Oct. 13, 1881, a representative of the Lafayette family was present as a national guest.

See the study by Wäin (1824); Sarrane, *La Fayette et la Revolution de 1830* (1832); Edward Everett, "Eulogy on Lafayette," delivered in Faneuil Hall, Boston, Sept. 6, 1834; *Memoires, Correspondance et Manuscrits de Lafayette*, published by his family (8 vols. 1837-40); the life by Tuckerman (New York, 1889); Dorriol, *Participation de la France a l'établissement des Etats Unis* (1889).

LAFAYETTE, MARIE MADELEINE PISCHE DE LA VERGNE, Comtesse de; novelist; b. at Le Havre, France, in 1634. She was unusually well educated, Menage, Huet, and Segrais being among her teachers; while she also frequented the society of the Hôtel de Rambouillet. Paris was her chief place of residence after her marriage with the Comte de la Fayette in 1665; but at that time a devoted attachment, destined to be life-long, arose between her and La Rochefoucauld. Her short stories, upon which rests her fame, on account of their directness and simplicity were in marked contrast to the tediously involved novels of that age. Among these are *Mademoiselle de Montpensier* (1662), and *La Comtesse de Tende* (about 1680), and her novels *Zayde* (1670), published under the name of Segrais; and *La Princesse de Clèves* (1678), her masterpiece. She has also left a number of memoirs; *Histoire d'Henriette d'Angleterre* and *Mémoires de la Cour de France pour les années 1668 et 1669*. Consult *La Princesse de Clèves, précédée d'une Étude par M. de Lescure* (Paris, 1881); d'Haussonville, *Madame de la Fayette* (Paris, 1891).

LAFAYETTE COLLEGE, at Easton, Pa., chartered 1826, opened 1832, George Junkin, D.D. (q. v.) was the first president (1832-41 and 1844-8). Founded as an independent institution, it passed in 1850 under the control of the Synod of Pennsylvania, of the Presbyterian church. Its productive investments amounted in 1897 to \$310,000; non-productive (grounds, buildings, etc.), to \$650,000; total income \$39,000. It is beautifully located at the junction of the Lehigh and Delaware Rivers, has 27 buildings, athletic grounds, etc. In 1897 the faculty consisted of 26 instructors; there were 307 students, in college and engineering courses. The library contained about 26,000 volumes. The apparatus and technological equipment is very valuable and complete. The older courses were largely developed by the gift of large sums, aggregating \$500,000, from 1866-76 by Ario Pardee, Esq., of Hazleton, for the endowment of scientific courses. He erected Pardee hall, a magnificent building, and thoroughly equipped it for these courses. These and many other gifts were received during the presidency (1863-83) of Rev. Wm. C. Cattell, D.D., who greatly developed the work of the college and added to its resources. Many celebrated men have taught in the college, notably Trail Green, M.D., LL.D. (chemistry), James H. Coffin, LL.D. (physics), Lyman H. Coleman, D.D. (Biblical antiquities), and Francis A. March, LL.D. (English philology). President, Ethelbert D. Warfield, LL.D. (1891), during whose administration special developments have been made in biology, in history, and political science.

LAFFITTE, JACQUES, a French banker and statesman, b. of humble parentage at Bayonne, Oct. 24, 1767, was early employed as a clerk by the rich banker Perregaux in Paris, and succeeded him in business in 1809. He soon rose to great wealth and a European reputation. He was made president of the chamber of commerce, and in 1814 governor of the bank of France. On the return of Napoleon from Elba, Louis XVIII. deposited a large sum in Laffitte's hands; and after the battle of Waterloo, Napoleon intrusted 5,000,000 francs to him, which he kept safe, although the government made some attempts to lay hold of it. After the second restoration, he became one of the opposition in the chamber of deputies, and enjoyed the highest popularity in Paris. When the revolution broke out in 1830, he wrote to the duke of Orleans, saying, "You have to make your choice between a crown and a passport." He freely supplied the money requisite on that occasion. He became one of the first ministry of the new king, and in Nov., 1830, was intrusted with the formation of a cabinet, the conservative character of which caused the loss of his popularity. Meanwhile his banking affairs fell into confusion, and he was obliged to sell all his property to pay his debts. A national subscription preserved him his hotel in Paris; and being again elected to the chamber as a deputy for Paris, he became a leader of the opposition. From the ruins of his fortune he founded a new discount bank. As the government receded more from the principles of the revolution of 1830, Laffitte became more active in opposition. In 1843, to the great displeasure of the court, he was elected president of the chamber of deputies. He died, May 26, 1844.

LAFITAU, JOSEPH FRANCOIS, 1670-1746; b. Bordeaux, France. He was sent as a Jesuit missionary to Canada in 1712, and assigned to the Iroquois mission at Sault St. Louis, on the St. Lawrence. The room occupied by him there is still shown. In 1716 he discovered and identified the ginseng plant, so highly esteemed in China for its medicinal properties. He returned to France in 1717, and published an account of his discovery, which led to a trade in ginseng between America and China. During his stay in Canada he devoted himself diligently to a study of the Indian character, and the results of his observations were published at Rome in 2 vols. 4to, 1724.

LAFITTE, JEAN, b. about 1780; a Frenchman, who held a commission as a privateer during the war between France and Spain, and was afterwards commissioned by Carthage for similar service. This service degenerated, however, into piracy; and Barataria bay in Louisiana became the rendezvous of a horde of adventurers and unscrupulous sailors, among whom the brothers Lafitte were pre-eminent, becoming the terror of traders in the gulf of Mexico. The outbreak of the war between the United States and Great Britain closed the unlawful career of Lafitte and his comrades. The British made overtures to him, hoping that he might be induced to attach himself to their interests. In the mean time an expedition was sent out by the Americans, under commodore Patterson, designed to break up the stronghold at Barataria bay, and capture the pirates; but this design was frustrated by the flight of the latter. The anticipated attack on New Orleans induced the governor of Louisiana and gen. Jackson to issue a proclamation inviting Lafitte and his men to unite in the defense of that city. The invitation was accepted, and the outlaws conducted themselves during the battle with such courage and fidelity that president Madison issued a proclamation early in 1815, recounting their services, and according them free pardon for their past misdeeds. There exists no record of the subsequent career of Jean Lafitte.

LA FONTAINE, JEAN DE, a French poet, distinguished above all his countrymen as a fabulist, was the son of a maître des eaux et forêts, and was b. July 8, 1621, at Château-Thierry, in Champagne. In his early youth he learned almost nothing, and at the age of 20, he was sent by his father to the oratory at Rheims, in a state of extreme ignorance. Here, however, he began to exhibit a decided taste for the classics and for poetry. Though selfish and vicious to the last degree, he possessed withal a certain child-like *bonhomie*; it was not grace, or vivacity, or wit, but a certain soft and pleasant amiability of manner, so that he never wanted friends. He successively found protectors in the duchess de Bouillon, who drew him to Paris; in Mme. de Sablière, and in M.

and Mme. Hervart. He enjoyed the friendship of Molière, Boileau, Racine, and other contemporary celebrities; and even the saintly Fenelon lamented his death in extravagant strains. In 1693, after a dangerous illness, he carried into execution what a French critic characteristically terms his *projet de conversion*, and spent the brief remainder of his life in a kind of artificial penitence, common enough among licentious men and women in those sensual days. He died at Paris, April 13, 1695. His best, which, however, are also his most immoral productions, are *Contes et Nouvelles en Vers* (Paris, 1665; 2d part, 1666; 3d part, 1671), and *Fables Choieses mises en Vers* (also in three parts, of which the first appeared in 1668, and the third in 1693). The editions of the *Fables* have been innumerable. The best edition of La Fontaine's collected works is that of Walckenaër (18 vols. Paris, 1819-20; improved, in 6 vols. 1822-23). See Taine's *Essai sur les Fables de La Fontaine* (1860), and Collins' *La Fontaine* (1882).

LA FOURCHE, a bayou in s.e. Louisiana, one of the outlets of the Mississippi, beginning at Donaldsonville on the right bank, and stretching s.e. through the parish of La Fourche Interior to the Mexican gulf, a distance of 150 miles. It is navigable for 100 m. from its mouth, and the channel of an extensive commerce with the interior.

LA FOURCHE, a parish of s.e. Louisiana, bordering on Barataria bay, and intersected by bayou La Fourche; 1020 sq.m.; pop. '90, 22,095. The surface is level, and the soil, except where it is too low and wet for cultivation, is very productive. The Louisiana and Texas railroad passes through the parish. The principal productions are corn, sweet potatoes, rice, sugar, and molasses. Judicial seat, Thibodeaux.

LA FUENTE, MODESTO, 1806-66. He was for a time professor at Astorga, and afterwards a satirical journalist at Leon and Madrid. His periodical writings were very popular, but his chief work is a *History of Spain* in 26 vols.

LAGER BEER, or **LAGER-BIER**. In the article **ALE** the process of manufacture of beer or ale and the principles of beer fermentation are given. The kind of fermentation there described, however, is performed at a higher temperature than that which is employed for making a kind of beer introduced by the Germans, called by them *lager-bier*. The yeast in ordinary fermentation is developed rapidly and rises to the top, and is called top-yeast. The buoyancy is caused by the rapid evolution of carbonic acid gas, which, adhering to the yeast, causes it to ascend in the liquid. The fermentation of lager beer takes place very slowly. The wort is prepared in much the same manner as for ale, and is pumped from the hop-back into shallow coolers placed in the upper stories of the brewery, and is also passed through a refrigerator until it is reduced to a temperature of about 45° F. Thence it is carried in pipes to large fermenting tuns, placed in cool cellars, or in chambers cooled by ice, having a temperature of 40° to 45° F. Here yeast is added, which, in the course of about three days, incites fermentation, which is manifested by the appearance of minute bubbles of carbonic acid gas, which, as in the fermentation of ale, carry a little of the yeast with them. This does not, however, remain there, but, discharging the gas to which it had adhered, settles to the bottom in the form of a viscous mass, which, with that which remains there, constitutes what is called bottom-yeast. The slow fermentation employed in the process of making genuine lager beer causes a clarification and the commencement of a ripening which affords a beverage free from the objectionable qualities of the common beer which goes under the same name, but which is known to brewers under the name of *Schenckbier*, or *present-use beer*. This is fermented in a much shorter time, but the fermentable matter is not all eliminated as in the genuine article, but for the purpose of neutralizing what acetic acid might appear from acetous fermentation, or for producing by union with it an additional quantity of carbonic acid gas to give it "life," the brewer adds in the operation of casking a quantity of bicarbonate of soda, immediately upon which the bung is driven in, and the beer is ready for market. Genuine lager, however, lies a long time to ripen, and attains certain qualities not possessed by any other kind of beer, and highly prized by lovers of this beverage. The number of breweries of all kinds making both ale and lager beer in the United States in 1895 was 2,112. The brewers of the United States sold for the year ending June, 1895, 33,469,661 barrels of malt liquors. The sales in the largest cities in the United States for the same year were as follows, in barrels: New York, 4,691,464; Chicago, 2,648,335; Milwaukee, 2,037,024; St. Louis, 1,912,869; Philadelphia, 1,819,113; Brooklyn, 1,814,553; Cincinnati, 1,224,372; Newark, 1,126,319; Boston, 1,092,379. The importation of malt liquors in bottles or jugs into the U. S. for 1896 amounted to 1,038,641 gallons, valued at \$1,665,016.

LAGERSTREEMIA, a genus of plants of the natural order *lythraceæ*, the type of a sub-order *lagerstremiæ*, which is distinguished by winged seeds, and in which are to be found some of the noblest trees of tropical forests, whereas the true *lythreæ* are generally herbaceous. *Lagerstremia reginæ* is the **JAROO** of India—a magnificent tree, with red wood, which, although soft, is durable under water, and is therefore much used for boat-building.

LAGO MAGGIORE, or **LAKE OF LOCARNO**, the largest of three lakes in northern Italy, the other two being Como and Lugano. It lies between the Italian states of Piedmont and Lombardy and the Swiss canton of Ticino, its main outlet being the river of the latter name. It is 40 m. in length and from 2 to 8 m. in breadth. The necessities of

the surrounding country give rise to a considerable trade, which is conducted by numbers of vessels that navigate the lake, while steamers connect the principal towns on its banks. Large forests of fine timber and extensive marble quarries have given rise to productive industries. The lake offers fine subjects for artists, and has been often painted from various points. See MAGGIORE LAGO.

LAGOMYS, a genus of rodent quadrupeds, of the family *leporidæ*, much resembling hares or rabbits, but with limbs of more equal length, more perfect clavicles, longer claws, longer head, shorter ears, and no tail. They are interesting from their peculiar instincts, storing up herbage for winter use in heaps or stacks. The ALPINE LAGOMYS, or PIKA of Siberia (*L. Alpinus*), the largest of the genus, is scarcely larger than a guinea-pig, yet its stacks are sometimes 4 or 5 ft. high, by 8 ft. in diameter, and often afford adventurous sable-hunters the food necessary for their horses. The little animals live in burrows, from the inhabited part of which galleries lead to the stacks. The herbage of which they are composed is of the choicest kind, and dried so as to retain much of its juices, and form the very best of hay.

LAGOON (Lat. *lacuna*, a hollow or pool) is a species of lake formed by the overflowing either of the sea or of rivers, or by the infiltration of water from these; and hence lagoons are sometimes divided into fluvial and marine. They are found only in low-lying lands, such as the coasts of Holland, Italy, the Baltic, and the e. coast of South America; are generally shallow, and do not always present the same aspect. In some cases, they are completely dried up in summer; in others, after being once formed, they preserve throughout the whole year the character of stagnant marshy pools; and in others, again, the sea, which reunites them to itself in winter, is separated from them in summer by a bar of sand or shingle.

LAGOS, a t. and island of Africa, on the coast of Upper Guinea. The island lies at the entrance to a lagoon of the bight of Benin, near the mouth of the river Ogun; the town is at the w. end of the island, 150 m. w. of Benin. It is now the most important trading place of Upper Guinea, exporting chiefly palm oil, cotton, ivory, and gum copal. Lagos was formerly a notorious seat of the slave-traffic. It was captured and destroyed by the British in Dec., 1851, and a treaty was concluded by which the ruler guaranteed freedom of commerce, the protection of Christianity, and the abolition of the slave-trade and of human sacrifices. Pop. of the island, '91, 85,000. Lagos since 1861 has been a British possession.

LAGOS, a city and seaport of Portugal, in the province of Algarve, on a wide bay, 42 m. n.w. of Faro. The harbor affords protection from n. and w. winds only, and accommodates only small vessels. A productive tunny-fishery is carried on in the vicinity. Pop. 7,300. In the bay of Lagos, admiral Boscawen obtained a signal victory over the French Toulon fleet, Aug. 18, 1759.

LAGOS, a city of Mexico, the capital of a canton of the same name in the state of Jalisco, near the frontier of the state of Guanajuato; pop. '89, 13,500. It is noted for its fine churches and car-works and cotton mills. It is in a central position in the country, favorably situated for through traffic between the Rio Grande and the city of Mexico.

LAGOSTA, the ancient Lastobon or Ladestris, an island in the Adriatic, off the coast of Dalmatia, belonging to Austria; 56 m. s.s.e. of Spalato; 6 m. long and 4 wide; pop. 1226. Its coast is guarded by steep cliffs and indented by several creeks; the interior is mountainous. It is surrounded by several small islands. On the n. side is the village of Lagosta with a small port.

LAGOSTOMUS, a genus of the family chinchillidæ, order rodentia, of South America. They have a more rat-shaped body than the genus *lagotis*, but still many of the characteristics of the rabbit. Their fore-feet have four toes and no pollex or thumb, as in that genus, but upon the hind-feet there are only three toes. Ears and tail considerably shorter than in *lagotis*. The principal species, *L. trichodactylus* (*dipus maximus* of De Blainville, *marmot Diana* of Griffiths, *Callomys viscacia* of Geoffroy and d'Orbigny), is the viscacha of the South American pampas. Much has been written about these interesting animals by travelers. The abbé Jolis, who lived 12 years in South America and made three journeys into the remote districts of the interior, gives an interesting notice of their habits; and Darwin, in his *Journal*, gives them particular attention. They form vast burrows or underground villages, the old, according to the abbé, living separately from the young. Darwin says that their most favorite sites for burrowing are those parts of the plain which, during one-half of the year, are covered with great thistles to the exclusion of other plants. In the evening they come out in numbers and sit upon their haunches, appearing at such times to be very tame. Their flesh when cooked is very white and good, but is seldom eaten. They have a very singular habit of collecting various kinds of objects, such as stones, the bones of animals, thistle stalks, etc., near the mouths of their burrows, sometimes forming piles as large as a common bushel basket. Dental formula is the same as in *lagotis* (q.v.). See CHINCHILLA.

LAGOTIS, or LAGIDIUM, a genus of the family chinchillidæ, order rodentia. There are two species, *L. Cuvieri* and *L. pallipes*. They inhabit the western declivities of the

Andes in Chili, Peru, and Ecuador; are known as the mountain viscachas, in contradistinction to the viscachas of the plains (lagostimus). Some regard the species *L. Cuvieri* as alone being the true viscachas of authors, from Pedro de Cieça downwards; but both species are generally called mountain viscachas. The *L. Cuvieri* is of the size and general form of the rabbit; hind limbs twice as long as the fore limbs; tail, length of the body exclusive of head; whiskers numerous, closely set, jet black; ears, 3 in. long by 1 in. wide, with margins nearly naked at base. Fore and hind feet alike, with four toes only, and no vestige of a pollex; claws concealed by long bristly hairs. The fur is long, soft, and very beautiful, but readily falls out unless carefully handled. The general color is a mottled grayish ash, rather yellowish on the sides of the neck and body. In *L. philipes* the fur is rather thinner and shorter than in the other species, and on that account feels rather softer, and that of both is inferior to the fur of the genus *chinchilla* (q.v.) The dental formula in both species is as follows: incisors $\frac{1-1}{1-1}$, molars $\frac{4-4}{4-4}$ = 20.

LAGRANGE, a co. in n.e. Indiana, bordering on Michigan, and drained by Pigeon river; 384 sq.m.; pop. '90, 15,615. It has a level surface and a fertile soil, and a considerable portion of the area is in forest. The Grand Rapids and Indiana railroad passes through. The chief productions are wheat, corn, oats, potatoes, wool, butter, hay, and live stock. There are in the county manufactories of carriages, woolen goods, flour, lumber, etc. Co. seat, Lagrange.

LAGRANGE, JOSEPH LOUIS, Comte, one of the greatest of mathematicians, was b. at Turin in 1736. He was of French extraction, and was the grandson of Descartes. When still a youth he solved the isoperimetrical problem of Euler, and when scarcely 19 years of age was appointed professor of mathematics in the artillery school in Turin. Frederick the Great appointed him to be Euler's successor, as director of the academy at Berlin, in 1759. After Frederick's death, Naples, Sardinia, Tuscany, and France strove for the honor of offering Lagrange a better position. He accepted the offer of France, and took up his quarters in the Louvre in 1787, obtaining a pension of 6000 francs (\$1200). In 1791 he was chosen a foreign member of the Royal Society of London, and the same year the national assembly confirmed to him his pension, and he was appointed one of the directors of the mint. He was in great danger during the reign of terror, but escaped, and was afterwards professor in the normal and polytechnic schools. Napoleon made him a member of the senate, bestowed on him the Grand Cross of the Legion of Honor, the title of count, and many other favors. He died April 10, 1813, and was interred in the Pantheon. His principal works are: *Memoirs "on the Motion of Fluids"* and "the Propagation of Sound;" another memoir refuted D'Alembert's views regarding the theory of the earth's formation. When only 24 years of age, he published his *New Method*, subsequently known as the *Calculus of Variations*, thus adding a new and powerful weapon to the philosophical armory. In 1764 his memoir on the "Libration of the Moon" carried off the first prize at the academy. It was in this treatise that he showed the extent and fruitfulness of the principle of "virtual velocities" which he afterwards so successfully applied to mechanics. Next appeared his works on the solution of "numerical" and "algebraic" equations; and in 1787 his *Mécanique Analytique*, a work in which mechanics is reduced to a mere question of calculation. His last important works were: *Calcul des Fonctions Analytiques; Traité des Fonctions; and Résolution des Equations Numériques*. Lagrange made many other important investigations in pure and mixed mathematics, and particularly in astronomy—the chief subjects of which are: the problem of three bodies, the long inequality of Jupiter and Saturn, the moon's secular inequality, attraction of ellipsoids, perturbations of Jupiter's satellites, diminution of the ecliptic, variation of the elements of the planetary orbits, etc.

LA GRANJA, or SAN ILDEFONSO, a small t. in the province of Segovia, Spain, 34 m. n.n.w. of Madrid, celebrated for its romantic situation on the northern declivity of the Sierra Guadarrama, and for a beautiful palace built by Philip V., 1724-27, at an elevation of 3,910 ft., with pleasure grounds in imitation of Versailles. One of the fountains rises 150 feet. It was formerly the summer residence of the royal family, and it was here that Queen Christina was surprised in the night of Aug. 12, 1836, by leaders of the liberal party, who had bribed her guards, and compelled her to enter into an agreement to restore the constitution of 1812. Philip V. and his queen are buried in the church of this town. The royal family has several villas and parks in the neighborhood.

LAGRIMO'SO, an Italian term used in music, meaning weeping, or mournfully; similar to *lamentoso*, which expresses the same, but in a higher degree. The delivery should be heart-stirring, but at the same time free from all mannerisms and embellishments.

LA GUAYRA, the principal seaport of Venezuela, in South America, stands on a narrow strip of land between the mountains and the sea, and is about 5 m. from Caracas, of which it is the port. The town, which is strongly defended, had a pop. (1891) of 14,000. The harbor is an open roadstead of the Caribbean sea, and the anchorage comprises 90 acres, accessible to the largest ships. The town was destroyed in 1812 by an earthquake.

The chief exports of La Guayra are coffee, cotton, cocoa, and hides. The trade with the United States exceeds that of the combined European countries; from this port there are over 400 steamers to New York, Southampton, Bremen and Hamburg.

LA GUÉRONNIÈRE, LOUIS ETIENNE ARTHUR, Vicomte de, a conspicuous French politician of the present century, was b. in 1816, of a noble family of Poitiers. He first attracted notice by the articles which he contributed to the *Avenir National* of Limoges, about 1835. Subsequently, he made the acquaintance of Lamartine, whom for many years he regarded both as his political and literary master. Ultimately he came to a rupture with Lamartine, and became an ardent Bonapartist, and after the *coup d'état* (Dec. 2, 1851), the apologist of that audacious deed. In 1853 he entered the council of state. La Guéronnière stood so well in the good graces of the late French emperor that his articles and pamphlets were considered to possess a semi-official value. In 1868 he went as ambassador to Brussels, and afterwards to Constantinople. On the downfall of the empire he was imprisoned for a time. He died Dec. 23, 1875. Among his most noted publications are—*L'Empereur Napoléon III. et l'Angleterre* (1858); *L'Empereur Napoléon III. et l'Italie* (1859); *Le Pape et le Congrès* (1859); and *La France, Rome, et l'Italie* (1861).

LA HARPE, FRÉDÉRIC CÉSAR DE, 1754-1838; born in Switzerland; having imbibed strong republican principles in his youth, was dissatisfied with the political condition of his country, and even contemplated emigrating to America to aid the cause of the revolted colonies. He was dissuaded from this intention through an appointment as tutor in the family of a Russian nobleman, and his success in this position having reached the knowledge of the empress Catharine II., she appointed him to the charge of Alexander and Constantine, the two sons of the czarowitz. In addition to this honor, La Harpe received the appointment of col. in the Russian army. His tendency to republican theories having induced him to support the French revolution by his writings, and as he sought to effect a reorganization of the Swiss confederacy into the form of a republic, Catharine dismissed him from his position, but provided that he should receive a life-pension on account of his previous services. He now threw himself with ardor into the prosecution of his plans for the regeneration of Switzerland—plans which, through the intervention of France, he was enabled to carry to an apparently successful conclusion. The presence of French armies at Bern enforced the establishment of the republic of 1798, and La Harpe became a powerful and active member of the new government. But this condition of affairs was short-lived. Napoleon restored temporarily the old cantonal system, and La Harpe was forced to retire to France, where he continued to reside until after the congress of Vienna and the establishment of the independence of Switzerland, when he made his home at Lausanne. The latter part of his life was devoted to the promulgation of his liberal political theories.

LA HARPE, JEAN FRANÇOIS DE, 1739-1803; b. Paris; began his literary life at a very early age by inditing satirical verses, which brought him under severe discipline, at the hands of the government. He next devoted himself to dramatic writing, but though meeting with some success, it was not to his mind commensurate with the ability of his work, and he grew disheartened and dissatisfied. In 1766 he visited Voltaire at Ferney, and remained his guest during the next two years. Returning to Paris, he devoted himself to criticism, becoming a regular contributor to the *Mercure de France*. He obtained a general reputation for the severity of his judgments, which did not, however, prevent his success in his new department, and he won a number of prizes from the French academy. But, curiously enough, his chief reward was gained through the production of *Mélanie, ou la Religieuse*, a play which was the cause of his gaining a seat in the academy. It is a somewhat remarkable coincidence that while the Swiss statesman La Harpe was engaged in teaching the two sons of Paul, grand duke of Russia, the French critic La Harpe was in correspondence with the grand duke himself, this correspondence being afterwards published. La Harpe, like his namesake, was a strong republican, and an adherent of Robespierre, yet he was so little determined in his opinions that he was imprisoned during the existence of the directory, a fact which resulted in overthrowing in him all his former Voltairean ideas, and inclining him to the profession of positive religious views. La Harpe's chief work was the *Lycée, ou Cours de Littérature Ancienne et Moderne*, 12 vols., Paris, 1799-1805.

LAHIJAN', an important trading t. of Persia, in the province of Ghilan, 8 m. from the southern shore of the Caspian sea, 29 m. e.s.e. of Resht. Pop. estimated at 7,000.

LAHN, an important affluent of the Rhine (q.v.).

LA HONTAN, ARMAND LOUIS DE DELONDARCE, Baron de, 1666-1715; b. France. He went to Canada in 1683 as a common soldier; made two excursions far into the then scarcely known regions of the lakes, and subsequently published several volumes describing the country and the Indian tribes between Montreal and Mackinac. Doubt was at one time thrown on the verity of his travels by the inaccuracy of his observations; but there is ample proof that at least he was at the points which he describes. He was in various military expeditions sent against the Indians; was at Michilimackinac and Sault St. Marie in 1688, at Green Bay in 1689, and claims to have been on the upper Mississippi

about this time. He returned to France in 1690; came back the next year; was bearer of dispatches from count Frontenac to the French government soon after. On his way to France the vessel in which he embarked put into Placentia bay, Newfoundland, where La Hontan aided in the defense of the port against an attack by the English with so much spirit that he received the appointment of lieutenant in Newfoundland and Acadia. Quarreling with the governor he was dismissed from the French service, escaped to Portugal, and thence made his way through Spain to Denmark and England. In 1703 he published at the Hague in Holland his adventures in America under the title *Nouveau Voyage dans l'Amerique Septentrionale, comprenant Plusieurs Relations des Différents Peuples qui l'habite*, etc., in 2 vols. In 1703 he published at Amsterdam one volume in continuation, entitled *Suite du Voyage de l'Amerique*, etc. His accounts of the lake region of America were misleading to the geographers of his time, and contain so much of fiction as to be now valueless.

LAHORE, one of the chief cities of the Punjab, near the left bank of the Ravi, the middle of the five rivers which give name to the country; lat. $31^{\circ} 34' \text{ n.}$, long. $74^{\circ} 21' \text{ e.}$ It is surrounded by a brick wall, formerly 25 ft. high, and by fortifications 7 m. in circuit. In the n.w. corner of the city stand the citadel, the great magazine, and military workshops. The streets are narrow and gloomy, the bazars well furnished, but the houses in general insignificant. Within the circuit, wells are abundant; the ground is well cultivated, adorned with magnificent gardens, and strewn with numerous ruins of a bygone splendor and prosperity. The present town, which had a population of (1891) 176,900, is said to have possessed under the Moguls 1,000,000 inhabitants. In the 12th c. it was the capital of the dynasty of the Ghaznevides, and subsequently a favorite residence of the successors of Baber. In 1799 Runjeet Singh, the Sikh prince, became ruler of Lahore; but as he chose for his head-quarters Amritsir, a city about 40 m. to the e., Lahore became much neglected. Since 1849, the epoch of the British conquest of the Punjab, Lahore has advanced in commerce and wealth. More especially, however, has the change of masters been beneficial to education. A seminary, not only for imparting Hindu and Mohammedan literature, but also for communicating, through vernacular languages, European knowledge, has been successfully established, and has about 500 pupils. Lahore is connected by railway with Amritsir and also with Multan and the wharves on the Chenab river there. There is also a university, a hospital and medical school, a museum, etc.

LAHR, a manufacturing t. of Baden, situated on the Shutter, an affluent of the Rhine, 53 m. s.s.w. of Carlsruhe. It stands in a rich and beautiful district, and carries on considerable manufactures of linen and woolen cloth, hats, leather, and tobacco. Pop. '90, 10,805.

LAHSA, or **EL HAZA**, the name of an independent dominion, situated on the eastern shore of Arabia, in lat. $25^{\circ} 25' \text{ n.}$, long. $49^{\circ} 45' \text{ e.}$, comprising well-watered and fertile valley, area about 31,000 sq. m. Dates and camels are the greatest sources of wealth, but the soil produces wheat, millet, and all kinds of fruits and vegetables. The population of the district numbers 150,000, that of the town 10,000. The government pays a small annual tribute to the sultan.

LAI'BACH, or **LAYBACH**, a t. of Austria, capital of the crownland of Krain or Carniola, lies in an extensive plain on a river of the same name, 50 m. n.e. of Trieste. It contains a lyceum, gymnasium, and other educational institutions, and carries on an extensive transit-trade with Trieste, Fiume, Grätz, etc. Its cotton-manufactures and sugar-refineries afford employment to a considerable number of its inhabitants. To the s.w. of the town is the Laibach morass, which formerly was frequently covered by the swollen waters of the river. It is upwards of 80 sq. m. in extent, and three-fourths of it have been brought under cultivation; the remainder affords an inexhaustible supply of turf. In 1895 the town suffered severely from an earthquake. Pop. '90, 30,505.

This town is famous for the congress of monarchs which met here in 1821. The purpose of this congress was to secure the peace of Italy against carbonarism, to arrest the then increasing progress of revolution, and to restore in Naples and Sicily the former condition of affairs. The result of it was the passing of a resolution establishing among European nations the right of armed intervention in the affairs of any neighboring state which may be troubled with factions. In this congress the British minister refused to take part.

LAI'D LIE, ARCHIBALD, D.D., 1727-78; b. at Kelso, Scotland; educated at the university of Edinburgh; entered the Presbyterian ministry in 1759, and for the next four years was pastor of the Scotch church at Flushing, Holland. Here he acquired a knowledge of the Dutch language and of the theology of the Reformed (Dutch) church. Having connected himself with this denomination, he was called to the pastorate of the Collegiate church in New York, and on April 15, 1764, preached in the Middle Dutch church, corner of Cedar and Nassau streets, the first English sermon ever addressed by a regular pastor to an American Dutch congregation. His ministry in New York was successful and popular. Soon after the beginning of the revolutionary war he retired to Red Hook, N. J., where he died.

LAING, ALEXANDER GORDON, 1794-1826; b. Edinburgh. Having entered the British army, he served some years in the West Indies, and was in 1820 aide-de-camp to the governor of Sierra Leone. He was employed in negotiations with native chiefs for the suppression of the slave-trade and while so engaged explored the upper course of the Niger. On returning to England he was promoted to the rank of major, and in 1826 attempted an overland journey, with a caravan of native traders, from the Mediterranean to the gulf of Guinea, but was murdered near Timbuctoo. He published an account of his earlier explorations under the title of *Travels through the Timannee, Kooranko, and Soolima Countries to the Sources of the Rokelle and Niger*.

LAING, MALCOLM, 1762-1818; b. on the island of Mainland, Orkneys; educated at the university of Edinburgh, and admitted to the bar in 1785. His life, however, was mainly devoted to literature. He wrote a continuation of Henry's *History of Great Britain*, and a *History of Scotland from the Union of the Crowns to the Union of the Kingdoms*, embracing dissertations on the Gowry conspiracy, and on the Ossian poems, and, in the second edition, an essay arguing the guilt of Mary queen of Scots in the murder of Darnley. He was elected a member of parliament in 1807; died in the Orkneys.

LAIRD, JOHN, 1805-74; was b. in Greenock, Scotland. He was (1829) the first builder of iron steamships, and for a long time the head of the firm of John Laird & Sons, iron-ship-builders and engineers at Birkenhead, near Liverpool. He was the builder of the confederate privateer Alabama, in consequence of which his name became unpleasantly familiar to the loyal people of the United States. He held several offices of responsibility, and was a member of parliament from 1861 until his death at Birkenhead.

LAIRESSE, GÉRARD DE, 1640-1711; b. Liege. His father, a successful painter, urged his son to the study of literature, history, and music, in which he made rapid attainments; but to paint was his dominant passion, which developed so rapidly that at the age of 15 he excelled in portraits, and was already composing historical paintings for the electorate of Brandenburg. Extravagant in his tastes and pleasures, notwithstanding an extraordinary facility in work, he was always embarrassed. When at work he played the violin and painted alternately. In energy and rapidity of execution he equaled Rubens. He excelled in architectural effects, and in general his compositions were remarkable for grace and animation. Several of them are in the Louvre; in Holland and Belgium they abound. He became blind in 1690, and then composed a treatise on painting, published after his death, which occurred in Amsterdam.

LAIS, the name of one, or, more probably, two Greek courtesans, celebrated for extraordinary beauty. The elder is believed to have been born at Corinth, and flourished during the Peloponnesian war. She was reckoned to possess the most graceful figure of any woman of her time in Greece, but she was capricious, greedy of money, and in her old age became a tippler.—The younger appears to have been born in Sicily, but came to Corinth when still a child. She sat as a model to the painter Apelles, who is said to have recommended her to adopt the profession of a prostitute, in which she obtained a "bad eminence." She was stoned to death by some Thessalian women whom she had made jealous. See PROSTITUTION.

LAITY (from the Gr. *laos*, the common people), the name given in the Roman Catholic church to all persons who do not belong to the clergy (q.v.). The name appears to have originated as early as the 2d c., when the idea grew up that the priesthood formed an intermediate class between Christ and the Christian community. The influence which the laity had at first exercised in the government of the church gradually declined as the power of the hierarchy increased, and although, as late as the end of the 3d c., cases occur in which learned laymen taught publicly with the approval of bishops, still this liberty was ever more and more narrowed, until finally, in 502, a synod, held at Rome under the bishop Symmachus, forbade laymen to interfere in any way in the affairs of the church. The Protestant church, in general, maintains on scriptural grounds the common and equal priesthood of all Christians; still, as marking a visible distinction of office, the words continue in very general use, the depth of the distinction implied varying with the "church" views of those employing them. Some very strict Protestants are careful to say minister and people, instead of clergy and laity.

LAJARD, JEAN BAPTISTE FELIX, 1783-1858; b. France. Attached in 1807 as secretary to the French ambassador to Persia, he spent three years traveling in that country, exploring its antiquities, studying oriental religions, and forming a collection of Babylonian curiosities of cylindric form which is in the national library in Paris. In 1815, while in government employ at Marseilles, he resumed archaeological studies, and won the prize offered by the academy of inscriptions and belles-lettres upon the question of the origin of Mithradatic culture. He wrote upon the origin of the Aryan race, advancing an original theory since accepted by the learned. His published works are numerous, mostly archaeological.

LAKANAL, JOSEPH, 1762-1845; b. France. Educated for the priesthood, but not ordained, he became a teacher, an enthusiastic participant in the great reforms of the French revolution, and one of the founders of a system of free education which was then decreed. An enthusiast for the transformation of society which he thought would result from the principles of the revolution, and moving with the turbulent tide of

revolutionary ideas, he voted for the death of Louis XVI. in 1792. Soon after he was made a member of the committee of public instruction, of which his energy soon made him head. He initiated most of the important reforms in the direction of universal education in France. In 1793 he procured decrees for the protection of the academy of science, for the regulation of property in literary and artistic works, for the establishment of the telegraph invented by Chappe, which up to that time had been neglected and opposed. In 1794-95 he proposed and obtained the laws for the organization of the normal school; the school for oriental languages; the bureau of longitudes; and the general system of primary and central schools. Through his efforts the *jardin des plantes* was preserved and made a national museum of natural history. Elected to the council of 500 after the fall of Robespierre, he lost no time in submitting a plan for the organization of the national institute, which is now an honor to France; and was charged to designate the 48 original members who would elect the others. Lakanal was chosen by these to act with Sieyès to draw the rules for its government. In 1798 he was made commissary-general of the departments of the Rhine, to reform abuses and laxity of administration that had become shameful. His energy and probity justified the confidence in his administrative ability; and his extraordinary activity in provisioning and otherwise preparing Mayence and the Rhine for an efficient defense against the allies was warmly recognized by the French directory. After Napoleon's assumptions of power Lakanal occupied subordinate positions in educational institutions. On the accession of Louis XVIII. he was proscribed as a regicide, and came to the United States. President Jefferson gave him a distinguished welcome. Congress voted him 500 acres of land, and he was offered and accepted the presidency of the state university of Louisiana. In 1825 he resigned to retire to a plantation on the shore of Mobile bay, being the land given him by the government. On the accession of Louis Philippe in 1830 Lakanal offered his services to the new government, but was not recognized until several years later, when, on the motion of Geoffroy de St. Hilaire, he was restored to membership in the French academy; and returned to Paris in 1837. His literary works are few, his talent being more administrative than scholastic.

LAKE (Lat. *lacus*) is a portion of water surrounded by land. There are (1) some lakes which neither receive nor emit streams; (2) some, fed by springs, emit, but do not receive streams; (3) others, as the Caspian and Aral seas, receive rivers, but have no visible outlet; but (4) by far the greater number both receive and emit streams. Almost the whole of the lakes coming under the third class are salt or brackish; lake Tchad, in central Africa, forming one of the most prominent exceptions.

We may say that the lake on land is what the island is in the sea; the one being surrounded by water, the other by land. Lakes differ from lagoons (q.v.) in their origin; and from ponds in being fed by streams, either flowing at the surface, or subterraneous; while a pond, however large, is only the accumulation of water in a hollow: if it be regularly fed it becomes a lake, though small. The principal difference in lakes consists in the processes by which they receive and distribute their waters. Some have no apparent affluents nor outlet, others have affluents without any visible outlet, some have an outlet without any visible affluents, and others, again, have affluents and outlet, both visible. Lakes without outlets have the level of their waters horizontal, that is, parallel to the curvature of the earth; while those which have affluents and outlets are, on the contrary, more or less out of the horizontal level, sometimes, as in the case of Lago Maggiore, as much as 3 in. in a mile. The sheets of water which are so numerous in the country n. of the Caspian sea, in the plains between the Ural mountains and the Irith river, and in the great steppe between the latter stream and the Obi, are most of them ponds, formed by accumulated rain-water and melted snow, though some of them are 10 or 12 m. in circumference. Lakes or ponds of this character sometimes occur in the craters of extinct volcanoes, as in the case of one near Mendoza in the state of La Plata, which is 4,000 or 5,000 ft. above the sea, and is in some way connected with the active volcano of Antuco, since it frequently, when the latter is in eruption, pours a stream of muddy water over the adjacent district. The small lake of Nemi, about 20 m. from Rome, is undoubtedly in the crater of an extinct volcano; as are also the celebrated lake of Averno, and those of Bolsena and Bracciano. It is even believed that London stands on the site of what was once a lake of large size. The Caspian, the sea of Aral, and the Dead sea are instances of lakes which are fed by affluents without possessing any visible outlet. It is believed that the Aral sea or lake once communicated with the Caspian, and it is a frequent phenomenon for lakes whose affluents have diminished or disappeared, to continue supplied with water from unseen sources; while in other instances more water is received into certain lakes than can be accounted for in their visible outlets. In the latter case evaporation has been assumed by Halley and others to be a sufficient explanation. In the case of the lake Neusiedel, which formerly communicated with the Danube by means of the Raab, into which it emptied its waters, it now has no communication except by a mere swamp. Such lakes as are without a visible affluent are fed by subaqueous springs. Such bodies of water are usually situated at considerable elevations above the level of the sea, one on Monte Rotondo, in Corsica, being at an elevation of 9,069 ft.; while lake Tahoe, in California, is said to be more than 6,000 ft. above the level of the sea, lake Titicaca, in the Bolivian Andes, 12,000

ft. above the sea-level, and even the surface of lake Superior 600 ft. above the sea. On the question as to the origin of the saltiness of certain lakes, authorities differ. Some have thought that these bodies of water must owe their saltiness to receiving the saline impurities of their affluents; but there are many salt lakes without affluents, and their saltiness is doubtless due to their being fed by salt springs at their beds. The most common as well as the largest lakes are those which receive one or more tributary streams, and have a visible outlet. Such are the lakes of Switzerland and northern Italy; lakes Ladoga, Onega, Peipus, and Ilmen, in Russia; others in Finland, Sweden, Lapland, etc.; the African lakes, the Tchad, the Ngami, Nyassa, and Victoria Nyanza; and the great lakes of North America, Superior, Huron, Erie, and Ontario. The origin of lakes differs as materially as their nature. Some occur through the sinking of the soil by the falling in of subterranean caverns; and of this kind lake Baikal is an illustration. Others are formed by the action of earthquakes, as occurred in the province of Quito in 1797. The Oschenen-see, in the canton of Berne, was caused by the fall of a mountain; and the lakes Aidat and Cassiere, in Auvergne, France, by lava currents damming up a stream. Finally, it is believed that many are the remains of the universal ocean which once covered the earth. There are many curious phenomena connected with lakes. Some have floating islands upon them, as occurs in the case of a small lake near St. Omer; and in lake Gerdass, in Prussia, which has a floating island on which a hundred head of cattle may be seen pasturing; lake Kolk, in Osnabruck, Prussia, on which fine elms are growing; and lake Rålang, in Smolend, Sweden, where, it is said, a small island appeared and disappeared ten successive times between 1696 and 1766. At Jemtia, in Sweden, there is said to be a lake having a double bottom, whose alternate rise and fall changes the apparent depth of the lake. In Poland there is a lake supposed to be impregnated with sulphureted hydrogen, which is said to turn to a brown color the skin of those who bathe in it. Certain lakes are intermittent, a condition supposed to arise from a play of natural siphons which act as their feeders, as occurs in the case of intermittent springs. The lake of Geneva is sometimes affected by a subaqueous wind, known as the *Vaudaise*, which rises to the surface and so disturbs it as to endanger navigation; and near Boleslaw, in Bohemia, there is a lake whose depth has never been sounded, from the bottom of which rise in winter fierce gusts of wind, having sufficient force to send into the air masses of ice weighing several hundred pounds. The lake of Geneva and other Swiss and Italian lakes experience another phenomenon, called the *Seiches*, which consists in a movement of the water in the nature of a tidal wave, rising sometimes to the height of 5 feet. Water-spouts are not infrequent on lakes, notably on the lakes of Zurich and Geneva. In lake Huron there is a bay over which electrical clouds are perpetually hovering, and it is alleged that thunder there is constant. This phenomenon is attributed to the proximity of the locality of the American magnetic pole. Near Beja, in Portugal, there is a lake which is said to announce the approach of a thunder-storm by a portentous rumbling; and in Siberia, Roaring lake is so named from a similar characteristic, not, however, connected with atmospheric disturbance. Certain lakes deposit carbonate of lime on objects immersed in them, producing the condition known as incrustation; others have the property of inducing petrification. The lake of Zurich displays at times a curious phenomenon, known as the flowering of the lake, when its surface becomes covered with a yellow scum or froth, examination of which has discovered it to be minute vegetation. But perhaps a phenomenon of still more remarkable peculiarity is that which is found to occur in certain lakes of Canada, in the strange adhesive property of the mud which forms their beds, and which appears absolutely to amount to attraction. In such instances it becomes nearly impossible to propel a boat, the mud clinging to its sides with such force as to overcome the influence of the paddles; loaded boats are said to be often in danger of sinking from this cause, and have to be towed over the dangerous spots by those that are lighter. Lake temperature varies greatly in different instances; loch Ness, in Scotland, 810 ft. in depth in its deepest part, is never known to freeze. Some lakes are remarkable for the transparency of their waters; lake Superior being a remarkable instance of this quality—so pellucid that fish and rocks are visible to an almost incredible depth. The Norwegian lakes exhibit also this peculiarity, the bed with its covering of shells or pebbles being plainly visible at a depth of 100 to 120 feet: in lake Wetter, also, in Sweden, it is said that a coin the size of an American cent can be seen at the depth of 120 feet. But the value of lakes to mankind does not lie in their eccentricities, or even in their beauty as natural objects. They perform most important functions in the economy of the earth: acting as reservoirs of water in districts where the rain-fall is irregular; supplying moisture to the atmosphere through evaporation, and thus favoring vegetation in their neighborhood; and, in some cases, furnishing fisheries of great value. Many lakes are navigable, and are most important media of communication and transportation in thickly settled countries; while others, as the source of rivers that are invaluable to commerce, could ill be spared from the economy of civilization, as well as that of nature.

LAKE, a co. in n.w. California, nearly surrounded by the Bear mountains and Mayacannas mountains, divisions of the coast range; 1125 sq.m.; pop. '90, 7101. Products, minerals, grains, and fruits. Clear lake, 25 m. in length, occupies the central part, discharging, through Cache creek, into the Sacramento river. Co. seat, Lakeport.

LAKE, a central co. of Colorado, several times reduced in area since 1870; 450 sq.m.; pop. '90, 14,663. Co. seat, Leadville.

LAKE, an inland co. of Florida, formed 1887; 1100 sq.m.; pop. '90, 8034. It has the highest elevations in the state and contains many large lakes; chief industry, orange culture. Co. seat, Tavares.

LAKE, a co. in n.e. Illinois, has for its east boundary lake Michigan, contains Grass lake, and is watered by the Des Plaines river. The surface is rolling and the soil is fertile. 490 sq.m.; pop. '90, 24,235. Co. seat, Waukegan.

LAKE, a co. in n.w. Indiana, having lake Michigan on the north and the state line of Illinois on the west; 500 sq.m.; pop. '90, 23,886. It is watered by Calumet, Deep, and Kankakee rivers. Chief products, corn, oats, etc. Co. seat, Crown Point.

LAKE, a co. in Michigan in the n. w. portion of the southern peninsula; 580 sq.m.; pop. '90, 6505. It is watered by the Little Manistee and Marquette rivers; surface generally level, and soil fertile. Co. seat, Baldwin.

LAKE, a co. in n.e. Minnesota, between lake Superior and the Canada line; 2380 sq.m.; pop. '90, 1299; surface hilly; productions chiefly copper and other minerals. Co. seat, Two Harbors.

LAKE, a co. in n.e. Ohio, on lake Erie, drained by the Chagrin and Grand rivers; 240 sq.m.; pop. '90, 18,235. The surface is irregular; the soil fertile, producing fine grains and fruits; iron ore is found. Co. seat, Painesville.

LAKE, a co. in southern Oregon, touching California on the south; formed 1875, when it included Klamath co.; 8040 sq.m.; pop. '90, 2604. Co. seat, Lakeview.

LAKE, a co. in eastern South Dakota, formed in 1873; 580 sq.m.; pop. '90, 7508. It contains lake Madison and other lakes, and is watered by affluents of the Vermillion and Big Sioux. Surface undulating and soil fertile. Co. seat, Madison.

LAKE, a co. in n.w. Tennessee, having for its w. boundary the Mississippi river, and bounded on the e. by Reelfoot lake; 210 sq.m.; pop. '90, 5304. The surface is level and subject to overflow. Agricultural products, corn, cotton, etc. Co. seat, Tiptonville.

LAKE, GERARD, Viscount, 1744-1808, b. England; entered the army when only 14 years of age, and fought in the seven years' war. He also served in America, with the duke of York in Holland, and was commander-in-chief in Ireland during the troubles in 1797-98. In 1800 he was sent by the marquis of Wellesley to India, where he was in chief command in the Deccan, and captured Delhi by an adroit strategic movement. He also took Agra, and continued his successful campaign until he had totally defeated the restless and enterprising chief, Scindia, and gained possession of all his dominions north of the Chumbul river. Gen. Lake was now raised to the peerage by the title of baron of Delhi and Laswaree, and after the campaign of 1804-5, he was created a viscount. He died at Plymouth, Eng., of which place he had been appointed governor.

LAKE DWELLINGS, huts, or houses, built upon piles sunk in the beds of lakes, and which are found in central Africa and in the islands of the Indian archipelago. Remains of settlements of this character have been discovered beneath the waters of the lakes of Switzerland, Italy, and other countries of Europe, and in Asia, apparently disclosing a period of antiquity extending back to prehistoric times. Accordingly the term has come to be employed particularly in regard to prehistoric remains of this class of habitation, and its use is almost always with this significance. The first discovery of lake dwellings was made in 1829, at Ober-Meilen, on the lake of Zurich; and this, in spite of the fact that legends suggestive of the existence of such remains had been prevalent in Switzerland, and in parts of France—notably at Voiron, department of Isère—for centuries. The Zurich discovery consisted of remains of piles and certain antiquities; but though curiosity was aroused concerning the finding of these at the bottom of the lake, it was not until 1853-54 that any investigation was made. The occurrence of a season when the waters of the lake fell unusually, facilitated examination, and it was found that two distinct beds existed. The first of these was from 1 to 2 ft. in thickness, and consisted of yellowish mud, containing quantities of rounded pebbles. The second bed was from 2 to 2½ ft. thick, consisting of sandy loam, colored black by decayed organic matter. In this latter bed were found piles and a large variety of antiquities of different kinds. The piles were of oak, beech, birch, and fir, and were from 4 to 6 in. thick. They showed evidence of having been formed partly by the action of fire, which had been used in some instances to sharpen the ends which were

LAKE DWELLINGS (*see also* ARCHÆOLOGY).—1. Pile and stone foundation at Hauteville, and other Swiss lakes, and from Wismar * the rest from the lake of Constance, and I

1. Arrangement of piles. 2. The same viewed from above. 3-21. Articles from Neufchâtel
 de Timon, Vicenza.

imbedded. There were also marks of the clumsy tools of the period, whose slow and imperfect action had been hastened by means of the application of fire. Here were also found tools and implements of stone, bone, and horn; and bones of the stag, wild goat, wild boar, fox, cow, sheep, and dog. There were stone celts, or hatchets, made in the form of a wedge, and varying in length between 1 and 8 in., and in weight between $\frac{1}{4}$ oz. and 1 lb. Some of these were made from a kind of stone which does not now exist in the vicinity of the district where they were found. Some were of syenite, others of black sandstone, and some of jade; the latter not being found in Europe, but which has been employed by the Maoris of New Zealand in the construction of hatchets. In the Zurich specimens they were found set in a hafting of stags' horn, and in wood handles. There were also discovered examples of pottery; stones which had been formed for use as net-weights, etc. In 1865-66 investigations at Voiron, already alluded to, resulted in the discovery of the remains of lake dwellings, where were found also bones, implements, and pottery, some of the latter resembling that of the Roman period. These dwellings were erected on piles, tenoned and mortised, and with door-posts and window-frames. There were also iron weapons and utensils; awls, gimlets, cramps, chisels, and knife-blades; and even keys, fish-hooks, and horse-shoes; a leaden bracelet, blue jewelers' paste, and other extraordinary evidences of an advanced degree of civilization, and even luxury. In Italy, from the extreme north to the shores of the Adriatic, these lacustrine remains have been brought to light; while similar instances have been found in Scotland and in n. Wales. They have also been discovered on the borders of Asiatic Turkey and Russia, in the Grocktscha, or Lewanza-lake, between the Araxes, Kura, and Euphrates rivers. The Irish *crannoges*, artificial fortified islands, partake of the same characteristics, and are found in certain of the Irish lakes; they are attributed to the 9th and 10th centuries. Among the lacustrine remains found in different parts of Europe have been discovered relics of the stone, iron, and bronze ages. Yet, as it is certain that these so-called "ages" occurred at different periods in different parts of the world, we have not, in consequence of this fact, any reliable data as to the precise antiquity of such relics. Herodotus (450 B.C.) described the Pæonians as living on platforms in lake Prasias. The fact that dwellings of this character are found to the present day among certain savage races, and that implements, ornaments, and utensils have preserved general characteristics wherever found, or of whatever period, are circumstances which are to be taken into grave consideration in attributing a specific antiquity to the Swiss and Italian lacustrine remains. See CRANNOGE.

LAKE FOREST UNIVERSITY, at Lake Forest, Lake co., Ill., is a Presbyterian institution, chartered in 1857 and organized in 1876. It comprises an undergraduate department, including Lake Forest college, Ferry Hall seminary, and Lake Forest academy, all at Lake Forest; the Chicago college of law, Rush medical college, and the Chicago college of dental surgery, in the city of Chicago, and a philosophical faculty located at Lake Forest and having in charge the graduate courses intended to give preparation for the profession of teaching, journalism, and for other literary work. Lake Forest College, admitting both sexes, allows a wide range of elective and optional studies during junior and senior years. Ferry Hall seminary prepares young women for any college admitting women, and has special courses leading to degrees. Lake Forest academy is a preparatory school for boys. The philosophical faculty offers graduate courses in philosophy, science, language and literature, extending over two years and leading to the degree of PH.D. The colleges of medicine, dentistry, and law, offer exceptional advantages. The buildings both at Lake Forest and at Chicago are large and well equipped. In 1896-97 the faculty numbered 50, including 15 professors and instructors in Lake Forest college and 77 in Rush medical college; students in all departments, 2,303, including 265 undergraduates, 720 law students, 838 medical students, and 480 students of dentistry. Acting president (1897), John J. Halsey, M.A.

LAKE GENEVA. See GENEVA, LAKE.

LAKE OF THE THOUSAND ISLANDS, an expansion of the St. Lawrence (q.v.), extends about 40 m. below the n.e. end of lake Ontario. It is well worthy of its name, being said to contain 1700 islets, the largest measuring 10 m. by 6. It separates Upper Canada from the state of New York.

LAKE OF THE WOODS, a body of water famous in the history of the international boundary between the United States and the Hudson's Bay company's territories, takes its name from the fact of its being studded with wooded islands, and lies 190 m. w.n.w. of lake Superior. At its s.e. end it receives the Rainy river from the Rainy lake; and at its n.w. extremity it sends forth the Winnipeg on its course to Hudson's bay. According to the treaty which closed the war of independence, it was divided by a central line between England and her old colonies. It measures about 300 m. round, and its remotest point is in lat. 49° n., and long. 95° west.

LAKES, in point of law, belong to the owner of the land which surrounds them; by which is meant not only the water and the use of it, but the soil under the water. Where the land surrounding the lake belongs to different owners, each has *primâ factâ* the right to use the lake for ordinary purposes, including fishing or boating; but it depends on how the properties were acquired, whether and how far this general rule applies to any particular case.

LAKES are certain pigments made by combining vegetable or cochineal dyes with metallic oxides, usually alumina or tin. Carmine lake is made by adding an alkali to a decoction of cochineal and alum, and the residues and mother liquors, which are produced in the preparation of carmine, are used for this purpose; but a carmine lake was made at Florence from Kermes mineral before cochineal was brought to Europe. Violet and purple lakes are made by adding a solution of alum to a decoction of logwood and precipitating in the cold by carbonate of potash. Yellow lakes are prepared in various ways. Dutch pink is made from Persian berries by making a decoction of them with potash or soda solution, and adding alum solution as long as a precipitate takes place. The addition of a solution of chloride of tin brightens the solution. Fustic lake is made by adding to a decoction of the wood glue or skimmed milk to remove the tannic acid. Alkali is added to remove acidity, and then the precipitation is accomplished by alum solution. Quercitron and wild lakes are made by similar processes. Orange lakes are made from arnotto or turmeric by similar processes. Blue lakes are prepared by adding sulphate of copper (blue vitriol) to a solution of logwood and precipitating in the cold with potash, or by precipitation with carbonate of potash from a solution of sulphindigotic acid and alum. Green lakes may be prepared by mixing blue or yellow lakes with blue or yellow pigments, or they may be made by a primary process. A decoction of coffee berries with sulphate of copper yields a good green lake by the addition of a moderate quantity of caustic potash. The addition of acetic acid heightens the color. Lakes are often adulterated by adding such substances as gypsum and white clay. A good eye will detect the adulteration at once from the loss of brilliancy, but a chemical test will detect the lime base in the gypsum or the silica in the clay.

LAKE SCHOOL, the name with which the *Edinburgh Review* dubbed certain poets (Wordsworth, Coleridge, and Southey) who, towards the close of last century, took up their residence in the lake district of Cumberland and Westmoreland, and who—though widely different from each other in almost every other respect—professed to seek the sources of poetical inspiration in the simplicity of nature, rather than in the works of their predecessors and the fashion of the times. The epithet, however, is not a happy one, and does not help us to a better knowledge of the men.

LAKE SURVEY. The shore line of the great lakes and rivers following the principal indentations is about 6,000 miles. The work laid out in surveys, soundings, etc., approached in magnitude that of the Atlantic coast. The first appropriation to defray expenses was made in 1841 of \$15,000. Previous to 1862 the largest annual appropriation had been \$75,000, after which it varied from \$50,000 to \$175,000. The first charts were published in 1852, but they were only of charts of localities, as a general survey had not then been made. After this the work became more extensive. It was very much like the work on the Atlantic coast, and was performed by primary triangulation in the first place, and followed by secondary and tertiary, and by hydrographic surveys. Some of the work was very intricate, requiring many nice mathematical processes. In some places where primary triangulations would have been difficult of direct application, as along the American shore of lake Huron, many points were only determined by a combination of triangulation and astronomical work. On the lake Michigan shores many positions were obtained by carrying lines from known points. The survey was carried on with commendable energy, under such difficulties; the triangulation has been completed, and the hydrography of the harbors carried on to meet the demands of navigation. The work was finished in 1882.

LAKE VIEW, Ill., now forms two wards of Chicago (q.v.).

LAKEWOOD, a famous resort for health and pleasure in Ocean co., N. J.; on the Central railroad of New Jersey, 44 miles s. by w. of New York. It is in the midst of a dense forest of pines, is wholly free from malaria, and its bracing air attracts thousands of visitors during the spring and winter. Here are several fine hotels, and many cottages owned by those who annually visit it. There are newspapers, seminaries, electric lights, etc. Its history is clear since 1786, and for many years it was known as Bricksburg.

LAKSHMĪ, in Hindu mythology, the name of the consort of the god Vish'n'u (q.v.), and considered also to be his female or creative energy. According to the mystical doctrine of the worshippers of Vish'n'u, this god produced the three goddesses, Brâhmī, Lakshmi, and Chan'dikâ, the first representing his creating, the second, his preserving, and the third, his destroying energy. This view, however, founded on the superiority of Vish'n'u over the two other gods of the Hindu triad—Brâhmī, or Saraswati, being generally looked upon as the energy of Brahmâ, and Chan'dikâ, another name of Durgâ, as the energy of Śiva—is later than the myth, relating to Lakshmi, of the epic period; for, according to the latter, Lakshmi is the goddess of fortune and of beauty, and arose from the ocean of milk, when it was churned by the gods to procure the beverage of immortality, and it was only after this wonderful occurrence that she became the wife of Vish'n'u. When she emerged from the agitated milk-sea, one text of the Râmāyan'a relates, "she was reposing on a lotos-flower, endowed with transcendent beauty, in the first bloom of youth, her body covered with all kinds of ornaments, and marked with every auspicious sign. . . . Thus originated, and adored by the world, the goddess, who is also called *Padmâ* and *Srî*, betook herself to the bosom of Hari—i.e., Vish'n'u. A curious festival is celebrated in honor of this divinity on the fifth lunar day of the light half of the month Mâgha (Feb.), when she is identified with Saraswati, the consort of Brahmâ, and the goddess of learning. In his treatise on festivals, a great modern

authority, Raghunandana, mentions, on the faith of a work called *Samvatsara-saṅgīta*, that Lakshmi is to be worshiped in the forenoon of that day with flowers, perfumes, rice, and water; that due honor is to be paid to inkstand and writing-reed, and no writing to be done. Wilson, in his essay on the *Religious Festivals of the Hindus* (works, vol. ii. p. 188, ff.), adds that, on the morning of Feb. 2, "the whole of the pens and inkstands, and the books, if not too numerous and bulky, are collected, the pens or reeds cleaned, the inkstands scoured, and the books, wrapped up in new cloth, are arranged upon a platform, or a sheet, and strewn over with flowers and blades of young barley, and that no flowers except white are to be offered. After performing the necessary rites . . . all the members of the family assemble and make their prostrations; the books, the pens, and ink having an entire holiday; and, should any emergency require a written communication on the day dedicated to the divinity of scholarship, it is done with chalk or charcoal upon a black or white board." In different parts of India, this festival is celebrated at different seasons, according to the double aspect under which Lakshmi is viewed by her worshippers. The festival in the month Māgha seems originally to have been a vernal feast, marking the commencement of the season of spring.

LALANDE, JOSEPH JÉRÔME LEFRANÇAIS DE, an eminent French astronomer, was b. at Bourg-en-Bresse, July 11, 1732. He devoted himself with such success to mathematics and astronomy, that the French academy sent him to Berlin in 1751, to determine the moon's parallax, at the same time that Lacaille was sent to the cape of Good Hope. In 1752 he returned, and was appointed one of the astronomers-royal; and in 1761 succeeded Lemonnier in the professorship of astronomy in the collège de France. His lectures had a rare attractiveness, and he published several astronomical works of a popular kind, as well as works of profound science. He finally filled the office of director of the Paris observatory, and died April 4, 1804. His principal work is his *Traité d'Astronomie* (2 vols., Paris, 1764—a new and augmented edition in 4 vols., Paris, 1771–81). He also published minor works on astronomy, navigation, etc., and an account of his travels in Italy, during 1765 and 1766 (9 vols., Paris, 1786).

LALEMANT, CHARLES, 1587–1674, b. France; went to Canada in 1625 as superior of the missions; in 1634 established the first school in Quebec; was at the deathbed of Champlain, returned to France in 1638, and was rector of Jesuit colleges at Rouen, La Flèche, and Paris, and died in the latter city. His letters on the missions of Canada were reprinted in Albany in 1870.

LALEMANT, GABRIEL, 1610–1649; b. France. He was a nephew of Jérôme Lalemant, entered the society of Jesus in 1630, and sailed for Canada in 1646. He was sent to the Huron mission, was taken prisoner by the Iroquois Indians, and with father Brebeuf was put to death, after the savages had tortured them for many hours.

LALEMANT, JÉRÔME, 1593–1673; b. France; a French priest who entered the Jesuit order in 1609, and after having been rector of various colleges in France, sailed for Canada in 1638, where he served as superior of all the Canadian missions from 1644–50. He made two trips to France, and became for a short period rector of the college of La Flèche, but returned to Canada in 1659, and died in Quebec in 1673. He wrote five of the *Jesuit Relations* of the Huron missions, and six of the general volumes for the years 1645–48 and 1661–64.

LALITA-PATAN, or PATAN, a t. of Nepal, 4 m. s. from Khatmandu, from which it is separated by the Bognmuty. Lalita-Patan was formerly the capital of a small independent state. It is a neat town, and has some good public buildings. It has manufactures of cotton, copper, and brass. Pop. supposed about 24,000.

LALITA-VISTARA is the name of one of the most celebrated works of Buddhist literature. It contains a narrative of the life and doctrine of the Buddha Śākyamuni (see BUDDHA), and is considered by the Buddhists as one of their nine chief works, treating of Dharma, or religious law. It is one of the developed Sūtras of the Mahāyāna system. An edition of the Sanskrit text, and an English translation of this work by Bābu Rājendrakīl Mitra, is publishing under the auspices of the Asiatic society of Bengal. A French translation from the Thibetan has been made by Ph. Ed. Foucaux. In Chinese there are two translations of it. See E. Burnouf, *Introduction à l'Histoire du Bouddhisme Indien* (1844); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1860).

LALLEMAND, CHARLES FRANÇOIS ANTOINE, Baron, 1774–1839; born in Metz; French general who fought with distinction in the Napoleonic wars, and became a lieutenant-general and member of the chamber of peers. Upon Napoleon's downfall he attempted to found colonies of French Imperialists in America. After 1830 his military and political honors, of which he had been deprived, were restored, and he again sat in the French Chamber. For two years he commanded in Corsica.

LALLEMAND, CLAUDE FRANÇOIS, 1790–1854; born in Metz. Professor of clinic medicine at Montpellier in 1819; removed for his political opinions in 1823; reinstated in 1826; in 1845 elected a member of the academy of sciences in Paris. Afterwards he accepted position as physician to Ibrahim Pasha and Méhémet Ali in Egypt. His special study was of the brain and its environments and the connection between genital and cerebral diseases. His most important work was *Recherches anatomico-pathologiques sur l'Encéphale et ses Dépendances*, which has been translated into many languages. His other works are also of standard authority.

LALLY-TOLLENDAL, THOMAS ARTHUR Count de, a French gen., of historic note as the victim of a judicial murder, was b. in Dauphiné in 1702. His father, sir Gerard Lally, was an Irish Jacobite refugee, and commander of an Irish regiment. Lally-Tollendal distinguished himself much as a soldier in Flanders; accompanied prince Charles Edward to Scotland in 1745; and in 1756 was made a lieut. gen. and appointed commander-in-chief in the French East Indian settlements. He commenced hostilities against the British in India, took many places, and besieged Madras itself; but sustained a severe defeat under the walls of Vandarachi, and was compelled to retreat to Pondicherry, which was attacked in Mar., 1760, by land and sea by a greatly superior British force. Lally, however, held out for ten months; and before Pondicherry fell, on Jan. 16, 1761, the sufferings of its defenders were terrible. Lally was conveyed as a prisoner of war to England; but hearing that he had been accused in France of betraying his trust in India, he obtained leave to proceed to France for the vindication of his character. An investigation was promised, but no step was taken for a year, and then Lally was only thrown into the Bastille, where he remained 19 months before his trial took place. The parliament of Paris at last, on May 6, 1766, condemned him to death for betraying the interests of the king and the Indian company, and the sentence was executed three days after. But his son, supported by the powerful assistance of Voltaire, procured a royal decree on May 21, 1778, declaring the condemnation unjust, and restoring all the forfeited honors.—The son, TROPHIMUS GERARD, MARQUIS DE LALLY-TOLLENDAL, was born in Paris, Mar. 5, 1751. He was one of those nobles who, in the states general, in 1789, united with the third estate; but alarmed at the democratic tendencies of the national assembly, he afterwards allied himself more with the court. He labored to procure for France a constitution with two chambers and a privileged aristocracy. He earnestly sought to protect the king, but was himself obliged to flee to England. After the revolution of 18th Brumaire he returned to France, and lived at Bordeaux. Louis XVIII. made him a peer; but he remained true to his political principles, and defended constitutional liberty. He died on Mar. 11, 1830. He was the author of a *Defense of the French Emigrants*, which made a great sensation in France at the time of its appearance, and of many other pamphlets.

LA'MAISM (from the Thibetan *bLama*,* spiritual teacher or lord) is the name of the religion prevailing in Thibet and Mongolia. It is Buddhism (q.v.) corrupted by Si'vaism (see *SIVA*), and by Shamanism (q.v.), or spirit-worship. As ancient Buddhism knows of no worship of God, but merely of an adoration of saints, the latter is also the main feature of Lamaism. The essence of all that is sacred is comprised by this religion under the name of dKon mChhog gSsum (pronounced *konchogsum*), which consists of the "three most precious jewels"—viz.: "the Buddha-jewel," the "doctrine-jewel," and "the priesthood-jewel." A similar triad is implied by the three Buddhistic formulae: "I take my refuge in Buddha; I take my refuge in the law (or doctrine); I take my refuge in the congregation (of the priests)," but it did not obtain the same dogmatic importance in Buddhism as in Lamaism, where it is looked upon as a kind of trinity, representing an essential unity. The first person of this trinity is the Buddha; but he is not the creator, or the origin of the universe; as in Buddhism, he is merely the founder of the doctrine, the highest saint, though endowed with all the qualities of supreme wisdom, power, virtue, and beauty, which raise him beyond the pale of ordinary existence. The second jewel, or the doctrine, is the law or religion—that which is, as it were, the incarnation of the Buddha, his actual existence after he had disappeared in the Nirvāna. The third jewel, or the priesthood, is the congregation of the saints, comprising the whole clergy, the incarnate as well as the non-incarnate representatives of the various Buddhistic saints. The latter comprise the five Dhyāni-Buddhas, or the Buddhas of contemplation, and, besides, all those myriads of Bodhisattwas, Pratyeka-Buddhas, and pious men, who became canonized after their death. It is obvious that among their number a portion only can enjoy practical worship; but the clergy, as the visible representative of these saints, claim and receive due homage at all the religious ceremonies. Inferior in rank to these saints are the gods and spirits, the former chiefly taken from the pantheon of the Si'vaits. The highest position amongst these is occupied by the four spirit-kings—viz., *Indra* (q.v.), the god of the firmament; *Yama*, the god of death and the infernal regions; *Yamāntaka*, or *Si'va*, as revenger in his most formidable shape; and *Vaiśravaṇa*, or the god of wealth. The worship of these saints and gods consists chiefly in the reciting of prayers and sacred texts, and the intonation of hymns, accompanied with a kind of music, which is a chaos of the most unharmonious and deafening sounds of horns, trumpets, and drums of various descriptions. During this worship, which takes place three times a day, the clergy, summoned by the tolling of a little bell, are seated in two or more rows, according to their rank; and on special holidays, the temples and altars are decorated with symbolical figures, while offerings of tea, flour, milk, butter, and others of a similar nature, are made by the worshippers; animal sacrifices or offerings entailing injury to life being forbidden, as in the Buddhistic faith. Lamaism knows especially three great festivals. The *Log gSsar*, or the festival of the new year, in Feb., marks the commencement of the season of spring, or the victory of light and warmth over darkness and cold. The Lamaists, like the Buddhists, celebrate it in

* The small letters prefixed to the initials of the Thibetan words in this article are not pronounced.

commemoration of the victory obtained by the Buddha Sâ'kyamuni over the six heretic teachers. It lasts fifteen days, and consists of a series of feasts, dances, illuminations, and other manifestations of joy; it is, in short, the Thibetan carnival. The second festival, probably the oldest festival of the Buddhistic church, is held in commemoration of the conception or incarnation of the Buddha, and marks the commencement of summer. The third is the *water-feast*, in Aug. and Sept., marking the commencement of autumn. Baptism and confirmation are the two principal sacraments of Lamaism. The former is administered on the third or tenth day after birth; the latter, generally when the child can walk and speak. The marriage ceremony is to the Thibetans not a religious but a civil act; nevertheless, the Lamas know how to turn it to the best advantage, as it is from them that the bridegroom and bride have to learn the auspicious day when it should be performed; nor do they fail to complete the act with prayers and rites, which must be responded to with handsome presents. A similar observation applies to the funeral ceremonies of the Thibetans. Properly speaking, there are none requiring the assistance of the clergy, for Lamaism does not allow the interment of the dead. Persons distinguished by rank, learning, or piety are burned after their death; but the general mode of disposing of dead bodies in Thibet, as in Mongolia, is that of exposing them in the open air, to be devoured by birds and beasts of prey; yet it is the Lama who must be present at the moment of death, in order to superintend the proper separation of body and soul, to calm the departed spirit, and to enable him to be reborn in a happy existence. He must determine the auspicious day and hour when, and the auspicious place where, the corpse is to be exposed. The most lucrative part of his business, however, is the masses which he has to perform until the soul is released from Yama, the infernal judge, and ready to re-enter into its new existence; the doctrine of metempsychosis being the same in this religion as in Buddhism.

One of the most interesting features of lamaism is the organization of its hierarchy. Its summit is occupied by two lama popes, the one called *dalai-lama*, i.e., ocean-priest, or priest as wide as the ocean—he resides at Potala, near H'lassa—the other bearing the titles of *tesho-lama*, *bogdo-lama*, etc., and officially called *pan-chhen rin po chhe*, literally, "the right reverend great teacher-jewel" (i.e., precious teacher); he resides in the convent at bKra Shiss Lhun po, near gShiss Ka rTse. In theory, both popes have the same rank and authority, in spiritual as well as in temporal matters; but, as the dalai-lama possesses a much larger territory than the other, he is in reality much more powerful. Next in rank are the *khutuktus*, who may be compared to the Roman Catholic cardinals and archbishops. The third degree is that of the khubilghans or hobilghans—which Mongol name is more frequently given to them than the Thibetan title *bjang chhub*—a translation of the Sanskrit bodhisattwa. Their number is very great. These three degrees represent the clergy that claims to be the incarnation of the Buddhistic saints. The dalai-lama and the pan-chhen were in their former lives the two chief disciples of the great lamaist reformer bTsong kha pa, who was an incarnation of the Bodhisattwa Amitâbha, or, as some will have it, of Manjus'ri and Vajrapân'i, and who is reputed to have founded, in 1355 or 1357 of the Christian era, the present system of the Lama hierarchy. The khutuktus were, in their prior existences, other Buddhistic saints of very great renown; and the khubilghans are those reborn hosts of saintly patrons whom the temples and convents of lamaism possess in boundless numbers. Up to the end of last century, the clergy of these various classes determined the choice of the children into whose bodies the souls of their departed members had migrated. At present, however, it seems that the emperor of China exercises a paramount influence on the discovery of those transmigrations,—or, in other words, on the filling up of clerical posts—and there can be no doubt that his influence is supreme in the case of determining the election of the two highest functionaries of this theocracy. In order to ascertain the re-birth of a departed lama, various means are relied upon. Sometimes the deceased had, before his death, confidentially mentioned to his friends where and in which family he would reappear, or his will contained intimations to this effect. In most instances, however, the sacred books and the official astrologers are consulted on the subject; and if the dalai-lama dies, it is the duty of the pan-chhen to interpret the traditions and oracles; whereas, if the latter dies, the dalai-lama renders him the same service. The proclamation of so great an event, however, as the metempsychosis of a dalai-lama or pan-chhen is preceded by a close examination of the child that claims to be in possession of the soul of either of these personages. The reborn arch-saint, usually a boy four or five years old, is questioned as to his previous career; books, garments, and other articles, used and not used by the deceased are placed before him, to point out those which belonged to him in his former life. But however satisfactory his answers be, they do not yet suffice. Various little bells, required at the daily devotions of the lama, are put before the boy, to select that which he did use when he was the dalai-lama or pan-chhen. "But where is my own favorite bell?" the child exclaims, after having searched in vain; and this question is perfectly justified; for, to test the veracity of the reborn saint, this particular bell had been withheld from him. Now, however, there can be no doubt as to the dalai-lama or pan-chhen being bodily before them: the believers fall on their knees, and the lamas who successfully performed all these frauds join them in announcing the momentous fact.

Besides these three classes of the higher clergy—representing the incarnate existences

of departed saints, and chosen, therefore, without regard to merit, amongst the children of privileged families—lamaism possesses a lower clergy, which, having no claim to incarnate holiness, recruits its ranks on the principle of merit and theological proficiency. It has four orders: the pupil or novice, who enters the order generally in his seventh or ninth year; the assistant priest; the religious mendicant; and the teacher, or abbot. To these may be added two academical or theological degrees, and also two dignities, conferred by the sovereign lamas on those doctors who have distinguished themselves by extraordinary sanctity or learning. All the members of these orders must make the vow of celibacy, and by far the greatest number of them live in convents. A lamaist convent, *dGon pa*, consists of a temple, which forms its center, and of a number of buildings connected with the temple, and appropriated to the meeting-rooms, the library, refectory, dwellings, and other spiritual and worldly wants of the monks. At the head of the convent is a khubilghan, or an abbot, the latter being elected by the chapter, and appointed by the dalai-lama, or the provincial khubilghan. In addition to these orders of monks and convents, lamaism has likewise its nuns and nunneries.

The lamaist bible bears the name of *bKa' gjur* (pronounced *kanjur*)—i.e., "translation of the words," *scil.*, of the Buddha. It contains not less than 1083 works, which in some editions fill 102 to 108 volumes in folio. It consists of the following sections: 1, *Dulba* (Sanskrit, Vinaya), or discipline; 2, *Sher phjin* (Sans. Prajñāpāramitā), or philosophy and metaphysics; 3, *Phal chhen* (Sans. Buddhavata Sangha), or the doctrine of the Buddhas, their incarnations, etc.; 4, *dKon brTsegss* (Sans. Ratnakūṭa), or the collection of precious things; 5, *mDo ssDe* (Sans. Sūtra), or the collection of Sūtras; 6, *Mjang 'dass* (Sans. Nirvāṇa), or the liberation from worldly pains; 7, *rgJud* (Sans. Tantras), or incantations, etc. Besides this mass of works, there is a very voluminous collection, the *bss Tan 'gjur*, or the translation of the doctrine, in 225 vols. in folio; but it does not seem to possess canonical authority.

The oldest history of lamaism is shrouded in darkness. For its growth and development under the Mongol and Manju dynasties, see the article THIBET.—The best work on lamaism is *Die Lamaische Hierarchie und Kirche, von Karl Friedrich Koeppen* (Berlin, 1859). See also Huc, *Souvenirs d'un Voyage dans la Tartarie, le Tibet et la Chine* (Paris, 1852); and Karl Ritter's *Erkunde* (vol. iv.).

LAMA, or LAMAS, GRAND. See LAMAISM.

LAMAN'TIN. See MANATEE.

LAMAR, a co. in n.w. Alabama, originally called SANFORD. It adjoins Mississippi, and is drained by branches of the Tombigbee; about 612 sq.m.; pop. 1890, 14,187, includ. colored. Surface undulating and soil productive. Staple products: cotton, sweet potatoes, oats, pork, and butter. Co. seat, Vernon.

LAMAR, a co. in n.e. Texas, has the Red river for its entire n. boundary, separating it from the Indian territory, and Sulphur Fork, a branch of the Red river, for its s. border. It is watered by many little rivulets from either stream; about 900 sq.m.; pop. 1890, 37,302, chiefly of American birth, including colored. It is intersected by the Texas and Pacific and several other railroads. The surface is generally level, diversified by forests of ash, hickory, oak, etc., and the soil produces winter wheat, corn, oats, sorghum, cotton and tobacco. Co. seat, Paris.

LAMAR', LUCIUS QUINTUS CINCINNATUS, 1797-1834, educated at the Litchfield, Conn., law school, and on being admitted to the bar, settled in Milledgeville, Ga., 1819, where he soon achieved a high reputation. Made judge of the circuit court in 1830, his decisions became recognized authority. He compiled the statutes of the state of Georgia by appointment of the legislature. Judge Lamar committed suicide, July 4, 1834, for no known cause, as he was peculiarly happy in all his relations, his ability acknowledged, and his position secured.

LAMAR, LUCIUS QUINTUS CINCINNATUS, b. Ga., 1826; received his education at a local institution; prosecuted the study of law, and afterwards practised in Mississippi, from which state he was elected to congress in 1856. He was re-elected, but retired after the secession of his state in 1861. During the civil war he held a colonel's commission in the confederate army, but filled a responsible mission abroad, and was not in active military service. Mr. Lamar at one time held the position of assistant editor of the *Southern Review*, and was adjunct professor of mathematics in the university of Mississippi. He was professor of political economy and social science in the same institution in 1866, and professor of law in 1867. He was elected to congress in 1872, re-elected in 1874, and in 1877 took his seat as U. S. senator from Mississippi, his term expiring in 1885. During his career as a senator he drew attention by his speeches upon sectional politics, and was a vigorous opponent of the "inflation" policy. Just after the death of Charles Sumner he delivered an eloquent eulogy upon that statesman. He was appointed by pres. Cleveland sec. of the interior dept., 1885; resigned, 1888, and was made associate justice of U. S. supreme court. He d. in 1893.

LAMARCK, JEAN BAPTISTE PIERRE ANTOINE DE MONET, Chevalier de, a most distinguished French naturalist, was b. of a noble family at Barentin, in Picardy, Aug. 1, 1744. He was intended for the church, but preferred the army. An accidental injury, which placed his life in danger, put a stop to this career, and he became a banker's clerk. His first scientific pursuit was that of meteorology, from which he turned to

botany, and attempted to introduce a new system of classification, which he called the analytical system, but which met with little acceptance. In 1778 he published his *Flore Française* (3 vols.), which was afterwards made the basis of the work of Decandolle. Shortly after, he was appointed botanist to the king, and tutor to the son of Buffon, with whom he visited foreign countries, and inspected their botanical collections. He also contributed many botanical articles to scientific works. After a considerable portion of his life had been spent in the earnest study of botany, Lamarck devoted himself chiefly to zoology, and in 1793, was made professor of the natural history of the lower classes of animals in the *Jardin des Plantes*. He rendered very important services to this branch of science. His greatest work is his *Histoire des Animaux sans Vertèbres* (7 vols. Paris, 1815-22; 2d ed., by Deshayes and Milne-Edwards, Paris, 1835, etc.). In his *Philosophie Zoologique* (2 vols. Paris, 1809), and some other works, he indulged in extremely speculative views, some of which, however, are attracting great attention in the scientific world at the present day. Lamarck was the first (if we except a few obscure words of Buffon towards the close of his life) to set forth the theory of the "variation of species," which has been recently revived by Darwin. Lamarck died Dec. 18, 1829, after having been for 17 years blind, in consequence of small-pox.

LA MARMORA, ALBERT, Count, 1789-1863; b. Turin, Italy; educated for the army at Fontainebleau, and served with distinction, being decorated by Napoleon I., after the battle of Bautzen. He fought on the side of the Sardinians in 1814, and during the military insurrection in 1821. On account of his latter course he was exiled to Sardinia, and remained there during nearly ten years, which he occupied in profound study and investigation of the natural characteristics of the island. The result of his labor appeared in an elaborate report, which is highly esteemed. In 1831, being recalled from his exile by the government, he was restored to favor and became a member of the *Accademia delle Scienze* of Turin. He was, nevertheless, as revolutionary as ever in spirit, and on the outbreak of the great movement of 1848, he joined Daniel Manin and became prominent during the unsuccessful revolt of Venice. Later he assumed the character of peacemaker, and by his wise counsels succeeded in allaying much of the irritation which existed among the leaders of the contending parties. His great work, written in French, and comprising an atlas and description, is entitled, *Voyage en Sardaigne, ou Description Statistique, Physique, et Politique de cette Isle*.

LA MARMORA, ALFONSO FERRERO, Marquis de, an Italian general and statesman, b. Nov. 17, 1804. In 1816 he entered the military academy, where he received the grade of lieutenant in the artillery, previous to leaving in 1823. He was speedily promoted to be adjt. maj., and directed his special attention to the improvement of regimental gymnastics, riding, and shooting, and to the organization of normal schools for the benefit of the private soldiers. In 1831, having obtained his captaincy, he set out on a tour of inspection of the great military establishments both of Europe and the east. In 1845, he became maj., and for his distinguished conduct in the national war of 1848, was decorated with the medal of valor. The services he then rendered the Sardinian army removed from the mind of Charles Albert a prejudice which his warm advocacy of military reform had aroused in the king. In 1849 he reentered the cabinet as minister of war, and notwithstanding his sincere zeal for useful reforms, a general spirit of censure was evoked by his vigorous efforts to displace from the Sardinian ranks the Italian refugees who had entered the regular army. In 1855 he withdrew from the ministry, to assume the command of the Sardinian troops in the Crimea, and at the close of the war was invested with the order of the bath, and the grand cross of the legion of honor, and re-entered the ministry in his former capacity. He took an active part in the war of 1859, by which Lombardy was acquired by Italy; in 1861 was appointed commander-in-chief of the Italian army, and in 1864 prime minister. In the campaign against Austria in 1866, he lost the battle of Custozza. Latterly he was intrusted with several diplomatic missions; and his account of the secret negotiations between Prussia and Italy incurred the censure of prince Bismarck. La Marmora died in Jan., 1878. See the monograph by Massari (1880).

LAMARQUE, MAXIMILIEN, Comte, 1770-1833; b. France; joined the army as a private soldier in 1791, and soon rose to be capt. of grenadiers in the famous corps commanded by Latour d'Auvergne, first grenadier of France. He was made a brig. gen. in 1801, and distinguished himself in the battles of Austerlitz and Wagram, and in the campaigns of the Tyrol and Naples (under Joachim Murat), and in Italy. Having taken the island and fortress of Capri from the English, he was made a gen. of division; and on Bonaparte's return from the island of Elba, he gave Lamarque the command of the city of Paris, and afterwards made him commander-in-chief of the army of La Vendée. In 1815, he was proscribed by the restored Bourbons, and retired to Amsterdam, where he remained until 1818, when he returned to Paris, and contributed articles on foreign politics to the opposition journals. In 1828 he was elected to the chamber of deputies, where he became an important member of the opposition or progressive party. The republican disaffection, which had for some time been apparent in France, broke out into open insurrection on the occasion of the funeral of Gen. Lamarque, who died June 1, 1832. Funeral orations were delivered on the Place de la Bastille; and, at the conclusion of the address of Gen. Lafayette, a red flag was unfurled, and the dragoons who

were posted about, in anticipation of trouble, were fired upon. The national guards who were in the procession quitted it in disorder; and the insurgents raised the cry "to arms," and began to build barricades, break lamps, and otherwise conduct themselves after the disorderly fashion of a Paris *émeute*. Night (June 5) brought a temporary cessation of the disturbances; and meanwhile the king (Louis Philippe) arrived from St. Cloud, and visited the different military posts. On the morning of the 6th the insurgents were in possession of certain quarters, but were soon surrounded by the troops, and forced to remain behind their barricades. The king issued from the Tuileries at the head of a brilliant staff, giving fresh confidence to the soldiers, and the barricades were carried; the troops losing 55 killed and 240 wounded; the national guards 18 killed and 104 wounded; and the insurgents 93 killed and 291 wounded. Paris was placed, by royal ordinance, in a state of siege; Garnier Pages and other deputies, and Armand Carrel, editor of the *National*, were arrested, and the polytechnic school and the school of Alfort were closed, on account of some of their students having taken part in the disturbance.

LAMARTINE, ALPHONSE, was b. at Mâcon, Oct. 21, 1790. In his *Memoirs of my Youth*, he has given us a touching account of the hardships to which his family was subjected during the reign of terror. He was educated principally at the college of the Pères de la Foi, at Belley. On leaving college, he spent some time in traveling in Italy. After the fall of Napoleon, he entered the army, which, however, he soon quitted, revisiting Italy in 1818. In 1820 appeared his *Méditations Poétiques*. The success of this work helped to open up for him a diplomatic career. He was appointed *attaché* to the French embassy at Naples, and on his way thither married, at Chambéry, a beautiful and accomplished English lady, Miss Birch, whom he had met the year before in the valleys of Savoy. In 1823 appeared his *Nouvelles Méditations*, and in 1824 he became secretary of the legation at Florence. An unlucky expression which Lamartine had used, descriptive of the Italians, in his *Dernier Chant de Childe Harold* (1825), led to a duel between him and Col. Pepé. Though Lamartine was wounded, the result, luckily, was not serious. In 1829 appeared the collection of *Harmonies Poétiques et Religieuses*. In the same year he was elected a member of the French academy. After the revolution of 1830, having failed to procure a seat in the chamber of deputies, he set out in 1832 to travel in the east. The death of his only daughter threw a gloom over this period of his life. Receiving news, when at Jerusalem, of his election by the constituency of Bergues, he returned to Paris. Though he soon became a noted speaker in the chamber, he still vigorously pursued his literary studies. In 1835 he published an account of his eastern travels. The *History of the Girondins*, which originally came out in journals, was, in 1847, published complete in 8 vols. It had unquestionably much influence in bringing about the great events of the following year. When the revolution took place in Feb., 1848, Lamartine became a member of the provisional government and minister of foreign affairs, and exercised a great influence over the first movements of the new republic. Ten departments elected him as their representative in the constituent assembly; he was also chosen one of the five members of the executive commission, and enjoyed for some months an immense popularity; whilst his spirited and patriotic conduct, in crushing the mere anarchic insurrections of April 16 and May 15, must be regarded as having prevented great evils. Yet this was one of the principal causes of his downfall; the crowd became enraged, the assembly hostile, and the supreme power passed for a brief period into the hands of Cavaignac (q. v.). Though Lamartine was nominated for the presidency, but few votes were recorded in his favor; and the *coup d'état* of Dec. 2, 1851, sent him back to private life. From that time he gave himself almost wholly to literary pursuits. His *History of the Revolution of 1848* had appeared in 1849. It was followed, in 1851-52, by his *History of the Restoration of Monarchy in France*; and in 1854, by the *History of Turkey*. He also contributed largely to several journals. In 1860 he undertook the publication of a complete edition of his works, revised and corrected by himself. He finished this labor in 1866. The edition consists of 41 vols. In 1867 a pension was granted him by the government. He died March 1, 1869.

LAMAS, ANDRES, b. Montevideo, 1817; a distinguished Uruguayan statesman, held also in high esteem for his learning, and particularly for his acquirements in the department of South American history. He held the office of prefect of Montevideo during the siege which began in 1839 and lasted nine years; he was also minister of finance, and was frequently sent on important diplomatic missions to other governments. He founded an institute of history in his native city, and made a large and valuable collection of manuscripts illustrative of South American history.

LAMASOOL, or LAMB'S-WOOL, an old English beverage, composed of ale and the pulp of roasted apples, with sugar and spices. The name is from the ancient British *La maes abhal*, the day of apples, because this beverage was drunk at a feast on the apple-gathering in autumn.

LAMB, a co. in n.w. Texas, part of the Staked Plain; formed in 1876; unorganized, and attached to Jack co. for judicial purposes; 1010 sq. m. Pop. '90, 4.

LAMB, Lady CAROLINE. See MELBOURNE, WILLIAM LAMB.

LAMB, CHARLES, English author, was born in London, Feb. 10, 1775, and received his education at Christ's Hospital School. An impediment in his speech debarred him from a university appointment, and he left school in 1789 to hold a small clerkship under his elder brother, in the South Sea house, until 1792, when a friend procured him an appointment in the accountant's office of the East India house. Insanity, inherited from Mrs. Lamb, cast a gloom over the family life, showing itself first in Charles, who in his twenty-first year was confined in an asylum for a few weeks, and manifesting itself frequently in his sister Mary (b. 1765), who in 1796 was suddenly seized with acute mania and stabbed her mother to the heart. This tragedy prevented Charles from marrying Alice Winterbourne, a young girl who is alluded to in several sonnets, and under the name of Bartram, in *Dream Children*, and the remainder of his life was devoted to his unfortunate sister, whom he refused to place permanently in confinement, and who in her periods of health was of great assistance to him in his literary work. Lamb's first published efforts were four sonnets contributed in 1796 to the volume *Poems on Various Subjects* by Coleridge, his old schoolfellow and devoted friend. In 1797 Coleridge published a second edition of his *Poems*, to which Lamb and Charles Lloyd, a mutual friend, contributed, and in 1798 Lamb and Lloyd issued *Blank Verse*, in which the former's now familiar lines, "Old Familiar Faces," appeared. Lamb did not acquire fame by these poems, nor by the tale *Rosamund Grey* (1798), the drama *John Woodvil* (1801), or the farce *Mr. H.* (1806). In 1807, he received a commission from William Godwin to contribute to his Juvenile Library. For this series, he and his sister wrote their *Tales from Shakespeare*, Mary writing the version of the comedies, and Charles that of the tragedies. This was his first real success and led to their writing jointly, *Mrs. Leicester's School* (1807), and *Poetry for Children* (1809). About this time, Charles wrote *Adventures of Ulysses*, which likewise won him well-merited approbation. A volume of selections from the English dramatists of Shakspeare's time displayed unmistakably his fine poetic taste and proved him to be one of the most profound and original of English critics. In 1820 he was invited to join the staff of the *London Magazine*, and contributed, as the first of the light prose essays called for, a description of the old South Sea house, signing himself "Elia," which was the name of an old fellow-clerk. This and the papers following it, which with his criticisms are considered by many the finest of their kind in the English language, appeared in collected form as *Essays of Elia* (1825), and *Last Essays of Elia* (1833). In 1825, Lamb was retired from his clerkship, on account of failing health, and given a pension of about \$2250, upon which the Lambs removed to the vicinity of London, first to Enfield and finally to Edmonton; but Mary Lamb's increasing insanity, Charles's separation from his literary friends, and the death of Coleridge in 1834, combined to surround the last years of the genial author's life with melancholy. In December, 1834, a fall brought on an attack of erysipelas, and he died on the 29th of the month, and was buried in Edmonton church-yard. Mary Lamb survived him nearly thirteen years, dying in May, 1847. See Talfourd, *Life and Letters of Charles Lamb* (1837), and *Final Memorials* (1848); W. C. Hazlitt, *Mary and Charles Lamb* (1874), and the Lives and editions of works by Fitzgerald (1870-76), and Canon Ainger (1888).

LAMB, JOHN, 1735-1800; b. New York. He was engaged with his father in the business of an optician and maker of mathematical instruments at the beginning of the revolutionary war, but at 40 years of age enlisted in the army and took a prominent part in Montgomery's unsuccessful expedition against Quebec, in which he was wounded and taken prisoner. He afterwards served under Gen. Knox as maj. and col. of artillery, doing good service to the end of the war.

LAMB, MARTHA JOAN READE (maiden name, Nash), b. Mass., 1829. Her chief work is the *History of the City of New York*, the valuable result of many years of patient labor and research. She was editor of the *Magazine of American History*. Died Jan. 2, 1893.

LAMB, MARY ANNE. See **LAMB, CHARLES**.

LAMB, WILLIAM, LORD MELBOURNE. See **MELBOURNE**.

LAMBALLE, MARIA THERESA LOUISA OF SAVOY-CARIGNAN, Princess of, a victim of the French revolution, was b. at Turin, Sept. 8, 1749, and was the daughter of prince Louis Victor Amadeus of Carignan. She was very beautiful and amiable, and was married in 1767 to Louis Alexander Joseph Stanislaus de Bourbon, prince of Lamballe, who soon after died a victim of debauchery. The princess became the intimate friend and chosen companion of Marie Antoinette. At the time of the attempted flight of the king and queen she sought refuge in England, but returned to them in Feb., 1793. After the events of Aug. 10 she received permission to share the captivity of the queen, but was soon separately immured in the prison of La Force, and on Sept. 3 was brought before the tribunal, and commanded to swear that she loved liberty and equality, and hated the king, the queen, and royalty. "The first oath," she replied, "I will swear, but the rest I cannot; my heart rebels against it." Many of those who stood by were anxious that she should escape, but she did not hear the advices which they addressed to her. "Let madame go!" said the president; and at this signal of death two men conducted her to the door, where she received a stroke of a sabre on the back of her head, when blood spouted up and her long hair fell down. On receiving a second stroke she fell, and the murderers tore her body to pieces, placed her head and heart upon pikes, and brutally paraded them before the windows of the Temple.

LAMBEAUX, a cross, in heraldry, is a cross formed in the upper like a cross pattée, but with the lower limb not widened, but terminating in a label of three points, "having," according to Sylvanus Morgan, "a great deal of mystery in relation to the top, whereon the first-born Son of God did suffer, sending out three streams from his hands, feet, and sides."

LAMBER, JULIETTE (MME. ADAM), French author, was born at Verberie in 1836. Her first husband was M. de la Messine, her second, Antoine Edward Adam (d. 1877), a prominent politician, who was Préfet de Police in Paris during the siege of 1871. Mme. Adam remained with him, and in 1871 published an account of her experiences under the title of *Le Siège de Paris; Journal d'une Parisienne*. She has written some tales, but her writings are chiefly on political and social subjects, particularly literature, education, and the position of women. Among her works are *Païenne*, 1883; *La Patrie Honnoise; Souvenirs Personnels*, 3d ed. 1884; *Le Général Skobelev*, 1886, etc. The *Nouvelle Revue*, started by her in 1879, and her salon, have been important agencies of the extreme Republicans.

LAMBERT, DANIEL, 1769-1809; an Englishman noted for his gigantic size. Until he reached his 19th year he was not remarkable for weight or dimensions, but from that period continued to grow, until at his death, he measured 5 ft. 11 in. in height, 9 ft. 4 in. girth, 3 ft. 1 in. round the leg, and weighed 739 lbs.

LAMBERT, FRANCIS, or **LAMBERT** of Avignon; so called from the name of his native place; 1486-1530; was one of the early apostles of the reformation. He became a gray friar when only 16 years of age, was ordained a priest, and preached with success. In 1522, having been refused permission to join the Carthusians, he attached himself to the cause of Martin Luther, and embraced the doctrines of the reformers. He now threw aside the garb of his order, assumed the name of John Serranus and began to preach the reformed faith in Germany and Switzerland. He joined Luther in 1523 at Wittenberg, and thence, having written his commentaries on Hosea and other works, proceeded to Metz and Strasburg. A Protestant academy having been established at Marburg, he became its first professor of theology; and in 1529 took part in a general conference held at that place of theologians from the different German provinces.

LAMBERT, JOHANN HEINRICH, a philosopher and mathematician, was b. Aug. 29, 1728, at Mülhausen in Upper Alsace. He was the son of a poor tailor; but his talents and application to study having gained him friends, he obtained a good education, and made remarkable progress in mathematics, philosophy, and oriental languages. He obtained a situation as clerk in an office, and gradually rose, till Frederick, in 1764, summoned him to Berlin and made him a member both of the council of architecture and of the academy of sciences. He died at Berlin, Sept. 25, 1777, leaving behind him the renown of having been the greatest analyst in mathematics, logic, and metaphysics that the 18th c. had produced. He was the first to lay a scientific basis for the measurement of the intensity of light, in his *Photometria* (Augsb. 1760), and he discovered the theory of the speaking-tube. In philosophy, and particularly in analytical logic, he sought to establish an accurate system by bringing mathematics to bear upon these subjects in his *Neues Organon oder Gedanken über die Erforschung und Beziehung des Wahren* (2 vols., Leip. 1764). Of his other works we may mention his profound *Kosmologische Briefe über die Einrichtung des Weltbaues* (Augsb. 1761).

LAMBERT, JOHN, an English parliamentary gen., was b. at Kirkby-Malhamdale, in Yorkshire, Sept. 7, 1619, and on the outbreak of the civil war became a capt. under Fairfax. He fought at Marston Moor, at Naseby, in Scotland, and at Worcester, but did not acquire importance till after the death of the great protector, when he became the head of the cabal of malcontent officers who overthrew the feeble administration of Richard Cromwell. Lambert was now looked upon as the leader of the fifth monarchy or extreme republican party; suppressed, with considerable vigor, the royalist insurrection in Cheshire, Aug., 1659; and two months afterwards, dismissing the remnant of the Rump parliament, virtually governed the country along with his officers under the title of the "committee of safety." For a brief period his position was considered so important that Charles II. was advised to make terms with him by marrying his daughter. The counterplot of Monk, however, frustrated all his designs; and on April 22 he was taken prisoner by col. Ingoldsby, tried in 1662 and banished to the isle of Guernsey, where he died in 1692.

LAMBERTVILLE, a city in Hunterdon co., N. J.; on the Delaware river, the Delaware and Raritan canal, and the Pennsylvania railroad; 46 miles n. of Philadelphia. It contains the Stryker public library, Masonic hall, electric light plant, national banks, Washington headquarters, and waterworks supplied from wells, and has railroad shops, rubber, paper, and grist mills, iron foundry, spoke and wheel works, and canning factory. Pop. '90, 4142.

LAMBETH, a parliamentary borough of England, in the county of Surrey, forms a great part of the s. w. quarter of London. It is said to cover an area of 8840 acres and had, in 1891, a pop. of 275,203. Besides Lambeth palace, which has been the official residence of the archbishops of Canterbury for several centuries, it contains Astley's theatre, the site of the once famous Vauxhall gardens, and the Surrey zoological gardens.

LAMBETH ARTICLES. The Calvinistic doctrine of predestination and free-will, having been brought by the refugees from the continent to England, was favored by Prof. Cartwright of Cambridge, but opposed by Barrett, a fellow of Caius College. Archbishop Whitgift directed him not to preach such doctrine again. Dr. Whittaker, the regius professor, supported the doctrines, and he and his party drew up nine articles which they submitted to the archbishop, who, Nov. 10, 1595, called at Lambeth an assembly to consider the question, consisting of Fletcher, the elect of London; Vaughan, elect of Bangor; Trindall, dean of Ely; Whittaker, and the Cambridge divines. They drew up the following nine articles, known as the "Lambeth Articles": "1. God from eternity predestinated certain persons unto life, and reprobated certain persons unto death. 2. The moving cause of predestination to life is not the foresight of faith, or of perseverance, or of good works, or of anything that is in the persons predestinated, but the alone will of God's good pleasure. 3. The predestined are a predetermined and certain number, which can neither be lessened nor increased. 4. Such as are not predestinated to salvation shall inevitably be condemned on account of their sins. 5. The true, lively, and justifying faith, and the Spirit of God justifying, is not extinguished, doth not utterly fail, doth not vanish away in the elect, either finally or totally. 6. A true believer—that is, one who is endued with justifying faith—is certified by the full assurance of faith that his sins are forgiven, and that he shall be everlastingly saved by Christ. 7. Saving grace is not allowed, is not imparted, is not granted to all men, by which they may be saved if they will. 8. No man is able to come to Christ unless it be given him, and unless the Father draw him; and all men are not drawn by the Father, that they may come to his Son. 9. It is not in the will or power of every man to be saved." The archbishop approved the articles Nov. 20, 1595, and sent them to Cambridge, but the queen ordered them to be recalled, and severely censured the archbishop.

LAMBETH DEGREES. Degrees conferred in arts or laws by the Archbishop of Canterbury in England.

LAMBINUS, DIONYSIUS (DENYS LAMBIN). A great French classical scholar born at Montreuil in 1520; died 1572. He was Professor of Greek at the Collège Royal in Paris (1561) and won fame by his editions of classical authors especially Lucretius (1564), Cicero (1566), Horace (1561), and Demosthenes (1570).

LAMBREQUIN, a word used in heraldry in three senses: 1. The mantling attached to the helmet, and represented as depending over the shield (see MANTLING); 2. A wreath (q.v.); 3. The point of a label. See LABEL.

LAMBTON, a co. in s.w. Ontario, Canada, bounded on the n. and the n.w. by lake Huron, and on the w. by the river St. Clair, which is navigable by large steamboats; 725 sq. m.; pop. '91, 47,715. It is intersected horizontally by three railroads—the Grand Trunk railroad, the Port Sarnia branch of the Great Western railway, and the St. Clair branch of the Canada Southern railway. It is drained by the Little Bear and Black creek in the s., and a few small streams in the n. and n.e. It has a fertile soil, and along the shore of the lake are beaches of sand and Silurian limestone, near which are tangled forests of cedar and fir in the almost impenetrable swamps; while in the interior the soil is more sandy and the trees are scattered and scrubby. It has saw, grist, and shingle mills, and manufactories of wooden and iron ware. It has springs of petroleum oil in the southern portion, at Oil Springs, and at Petrolia. Seat of justice, Sarnia.

LAMEGO, an old t. of Portugal, in the province of Beira, is situated amid rocky mountains on an affluent of the Douro, about 8 m. from that river, and 43 m. e. of Oporto. It contains a Gothic cathedral and a bishop's palace. Pop. 8100.

LAMEL LIBRANCHIA'TA, a class of acephalous mollusks, all of which have bivalve shells (see BIVALVES), and which respire by gills in the form of vascular plates of membrane attached to the inner surface of the mantle. Oysters, cockles, and mussels are familiar examples. The *adductor* muscle, which closes the shell, is single in some, double in the greater number. More important differences exist in the powers of locomotion possessed by some, and denied to others. Thus, oysters are fixed to one spot by one of the valves of the shell; but most of the lamellibranchiata have the power of moving by swimming, leaping, or burrowing in sand, sometimes in more than one of these ways, being provided for this purpose with a fleshy muscular organ called the *foot*. Some, as mussels, when they have found a suitable place, fix themselves there by a *byssus* (q.v.). The mouth of the lamellibranchiata is jawless and toothless, and all seem to depend for their food on the currents of water continually brought by ciliary action into the mouth. They all seem more or less sensitive to light, and numerous small red spots on the edge of the mantle of some are supposed to be eyes.

LAMELLICORNES, a very numerous family of coleopterous insects, of the section *pentamera*, containing the largest of the beetles, as well as many species remarkable for peculiar conformations of the head and thorax. The three last joints of the antennæ are flattened into lamellæ, which are sometimes disposed like the leaves of a fan, sometimes like teeth of a comb. Many of the lamellicornes feed on decaying animal or vegetable matter, but some on leaves or flowers; the latter are generally of brilliant metallic colors; the former, black or brown. The larvæ are soft, cylindrical, with six small legs, and the body always curved. Dung-beetles, stag-beetles, cock-chafers, etc., belong to this family.

LAMELLIROSTRÉS, in the system of Cuvier, a large group of web-footed birds (*palmipeds*), distinguished by a thick bill having tooth-like *lamellæ* at its edges, apparently more for the purpose of straining water from the food than of masticating or comminuting it. The *anatidæ* and *mergidæ* (ducks, swans, geese, goosanders, and mergansers), constitute the group of lamellirostrés.

LAMENNAIS, HUGUES FÉLICITÉ ROBERT DE, a celebrated politico-religious writer of France during the present century, was born of a family engaged in the shipping-trade at St. Malo, June 19, 1782. With the exception of some instruction in Latin, which he received from his elder brother, Lamennais was, owing to the revolutionary troubles, almost entirely self-taught. His early turn of thought was strongly religious, as well as decidedly literary; and resisting all his father's efforts to fix him in commercial life, he pursued a literary career, and in 1807 received an appointment as teacher of mathematics in the college of his native town. His first work, published in the next year, *On the State of the Church in France during the 18th Century*, is written in a strain of high orthodoxy, and directed against the materialistic philosophy of the 18th c., its influence still subsisting in the literature of his own time. A few years later—having meanwhile taken the clerical tonsure—he produced, in conjunction with his brother, a treatise *On the Tradition of the Church on the Institution of Bishops*, which arose out of the conflict of Napoleon with the Holy See as to the affairs of the church in France. During the Hundred Days he was obliged to flee to England, where he was received by the celebrated abbé Caron; and on his return to France he entered the seminary of St. Sulpice, where he received priest's orders in 1816. A year afterwards he published his most celebrated work on the side of orthodoxy, *An Essay on Indifference in Religion*, which is a work of exceeding acuteness, and of great learning and brilliancy. In this work, however, he pushes the claim of authority to such a length, and makes all reasoning resolve itself so completely into authority, that even those who agreed in the conclusion at which he arrived, were not surprised at the recoil by which, this principle of authority once abandoned in his after conflict with the church, his mind rushed into the opposite extreme of utter and unlimited unbelief. The celebrity which this work won for him led to a design on the part of the pope, Leo XII., to promote Lamennais to the cardinalate. This design, however, was afterwards abandoned. Lamennais's political views, from the first moment of the restoration, had been liberal. Nevertheless, he joined himself to a powerful and active section of the most distinguished members of the royalist and church party—Chateaubriand, De Bonald, Frayssinous, and others, the organ of which was a journal named the *Conservateur*, and afterwards the *Defenseur*, and the *Drapeau Blanc*; but he rapidly outstripped the views of most of his colleagues. He was fined, in 1824, for a work *On the Relations of Religion and Politics*. After the revolution of 1830, while he adopted in its fullest sense the doctrine of the sovereignty of the people, he continued a zealous adherent of the faith of the church; and he established a journal called *L'Avenir*, the aim of which was to reconcile liberty and religion. The doctrines of this journal were censured by the pope, Gregory XVI., in 1832; and Lamennais, in obedience to the papal sentence, discontinued his journal, and professed his future submission to authority; but from this date his opinions underwent a rapid change, and in a work which he published in the year 1834, and which obtained an immediate and unprecedented popularity in France, *Paroles d'un Croyant*, proclaimed his complete and irreconcilable rupture with the church of which he had long been the champion. The work was immediately condemned at Rome: but it passed in France through innumerable editions, and was translated into all the languages of Europe; and the author's reply to the papal condemnation was in a still more pointedly aggressive work, in 1836, entitled *Affaires de Rome*. His successive publications, *The Book of the People* (1837); *The Country and the Government* (1840); *On Religion* (1841); *The Guide of the First Age* (1844); *A Voice from Prison* (1846); were but so many new utterances of the most extreme democratic principles. The revolution in his religious sentiments was equally decisive and complete; he not merely ceased to be a Romanist, but even a believer. In his last illness, he declined all religious ministrations; and at his death, which occurred Feb. 27, 1854, he gave directions that his interment should not be marked by any religious ceremony. His *Posthumous Works* were published in 1855-59. The most elaborate work of Lamennais's latter period is his *Esquisse d'une Philosophie* (4 vols., 1840-46).

LAMENTATIONS OF JEREMIAH (*Megillath Echa*; LXX., *Thrēnoi*), the name given to one of the canonical books of the Old Testament, containing laments over the desolation of the land, the exile of the people, the destruction of the first temple, the fall of the kingdom of Judah, and the writer's own woes. These laments are five in number, and are closely connected in regard to their subject-matter; but considerable diversity of opinion exists concerning their artistic relation to each other. Some, as De Wette, Ewald, and Keil, have tried to show that they are really parts of one poem; others, as Eichhorn and Bertholdt, that they were originally quite independent and isolated elegies; while a third party, as Lowth and Davidson, hold that there is a certain pervading harmony of sentiment and idea, indicating, probably that they were composed by the poet-prophet under the same condition of religious feeling. The structure of the laments is very artificial. These lamentations have been universally acknowledged by the Jews as the work of their weeping prophet, and have his name attached to them in the

Septuagint version—made about 260 B.C.—which declares also that he wrote them very soon after the Jews had been carried captive and their city destroyed. This declaration the subject-matter and style very well sustain. The book is divided into five parts by peculiarities of structure which, appearing fully in the original, are partly preserved in the Septuagint, but are noticed in the English translation only by the number of chapters and verses being retained. The first, second, and fourth parts each contain 22 verses, which, with one or two variations, are arranged in the order of the Hebrew alphabet and all begin with the corresponding letter; the third multiplies this arrangement by three—each letter beginning three verses in succession—so that the whole number of its verses is 66; and the fifth contains 22 verses, but their initial letters are not in alphabetic order like the rest. I. Lamentation over the solitariness of Jerusalem after the people had been carried captive: the change in its civil state and religious privileges mourned over; its sins acknowledged as the justly procuring cause; its friends complained of as false, timid, and cruel; the Lord penitently sought as the only source of help. II. The destruction of the city lamented: of its dwellings, palaces, altars, temple, gates, walls, ramparts, and strongholds; the sufferings of little children bewailed; mourning by the young and old over the strong and the weak slain in the streets; the sorrow aggravated by the exultation of enemies over the city that had once been called “the perfection of beauty and joy of the world;” the false prophets condemned for misleading the people; and the Lord again invoked as alone able to save. III. Lamentation of the prophet as representing the people himself, and perhaps Christ, who was thought by some to be Jeremiah, probably because of his tears over the sins and sorrows of men, his estimate of himself as eminently the man who had seen affliction through the visitation of God upon sin; his hope arising in darkness through his remembrance of the divine mercy, compassion, and faithfulness; his conviction of the good resulting from both hoping and waiting for the salvation of God, and from bearing the yoke submissively, seeing that afflictions have a benevolent design and are not to continue forever; the afflicted exhorted to try their ways, acknowledge their transgressions, and turn to the Lord; deliverances recounted which the prophet had already received from the depths of the dungeon into which he had been cast. IV. Lamentation over the desolation of the land, especially as contrasted with its former prosperity and glory: the sons of Zion, once regarded as fine gold, now compared to earthen vessels; mothers once tender and self-denying, now selfish and cruel; persons once living in luxury and clothed in scarlet, now desolated and defiled; the protracted misery of Jerusalem regarded as more bitter than the sudden destruction of Sodom; and all this confessed to be the result of its own transgressions, of the sins of its prophets, and the iniquities of its priests. V. Final appeal to the Lord as alone able to deliver and willing to forgive: the calamities of the nation again recited; the sins that caused them penitently confessed; and God, as eternal and almighty, entreated to turn his people back to himself and to renew the blessings they had formerly enjoyed.

LAMETH, ALEXANDER, 1760-1829. On his return from the war in America, he was elected to the Constitutional Assembly, but, hampered by the tendency to demagogism, he returned to service in the army. As marshal under Lafayette he was imprisoned for three years in Olmütz, Austria. In 1815 he was given the title of Count by Napoleon.

LAMETH, CHARLES MALO FRANÇOIS, 1757-1832; brother of the preceding; French general. He took part in the American war of independence and on his return home he was elected to the National Assembly. Opposing the Jacobins as to dethroning the king, after a short imprisonment he went to Hamburg, but returned in 1800 to France. In 1809 he became governor of Würzburg and in 1827 was chosen a deputy.

LA METTRIE, JULIEN OFFRAY DE, 1709-51; b. France; educated for the church, he was disinclined to adopt that profession, and studied medicine at Leyden with Boerhaave. Being in Paris in 1742 he was appointed physician to the *gardes française*, and, with his regiment, was present at the important battles of Fontenoy and Dettingen. In 1745 he began to make public atheistic views which he had formed, the result being that he was deprived of his position and driven out of France and Holland. Up to this time he had published three philosophical treatises: *Histoire Naturelle de l'Âme*; *Politique du Médecin de Machiavel*; and *L'Homme-machine*. Having attracted the attention of Frederick the Great, he was by him invited to Berlin, appointed to a position, and encouraged to continue his authorship. He accordingly wrote *L'Homme-plante*; *Réflexions sur l'Origine des Animaux*; and *Vénus Métaphysique, ou Essai sur l'Origine de l'Âme Humaine*. The materialism of Mettrie was due to the effect upon his mind produced by a serious fit of sickness. Finding that his mind and body were apparently becoming enfeebled together, he conceived the idea that the death of the soul must be simultaneous with that of the body. Voltaire, who was best acquainted with him, said he was “a fool that never wrote except when intoxicated.”

LAMIA was a female demon whose name was used by Greek mothers to frighten their children. She is also known as a prototype of the modern vampire (q.v.). Viewed in this light, Goethe has used the tale as the subject of one of his most powerful poems, *Die Braut von Corinth*. Lamia is the feminine form of Lamius, who was king of the Laestrygonians. At an early period in some parts of Greece, both of these beings were worshipped as gods, but this worship soon disappeared and the names have been preserved only in legend.

LAMINA (Latin). A thin layer or coat, which may be laid over another; or a plate or scale; as a thin layer of minerals, bone, etc. In Anatomy a bone or part of a bone said to resemble a thin plate, as the cribriform plate of the ethmoid bone. In Botany, the broad thin petal of a flower, or what is called the blade of a leaf, is technically known as a *lamina*.

LAMINA'RIA. See TANGLE.

LAMINA'TION, the arrangement of rocks in thin layers or laminae, the condition of a large proportion of the earth's strata. Shale deposits exhibit this structure very plainly, being frequently easily separable into the thin laminae in which they were originally deposited. Shale is the fine sediment that settles down at the bottom of some tranquil or slightly moving water. The laminae indicate interruption in the supply of the materials, which may have been occasioned by successive tides, by frequent or periodical floods, or by the carrying medium having access to a supply of different material, passing, e.g., from mud to sand, and back again to mud. The laminae of the brick-clay deposits are separated, in many places, by the finest sprinkling of sand, which is almost invisible in the vertical sections. The layers are occasionally obvious, from their being of different shades of color, often produced by the bleaching of the layers when they were deposited; but frequently the various laminae of a bed are so united, and the bed so homogeneous, that except when the face is exposed to weathering, the laminated structure is not visible. This condition seems to have resulted from the shortness of the interruptions in the deposit not permitting the solidification of any of the layers until all was deposited, when the whole set cohered together as a single bed. See *illus.*, STRATA, vol. XIV.

LAMMAS-DAY, Aug. 1, is one of the cross quarter-days, or half-quarter days, in England. On this day, which is the feast of St. Peter ad Vincula, it was customary in early times to make offerings of the first-fruits of the harvest, and hence the feast took the name of *Ilafmesse* (Ang.-Sax., loaf-mass or loaf-festival), afterwards corrupted into Lammas. In Scotland, it is the practice with farmers to pay the half-year's rent due at Whitsunday on Lammas-day.

LÄMMERGEIER (*Gypaëtos barbatus*), a large bird of prey, also called the BEARDED VULTURE, BEARDED GRIFFIN, and GIER-EAGLE. It is the only known species of its genus, which forms a connecting link between vultures and eagles, although commonly ranked among the *vulturidae*, to which it approaches most nearly. The full-grown lämmergeier is of a shining brownish black on the upper parts, with a white stripe along the shaft of each feather; the head is whitish, with black stripes at the eyes; the neck and underpart of the body are rusty yellow. It is 4 ft. high when sitting; nearly 5 ft. long; and from 9 to 10 ft. in expanse of wing. It is very bold and rapacious, swooping down on hares, lambs, young goats, chamois, etc., and sometimes carrying off children. It lives on animals newly killed, eating carrion only when pressed by necessity. It was once pretty common in the Alps, but is now rare. It is found also in the Pyrenees, and in the mountains of Asia, South America, and the n. of Africa, and will soar high above the loftiest peaks.

LAMMERMOORS, a range of low hills in Scotland, running in an e.n.e. direction for one half of their length on the boundary-line between East Lothian and Berwickshire, the other half lying in the south-eastern corner of the former county, and forming, where it meets the German ocean, a bold, rocky, and dangerous coast. The Lammermoors send off several minor ranges southwards into Berwickshire. The highest summits are Lammer Law (1733 ft.) and Spartleton (1534 feet).

LAM'NIDE, a family of sharks, represented by two well-defined groups, viz.: *lamnae*, having lanceolate teeth, sigmoidally curved and not serrated, including the mackerel or green-back shark, and the ferocious *man-eater* of the American coast; and *carcharodontes*, having triangular and serrated teeth, including *carcharodon Atwoodii*. Enormous teeth of carcharodon have been found in the tertiary formation and occasionally in the cretaceous, and teeth undistinguishable from carcharodon have been dredged from great depths in the Atlantic ocean by the "*Challenger* expedition." Remains of other sharks have been found occasionally in the paleozoic, more frequently in cretaceous (upper greensand), and in eocene tertiary (London clay).

LAMOILLE, a co. in n. Vermont, watered by branches of the Onion river; the Lamoille flows through it centrally, and a few small lakes appear in the northern section; 450 sq.m.; pop. '90, 12,831. It includes some of the northern spurs of the western range of the Green mountains, and the three peaks of mount Mansfield in the western part, 20 m. n.w. of Montpelier, and 24 m. s. by n. from Burlington, the highest having an altitude of 4430 ft. above the level of the sea, and called respectively the Chin, the Nose, and the Forehead. The rocks on these mountains are partly of old red sandstone, containing iron ore and manganese, and in some localities have a geological formation consisting of hornblende, granite, and gneiss. Co. seat, Hyde Park.

LAMOILLE RIVER, in n. Vermont, rises in Longpond, about 30 m. n.e. of Montpelier, in the extreme s. part of Orleans co. After flowing s.w. for a short distance in Caledonia co., it changes its course to w.n.w. through Lamoille co., and again to s.s.w. in Franklin co., thence through Chittenden co. emptying into lake Champlain near the s. extremity of Grand Island.

LAMONT, DANIEL SCOTT, was born at Cortlandville, N. Y., in 1851. He studied at Union College, having already had some experience in politics as Deputy Clerk to the State Assembly, and as delegate to the State Convention in 1871. Subsequently he was Chief Clerk in the N. Y. State Department; and in 1875, Secretary to the Democratic State Committee. During Cleveland's term as Governor, Mr. Lamont was his Military Secretary, and when his chief became President in 1885, he followed him to Washington as private secretary, in which position he became widely known. From 1889 to 1893 Mr. Lamont engaged in business in New York, but in March, 1893, was appointed Secretary of War in Mr. Cleveland's second administration.

LAMORICIÈRE, CHRISTOPHE LÉON LOUIS JUCHAULT DE, a French general, was b. at Nantes, Feb. 5, 1806, studied at the école polytechnique, and after the revolution of 1830 went to Algeria as a lieutenant of engineers. In 1833 he became chief of the battalion of zouaves; in 1835, lieutenant-col.; and in 1837, colonel. He particularly distinguished himself at the siege of Constantine. In 1843 he was appointed a general of division; in the following year commander of the legion of honor; and in 1845, interim-governor of Algeria. To him belongs the glory of concluding the war in Africa, where he had made no fewer than 18 campaigns, by forcing Abd-el-Kader to surrender in 1847. On the outbreak of the revolution in Feb., 1848, he nearly lost his life in endeavoring to proclaim the regency of the duchess of Orleans. In June, 1848, he commanded the attack on the barricades, and quelled the anarchic tumults of the socialists. He was war minister during the government of gen. Cavaignac, to whose republican party he afterward attached himself in the legislative chamber; but being a very decided opponent of the schemes of Louis Napoleon, he was arrested on the occasion of the *coup d'état* of Dec. 2, 1851, and at first imprisoned in Ham, but afterward conveyed out of France and set at liberty. During his exile, which he spent in Germany, Belgium, and England, the great soldier became *devout*, as his countrymen phrase it; and when the Italian war of independence threatened the safety of the pope, Lamoricière proceeded to Rome in 1860, and was appointed by Pius IX. commander of the papal troops. He was, however, compelled to surrender with his whole force to the Sardinian gen., Cialdini, at Ancona. D. 1865.

LA MOTTE-FOUQUÉ. See **FOUQUÉ**.

LA MOTTE-VALOIS, JEANNE DE LUZ DE ST. RÉMY, Comtesse de, 1756-91; b. Champagne, France; an irregular descendant of Henry II. She was an adventuress who married a worthless count de La Motte, was involved in intrigues with the cardinal de Rohan; afterward, in some crime concerning a diamond necklace which, in her memoirs, she accuses Marie Antoinette of having been an accessory to; was condemned, evaded prison, and escaped to London, where in a revel she is said to have fallen out of a window and died. She is supposed to have been under pay of Marie Antoinette. The memoirs alluded to were seized on their first appearance by the authorities, and the entire edition searched for and supposed to be destroyed; but it subsequently reappeared under the title of the *Vie de la Comtesse de La Motte*.

LAMOURE, a co. in southern N. Dakota, formed in 1873; about 1152 sq. m. It is watered by the James river and intersected by the Northern Pacific and other railroads. Pop. 1890, 3187. Co. seat, Lamoure.

LAMOUREUX, CHARLES, musician, b. in Bordeaux, Sept. 21, 1834. He studied in the Paris Conservatoire, winning the first prize for the violin in 1854. For many years he was solo violinist in various theaters in Paris, and in 1860 he founded a society for chamber-music, where he produced many novelties. He also organized the Société de l'Harmonie Sacrée, giving with this *The Messiah*, Bach's Passion music, and other great works unfamiliar to the French public. In 1881 he organized the Nouveaux Concerts at the Cirque des Champs Élysées.

LAMOV, or Lomov, the name of two towns of European Russia, in the government of Penza, and on the river Lamov, a branch of the Mokscha, which itself is, through the Oka, a feeder of the Volga. Verknii Lamov (Old or Upper Lamov) is 65 m. w.n.w. from Penza. It has seven churches. Pop. 5200. Nijni Lamov (New or Lower Lamov) is 68 m. w.n.w. of Penza. Pop. 8215.

LAMPADEPHORIA, the name given to a ceremony customary in Athens at the celebration of the festivals of the so-called "fire-gods," Prometheus, Vulcan, and Minerva. Runners carrying lighted torches ran races between the altar raised to these gods in the outer Ceramicus, on the s. side of the Acropolis, and the latter point, which was the goal. The distance was about half a mile, and the object was to convey the lighted torch to the goal without permitting it to be extinguished. This was accomplished by means of different lines of runners, each of whom carried the torch in turn, passing it to his successor, the line whose torch first reached the goal still burning being considered victorious. The ceremony is supposed to have symbolized the theft of fire by Prometheus from the chariot of the sun.

LAMPÁSAS, a co. in central Texas, has for its w. boundary the Colorado river and a small branch. Area, 800 sq.m.; pop. '90, 7565. Co. seat, Lampasas.

LAMP-BLACK, the soot produced by burning resin, turpentine, pitch, oil, and other matters, in such a manner that large volumes of smoke are formed and collected in

properly arranged receptacles. Lamp-black is the coloring matter of black and slate-colored paints.

Large quantities of this pigment are made in Germany by burning the refuse resin and fragments of fir and pine trees. The combustion is carried on slowly, and the dense smoke passes up a long flue, at the top of which is a large hood made of coarse woolen cloth. In this hood the carbon is deposited rapidly at the rate of 20 to 30 pounds an hour, which is collected by lowering the cloth hood, and shaking it out. In Great Britain a similar process is adopted; but large quantities of an inferior kind are also collected from the flues of coke-ovens; and a superior kind, known as *bone-black*, is obtained from the flues of kilns in which bones are calcined for manure. By mixing lamp-black in various proportions with white-lead, every gradation of color, from jet black up to slate and gray, can be easily produced.

LAMPEDUSA (anc. *Pelagia*), a small uninhabited island in the Mediterranean sea, about midway between Malta and the coast of Tunis. It belongs to the kingdom of Italy, having been formerly a dependency of Sicily. It is about 7 m. in length, and in most places not quite one m. in breadth, its circuit being about 13 miles. The w. part of the island is covered with dwarf olives; and these and other shrubs supply great quantities of firewood, both to Tripoli and Malta. Great numbers of wild goats inhabit the island. Lampedusa was at one time inhabited. Near it are the two islets of Lampione and Linosa.

LAMPOON. (French, *lampon*, "a drinking song.") This term is applied to any stinging satire written with a direct purpose to vex, reproach, or abuse particular individuals; as distinguished from satire directed against vice and folly. Its use probably arose from the fact that drinking songs often contain personal abuse or satire which is allowed to pass unnoticed when the writer or singer has been drinking deeply.

LAMPREY, *Petromyzon*, a genus of cartilaginous fishes, dermopterous (q.v.), and having a circular mouth formed for sucking (*cyclostomous*). They are of eel-like form, and have no scales. The skeleton is very soft and imperfect. The tongue acts as a piston in the sucking mouth, which is armed with numerous hard teeth, or tooth-like tubercles. There are seven roundish gill-orifices on each side; the German name is *Neun-Augen* (nine-eyes). Lampreys have the power of drawing in as well as of expelling water through the gill-orifices, and thus respiration is carried on even when they are firmly attached to some object by the sucking mouth. Lampreys often attach themselves very firmly to stones, and seem to rest with the body floating in the water: they live by sucking the blood of fishes, the skins of which their teeth readily pierce, and which are unable to shake them off. They eat also any soft animal matter. The species are numerous, and are widely distributed in the seas of different parts of the world. Some of them are periodical visitants of fresh waters, as the COMMON LAMPREY (*P. marinus*), found on the shores and in the rivers of most parts of Europe. It sometimes attains a length of more than 3 ft., and is often 2 ft. long. It ascends rivers in the latter part of spring or beginning of summer, for the purpose of spawning. It was formerly in the highest esteem for the table, and it is an old custom for the city of Gloucester to present a lamprey pie annually to the sovereign. Worcester is also famous for its lamprey pies and potted lampreys. In Scotland a strong prejudice exists against the lamprey.—The lamprey of North America, although very similar, is said to be a distinct species (*P. Americanus*).

LAMPRIIS, a genus of fishes belonging to the family *scomberidæ* or mackerel family; body oval, greatly depressed, small deciduous scales; teeth wanting in adults, small mouth; a single elevated and elongated dorsal fin, sides of tail carinated, numerous pyloric cæca, and a large, posteriorly bifurcate air-bladder. See ОРАН.

LAMPS are contrivances in which to burn any light-giving material, and so make use of its illuminating power. The most primitive lamps were probably the skulls of animals, in which fat was burned; and certain sea-shells formed admirable lamps for those to whom they were attainable. To this day, there may occasionally be seen suspended in the cottages of Zetland, shells of the "roaring buckie" (*Jusis antiquus*: see FUSUS), which form, perhaps, the most ancient kind of lamp in existence.

When pottery and metal began to be used, the principle of these natural lamps was for a long time retained, as seen in ancient Egyptian, Greek, and Roman lamps, and in the stone cups and boxes of northern nations. The invention of lamps has been attributed to the Egyptians, but it is far more probable they received it from the older civilization of India. Herodotus (ii. c. 62) reminds us of the Chinese feast of lanterns, by speaking of the feast of lamps at Saïs, in Egypt. Such lamps were called *lychna* by the Greeks, and *lucernæ* by the Romans, and various modifications of the form are frequently found in the ruins of Greek and Roman cities; very considerable numbers have been obtained from the excavations of Tarsus and of Pompeii and Herculaneum. The principle in all is the same. At first, these *lucernæ* were made of unglazed pottery, and only with one wick-hole; but better material and more elaborate forms were introduced, and their light-giving power was increased by their being made to hold several wicks, from two to twelve. The wick used in this lamp was generally made of flax-tow sometimes, however of rushes and other vegetable fibers.

Amongst the northern nations of antiquity, lamps were in use, but the difference of climate necessitated a different kind of lamp. The limpid oils of the present day were unknown to our Celtic and Saxon forefathers; besides, the cold winters would have solidified them, and they would not have been drawn up by the wick, if arranged as in the old Roman and Greek *lucernæ*. The solid fat of various animals was their chief illuminating material, except on the sea-coast, where seal and whale oil occasionally helped them. Small open stone pots, afterwards exchanged for metal, were used, and being partly filled with grease, a wick was thrust down through the middle, and being lighted, consumed the fat as it melted. Stone cups of this kind are occasionally dug up in Scotland and elsewhere: in principle, they are the same as the *padelle*, used in Italian illuminations, and the old grease-pots, which formed the foot-lights of our theaters not many years since, and which may still occasionally be seen in the traveling-shows at country fairs. The Esquimaux form square boxes of soap-stone, and use them in the same way.

No great improvement took place in the construction of lamps until the beginning of the present century. Taste had been shown in the designs, but the principle remained the same; a wick sucking up oil from the reservoir of the lamp to supply itself during combustion, and nothing more, if we except the improvement effected by the invention of M. Argand in 1784. See ARGAND. In 1803 M. Carcel, another Frenchman, made an excellent improvement on the lamp by applying clock-work, which acts by raising the oil up tubes in connection with the wick, so that the latter is kept continually soaked. If properly managed, this is perhaps the best of all oil-lamps, as it will keep up a well sustained and brilliant light for seven or eight hours, and the light rather increases than otherwise as the lamp burns and becomes warmer, thereby rendering the oil more limpid. But the Carcel lamp has two disadvantages; it is expensive, and is easily disarranged, therefore it has never become common.

The French moderator lamp is much simpler, and appears to overcome the difficulties of the case. The body of this lamp consists of a cylinder or barrel, the lower part of which contains the store of oil. On the top of the oil rests a piston, which is constantly pressed down by a spiral spring, situated between it and the top of the barrel. Through the piston is inserted a small tube, which passes up to the burner at the top; and the pressure of the spring on the piston causes a constant stream of oil to rise up through this tube and feed the wick. What is not consumed flows over the burner, and back into the barrel above the piston. It is above the piston also that fresh oil is introduced. When the piston has reached the bottom, it is wound up again by a rack and pinion, and a vacuum being thus formed, the oil above it is forced to the under side through a valve kind of contrivance round its edge.

It is obvious that in this machine the flow of oil will be greatest when the piston has been newly wound up, and the spring is at its greatest tension. This inequality is regulated, or *moderated*—hence the name of the lamp—by an extremely ingenious contrivance, which narrows the passage for the oil when the pressure is strongest.

The introduction of mineral oils—known under the various names of paraffine oil, petroleum, kerosene, naphtha, shale oil, etc.—has in a great measure superseded the use of animal and vegetable oils for lighting purposes. The great recommendation of the former is their cheapness. One great difficulty with the mineral oils at first was that, without careful preparation, they are apt to give off inflammable vapors at a low temperature, which give rise to dangerous explosions. This has been obviated by processes of rectification which get rid of the lighter and more volatile ingredients. An oil that gives off an inflammable vapor at a temperature under 120° F. can hardly be considered safe. Paraffine oil from Boghead coal will not form an explosive mixture under 146° F. It is illegal to store or issue oil forming an inflammable mixture under 100° F. Another difficulty was to make the oil burn without smoke. The kind of lamp found to effect this purpose best was introduced into Great Britain from Germany about 1856, and, with minor improvements, the form is still adhered to. The body of the lamp is a globular-shaped reservoir of glass or stoneware for the oil, mounted on a foot or pedestal; into this a brass wick-holder is screwed, the wick being raised or lowered by means of a rack and pinion. The peculiarity of the paraffine lamp is a dome-shaped cap surrounding the wick-tube, and having a slit running across it, through which the flame issues. A long glass chimney rests on a ledge or gallery around the base of the cap; and by perforations in the brass an air-chamber is formed below. The chimney causes a strong draught through this chamber, and the cap or dome deflects the current of air, and makes it impinge against the flame as it passes through the slit, thus producing perfect combustion and a white, brilliant light without smoke. The demand for these lamps has become so great, that the manufacture and sale of them forms an extensive business of itself.

A great drawback in the use of the common paraffine lamp is the expense and annoyance attendant on the frequent breakage of the glass chimney. To obviate this, Rowatt & Son of Edinburgh first introduced their patent *Annucapnic* (smokeless) lamp, which dispenses with the glass chimney altogether. Instead of it, a second cap or dome is placed over the ordinary one, leaving a narrow space between the two. As the two cones get hot, a powerful draught is created, and two separate currents of air are directed against the flame, one by the lower cap, as in the ordinary lamp, and the other from

between the two caps. The result is perfect combustion, without a chimney. A large glass globe is used to protect the flame from currents of air, as well as to disperse and soften the light. Such a globe is also often used with the ordinary lamp in addition to the chimney, a flange for supporting it being added to the burner. Mineral oil thus burned furnishes a satisfactory light, rivaling gas in cheapness.

LAMP'SACUS, a city of Mysia in Asia Minor, on the Hellespont, near where it begins to open into the Propontis. The original name was Pityusa, from the number of pine trees which grew there. A colony of Ionians from Phocæa and Miletus settled there, calling it Lampsacus from a Greek word denoting to *shine*, an oracle having directed them to settle on the spot where they first saw the light. It had an excellent harbor, and became a great commercial mart. During the Ionian revolt it passed into the power of the Persians, but on their overthrow at Mycale 479 B.C. it became the ally of Athens, to which it remained faithful until the Athenian disasters in Sicily, when it revolted. The Athenians, however, soon reducing it, held it until it was taken by Alexander the great. Afterwards it submitted to the Romans, under whom it flourished for a long time. Several distinguished men were natives of this city, among whom were Anaximenes the orator, Charon the historian, and Metrodorus the Epicurean philosopher. It was the chief seat of the worship of Priapus, who was said to have been born there of Aphrodite. A small town called Lamsaki occupies the site of the ancient Lampsacus, of which now no trace remains.

LAMP, SAFETY. See SAFETY LAMP.

LAMP-SHELL (*Terebratula*), a genus of brachiopodous mollusks (see BRACHIOPODA), having a delicate shell, of which one of the valves is larger and more convex than the other, prolonged backwards into a kind of beak, which is pierced by a hole or fissure. Internally, there is a delicate bony framework, of two branches, attached to the dorsal valve, by which the *arms* (see BRACHIOPODA) are supported. This is called the *loop*, and often by shell-collectors the *carriage-spring*. It is well seen in many fossil *terebratule*. The recent species are numerous, and very widely distributed from the polar to the tropical seas; the fossil species are extremely numerous.

LAMPSON, Sir CURTIS MIRANDA, b. Vt., 1806; removed to England in 1830, and was naturalized in 1848. He devoted himself to mercantile pursuits in London, and acquired a fortune. In 1856 he was appointed a director in the first Atlantic cable company, became vice-chairman, and 10 years later was made a baronet on account of his valuable services to that enterprise. He was a friend of George Peabody, and was appointed one of the trustees of the Peabody fund. In the year '80 he was deputy governor of the Hudson's Bay company. He d. 1885.

LAMPYRIS and **LAMPYRIDÆ**. See GLOWWORM.

LAMSON, ALVAN, D.D., 1792-1864; b. Mass.; having pursued a preparatory course of study at Phillips academy, entered Harvard university, graduating in 1814, and in the same year accepted the position of tutor in Bowdoin college, Brunswick, Me. In 1818 he became the pastor of the First Church in Dedham, Mass., after a 2 years' course of theological study at the Harvard divinity school, and remained in charge of that pastorate until 1858. In 1857 he published a carefully prepared volume of sermons, and was a frequent contributor to the *Christian Examiner*.

LAMY, JOHN BAPTIST, D.D., b. near Clermont, France, 1814; was educated at Clermont and at the sem. of Montferrand, where he was ordained a Rom. Cath. priest, 1838; came to the U.S. 1839, and labored for 11 years in the diocese of Cincinnati; was consecrated bp. of Santa Fé, N. M., 1850, and abp., 1875. He d. in 1888.

LAN'ARK, a parliamentary and municipal burgh and market t. of Scotland, in the co. of the same name, is situated on an elevation rising from the Clyde, 30 m. s.w. of Edinburgh. Its antiquity is attested by the fact, that here, in 978, Kenneth II. assembled a parliament, or meeting of the estates of the realm. Little trade is here carried on; but the town derives some support from the numbers attracted to this district by the beauty of the scenery in the vicinity. Lanark unites with Hamilton and four other burghs in sending a member to parliament. Pop. '81, 4,908.—About a mile to the s., lies the manufacturing village of NEW LANARK (pop. 973), celebrated as the scene of Robert Owen's experiment (1815-27) for the social improvement of the working-classes.

LAN'ARK, a co. in e. Ontario, Canada, drained by the Mississippi river (rising in Mississippi lake, in the eastern portion, and flowing n. 100 m. into the Ottawa river), by the Clyde, the Tay, navigable as far as the Rideau canal, and the river Rideau, a branch of the Ottawa. It is partially bounded on the s. by lake Rideau, and the Rideau canal, which passes through the lake, connecting the Ottawa river with lake Ontario, and the entire southern portion is dotted with picturesque little lakes. It is celebrated for its beautiful scenery, 1194 sq. m.; pop. '91, 39,122. It is traversed by a division of the Canada Central railway, and by other roads. Capital, Perth.

LAN'ARKSHIRE, or CLYDESDALE, an inland co. of Scotland, and the most populous in the country. Its length is 52 m. and width 34 miles. Its area is 564,284 acres; its surface is exceedingly varied and rises from the n.w. to the s.e. and s. The north contains the chief mining region of the county and is divided into three districts, that of

Coatbridge and Aillie in the east, that of Glasgow in the west, and that of Baillieston and Shettleston in the middle. The principal hills are the Lowthers, which rise in Green Hill to the height of 2,403 ft.; Tintock is 2,350 ft. high. In the upper ward is the village of Leadhills, which is 1323 ft. above sea-level, being the highest inhabited place in Scotland. This county possesses great mineral wealth. Iron ore is smelted at Glasgow, Hamilton, Govan, Wishaw, Motherwell, Newmains, Bothwell, Rutherglen, Airdrie, Shotts, and Coatbridge. The cotton, flax, and woolen manufactures, which are very extensive, and constitute one of the most important sources of wealth in the country, are carried on in and around Glasgow. The county is watered principally by the Clyde (q.v.) and its affluents. Lanarkshire was famous for its orchards as early as the time of the Venerable Bede. They yielded, early in the present century, as much as £8,000 yearly, but have latterly fallen off; and the ground is more profitably employed in producing gooseberries, vegetables, etc., for the Glasgow market. The climate of Lanarkshire is moist, and in many of the lower districts mild and genial, but often cold and boisterous in the high grounds. It is not in general well suited for raising grain-crops; but much of it is excellently adapted for the rearing of stock and for dairy purposes. Besides Glasgow, Lanarkshire contains the parl. burghs of Govan, Partick, northwestern, northeastern, mid, and southern. Pop. '91, 1,046,040. Lanarkshire at an early period was inhabited by the *Damnii*, a Celtic tribe, whose territory was divided by the Roman Wall of Antonine between the Forth and the Clyde, although they were never wholly subdued by the Romans. Numerous traces of these inhabitants still exist in the form of mounds, fortifications, and circles. In the 7th century a large district, including Lanarkshire, was subdued by the Saxons of Northumberland. Among the more important events of later history which relate to this county are the two battles of Drumclog, June 1, 1679, in which Graham of Claverhouse was defeated by the Covenanters, and of Bothwell Bridge, near Hamilton, June 22, 1679, in which the Duke of Monmouth defeated the Covenanters with great slaughter. Among objects of historical interest may be mentioned Bothwell castle, Douglas castle, and Craignethan castle, the *Tullietudlum* of Sir Walter Scott, where Mary Queen of Scots took refuge after escaping from Lochleven.

LANCASHIRE, one of the largest and the most populous counties in England, is bounded on the e. by Yorkshire, and on the w. by the Irish sea; on the n. by Cumberland and Westmoreland, and on the s. by Cheshire. Area, 1,207,605 statute acres. Pop. 1891, 3,972,760. The larger division is intersected in the n. and e. by branches of the hill system which runs southward through the counties of York and Derby, while Furness has on its eastern border the Cumbrian range. Towards the coast on the w. the surface is flat, particularly in the larger division, with a curving outline and large stretches of sand, over which in various places the sea seems to be extending its dominion. The chief rivers are the Mersey, Ribble, Lune, Wyre, Leven, and Duddon, all of which enter the Irish sea by estuaries more or less important; Morecambe bay being the chief indentation. The climate is moist, but mild, the soil being peaty in the upland districts, but a fertile loam for the most part in the flats. Oats and potatoes are general crops; wheat also grows well in the southern division. Coal is the chief mineral product (the coal-field being estimated at over 400 sq. m.); lead and copper also occur, and iron is plentiful in Furness. The whole surface is covered with a net-work of canals and railways, which connect the principal manufacturing and commercial centers. See MANCHESTER, LIVERPOOL, PRESTON, BLACKBURN, etc. Lancashire is famous for its immense cotton manufactures. The other textile manufactures are likewise of considerable importance. The manufacture of all kinds of machinery is extensively carried on; as well as shipbuilding, glass making, soap manufacturing, the alkali industry, and more especially cotton spinning, the latter being the most extensive. Lancashire contains 18 parliamentary boroughs. The district of Furness presents many attractions to the tourist. On its north-eastern border stretches the beautiful lake Windermere, westward from which is Eastwaite Water; and further w., Coniston lake, and the "Old Man of Coniston," with a height of 2,633 feet. In the peninsula between the rivers Duddon and Leven is Furness abbey, a noble ruin, the effect of which is enhanced by the picturesque beauty of the scenery in the vicinity. The abbey was founded by Stephen, earl of Mortagne or Mortoil, and afterwards king of England in 1127. The church is 287 ft. long, the nave 70 ft. broad. In the township of Whalley, in the e. of Lancashire, is a very old church, and in the churchyard are three crosses, apparently of Saxon origin. In the vicinity are the ruins of an abbey of about the same age as Furness.

LANCASTER, a co. in s.e. Nebraska, drained by Salt or Saline creek, and tributaries of the Missouri, Kansas, and Platte rivers. It is intersected by branches of the Union Pacific railroad, the Burlington Route, and the Chicago, Rock Island and Pacific railroads; 864 sq. m.; pop. '90, 76,395, chiefly of American birth. The surface is uneven, with good pasture and fertile prairie land, thinly timbered and productive of grain; it is also adapted to stock-raising. It has salt-basins and salt springs, and quarries of building stone, carboniferous limestone, and cretaceous sandstone. Among the products are tobacco, wool, Irish potatoes, honey, flax-seed, and sorghum. Co. seat, Lincoln.

LANCASTER, a co. in s.e. Penn., has for its w. boundary the Susquehanna river, and for the s.e. Octorara creek. The Conestoga creek crosses it from n.e. to s.w., and South mountain extends along the n.w. border. Mine ridge is in the s.e. It is traversed by

the Pennsylvania, the Philadelphia and Reading, and the Lancaster and Reading Narrow Gauge railroads; 965 sq. m.; pop. '90, 149,095, chiefly of American birth. Its mineral resources comprise iron, nickel, micaceous roofing slate, blue limestone and Potsdam sandstone; marble, chrome, and magnesia are also found. The soil is a rich loam, of which lime forms a principal part, and is exceptionally fertile. The scenery is delightful, the surface of the country being diversified by low hills and broad green valleys. Its products are fruit, sorghum, corn, hops, honey, wheat, buckwheat, tobacco, barley, wool, flax, oats, and sweet potatoes. It has excellent water-power, and large manufactories of lumber, tin, copper, sheet-iron ware, and machinery; also cotton and woolen and paper factories, 12 breweries, and planing and saw mills. It has extensive forests of oak, hickory, chestnut, and ash. Co. seat, Lancaster.

LANCASTER, a co. in South Carolina, has for its w. border the Catawba river and the state of North Carolina on the n. and n.w. It is bounded on the e. by Lynch's creek; 535 sq. m.; pop. '90, 20,761, chiefly of American birth, with 6000 colored. The surface is undulating; in some portions densely wooded; in others the fertile soil produces cotton, tobacco, wool, wheat, fruit, to some extent, oats, rye, and the best sweet potatoes; other products are Indian corn and grass, honey, sorghum, and sugar-cane. Gold is found near the Catawba river. Co. seat, Lancaster.

LANCASTER, a co. in e. Virginia, has for its western border the Rappahannock, a navigable river, flowing s.e. past Windmill point into the Chesapeake bay, which is the s.e. boundary; 160 sq. m.; pop. '90, 7191, chiefly of American birth, 4000 colored. The surface is level and equally divided into forest and plain. The portion of the soil under cultivation is adapted to fruit, corn, winter wheat, rye, wool, and sorghum; other products are sweet potatoes and oats. Horses and cattle are raised, and a large number of swine. Co. seat, Lancaster.

LANCASTER, a municipal borough and seaport of England, capital of Lancashire; is picturesquely situated on an eminence on the left bank of the Lune, near the mouth of that river, and 45 m. n.e. of Liverpool. The ancient castle, which overlooks the town, is now used as a county jail and court-house. The houses are built of the freestone quarried in the vicinity, and though the streets are narrow, the town is neat and well built. The Lune is here crossed by a bridge of five arches, and by an aqueduct carrying the Lancaster canal across the river. The harbor has 1700 ft. of quays and a depth of 12 ft. at spring tides. There is some trade in coal and limestone. The chief manufactures are furniture, cotton, table-baize, cloth, and cast-iron work. Pop. '91, 64,300.

LANCASTER, a town in Worcester co., Mass.; on the Nashua river and the Boston and Maine railroad; 16 miles n.e. of Worcester. It contains the villages of Lancaster, South Lancaster, and Poniken, the state reform school for girls, public library, electric street railroad, and cotton and woolen mills. Pop. '90, 2201.

LANCASTER, city and co. seat of Fairfield co., O.; on the Hocking river, Hocking canal, and the Cincinnati and Muskingum Valley and the Columbus, Hocking Valley and Toledo railroads; 32 miles s.e. of Columbus. It contains the State industrial school for boys, Crawfis institute, Columbia commercial college, public library, national bank, and electric light plant, and has an attractive county court-house, excellent public and private schools, good water supply, and several daily and weekly newspapers. The city is in a rich agricultural region and in the natural gas belt. The industries comprise the manufacture of agricultural implements, foundry products, flour, shoes, glass, etc. There are several hotels. The facilities for shipping by rail and water have made the city an important trade and produce center. Pop. '90, 7555.

LANCASTER, city and co. seat of Lancaster co., Pa.; on Conestoga creek and the Lancaster and Reading Narrow Gauge, the Philadelphia and Reading, and the Pennsylvania railroads; 68 miles w. of Philadelphia. It is the seat of Franklin and Marshall college and the theological seminary of the Reformed Church, and contains the Lancaster general hospital, St. Joseph's hospital, County hospital, Children's home, Mechanics' and Y. M. C. A. libraries, Conestoga park, the graves of Thaddeus Stevens and ex-President James Buchanan, gas and electric light plants, electric street railroads, national and state banks, and about 50 churches. The industries include tobacco-growing, cigar-making, cattle-raising, and the manufacture of cotton goods, iron, locks, forges and blowers, and caramels. The city is the center of a large tobacco trade and has numerous tobacco warehouses. Lancaster was settled in 1729. During the occupation of Philadelphia by the British, in 1777-78, the Continental Congress sat here. From 1799 to 1812 it was the state capital and in 1818 it received its city charter. Pop. '90, 32,011.

LANCASTER, DUCHY OF. Lancaster is a duchy and county palatine (see PALATINE) of England, created by royal charter, in which respect it differs from Durham and Chester. Edward III., on the death of Henry, duke of Lancaster, conferred the duchy on John of Gaunt and his heirs forever. During the wars of the Roses, Henry IV. and Edward IV. both endeavored so to settle the duchy that it should descend to the heirs of their body apart from the crown, and continue with them in the event of their losing the latter. The result of these several attempts has been the preservation of the duchy as a separate possession in order and government, but united in point of inheritance.

The revenues of the duchy form no part of those hereditary revenues in lieu of which the civil list (q.v.) was granted. The net proceeds are paid over to the privy purse, and wholly exempted from parliamentary control, except that the annual account for receipt and expenditure is presented. The county palatine forms only a portion of the duchy, which includes considerable estates not within the county palatine. There is a chancellor of the duchy (i.e., of the part of it which does not lie within the county), and of the county palatine, which two offices are generally united. The duchy court of Lancaster, held at Westminster, and presided over by the chancellor of the duchy, or his deputy, exercises jurisdiction in all matters of equity relating to the lands of the duchy. The administration of justice has recently been assimilated to that of the rest of England. The office of chancellor is a political appointment, which it is the practice to confer on a statesman of eminence, frequently a member of the cabinet, who is expected to devote his time to such larger questions occupying the attention of government as do not fall within other departments. The emoluments of the office are about £2,000 per annum.

LANCASTER, HOUSE OF. The name of the ruling house to which Henry IV., V. and VI., kings of England, belonged. The title was created by Henry III., who in 1267, made his second son, Edmund Crouchback, earl of Lancaster. The fourth earl and first duke of Lancaster, Henry Wryneck, died without male heirs. His daughter Blanche married John of Gaunt, fourth son of Edward III. Thus John of Gaunt became duke of Lancaster. His son, afterwards Henry IV., claiming descent from Henry III., seized the throne upon the deposition of Richard II. John of Gaunt through his daughters was the progenitor of several lines of foreign kings, and by his third wife, Catherine Swynford, he became the ancestor of the Tudors. The Lancastrian sovereigns were Henry IV., Henry V., and Henry VI. (q.v.). Henry IV. held the throne by virtue of a parliamentary title, a fact which may have influenced him to rule in a somewhat cautious manner. The brief reign of Henry V. is distinguished for the brilliant successes in France. Henry VI., in whose reign the wars of the Roses broke out, was deposed and murdered. His successor was Henry VII., the first of the Tudors.

LANCASTER, Sir JAMES, the first English navigator who commanded a fleet bound for the East Indies, sailed from Plymouth April 10, 1591. In 1600 the newly constituted *East India Company* intrusted him with their first expedition. Lancaster having, in the course of his voyages, collected a number of valuable documents in support of the existence of a n.w. passage, the government, acting on his advice, sent out an expedition to attempt to discover it. They discovered a strait in 74° n. lat., which was named by Baffin *Lancaster sound*, in honor of Lancaster. Lancaster was created a baronet for his services, and died in 1620. The history of his voyages has been preserved by Hakluyt and Purchas.

LANCASTER, JOSEPH (1778-1838); one of the rival inventors of the monitorial or mutual system of instruction, was born in London and was the son of a Chelsea pensioner; of a dissenting family, he altered his religious opinions when a young man, and attached himself to the Society of Friends. When about the age of twenty he began to instruct the poor children of the vicinity, and soon had a thousand under his care, and his philanthropic efforts led the Duke of Bedford and others to build him a schoolroom and furnish it. The experiments in teaching made at Madras by Dr. Andrew Bell (q.v.), and reported by him in a pamphlet in 1797, came to Lancaster's notice, and he adopted some of Bell's measures, but improved vastly upon the latter's system, and being called to lecture in various places, established many schools and gave a great stimulus to popular education. The Royal Lancasterian Institution, afterwards called the British and Foreign School Society, was founded in 1818 for his benefit, but he quarrelled with his benefactors, and emigrated to America, where for a time he lectured with success. He was run over by a carriage and killed in New York city. He published *Improvements in Education; An Epitome of the Chief Events and Transactions of His Own Life* (1833), and other pamphlets. See **MONITORIAL SYSTEM**.

LANCASTER HERALD, one of the six heralds of England, ranking second in point of seniority. His office is said to have been instituted by Edward III., in the 34th year of his reign, when he created his son, John of Gaunt, duke of Lancaster. Henry IV. raised Lancaster to the dignity of a king-at-arms. Edward IV., after reducing him to the status of a herald, abolished his office, which was revived by Henry VII.

LANCASTER SOUND, a western inlet of Baffin's Bay, in lat. 74° n., and extending from 80° to 87° w. longitude. Though this opening into the polar ocean was discovered by Baffin himself, as far back as 1616, yet it lay virtually neglected for more than 200 years. At length Parry, in 1819, penetrated through it into Barrow's Strait, and beyond.

LANCASTERIAN or LANCASTRIAN SYSTEM. See **MONITORIAL SYSTEM**.

LANCE differed from *spear* or *javelin* in that it was not intended to be thrown, but to be thrust at the enemy by force of hand, and with the impetus acquired by speed, and thus was most effective in the hands of a mounted soldier. Hence the lance was the favorite arm with knights for commencing a combat; it was of tough ash, of considerable length, weighted at the end, and held not far from the hilt. See **TOURNAMENT**. In modern warfare, the lance is a long rod of tough ash, with an iron point, and usually a colored flag near it. It is the offensive arm of lancers (q.v.).

LANCE, GEORGE, 1802-64; b. England; studied historical painting with Haydon, but left this branch of art on discovering, accidentally, his remarkable talent for the delineation of still-life. As a painter of fruit and flowers, both in composition and as a colorist, he was unequaled among the English oil-painters of his time. He was also a remarkably successful copyist, and restored, with great accuracy and fidelity to the manner of the master, a painting by Velasquez in the national gallery, London. His works exhibited at the royal academy and British institution exhibitions always attracted general attention. His *forte* lay in the wonderful brilliancy of his coloring, the exactness of his imitation, and the taste displayed in his grouping and arrangement of accessories.

LANCE, THE HOLY, the name applied in the Greek church to the knife with which the priest cuts the bread at communion. This knife is formed like a lance, designed to imitate the spear by which Christ was pierced.—2. A lance which was given to king Henry I. of Germany by Rudolph of Burgundy, and which is claimed by tradition to have been in large part made from the nails employed in Christ's crucifixion. Another narrative has it that this was the same lance employed by the Roman soldier. It became considered to be a powerful talisman, and was one of the most important insignia belonging to the German empire. In its honor, in 1354, pope Innocent VI. instituted a special festival, and it was used during the crusades to raise the spirits of the soldiers of the cross.

LANCELET, *Amphioxus* or *Branchiostoma*, a genus of dermopterous (q.v.) fishes, of very remarkable organization, far lower than that of any other vertebrate animals, connecting cartilaginous fishes both with mollusks and with annelids. A few species are known, all small; one of them (*A. lanceolatus*), the first which was discovered, a native of the coasts of Britain, and of Europe generally. It inhabits banks of sand, and when dug up, buries itself again in the sand with wonderful activity. It is at the utmost scarcely more than 2 in. in length, very much compressed, tapering to a point at each extremity, the head not notably distinct from the body. It is silvery-white and semi-transparent; the skin destitute of scales. A low dorsal fin extends the whole length of the back.

LANCELOT. The original story of Lancelot was written about the year 1200 and there is every reason to believe by Walter Map or Mapes (q.v.). It embodied as an introduction, the substance of Geoffrey's Arthur (q.v.), Guinevere and Merlin (q.v.), and there was no mention of Perceval, although from the free use of incidents connected with the Graal (q.v.) and Perceval (q.v.) of De Borron it is supposed they were written contemporaneously, although De Borron's second part, *Quest*, preceded Map's second part. In Map's version, Lancelot is represented as the son of King Pillinore, who was brought out of retirement and introduced at King Arthur's court for an inferior order of knighthood. He was much beloved by Arthur and Guinevere and entered the lists in the quest of the Holy Grail, the accomplishment of which was only possible to the best knight in armor. The tale is one of much interest, although long overlaid with many adventures foreign to the plot. While he professed the greatest affection and reverence for King Arthur, he did not hesitate to carry on a criminal intrigue with the queen, Guinevere, and while he performed deeds of heroic daring, with the most generous enthusiasm, he did pious penance for his sins. While he devoted himself with utter self-abnegation to the interest of the queen, he was no less devoted to the king. He relinquished the quest of the Grail on account of his sins, yet he carried on an amour with the beautiful Elaine, daughter of King Pelles, for whose son, Galaad, was reserved the glory of winning the Grail and redeeming the sins of his father, Lancelot. To preserve his fidelity to the queen and keep the character of his hero intact, the romancer asserted that Lancelot's senses were deceived and the spell given him by Elaine's maid, who at the suggestion of her mistress led him to believe the queen was his companion. When Guinevere discovered his treachery she drove him from her presence with such cruel invectives that he became insane and wandered about the woods for years. Chance took him to the castle of King Pelles; who, in the version of Walter Map, had custody of the Grail, and he was recognized by Elaine, who cured him by the charm of the holy vessel. Lancelot at one time arrived at the door of the chamber containing the Holy Grail; he was warned not to approach, but he nevertheless ventured to look in "and saw a table of silver and the holy vessel covered with red samite and many angels about it, whereof one of them held a candell of wax burning and the others held a crosse and the ornaments of the altar." Having dared to enter, a blast of fire smote him to the ground, where he lay "twenty-four days and as many nights as a dead man." After his entire recovery he found his way back to Guinevere and the king and knights rejoiced to see him. He had failed in the quest and he and the queen returned to the old sin. Guinevere was accused of having poisoned a knight and was exposed to the usual ordeal. Lancelot espoused her cause and conquered her accuser, but received wounds which reopened at the next secret meeting between them. Scandal and spies finally connected them, and the queen was doomed to the stake, but at the moment of execution Lancelot appeared and rescued her. They took flight together to his castle of Joyeuse Garle, where King Arthur besieged them, with his nephew Gawain and other faithful knights. Lancelot offered to give up the queen if she was promised protection, but Arthur refused this, until he was warned by the pope that it would be fatal to his kingdom if he persisted, when he received her, but continued his war against Lancelot,

whom he followed to his castle in Gannes, France. During the siege, news arrived of the insurrection of his nephew, Modred, who had seized his throne, and the queen had fortified herself in London. He returned, and after a series of desperate battles Modred was killed and Arthur, wounded to death, flung away his sword and was borne by fairies to Avelon. Lancelot also returned to England, mourned the king's death, paid a melancholy visit to the queen, already in a nunnery, and retired himself to a monastery and died soon after in sorrow and repentance. According to Map's version Galaad, the son of Lancelot and Elaine, was the successful hero of the *Quest of the Holy Grail*. On the eve of Pentecost an old man dressed in white brought a youth to King Arthur's court. When all the knights were assembled at the ensuing banquet every seat was filled save that which was always reserved for the successful knight of the Holy Grail, leaving none for the young Galaad. The old man revealed wondrous signs which indicated that the "seat perilous" was intended for the young hero, who, at once accomplished a test in which Gawain and Perceval had failed. The Grail appeared and light and perfume filled the hall; it again passed out of sight and the next day the knights departed on its quest. Galaad, thus pointed out, succeeded, and became king of the Holy City: then Joseph of Arimathea appeared and Galaad died, his task accomplished. The many manuscripts upon the subject, of the thirteenth, fourteenth and fifteenth centuries, were compiled in book form and translated by Sir Thomas Malory under the title of *Morte Arthur*. Tennyson's (q.v.) *Idyls of the King* and Lowell's (q.v.) *Vision of Sir Launfal* are also founded upon this narrative.

LANCERS, a description of cavalry soldiers who are armed with lances. The type and perfection of lancers are the Russian Cossacks, whose long lances enable them to combat with enemies at a distance from which they themselves take little harm. The lancers were brought into European notice by Napoleon, who greatly relied upon some Polish regiments. After the peace of 1815, the arm was adopted in the English service, but it is thought by many that the British lancer has a weapon too short to enable him to charge an infantry square with any chance of success. The regiments armed as lancers are enumerated in the article CAVALRY.

LANCET-WINDOW, a narrow window with acutely pointed arch head. This form was much used in England and Scotland during the early pointed period of Gothic architecture. Several lancet-windows are frequently grouped together, so as to produce a pleasing effect. In Scotland, the lancet-window was, like many other features of Scotch Gothic, retained to a much later period than in England.

LANCE-WOOD, a wood valuable for its great strength and elasticity. It is produced by the small tree *guatteria virgata* (natural order *anonaceæ*). Another species, *G. lar-rifolia*, yields the wood called white lance-wood. The latter is not much used. Lance-wood is of great value to coach-builders, by whom it is used for shafts and carriage-poles, for which it is especially fitted. The part used is the main trunk of the tree, which is very straight, and rarely more than 9 in. in diameter, with the bark on. It comes in small quantities from the West Indies, chiefly, however, from Jamaica.

LANCIANO (the *Anxia* or *Anaa* of Pliny, subsequently *Ancianum*), a t. of South Italy, in the province of Chieti, and capital of the district, 6 m. from the Adriatic, and 15 from Chieti. Pop. com. 7200. Its present site occupies three hills, of which the two most adjacent are connected by an ancient bridge of great square blocks of stone, originally dedicated to Diocletian. The central position of this town favored its being selected as a center of judicial and civil administration during both the Roman and Gothic periods, and from its extensive traffic it obtained the title of "The Emporium of the Frentani." Lanciano possesses a fine cathedral, adorned with marbles and valuable paintings; contains several large foundries, and carries on a trade in wine, oil and silk.

LAND, TITLES TO. See TITLE.

LANDAU, a t. and fortress of Bavaria, in the district of Rhenish Pfalz, is situated in a beautiful region on the Queich, which fills its fosse with water, 18 m. n.w. of Carlsruhe. There are here manufactures of hats, watches and furniture. The pop. in 1890 was 11,236. Landau has been the scene of important events during every great war since the 15th century. In the Thirty Years' war, it was taken eight times by Swedes, Spaniards, Imperialists, and French. In 1684 it was fortified by Vauban, and was considered impregnable until taken, in 1702, by the imperialists under the markgraf Ludwig of Baden.

LAND-CRAB, the popular name of all those species of crab (q.v.) which in a mature state are not aquatic. They are now erected into a family or tribe, and divided into several genera. The species are numerous, and all inhabitants of warm countries. They very much resemble the common crabs of our shores, and are remarkable as animals breathing by gills, and yet not aquatic, some of them inhabiting very dry places, where they burrow in the sand or earth; but such presence of moisture is absolutely necessary to them as to prevent the desiccation of their gills. Many, and probably all of them, deposit their spawn in water, for which purpose some of them annually migrate from considerable distances to the sea; but there is reason to suppose that some deposit their spawn in fresh water. The **BLACK CRAB**, or **MOUNTAIN CRAB** (*gecarcinus ruricola*), of the West Indies, usually resides in woods and on hills at a distance of at least one mile,

often two or three miles from the sea, which, however, it regularly visits in the months of April and May, when immense numbers may be seen journeying together, moving straight on, unless obstacles quite insuperable impede their progress. Like most of the other species, this land-crab is active chiefly during the night; and except in rainy weather, it seldom leaves its burrow by day. It feeds chiefly on vegetable food. When in season, it is highly esteemed for the table, as some of the other land-crabs also are; and its spawn or roe, which before being deposited forms a bunch as large as a hen's egg, is accounted a delicacy.—A land-crab of Ceylon (*ocypode*) is so troublesome on account of the burrows which it makes in the dry soil of the equestrian promenade at Colombo, that men are kept in regular employment to fill them up.—The grass-lands of some parts of India swarm with small land-crabs, which feed on the grass or on green stalks of rice. See *illus.*, CRUSTACEANS, vol. IV.

LANDED MEN, JURY OF. In Scotch law, it is a privilege belonging to a landed proprietor, when tried for a criminal offense, to demand a jury the majority of whom are landed proprietors.

LANDED PROPERTY is not a legal, but rather a popular phrase, to denote that kind of property which consists of freehold estates in land, or, in Scotland, heritable estates. A person may have a mere chattel interest in land, such as a lease (though in Scotland even that is heritable estate), and the landed property does not in such case belong to him, but to his landlord, to whom and whose heirs the land descends forever, until alienated. Landed property includes houses and all things called corporeal, and also some incorporeal rights connected with land.

The various ways in which this important kind of property is held, and the formalities attending its transfer, are treated of under such heads as ALLODIUM; CHARTER; CONVEYANCING; COPYHOLD; DEED; FEE; FEOFFMENT; FEUDAL SYSTEM; FREEHOLD; SASINE; SALE; TITLE, etc.

LANDER, a co. in north central Nevada, is bounded on the west by the Fish Creek mountains, is crossed by the Shoshone mountains, and is drained by the Reese and Humboldt rivers; 5296 sq. m.; pop. '90, 2266. There are good grazing lands, and in the Reese river valley silver and lead are mined. Co. seat, Austin.

LANDER, FREDERIC WILLIAM, 1821–62; b. Mass.; received a military education at the Norwich, Vt., military academy, and devoted himself to railroad engineering. He superintended two of the early expeditions for the survey of the route for the Pacific railroad, both of which were arduous and dangerous, and of the latter of which he was the sole survivor. He joined the U. S. army in 1861, was appointed a brig.-gen., and served with great credit, distinguishing himself as an able and daring officer. In Mar., 1862, he was stricken down by disease, and died at Paw Paw, Va. Gen. Lander married, in 1860, Jean Margaret Davenport.

LANDER, JEAN MARGARET DAVENPORT, b. Eng., 1829; entered upon the stage as a profession, and gained a high reputation in the United States as an actress of remarkable vigor and fine natural gifts, which had been cultivated to a point of rare excellence. In the character of *Camille* she was preferred by many even to Matilda Heron, the great American original in that part. She married Gen. Lander in 1860, and on his death in 1862 she served as a hospital nurse, continuing in that duty until the close of the war. In 1865 she returned to the stage.

LANDER, LOUISA, b. Salem, Mass., 1826; exhibited, when quite young, a talent for modeling and sculpture; and at the age of 20 went to Rome and studied with Crawford. Besides busts of Hawthorne and others, she has produced a number of statuettes and statues in marble, which have been highly commended. Among her works are "Galatea," "Virginia Dare," and "Undine," statuettes; "Evangeline," "Ceres Mourning for Proserpine," and "A Sylph Alighting."

LANDER, RICHARD, the discoverer of the mouth of the Niger, was b. in Cornwall in 1804, and became a printer; but in 1825 went with capt. Clapperton, as his servant, to Africa, and accompanied him from the bay of Benin to Sôkoto. There Clapperton died; and Lander, returning to England, published a journal containing an account of the expedition, giving proof of such qualifications, that the British government intrusted to him the prosecution of further researches concerning the course of the Niger. In 1830 he and his brother John succeeded in proving that the Quorra, or Niger, falls by many mouths into the bight of Benin. The brothers were, however, seized by the negroes, and sold to a slave-dealer, but being brought to cape Formosa, were redeemed by the master of a Liverpool ship. They returned to England in June, 1830, and published a *Journal of an Expedition to Explore the Course and Termination of the Niger* (3 vols., Lond., 1832). In 1832 they undertook a new expedition to the Niger in an iron steamboat, and bought a small island as a British trading-station. In 1833 Richard Lander, with a few companions, made a trading excursion in the delta of the Niger; but they were assailed by the natives, and Lander received a wound, of which he died at Fernando Po, February, 1834.—JOHN LANDER, who was about three years younger than his brother Richard, was rewarded with an appointment in the customs; but died Nov. 16, 1839, from the effects of the African climate.

LANDERNEAU, a small seaport t. of the dep. of Finistère, France, 13 m. n.e. from Brest.

Only a few small vessels belong to the town, although about 700 enter and clear the port annually. The harbor admits vessels of 400 tons. Pop. '86, 8003.

LANDES (Fr., heaths), extensive tracts on the coast of the bay of Biscay, between the Gironde and the Pyrenees. Few districts in Europe are more desolate and unproductive. The part nearest the sea is more so than that which lies further inland on the rivers Adour and Midouze. Since the marshes have been drained, the district, previously the most unhealthy, has become one of the healthiest in France.

LANDES, a maritime department of France, and one of the largest and most thinly peopled in the country, is bounded on the w. by the bay of Biscay. Area, 3,615 sq. m.; pop. '96, 292,884. The principal river is the Adour. The department is divided into the three arrondissements, Mont-de-Marsan, St. Sever, and Dax. Capital, Mont-de-Marsan. As a forest department, Landes stands first in France.

LANDGRAVE, or **LANDGRAF**. See **GRAF**.

LANDIT, a fair or market, said to have been established by Charlemagne about 800, and which received its name from *Lundi* (Monday), the day of the week on which it began. The actual period of the *landit* included the week beginning with the first Monday after St. Barnabas day (June 11). It was at once a trade center and a religious and popular festival. It was held both in Paris and at St. Denis, and its opening was accompanied by an imposing ceremonial of a semi-religious character, conducted by the bishop and clergy, students and officials. The *landit* was abolished in 1789.

LAND LEAGUE. See **IRELAND**—**LAND LEAGUE**.

LANDLORD AND TENANT. The relation of landlord and tenant exists either (1) when one lets lands to another for a definite and fixed period of time agreed upon between the parties, in which case the tenancy is said to be one *for years*; or (2) when one holds lands of another for an uncertain period, terminable at the will of either party, in which case the tenancy is said to be one *at will*; or (3) when one holds lands of another for a year, and by holding over his tenancy is renewed by implication of law for another year, and so on from one year to another, in which case his tenancy is said to be one *from year to year*; or if such implied renewal be monthly, weekly, etc., his tenancy is said to be *from month to month, from week to week, etc.*; or (4) when, after having entered and held lands rightfully, one holds over wrongfully or by the mere laches or forbearance of the owner, in which case the tenancy is said to be one *at sufferance*.

The tenancy for years, which is the most important, is created by a contract called a lease. The English statute of frauds requires a lease for over three years to be in writing, in order to create a tenancy for years. In some of the United States, a writing is required in order to make a valid lease for more than one year. It is generally not required that any lease shall be a deed under seal.

The chief duties of a tenant for years are to strictly observe and fulfil the conditions and covenants in the lease, to refrain from the commission of waste, to make ordinary repairs, to pay rent, and to refrain from denying the landlord's title. A condition is a stipulation in the lease, which gives to the landlord the right to enter and repossess the premises, if its terms are not complied with. The courts look with disfavor upon such provisions, and in cases of doubtful construction prefer to treat the stipulations as covenants. A covenant is in the nature of a contract, and its breach gives to the landlord a right of action at law for damages or an injunction in equity to restrain its further breach. Sometimes the same provision is so drawn as to constitute both a condition and a covenant, so that the landlord may have either of the three remedies above specified. The commission of waste is frequently forbidden by the express words of the lease, as well as by implication of law. It is permissive waste for the tenant to allow the premises to decay, although he do no positive act of injury. He must, therefore, in the absence of the landlord's express agreement to repair, make ordinary repairs to the property. The landlord does not impliedly warrant that the premises are habitable, and he is under no implicit obligation to make them so. If the tenant enter, he will be bound by the lease, although the building is unsuitable for occupation, unless the landlord were guilty of fraud in concealing or not disclosing the defect. If strangers be injured because of a defect in the premises, the tenant, and not the landlord, will ordinarily be liable, unless the latter caused the defect or leased the premises with knowledge of its existence, or it were on a part of the premises over which he retained control. At common law, if the leased house were burned, the tenant was still bound to pay rent. But modern statutes have modified this onerous rule, so that if the tenant vacate the premises after the destruction of the building by the elements or inevitable accident and without his fault, his obligation to pay rent then ceases. If the lease contain no express covenant to pay rent, an action for "use and occupation," so called, will lie for the recovery of the reasonable value of the possession of the property during the term. The tenant's duty to refrain from denying his landlord's title is a modern outgrowth of the feudal oath of fealty, which the vassal rendered to his lord. It precludes the tenant, when sued for rent or for the possession of the premises, from defending on the ground that the landlord has no title to the property. But if the tenant were induced to take the lease and possession through the fraud or misrepresentations of the landlord, or if he be evicted by one having a title paramount to that of the landlord, or by the landlord or any one properly claiming under him, or if his lease have been surrendered and his possession given up, so that the technical relation of landlord and tenant no longer exists, this obligation

will no longer bind him, and he may set up, in defence, that the plaintiff does not own the premises in question. If the tenant be evicted in any of the ways above specified, his obligation to pay rent will generally cease. Such an eviction is a breach of the landlord's implied covenant, that the tenant shall have quiet enjoyment during the term. In the absence of restrictions in the lease, the tenant may assign his entire interest in the property, or sub-let a portion of the term which he himself holds. A tenancy for years may be terminated by a surrender of the term to the landlord, by its forfeiture because of the breach of some condition or by its natural termination through lapse of time; and in the last case no notice to quit is necessary. In order for either party to terminate a tenancy from year to year without the consent of the other, six months' notice, terminating at the end of the year for which the premises are held, is necessary; while in a tenancy from month to month, one month's notice is required; in that from week to week, one week's notice, etc. No notice, on either side, is necessary to terminate a tenancy at will or at sufferance; but many modern statutes change this rule and require one month's notice.

LANDON, LETITIA ELIZABETH, an English poetess—better known by her initials L. E. L.—was b. in London in 1802. Her childhood was spent in the house of a relative in Hertfordshire. In 1820 her first poems appeared in the *Literary Gazette*, and attracted considerable attention. On the death of her father, she devoted her entire attention to literature, earning both fame and money. She published several volumes of verse, the most widely read and admired of which was the *Improvisatrice*, and three novels, which have long since been deserted by the world of readers. On June 7, 1838, she married George Maclean, esq., governor of Cape Coast Castle, and was found dead in her new house on Oct. 15, 1838. It is understood that for the alleviation of spasms, with which she was occasionally visited, she was in the habit of taking small doses of prussic acid, and her death is supposed to have been caused by an overdose. There is no reason to suppose that her death was other than accidental.

LANDOR, WALTER SAVAGE, son of Walter Landor and of Elizabeth Savage, was b. at Ipsley Court, Warwickshire, in 1775. He was educated at Rugby, and at Trinity college, Oxford, quitting the university without taking a degree. He succeeded to the family estates on the death of his father. In 1808 he raised a body of men at his own expense, and joined the Spanish patriots under Blake. He was made a col. in the service of Spain, but resigned his commission on the restoration of king Ferdinand. In 1811 he married Miss Julia Thuillier, of Bath. After his marriage he resided first at Tours, then at Florence, where he bought an estate. He first became known as the author of *Count Julian*, which was followed by a poem called *Gebir*. In 1820 appeared *Idyllia Heroica* (in Latin), and in 1824-29 his *Imaginary Conversations of Literary Men and Statesmen* (5 vols.). Landor was a thorough classical scholar, and his Greek and Roman characters speak as we should expect the ancient heroes to have spoken. He is greater as a prose writer than as a poet; but, according to Emerson, who visited him in 1833, nature meant him rather for action than for literature. "He has," says Emerson, "an English appetite for action and heroes." In 1836 he published *Letters of a Conservative*; in the same year, a *Satire on Satirists*, and *Admonition to Detractors*; in 1837, *The Pentameron and Pentologue*; in 1847, *The Hellenics*; in 1848, *Imaginary Conversations of King Carlo Alberto and the Duchess Belgioioso on the Affairs and Prospects of Italy*; in 1851, *Popeery, British and Foreign*; in 1853, *Last Fruit off an Old Tree*; in 1854, *Letters of an American*. He died at Florence, Sept., 1864. His *Life and Works* were published in 1876, in 8 vols., the life being by John Foster. See also Colvin's *Landor* (1881).

LAND-RAIL. See **CRABE**.

LANDS'BERG, a t. of Prussia, in the province of Brandenburg, is situated in a pleasant and fruitful district on the Warthe, 40 m. n.e. of Frankfurt. It contains boiler factories and important iron foundries. Pop. '90, 28,065.

LANDSCAPE GARDENING, the art of laying out grounds in order to beauty and pleasure, which may fairly claim to be reckoned among the fine arts. It is chiefly practiced either in connection with the residences of the opulent, or in public parks.

Where the general aspect of a country is wild, and has been little modified by cultivation, inclosures, and other works of man, those scenes are felt to be most pleasing which exhibit his progress and triumph. Thus, when pleasure-grounds first began to be laid out, they exhibited only geometric forms; and alleys, avenues, and parterres did not seem artificial enough to give delight without buildings of various kinds, terraces, mounds, artificial hills, lakes, and streams, close-clipped hedges, and trees or shrubs trimmed by *topiarian* art into fantastic shapes, such as figures of animals, vases, and the like. The art of the *topiarius* or *pleacher*—dating from the Augustan age in Rome—is now no longer in repute. In districts where the general scene exhibits a succession of rectangular fields, and where everything has evidently been reduced to a condition subservient to utility, a greater irregularity gives pleasure, and the eye loves to rest on any portion of the landscape which seems to exhibit the original beauties of nature. The landscape gardener, however, must not attempt an exact imitation of nature, or to reduce everything to a state of primitive wildness. Like the painter, he must seek to exhibit nature idealized. The introduction of water is seldom successful; the mere landscape gardener's lake or cascade is too obviously artificial. Where water is within view, it is a chief object of the landscape gardener to arrange everything so that the view of it may be enjoyed from the windows of the mansion, or from the principal walks. Much care is given to the disposal of wood, in masses, groups, and single

trees. Belts and clumps, which were much in vogue in the latter part of the 18th c., are now comparatively seldom planted.

The style of landscape gardening in which regular forms prevail is called the *geometric*; and the opposite style, from having been first extensively practiced in England, in which country, indeed, it may be said to have originated, is known as the *English*. On the continent of Europe, a pleasure-ground laid out with winding and irregular walks, and scattered trees or groups of trees and shrubs, is called an *English garden*. But many of the continental English gardens are rather caricatures of the true English style than illustrations of it.

The taste of the present age rejects the grottoes, temples, statues, monuments, fountains, jets-d'eau, etc., with which it was once the fashion to fill pleasure-grounds, or admits only of their sparing introduction.

In the laying out of grounds, whether on a large or a small scale, it is of great importance that the trees and shrubs be well chosen, and the different kinds well grouped.

The public parks of the United States (see PARK) now exhibit some of the best models of landscape gardening on a great scale. The cemeteries of nearly all American cities are also designed to produce pleasing effects in landscape gardening; and as far as such effects can be produced where numberless monumental tributes to the dead must necessarily be conspicuous features of the scene, they are the most beautiful art works of their kind in the world. In private grounds the development of taste in the United States, in what is called landscape gardening, but should be called decorative gardening merely, has been rapid; and although architectural gardening has received little of the study which its capabilities invite, the lovely surroundings of grass, trees, and flowers of American homes marks an advanced taste in the arts of gardening. The principal American works on this subject are A. J. Downing's "Treatise on Landscape Gardening," published 30 years ago, and a work by Weidemyer on decorative gardening on a scale adapted to suburban homes, F. J. Scott's treatise entitled "The Art of Beautifying Home Grounds." London's "Encyclopedia of Gardening" (English) is by far the most complete work of the kind extant; of greatest value to those who may intend to practice landscape gardening as a profession.

LANDSEER, CHARLES, 1799-1879; b. England; elder brother of sir Edwin. Received his first instructions in art from his father, and from the celebrated historical painter, B. R. Haydon, and entered the school of the royal academy in 1816. Four years later he accompanied lord Stuart de Rothsay on a mission to Brazil, where he made a large number of drawings and sketches for Dom Pedro I. He made his first exhibition at the Royal Academy in 1828; in 1837 was elected an associate; and in 1845 an academican. In 1851 he became Keeper of the Academy, and held that office until 1873, when he retired with a pension of the amount of his salary. Among his paintings, the most important are "Pillaging of a Jew's House;" "The Temptation of Andrew Marvell;" "The Departure of Charles II. from Bentley;" and "The Eve of the Battle of Edgehill." One of his paintings found a place in the Vernon Gallery.

LANDSEER, SIR EDWIN, R.A., an English painter, son of John Landseer, an eminent engraver, was born in London in 1802, and was carefully trained by his father, who used to take him out, when only a child, to Hampstead Heath, and accustom him to sketch animals from life. The first work of Landseer's that brought him prominently before the public was "Dogs Fighting," exhibited in 1819. It was succeeded by the "Dogs of St. Gothard" (1819), the popularity of which was very great. The scene of several of his finest pictures is laid in the Highlands of Scotland. For upwards of thirty years, every London exhibition has witnessed his success. In 1826 he was elected A.R.A., and in 1850 he was knighted. Among his most celebrated achievements are: "The Return from Deer-stalking," "The Illicit Whisky-still," "High Life," "Low Life," "Poachers Deer-stalking," "Bolton Abbey in the Olden Time," "The Drover's Departure," "Return from Hawking," "The Old Shepherd's Chief Mourner," "Dignity and Impudence," "Peace," "War," "Stag at Bay," "The Drive—Shooting Deer on the Pass," "The Random Shot," "Night," "Morning," "The Children of the Mist," "Saved," "Highland Nurses," "Deer-stalking," and "Flood in the Highlands" (1861), and more recently, "Windsor Park," "Squirrels Cracking Nuts," and "Man Proposes, but God Disposes." Landseer was elected president of the royal academy in 1866, but declined the honor. He died Oct. 1, 1873. Landseer is reckoned the most superb animal painter of his time. Most of his pictures have been engraved.

LANDSEER, JOHN, 1761-1852, b. Lincoln, Eng.; now best known as the father of sir Edwin Landseer, whose paintings he was first to engrave and make widely known. At 24 he had executed some admirable plates. In 1806 he opened a school of engraving, became an associate of the royal academy the year after, and devoted much time to archæology. Among his engravings are the plates in Bower's History of England.

LANDSEER, THOMAS, 1795-1880, b. London; brother of sir Edwin, and engaged most of his life engraving on steel from the latter's superb animal pictures. His engravings are remarkable reproductions, often full-sized copies, of the original paintings; and give the life, spirit, and atmosphere of the paintings of sir Edwin as really as the paintings themselves. Among his other works is the engraving of Rosa Bonheur's *Marché aux Chevaux*. The French national library contains an album of his designs

and sketches, which indicate high talent. He was author of the *Life and Letters of William Bewick*.

LAND'S END. See CORNWALL.

LANDSFELDT, COUNTESS OF. See LOLA MONTEZ.

LANDSHUT, an ancient and picturesque German town, of Upper Bavaria, is situated in a pleasant and fertile district on the Isar, 39 m. n.e. of Munich. Its streets are rich in quaint old gables, and there are numerous towers; that of St. Martin's church (a Gothic building, dating from 1407) is 420 English ft. in height. Landshut contains numerous breweries, and has manufactures of woolen cloth, hosiery, tobacco and scientific instruments. In 1826 the university, which was removed hither from Ingolstadt in 1800, was transferred to Munich. The castle of Trausnitz, long the residence of the dukes of Bavaria, is supposed to have been originally a Roman station. During the Thirty Years' war and the war of the Austrian succession, Landshut was an important fortress, and the scene of many conflicts. Pop. '90, 18,802.

LANDSHUT, or **LANDESHUT**, a t. about 50 m. from Breslau, in Silesia, Prussia; pop. '90, 7,572. An important linen trade is carried on by the inhabitants, but the place is not otherwise remarkable in a commercial sense. Here was fought in 1760 an important battle between the Prussians, and the Austrians under gen. Laudon, in which the latter were successful.

LANDSKRONA, a fortified seaport t. of Sweden, on a tongue of land which projects into the sound, 18 m. n.n.e. from Copenhagen. The harbor is very good. Shipbuilding is carried on. Iron, sugar, leather, tobacco and wool are the principal exports. Pop. (1890) 12,253.

LANDSLIPS, large portions of land which from some cause have become detached from their original position, and slid down to a lower level. They are especially common in volcanic districts, where the trembling of the earth that frequently accompanies the eruption of a volcano is sufficient to split off large portions of mountains, which slide down to the plains below. Water is another great agent in producing landslips. It operates in various ways. The most common method is when water insinuates itself into minute cracks, which are widened and deepened by its freezing in winter. When the fissure becomes sufficiently deep, on the melting of the ice, a landslip is produced. Sometimes, when the strata are very much inclined, and rest on a bed susceptible of absorbing water, and becoming slippery, the superincumbent mass slides over it to a lower level. This took place on a large scale in Dorsetshire between Lyme and Axminster, in 1839, an unusually wet season, in which the strata had become saturated with moisture. A mass of chalk and greensand here slid over the slippery surface of a bed of liassic clay down into the sea, leaving a rent three-quarters of a mile long, 240 ft. wide, and 150 ft. deep. Of the same kind was the slip of the Rossberg, in Switzerland (see **GOLDAU**). Landslips of a different kind have been produced in peat-mosses, which becoming by heavy rains thoroughly saturated with water, have burst their natural boundaries, and discharged themselves on a lower level. The most remarkable case on record is that of the Solway Moss, which, in 1772, owing to greater rains than had fallen for nearly two centuries, spread itself in a slowly rolling, resistless deluge of black mud over 400 acres of cultivated fields.

LANDSMAN, the lowest rating aboard of a man-of-war. At present landsmen are seldom enlisted except to perform the duties of berth-deck-cooks or officers' servants. The pay per month is \$16, and they are classified under the head of seamen of the third class.

LANDSTAD, MAGNUS BROSTRUP, 1802-80; a priest in the national church of Norway, and distinguished for his contributions to the literature of his country. He has been regarded as one of the twelve great Norwegian poets of this century. He published a hymn-book, which in 1869 was authorized to be used in the public religious services, and is now used in nearly every parish in Norway. In 1853 he published his Norwegian ballads, which, with notes, fill more than 900 octavo pages.

LANDSTURM. See **LANDWEHR**.

LAND-SURVEYING, or the measurement of the area of a portion, whether small or large, of the earth's surface, is an important application of mathematics, and involves a thorough acquaintance with geometry, trigonometry, and the theory and use of the instruments employed for the determination of angles. Fields or portions of ground of small extent are measured easily and with sufficient accuracy by a chain (for distances), and a box-compass or cross-staff (for angles). For larger areas, the use of the surveyor's table is requisite; and for those of still greater extent, in which the greatest accuracy is requisite in the determination of the angles, the astrolabe, theodolite, sextant, circle, reflector, micrometer, etc., are used. The surface to be measured is divided into triangles, which are separately measured and calculated; but when a large extent is included in the measurement, it is not enough to proceed from one triangle to another, in which way an error at the outset may be propagated with continual increase; but a base line, as long as circumstances admit of, must, in the first instance, be accurately measured, upon which, by means of the measurement of angles, all the subsequent calculations are

made to depend, and lines subsequently measured are only intended to be corrective of the results obtained by calculation. When the extent of surface is still greater, as when a whole country is to be measured, points here and there are astronomically determined, their meridians are accurately laid down, and a complicated system of triangles is employed to insure accuracy. This is called *triangulation*.

LAND-TAX, an English tax upon land and houses for purposes of revenue, in lieu of the ancient subsidies, scutages, talliages, tenths, fifteenths, and such occasional taxes. From a very early period to the middle of the 17th c., parliament had provided for the extraordinary necessities of the government chiefly by granting subsidies, which were raised by an impost on the people in respect of their reputed estates. Landed property was the chief subject of taxation, and was assessed nominally at 4s. in the pound. But this assessment was made in such a way that it did not rise with the value of land, but dwindled away to about 2d. in the pound. The Long parliament devised a more efficient plan by fixing the sum to be raised, and then distributing it among counties according to their supposed wealth, leaving them to raise it by a rate. In 1692 a new valuation of lands was made, and it was found that a tax of 1s. per pound would yield half a million. In war this was raised to 4s. In 1798 the parliament relieved itself of the trouble of every year passing an act, and a general act was passed, permanently fixing the land-tax at 4s. in the pound. This act (38 Geo. III. c. 60) enabled the landlord to redeem the tax, and accordingly, since that time, a great part of it has been redeemed, only about one million being unredeemed. Though the act of 1798 directed the tax to be assessed and collected with impartiality, this provision was not carried out, but the old valuation of 1698 was acted on, and in modern times the greatest possible inequality prevails. If the tax is in arrear, the tenant is liable to a distress; but the tenant may deduct it from the next rent he pays. The tax, though nominally chargeable on the landlord, falls neither on the landlord nor the tenant, but on the beneficial proprietor, as distinguished from the tenant at rack-rent; for if the tenant has sublet, and has a beneficial interest, he pays *pro tanto* the tax, charging the residue on the landlord. The proportion of land-tax fixed on Scotland was £47,954, and a proportion was fixed on each county, the commissioners having power to amend the valuation. The collection and management of the tax was given to the commissioners of taxes by the statute 3 and 4 Will. IV. c. 13.

LAND'WEHR (land defense), a military force in the German and Austrian empires, somewhat corresponding to the militia (q. v.) of this country. It is not always retained under arms. During peace, its members spend most of their time in civil pursuits, and are called out for military service only in times of war or of commotion—care being taken, however, that they are sufficiently exercised to make them ready for such service when necessary. The name Landwehr was first applied to the Tyrolese, who rose against the French; and in 1805 a similar force was raised in the other German provinces of Austria. The L. of Austria-Hungary is now like that of Germany. By far the most complete system of land-defense was the Prussian, which was called into existence in 1813, when all Germany rose against Napoleon. As early, indeed, as 1806, or earlier, marshal Knesebeck, then a major in the Prussian army, had proposed such a thing; but it was not till the opening of the campaign of 1813 that the Prussian Landwehr was organized according to Scharnhorst's plan by a royal edict, dated Mar. 17. At first, it was designed solely as a land-defense, properly so called, and not, what is now the case, as an integral part of the regular army. It was called out in two separate levies, the first comprising all men from 26 to 32, and the second those from 32 to 39. The old men up to 60 belonged to the *landsturm*, which was called out only for the defense of house and hearth.

After the second peace of Paris appeared the *Landwehrordnung* (Landwehr-regulation) of April 21, 1815, according to which the country was divided into 104 districts, each of which had to furnish a battalion of Landwehr. To every battalion of Landwehr was attached a squadron of uhlans; three battalions formed a regiment; two regiments, a Landwehr brigade, which, along with the brigades of cavalry and infantry, was placed under a general of division. By the constitution of April, 1871, the Prussian obligation to serve in the army was extended to the whole German empire. Every German capable of bearing arms, after serving in the standing army for seven years, has to enter the Landwehr, and remain in it for other five years. See GERMANY.

LANE, a co. in w. Kansas, formed of extensive prairies and watered by Walnut creek, North Fork, and South Fork; 720 sq. m. Pop. '90, 2060. Co. seat, Dighton.

LANE, a co. in w. Oregon, having for its n. boundary a branch of the Willamette river, called McKenzie's Fork; the Cascade range of mountains for its e. border, and the Calapooya mountains extending along the s. boundary line to where the Sinslaw river rises and flows w. to the Pacific ocean, which forms its w. boundary; 3860 sq. m., pop. '90, 15,198. The Willamette valley formed by the river of that name lies along the e. section for 200 m., and is from 20 to 30 m. wide; for two-thirds of the year the river is navigable by steamboats as far as Eugene City, 200 m. from its mouth. The surface is uneven, varied by hills, valleys, and dense forests of fir and pine. The scenery is mag-

nificent. It embraces three peaks of the Cascade range, Mt. Hood, 11,934 ft. above the level of the sea, Mt. Jefferson, and Mt. Pitt. Igneous rocks are found in the mountainous district; but in the valleys the soil is very fertile, and productive of grain, honey, and tobacco. Co. seat, Eugene.

LANE, EDWARD WILLIAM, PH.D., 1801-76; b. England; prepared for the church, but visited Egypt in 1825, and continued to travel and reside in that country till 1842. Having devoted himself to the study of the manners and customs of the Egyptians, he published a popular work on that subject in 1836; and, five years later, a new translation of the *Arabian Nights*, 1841. Other works from his pen are *Selections from the Kur-an*, 1843; and *Arabian Tales and Anecdotes*, 1845. He labored for many years at the compilation of an Arabic-English dictionary, and left behind him at his death, in 1876, the manuscript complete for the seventh and eighth volumes of his great work, which was completed (1876-90) by his nephew, S. Lane-Poole. Mr. Lane's fluency in the Arabic language was extraordinary, and his acquaintance with the customs of the Arabs gave him facilities for acquiring knowledge which no other English writer has possessed, with perhaps the exception of Prof. E. H. Palmer (q.v.).

LANE, HENRY SMITH, 1811-81; b. Montgomery co., Ky.; removed to Indiana early in life, and was admitted to the bar, 1832; was elected to the state senate, 1835; was a member of congress, 1840-43; served in the Mexican war as a lieutenant-col. of Indiana vols. He was elected gov. of Indiana, 1861, but resigned two days after his inauguration, having been elected U. S. senator as a republican; and served, 1861-67.

LANE, JAMES HENRY, 1814-66; b. Lawrenceburg, Ind.; educated for the legal profession, and admitted to the bar. On the outbreak of the Mexican war he volunteered as a private in the 3d Ind. regiment, became its col., and at Buena Vista, where he was in command of a brigade, distinguished himself by his gallantry. Returning to Indiana in 1848, he was elected lieutenant-gov., and in 1853 a member of congress. He voted for the repeal of the Missouri compromise, and on the breaking out of the Kansas political troubles, removed to that state, and was a prominent member and chairman of the executive committee of the Topeka convention. He was made president of the Leavenworth constitutional convention of 1857, and on the outbreak of actual hostilities between the "free-state" and "border-ruffian" elements, so-called, was put in chief command of the former. Being elected U. S. senator by the Topeka legislature, his election was held by congress to be invalid, and he was indicted for high-treason. He became senator, however, in 1861. He was in Lawrence, Kan., at the time of the Quantrell massacre, and narrowly escaped with his life. He retained his seat in the senate during the war, and in 1865 was re-elected. But in the following year he was attacked with paralysis, and, during temporary aberration of mind, committed suicide.

LANE, JOSEPH, b. N. C., 1801; removed to Indiana, where he interested himself in local politics, and was several times elected to the state legislature. He fought in the Mexican war with distinction, was col. 2d Ind. vols., promoted to brigadier and brevet major-gen. for gallantry, and was wounded at Buena Vista. In 1848 he was appointed governor of Oregon territory, and was sent from there delegate to congress in 1851, and to the U. S. senate in 1859. In 1860 he was nominated for vice-president on the ticket with John C. Breckenridge, by the democratic convention at Baltimore. He d. 1881.

LANE-POOLE, STANLEY, b. London, 1854; was educated at Oxford. He studied numismatics, and in 1872 published a treatise on Arabic coins. He wrote the *British Museum Catalogue of the Oriental Coins* (8 vols.), *Catalogue of Indian Coins*, *A Catalogue of the Arabic Glass Weights in the British Museum*, and a *Catalogue of Mohammedan Coins in the Bodleian*. He completed the Arabic lexicon of his great-uncle, E. W. Lane, after the latter's death. He wrote many biographies and other works, among which are *Life of Edward William Lane*, 1877; *Speeches and Table-talk of the Prophet Mohammed*; *Prose Writings of Jonathan Swift*, 1884; and *The Mohammedan Dynasties*, 1893. He is a member of many learned societies. His latest biography is the *Life of Sir Harry Parkes*, in which F. V. Dickens collaborated, 1894.

LANFRANC, the most eminent of the foreign churchmen who rose to distinction in the mediæval church of England, was born of a noble family at Pavia, in 1005, and educated, partly at Pavia, partly at Bologna, for the profession of the law. In the hope of greater distinction, he removed to France, and founded at Avranches a school of law, which soon became one of the most popular in France. Having been waylaid and all but murdered by robbers during one of his journeys to Rouen, he was carried to the monastery of Bec, where he was treated with much tenderness; and the deep religious impressions there received determined him to abandon the world and become himself a monk. Having enjoyed the confidence of William, duke of Normandy, for many years, he was selected by him, after the conquest of England to fill the primatial see of Canterbury, and he was induced with much reluctance to accept it in 1070. Under his spiritual rule, the church of England received as strong an infusion of the Norman element as was forced upon the political system of England by the iron hand of the conqueror. Lanfranc outlived William; and to his influence the historians mainly ascribe the peaceful submission with which that monarch's successor, Rufus, was accepted by the kingdom, as well as the comparative moderation of the earlier years of Rufus's reign. The tyranny which has made the name of Rufus odious dates mainly after the

death of Lanfranc, which occurred in 1089, in the 84th year of his age. His chief writings are—Commentaries on the Epistles of St. Paul, the Treatise against Berengar, and Sermons. His letters, however, are very interesting. The first complete edition of his works is that of D'Achery (fol. Paris, 1648). They are also found in the *Bibliotheca Patrum*. See Milman's *Latin Christianity*, vol. iii. pp. 438–440, and also Dr. Hook's *Lives of the Archbishops of Canterbury*, vol. ii., 1861.

LANFRANCO, GIOVANNI, 1531–1647; b. Parma, Italy; exhibited a remarkable aptitude for painting while serving as a domestic, and was placed by his employer, count Orazio Scotti, with Agostino Caracci, and afterwards sent to Florence, Venice, and Boulogne, for study. He assisted Annibale Caracci in the frescos of the Farnese palace. He was a remarkably rapid painter, of fertile imagination, and overflowing with energy and originality. The cities of Italy abound with his works, of which the most remarkable are the cupola frescos, that of “St. Andrea della Valle” in Rome being one of the most noted. In the Louvre at Paris are his “Crowning of the Virgin,” “Hagar in the Desert,” “The Separation of St. Peter and St. Paul,” and “St. Peter Praying;” in the London national gallery, “St. Peter and Judas,” and others. The galleries of Dresden, Munich, Vienna, and Berlin all have some of his works.

LANFREY, PIERRE, 1828–77; b. Savoy; was educated at a Jesuit college at Chambéry, and at the Lycée Bourbon, Paris, and studied jurisprudence. He entered upon the profession of authorship by publishing, in 1855, *L'Eglise et les Philosophes du 18^{me} Siècle*, which attracted general attention. This was followed, in 1860, by his *Histoire Politique des Papes*; and three years later by *Le Rétablissement de la Pologne*. But his great work was his political and social study of the empire, published under the title *Histoire de Napoléon 1^{er}* (6 vols., Paris, 1867–74). Lanfrey fought with the *garde mobile* in the Franco-German war. In 1871 he was elected a member of the assembly from Marseilles, and shortly after appointed by president Thiers ambassador to Switzerland. In 1873, on the election of MacMahon, he resigned this position, and in 1875 was elected a life-senator. In politics he acted with the moderate left.

LANG, ANDREW, b. in Scotland, 1844; was educated at Oxford, and was made a fellow of Merton coll. He made, with S. H. Butcher, some excellent prose translations from Homer, followed by translations from other Greek poets, chiefly pastoral. His own poetical works include *Ballads in Blue China* (1880), *Ballades and Verses Vaine* (1884), *Verses à la Mode* (1885), *Helen of Troy*. His verse is of a light tone, often graceful in model. He has also published *Custom and Myth* (1884), *Letters to Dead Authors* (1885), *Myth, Ritual and Religion* (1886), *Life of Sir Stafford Northcote* (1890), *Letters to Dead Authors* (1893), an edition of the *Poetical Works of Sir Walter Scott* and *A Monk of Fife* (both 1895), *The Life and Letters of John Gibson Lockhart* and *The Animal Story Book* (1896), *Pickle, the Spy* and *At the Sign of the Ship* (1897), etc.

LANGBAINE, GERARD, 1656–92; b. Oxford; received a university education, but led a reckless and wild life, finally devoting himself to the collection of plays and the preparation of catalogues of them, in which he showed considerable bibliographical accuracy. These catalogues were published between 1687 and 1719, and are still held in some esteem for the information which they afford concerning the early English drama.

LANGDELL, CHRISTOPHER COLUMBUS; b. N. H., 1826; was educated at Phillips Exeter academy and Harvard. He studied law at the Harvard law school, and took the degree of LL.B. After practicing law for a time at the New York bar, he was made Dane professor of law at Cambridge, and in 1870 dean of the law faculty. He has compiled several volumes of cases and pleadings, including *Select Cases on Contracts*; *Select Cases on the Law of Sales*; and *Summary of Equity Pleading*.

LANGDON, JOHN, LL.D., 1739–1819; b. N. H.; received a common-school education, and pursued a mercantile career until the outbreak of the revolution, when he devoted his time and his accumulated wealth to the patriotic cause. He was a delegate to congress in 1775, and speaker of the assembly of New Hampshire the following year. After advancing a large sum for the sustenance of a regiment which had been formed, he furnished the means with which was raised the brigade which gen. Stark commanded in his victory at Bennington, during which engagement Langdon commanded a company. In 1783 he was again chosen a delegate to congress; in 1788 he was governor of New Hampshire; and from 1789 almost continuously until 1811, a U. S. senator.

LANGDON, SAMUEL, D.D., 1723–97; b. Boston, Mass.; was educated at Harvard university, and taught a grammar-school in Portsmouth, N. H. He attended the expedition against Louisburg in 1745 as chaplain, and in 1747 settled in Portsmouth, where he remained as pastor of the First church (Congregational), until 1774, when he became president of Harvard university. He continued to hold this position until 1780, and was still later a minister at Hampton Falls, N. H. Dr. Langdon received his degree of D.D. from the university of Aberdeen, Scotland. He held a high position and exercised profound influence in public affairs, and was a prominent member of the New Hampshire convention which adopted the federal constitution.

LANGE, JOHANN PETER, D.D., b. Prussia, 1802; was in a great measure self-educated, but studied at the gymnasium of Düsseldorf, and afterwards theology at Bonn,

where he was appointed professor of theology in 1854. His writings are highly esteemed among theologians, his *Theologisch-homiletische Bibelwerk* in particular, a very full, critical, exegetical, doctrinal, and homiletic commentary on the Bible, prepared under his supervision, and translated and published in the United States under the general editorship of Dr. Philip Schaff, under the title *Lange's Commentary*. This great work has been received in this country as a welcome addition to the apparatus for biblical study. His other works are: *Leben Jesu*; *Christliche Dogmatik*; and *Apostolische Zeitalter*. He d. 1884.

LANGÉLAND (i. e., *long land*), a Danish island, situated at the southern entrance to the Great Belt, between Fuhnen and Laaland. It is 33 m. in length, and about 3 m. in average breadth. Area, about 100 sq. m.; pop. 19,100. It consists of a ridge of low hills, is very fertile in soil, and is well wooded. Grain, peas, butter, and cheese are largely produced. Rudkjøbing, pop. '80, 3,179, on the w. coast, is the only town.

LANGENBECK, BERNHARD VON, 1810-87; prof. of surgery, university of Berlin, director of the Royal Clinical hospital, and general staff physician of the army, was cousin of the famous surgeon, Max Langenbeck, of Göttingen. Having been appointed (1847) successor to the great operator, Dieffenbach, in Berlin, he was not long in acquiring an equally high celebrity, especially through his great skill and success in the operation for harelip, as well as in the replacement of noses, eyelids, and lips. He likewise earned a great reputation through his execution of the operation of resection (q. v.), in which the diseased or injured part only of a bone is removed, instead of the whole limb perhaps being amputated. During the late wars in Germany, a great field opened itself for this kind of operation, and hundreds of the wounded who came under the knife of Langenbeck have to thank him for the preservation of their limbs. On account of his eminent services, he was ennobled, and received the highest medical rank in the Prussian army. He was a man of prepossessing appearance; and instead of that bluff harshness which, whether natural or assumed, has characterized so many great surgeons, he was eminently tender and sympathetic with his patients. As a teacher, he was highly successful; and the Clinical hospital in Berlin under his personal direction was the resort of patients from all countries of the world.

LANGENBIE LAU, a group of nine contiguous villages in Prussian Silesia, 33 m. s. w. of Breslau. Pop. '90, 15,860, employed in linen, cotton, and other manufactures, bleaching, and dyeing.

LANGENSALZA a t. of the Prussian province of Saxony, with a pop. of '90, 11,501, and considerable manufactures. Here in June, 1866, in an encounter between the Hanoverians and a body of Prussians, the latter were at first defeated, but being reinforced compelled the former to capitulate.

LANGERON, ANDRAULT, Comte de, 1763-1831; b. Paris; appears to have been a soldier of fortune, who did not even hesitate to fight against his own country. He was a subordinate officer in the French contingent during the latter part of the American revolutionary war, and rose to the rank of col. The French revolution expatriated him, and in 1790-91 he was in the Russian service, fighting in the wars with Sweden and Turkey. When the Austrians invaded France and Holland in 1792-94, he served with them, but was again in the Russian employ in 1799, and at Austerlitz was a gen. of division in that service. He fought against Napoleon I. when the latter made his disastrous invasion of Russia, and also in the battle of Leipsic. In 1822 he was appointed governor-general of New Russia. His last military service was in the Turkish war of 1828-29. Died in St. Petersburg.

LANGEVIN, Sir HECTOR LOUIS, b. Quebec, 1826, where he was educated, and having studied law at Montreal, commenced practice at the bar in 1850. He edited several papers published in the French language in Montreal and Quebec; was mayor of Quebec, 1857-59; member of the provincial parliament in 1858; solicitor-general for lower Canada in 1864; and postmaster-general in 1866. He was one of the commissioners sent to London to organize the confederation of the British North American provinces in 1866, and in 1867 entered the Dominion cabinet. In 1875 he represented Dorchester, Quebec, in the house of commons; in 1879 was postmaster-general; was knighted 1881, and served as minister of public works till 1891.

LANGHAM, SIMON DE, Cardinal, 1310-76; was a monk in Westminster in 1335, and became subsequently prior and abbot. In 1360 he was lord high treasurer of England; two years later, bishop of Ely; and in 1366, archbishop of Canterbury. He dismissed Wycliffe from the wardenship of Balliol college, Oxford, thus coming in conflict with Edward III.; and having been made by pope Urban V. a cardinal-presbyter, he was driven from his archbishopric, and forced to retire to Avignon. Here he occupied a confidential position with pope Gregory XI. until his death.

LANG HOLM, a burgh of barony and market t. in Dumfriesshire, Scotland, at the junction of the Ewes, the Wauchope, and the Esk, about 30 m. e. of the county town, and 8 m. n. of the English border. There are factories in the town, whose staple manufactures are woollen yarns, and a woollen cloth called tweed, for which the town is noted. Dye-works are also in operation. Pop. '91, 6343.

LANGHORNE, JOHN, D.D., 1735-79; b. Kirkby-Steven, Westmoreland. After studying at Winton and Appleby, he devoted himself to private teaching; took orders; went to Cambridge; was private tutor in the family of a Lincolnshire gentleman, to whose daughter he became attached. His suit was rejected, and he went to London, became curate of St. John's, Clerkenwell, and wrote for the periodicals. A short poem in 1765, entitled *Genius and Valor*, defending the Scottish nation against the invective of Churchill's *Prophecy of Famine*, obtained for him the degree of D.D. from the university of Edinburgh. While living at Folkestone, in Kent, where his brother was curate, he began with his brother's assistance the translation of *Plutarch*, which was published in 1771.

LANGLAND, OR LANGLEY. See **PIERS PLOWMAN.**

LANGLÉS, LOUIS MATHIEU, 1763-1824; b. France; devoted himself to oriental studies, and in 1787 translated Tamerlane's *Institutes* from the Persian. Two years later he edited the Mantchou-French dictionary of Father Amiot, and in 1795 was appointed administrator and professor of the Persian language in the new School of Oriental Languages founded by the French government. He was the founder of the Geographical Society of Paris, and wrote a number of works on Oriental literature.

LANGLEY, SAMUEL PIERPONT, D.C.L.; an eminent American astronomer, born at Roxbury, Mass., in 1834. He was educated at the Boston Latin School, and after studying in Europe became Professor of Mathematics in the U. S. Naval Academy at Annapolis. Later he became Professor of Astronomy at the Western University of Pennsylvania (1867); and Secretary of the Smithsonian Institution (1887). His solar observations, made at Pike's Peak in 1878, at Mt. Etna in 1878-79, and at Mt. Whitney, Cal., in 1881, have added greatly to our knowledge of the phenomena of solar heat. In 1886 he became President of the American Association for the Advancement of Science, and in Aug. 1894 received the degree of D.C.L. from Oxford University. For several years he gave much study to aerial locomotion, and in 1897 officially reported that mechanical flight had been attained. A mechanism of his design, built chiefly of steel and driven by a steam engine, made two flights of over half a mile in 1896, and afterward nearly doubled this distance. In each case there was no support from gas.

LANGLOIS, VICTOR, 1829-69; b. France; traveled in Asia Minor and Armenia, in western Asia, in 1852-53, making excavations and collecting ancient coins, medals, and inscriptions. At Tarsus, in Cilicia, the birthplace of St. Paul, of the stoic Antipater, and the philosopher Athenodorus, anciently the seat of a celebrated school of philosophy, he found in the cemetery some figures in terra-cotta, which were afterwards exhibited in Paris. He was happy in his discoveries of Greek inscriptions, which numbered over 80. He published, in 1858, *Numismatique de l'Arménie*. Previous to 1861 he went to Italy, adding to his investigations in relation to Armenia in the time of the crusade, a collection of data for an important work on the doctrines of the Mechitarists, the most celebrated of the Armenian monks; visiting San Lázaro, an Armenian convent, a center of Armenian literature, on an island near the city of Venice. The work appeared in 1862. In 1867 he published *Le Mont Athos et ses Monastères*, with a lithographic copy of the Greek manuscript of the geography of Ptolemy, 17th c., which he found in the libraries of the monasteries of Mt. Athos, in Turkey, the seat of the first and most celebrated theological seminary of the Greek church. As the result of his researches, the first volume of his *Collection des Historiens Anciens et Modernes de l'Arménie*, was produced in 1868.

LANGNAU, a t. of the canton of Bern, Switzerland, 16 m. e. from Bern, in the Emmenthal. It is situated on the Ilfis, a branch of the Emmen. Langnau is the principal mart for the cheese and linen thread of the Emmenthal. Pop. '90, 7643.

LANGRES, a manufacturing t. of France, in the department of Haute Marne, is situated at an elevation of 1460 ft. above sea-level, 40 m. n.n.e. of Dijon and a citadel of the first class. Here cutlery of the finest quality is manufactured. It is said to have been the see of a bishop since the 3d c., and possesses a cathedral of the 11th century. Pop. '91, 10,719. Langres, the ancient Andematunnum, was in the time of Cæsar the capital of the Lingones, a name corrupted into Langres.

LANGSTON, JOHN MERCER, LL.D., b. in slavery at Louisa Court-house, Louisa co., Va., 1829. He was emancipated at 6 years of age, and, having subsequently fitted himself for college, entered Oberlin, where he graduated in 1849. He then entered the theological school of the same institution, whence he graduated in 1853. Having studied law, he was admitted to the bar in 1854; and after a practice of 13 years in the legal profession in Ohio, he accepted a professorship of law in Howard University, Washington, D. C. After a time he was appointed dean of the faculty, and in 1873 became vice-president and acting president of the institution. In 1871 he was appointed by President Grant a member of the board of health of the District of Columbia, of which in 1875 he was elected secretary. In 1877 he was appointed by President Hayes minister to Hayti, a post at which he remained till 1885, when he became president of the Virginia normal and collegiate institute. In 1888 he was elected to congress, but was counted out, and after a contest was declared entitled to the seat in Sept., 1890. He was defeated for reelection in 1890.

LANGTOFT, PETER, b. 13th c.; was a canon-regular of the order of St. Austin at Bridlington in Yorkshire, England. He was the translator into French of Herbert Bosenham or Boscam's *Life of Thomas à Becket*; and also compiled in French verse a *Chronicle of England*, manuscripts of which are preserved in the Cottonian collection, and among the Arundel MSS. in the Heralds' college in England. His works were translated into English in a metrical version by Robert de Brunne, and published by Hearne in Oxford, 1725.

LANGTON, STEPHEN, celebrated in the history of the liberties of England, was b. probably in Lincoln or Devonshire, about the middle of the 12th century. He received the chief part of his education in the university of Paris, where he was the fellow-student and friend of Innocent III.; and having completed his studies, he rose through successive grades to the office of chancellor of the university. After the elevation of Innocent, Langton, having visited Rome, was named to the cardinalate by the pope; and, on occasion of the disputed election to the see of Canterbury, he was recommended to those electors who had come to Rome on the appeal, and having been elected by them, was consecrated by Innocent himself at Viterbo, June 27, 1207. His appointment, nevertheless, was resisted by king John; and for 6 years, Langton was excluded from the see, to which he was only admitted on the adjustment, in 1213, of the king's dispute with Innocent through the legate Pandulf. See INNOCENT III. This reconciliation, however, was but temporary. In the conflict of John with his barons, Langton was a warm partisan of the latter, and his name is the first of the subscribing witnesses of Magna Charta. When the pope, acting on the representation of John, and espousing his cause as that of a vassal of the holy see, excommunicated the barons, Langton refused to publish the excommunication, and was in consequence suspended from his functions in 1215. He was restored, however, probably in the following year; and on the accession of Henry III., he was reinstated (1218) in the see of Canterbury, from which time he chiefly occupied himself with church reforms till his death, which took place July 9, 1228. Langton was a learned and successful writer, but his writings are lost, and the chief trace which he has left in sacred literature is the division of the Bible into chapters, which is ascribed to him. Giraldus Cambrensis (q.v.) dedicated several of his books to Langton.—See Wharton's *Anglia Sacra*, vols. i. and ii.; Lingard, vol. ii.; Milman's *Latin Christianity*, vol. iv.; and Dr. Hook's *Lives of the Archbishops of Canterbury*, vol. ii. 1861.

LANGTRY, EMILIE CHARLOTTE LE BRETON, b. in the island of Jersey, abt. 1853; daughter of an English clergyman; became well known in English society by her great beauty and social charms. She made her début as an actress at Twickenham, Eng., Nov. 19, 1881, as the young widow in *A Fair Encounter*. She was married to Edward Langtry in 1876, and was divorced from him in 1897.

LANGUAGE. See PHILOLOGY; PALEOGRAPHY.

LANGUAGE OF FLOWERS. See FLOWERS, LANGUAGE OF.

LAN'GUED, or LAMPASSÉ, in heraldry. An animal whose tongue is of a different color from his body, is said to be *langued* of that color.

LANGUEDOC, the name given in the middle ages, and down to the French revolution, to a province in the s. of France, bounded on the n. by Auvergne and Lyonnais; on the e. by the river Rhone; on the s. by the Mediterranean and the counties of Foix and Roussillon; and on the w. by Gascony and Guienne. It was traversed through its whole length, from n.e. to s.w., by the Cevennes (q.v.). Languedoc is now divided into the departments of Lozère, Gard, Ardèche, Aude, Hérault, Upper Loire, Tarn, and Upper Garonne. The capital of Languedoc was Toulouse. The name is derived from that of the southern French dialect or Provençal, which was called the *langue d'oc*, whilst the northern was called *langue d'oui* or *langue d'oïl*, because in the former the word *oc* (an abbreviation of Lat. *hoc*) was used for *yes*, and in the latter *oil* or *oui* (from Lat. *hoc illo*).

LANIER, SIDNEY, 1842–81, b. Macon, Ga. He graduated at Oglethorpe coll., 1860; was for a year tutor in the coll., and then served as a private in the confederate army. After the war he studied law and practiced until 1872. His health failing, he went to Texas, and finally settled in Baltimore, 1874, and was prof. of literature in the Johns Hopkins univ. He published *Tiger Lilies*, 1867; a vol. of *Poems*, 1877; *The Science of English Verse*, 1880; and several editions of old legends. He was the author of the cantata sung at the Centennial celebration. A volume of his poems edited by his wife appeared, 1881. With some peculiar limitations, he is in some respects one of the most remarkable poets of this century. His thought, intellectually subtle and morally elevated, often moves in a surprising but never unnatural blending and change; while his words have a delicate musical flow suggestive of restrained strength. Through years of struggle with unfavorable circumstances, he developed a nature singularly faithful to ethical and poetic ideas. He also published for juvenile readers editions of Froissart's *Chronicle*; *King Arthur*; *Mabinogion*; and *Percy's Reliques*. See his complete poetical works and *Memoir* (1884), and *The English Novel*, revised by his widow (1897).

LANJUINAIS, JEAN DENIS, Comte de, 1753–1827; b. Rennes, France; named by the Parisians “iron head and lion heart.” He made an early success at the bar of Rennes; in 1775 became professor of ecclesiastical law and wrote treatises on the canonical legislation of France. In 1789 he was deputy from Rennes to the states-general, which soon

after became the revolutionary national assembly. He entered with ardor into the reforms inaugurated by that body to lift the common people and to destroy the special privileges of classes, but his opinions did not go much beyond a constitutional monarchy similar to that of England, to which idea he maintained a theoretical adherence, though in the stormy history in which he took part he combated nearly every separate feature of the English system. He pronounced with energy against the French nobility as useless parasites, nuisances to society, and demanded the suppression of all feudal rights and privileges. He helped to start the *Club Bréton*, which afterwards became the Jacobin club. Early in the assembly he demanded that the impertinent formulas—*je veux, et j'ordonne*—which Louis XVI. had continued to use in his messages to the assembly, should be discontinued. He was a member of the committee on ecclesiastical legislation, and was always considered a stout adherent of the Christian faith of the Jansenist shade. He supported the tithe to king and church as a divine right, and protested energetically against the seizure of the property of the clergy, yet denounced the nobility of Bretagne, Dauphiné, and Languedoc for their opposition to liberty, which "liberty" was then proceeding to confiscate their estates. He opposed and defeated Mirabeau's motion to give the ministers a consultative voice in the assembly. On June 16, 1790, Lanjuinais demanded the abolition of all titles; in May, 1791, the admission of colored men to all the rights of citizenship; in Aug. that the king and prince should not continue to assume their titles, nor wear the insignia of rank. During that memorable session of the national assembly he took an energetic part in all its reformatory legislation, contributing especially to that affecting ecclesiastical establishments, and cherished the illusion that the church might be brought back to the early democracy of its faith and doctrines and become a coadjutor in national reforms. Lanjuinais was returned a member of the legislative assembly which succeeded the national assembly Oct. 1, 1791; but the radical reform movement of which he had been a leader was now getting beyond his convictions, which gave the color of reaction to his part in the new assembly. The monarchy, crushed by his aid, he seemed to wish preserved. Energetic, brave, and obstinate, he attempted with curious contradictions of opinions to make head against the logic of events which was leading to a democratic republic. He joined with the eloquent Louvet and Barbaroux to denounce and oppose Robespierre, but sustained the motion to exile the Orleans family. He rose with courageous vehemence against the act of accusation of the king, against the right of the assembly to judge him, and against the forms employed, yet at last voted the king guilty under the accusation. He then voted for his banishment as the last means to save his life. In Feb., 1783, in the climax of Robespierre's power, he supported the decree against the participants in the massacre of the previous Sept., combated the establishment of a revolutionary tribunal, attacked the commune of Paris, and faced the orators of the Jacobins in the assembly in the fiercest parliamentary battles of the memorable session which brought the Girondists to the guillotine. Often in personal danger, he clung to the tribune by main force, faced all, answered all, and yielded nothing. When the brutal Legendre, who was by trade a butcher, threatened to hurl him from the tribune, he retorted—"Yes, obtain a decree that I am an ox, that you may club me." He was placed under arrest by the Jacobins, but escaped and concealed himself until the fall of Robespierre. He was returned to the assembly in 1795, renewed the battle against the Jacobins, aided to remove the disabilities of exiled priests and émigrés, and took part in the formation of the new constitution. During the prolonged despotism of Napoleon, Lanjuinais took a subordinate part in politics; but he had little sympathy with the reactionary policy of the Bourbon restorations which followed. All these years, till his death in Paris, he was unceasingly industrious in literary work.

LANKĀVATĀRA, the name of one of the chief religious works of the Buddhists. It treats of their religious law, and of some of their most abstruse philosophical problems. See E. Burnouf, etc., and W. Wassiljew, etc., as named under *LALITA-VISTARA*.

LANKESTER, EDWIN, LL.D., 1814-74; b. England; was educated at University college, London, and at Heidelberg, for the profession of medicine. He held official positions in a number of English medical societies, and gained reputation as a lecturer and author. He devoted himself to investigations in hygiene and social science, and to studies in natural history and in other directions with a view to perfecting himself in these departments. He was an editor of the *Quarterly Journal of Microscopical Science*.

LANKESTER, EDWIN RAY, b. London, 1847; son of Dr. Edwin; educated at St. Paul's school, London, and Christ Church, Oxford. In 1872 he was appointed to a fellowship of Exeter college, Oxford, in 1874-90 was professor of zoology and comparative anatomy in University college, London; and in 1890 became Linacre professor of comparative anatomy at Oxford. He is the author of a large number of papers on scientific subjects, chiefly comparative anatomy and paleontology, contributed to the *Trans. Philos.* of the Royal Society, and other publications. He became chief editor of the *Quarterly Journal of Microscopical Science* in 1869; and brought out a new edition of Haeckel's *History of Creation* in 1893.

LANMAN, CHARLES, b. Mich., 1819, son of Charles James; was educated at an academy, and was for ten years, 1835-45, in a business situation in New York. He adopted the profession of journalism, and was employed on leading newspapers in New

York, Washington, and Cincinnati, and also as correspondent of the *Illustrated London News* and *London Athenæum*. He settled in Washington, and held at different times the positions of librarian to the war department, librarian of copyrights in the state department, and librarian of the house of representatives and of the interior department, besides being private secretary to Daniel Webster. In 1871 he was made American secretary of the Japanese legation, a position which he retained till 1882. Mr. Lanman published *Adventures in the Wilds of America*; *Private Life of Daniel Webster*; *Essays for Summer Hours*; *the Japanese in America*; and many other works. He d. in 1895.

LANMAN, CHARLES ROCKWELL, PH.D., American philologist, was born at Norwich, Conn., in 1850; graduated at Yale College in 1871; remained there studying Sanskrit and linguistic science until 1873; continued his Oriental studies at Berlin, Tübingen, and Leipzig; accepted a fellowship at Johns Hopkins University in 1876, and in 1880 was called to Harvard University, as professor of Sanskrit. He published in 1880 *Noun-inflection in the Veda*; in 1888 a *Sanskrit Reader with Vocabulary and Notes*. He was secretary of the American Philological Association, 1879-84, and edited vols. x. to xiv.; became its president in 1890, when he delivered an address on *The Beginnings of Hindu Pantheism*; and has been corresponding secretary of the American Oriental Society since 1884. He projected the *Harvard Oriental Series* (1891).

LANMAN, JOSEPH, rear-admiral, 1811-1874; b. Conn.; joined the navy as a midshipman when fourteen years of age, and was promoted through the different grades to rear-admiral (1867). During the two attacks on fort Fisher (1865) he commanded the second division of admiral Porter's squadron, and led the attack with the flag-ship, *Minnesota*. For this service he was highly commended in Porter's official report. In 1869-71 he commanded the s. Atlantic squadron; and in 1872 was retired.

LANNES, JEAN, Duke of Montebello, a marshal of the French empire, was b. April 11, 1769, at Lectoure; entered the army in 1792, and soon rose to high military rank. He rendered Napoleon important service on the 18th Brumaire, and enjoyed his highest favor. On June 9, 1800, he won the battle of Montebello, whence his title. He bore a principal share in the battle of Marengo, and commanded the left wing at Austerlitz. He served in the campaign against Prussia in 1806, commanded the center at Jena, and distinguished himself at Eylau and Friedland. Being sent to Spain, he defeated general Castaños at Tudela, Nov. 22, 1808, and took Saragossa. In 1809 he again served on the Danube, and commanded the center at Aspern (May 22), where he had both his legs carried away by a cannon-shot. He was removed to Vienna, and died there, May 31. He was interred in the Pantheon, in Paris.

LANNION, a t. and river-port of France, in the department of Côtes-du-Nord, on the Guer, about 7 m. from the mouth of that river. Its chief industry is fishing. Pop. '91, 5,693.

LA NOUE, FRANÇOIS DE, called **BRAS DE FER** (arm of iron), 1531-91; of an illustrious family in Bretagne; became a conspicuous defender of the Protestants of France. When Henry IV. heard of his death he made this memorable compliment to his memory: "He was a great warrior, and still greater in goodness. One cannot but regret that to gain a little fortress one should lose such a captain—worth more than a whole province." Educated in arms, La Noue was placed at the court of Henry II. at the age of 18, where he evinced more respect for learning than for military exercises, and set to improving the system of court training. He became a Protestant through the influence of d'Audélot, and after the massacre of Vassy joined the great Condé; was in the battle of Dreux, where Condé was made prisoner, and assisted Coligny in conducting a retreat. He was afterwards under Condé, and gained that reputation for bravery, prudence, and humanity combined, which led even the Roman Catholics of that time to give him the name of *the Protestant Bayard*. In 1570 he lost his left arm in battle and had its place filled with an iron one—hence his sobriquet. In 1570, when peace between the Romanists and Protestants was declared, La Noue was about to offer his services to Charles IX. when the latter broke the treaty and again massacred Protestants, and the former escaped into Spain. The king sent for him to negotiate with the Protestant insurgents of Rochelle, whose distrust of the treacherous court made his mission futile, though he succeeded in preventing further bloodshed at that time. They afterwards fought under him in the service of the king of Navarre, resisting the persecutions of the French king. In 1580 he was made captive by Philip II. of Spain, and remained for five years in prison, where he composed his *Discours politiques et militaires*, which was translated into several languages, and placed him in the rank of great writers and statesmen. Philip II., during his captivity, kindly offered him freedom if he would consent to have his eyes put out so that he could not again serve against Spain. In 1586 he aided to defend Geneva against the duke of Savoy. Later, Henry III. of France permitted him to return to his own country. He immediately resumed command in the French army, and his military services were as brilliant and energetic as in youth. Died at the siege of Lamballe.

LANOUE, JEANNE DE, 1666-1736; b. France. After a youth noted for cold penuriousness she changed suddenly to a life of active beneficence, helpful to the poor and the sick, giving her own means and soliciting from others to provide for them. Losing her estate, she continued to dedicate her life to the work begun, and in spite of the coldness of certain religious orders towards her, who even refused their stable for shelter

for her sick, she succeeded in founding a permanent society of young ladies for the work, with a peculiar vestment, who have since been known as sisters of Providence.

LANDSDOWNE, HENRY CHARLES KEITH PETTY-FITZMAURICE, Marquis of, ex-governor-general of Canada, b. in England, 1845. He held the offices of lord of the treasury 1868-72, under-secretary for war 1872-74, and for two months in 1880 under-secretary for India. As governor-general of Canada, 1883-88, he was successful and popular. From 1888 to 1893 he was viceroy of India.

LANDSDOWNE, HENRY PETTY-FITZMAURICE, third Marquis of, an English statesman, was b. at Lansdowne house, London, July 2, 1780. His father, the celebrated earl of Shelburne, was premier to George III., and received the coronet of a marquis in 1784. Lansdowne (then lord Henry Petty) was a younger son, and was sent to Westminster school, and afterwards to Edinburgh, then the school of the young whigs destined for political life. He took his degree at Trinity college, Cambridge, in 1801, and when barely of age, entered parliament as M.P. for Calne. He turned his attention to finance; and on Pitt's death he became, at the age of 25, chancellor of the exchequer, in the administration of lord Grenville. In 1809 he succeeded his half-brother in the marquissate, became one of the heads of the liberal party in the house of lords, and during a long opposition consistently advocated those various measures of progress which he lived to see triumphant. When the whigs, after their long exclusion from power, came into office with earl Grey at their head, Lansdowne became lord president of the council, which post he held, with a brief interval, from Nov., 1830, to Sept., 1841, resuming it in 1846, after the fall of the Peel ministry, and again filling it until 1853. He then formally bade farewell to office, and resigned the leadership of the house of lords; but consented to hold a seat without office in the Aberdeen cabinet, and again in the first administration of lord Palmerston. After the death of the duke of Wellington, he became the patriarch of the upper house, and the personal friend and adviser of the queen. He had a keen relish and a cultivated taste for literature, and was the generous patron of men of letters. He formed a splendid library, and one of the noblest collections of pictures and statuary in the kingdom. He refused a dukedom, and might more than once have been prime-minister. His death took place Jan. 31, 1863, at Bowood.

LANDSDOWNE, WILLIAM PETTY, Marquis of. See **SHELburne, Earl of**.

LANSING, city and capital of Michigan; in Ingham county, at the junction of the Grand and Cedar rivers, and on the Chicago and Grand Trunk, the Detroit, Lansing, and Northern, the Lake Shore and Michigan Southern, and the Michigan Central railroads; 85 miles n.w. of Detroit. It was laid out for the state capital in 1847, and was chartered as a city in 1859. It contains the State capitol, built in 1872-78 at a cost of \$1,500,000; State hospital; State library, including one of the best equipped law libraries in the country; city hall, completed in 1897 at a cost of \$125,000; city hospital; public library; U. S. government building, cost \$125,000; State school for the blind; State industrial school for boys; and, in the suburbs, the State agricultural college, with a farm of 700 acres. The city has abundant water power from the rivers, which are spanned by several bridges, and electric lights, electric street railroads, waterworks supplied from wells, about 20 churches, national and state banks, and daily, weekly, and monthly periodicals. The manufactures include agricultural implements, flour, stoves, machinery, carriages, wagons, trucks, wheelbarrows, artificial stone, condensed milk, and knit goods. There are several public parks, the capitol standing on an eminence in one of 12 acres, numerous hotels, and large interests in agricultural and general trade. The city owns the electric light and waterworks plants. Pop. '90, 13,102.

LANSING, JOHN, 1754-1829; b. N. Y.; studied law, but during the beginning of the revolutionary war was gen. Schuyler's military secretary. He served seven years in the legislature of New York, was mayor of Albany four years; a member of the congress of 1784-88, and of the state convention on the constitution of the United States. He was judge of the supreme court in 1790, chief-justice 1798, and chancellor of the state 1801-14.

LANSINGBURG, a town and village in Rensselaer co., N. Y.; on the Hudson river and the Fitchburg railroad; 3 miles n. of Troy. It was named from Abraham J. Lansing, one of the original settlers in 1771; contains a public school library, and electric light and street railroad plants; and has bridges across the river connecting with Waterford and Cohoes, weekly newspapers, and manufactories of collars, cuffs, shirts, brushes, carriages, crackers, oilcloth, etc. Pop. '90, town 10,871, village 10,550.

LANSQUENET (French, from German, *land* and *knecht*, a peasant-soldier), is a German game of cards, said to be the earliest game of cards known, having been used in Germany and France as early as 1392. Any number may participate in the game, the company playing against the dealer, and betting on the cards as they are dealt. Longfellow makes reference to this game in his poem *The Baron of St. Castine*.

LANTANA, a genus of shrubs belonging to the order verbenaceæ, ordinarily called the vervain family. The lantana shrubs are chiefly tropical. They are odoriferous and stimulant from the presence of an essential oil. *L. pseudothea* is used in Brazil as a substitute for tea. *L. camara* and *L. camixta* are natives of tropical America.

LANTERN, in architecture, an ornamental structure raised over domes, roofs, etc., to give light and ventilation. The dome of St. Paul's cathedral and many other large

domes are crowned with a lantern. Where a lantern is for the purpose of giving light, it is called a *lantern-light*. In Gothic architecture, a *lantern-tower* is frequently placed over the center of cross churches—the vault being at a considerable height, and the light admitted by windows in the sides. York and Ely cathedrals, and many churches in England, have such lantern-towers.

LANTERN-FLY (*Phyllocolpa*), a genus of homopterous insects; the type of a family *fulgoride*, allied to *cicadide*, but having legs more adapted for leaping, and destitute of organs for producing sound. The forehead is remarkably prolonged into an empty vesicular expansion, which assumes in the different species various and very singular forms, sometimes equaling the body of the insect in size. The colors are generally rich. The species are natives of the warmest parts of the world. The name lantern-fly was originally given to *F. laternaria*, a large species, found in Guiana, and of which the inflated projection of the forehead is said to be sometimes most brilliantly luminous; but the evidence is doubtful, and many naturalists refuse to believe in the luminosity of any of this genus. The most probable explanation is that the luminosity is sexual, and merely occasional, perhaps limited to particular seasons. Concerning the luminosity of the CHINESE LANTERN-FLY (*F. candelaria*), there is still greater doubt. The prolongation of the forehead in this species is a comparatively narrow snout.

LAN THANUM, or LANTHANUM, so named from the Greek word *lanthanein*, to lie hid, is a metal which was discovered by Mosander in 1841 in *cerite* (q.v.), a hydrated silicate of cerium. It is of little chemical interest, and is of no practical value. Till recently, the three metals cerium, lanthanum, and didymium were all confounded together under the name cerium.

LANUVIUM, an old and important city of Latium on the Appian way, about 16 m. s. of Rome, on a hill commanding an extensive view of the sea. It was probably colonized from Alba. It first became important in the 5th c. B.C., by the part it took against Rome as one of the 30 cities of the Latin league. Afterwards in the wars between Rome and the Æqui and Volsci it sided with Rome. But in the great Latin war, B.C. 338, it took part against Rome, but was treated leniently by the victorious Romans, who, instead of punishing, made the inhabitants Roman citizens. After the time of Cicero it was important only as the chief seat of the worship of *Juno Sospita*. After this it continued faithful to the Romans, particularly in the second Punic war. It was the birth-place of Antoninus Pius, of Milo the antagonist of Clodius, and near it was born the comedian Roscius. The small town of *Civita Lavinia* or *Citta della Vigna* occupies part of the site of the old Lavinium, of which but few remains are found.

LAN YARDS, in a ship, are short ropes used either to make fast various apparatus in its place, or to stretch other and important ropes to their utmost tension.

LANZA, GIOVANNI, b. Vignala, Piedmont, 1815; studied medicine at Turin, and entered into practice in his native place. In 1848 he entered the Italian parliament as a supporter of Cavour. In 1855 he entered the cabinet as minister of public education, and, after serving three years, exchanged this office for that of minister of finance. In 1859, after the peace of Villafranca, he resigned at the same time with the rest of the Cavour cabinet. Again entering parliament, he was several times elected president of that body; but in 1864 he was minister of the interior under La Marmora, serving, however, but for a single year, after which he again entered parliament, and was elected president. Having opposed the financial policy of the prime minister, he resigned the presidency when the ministry triumphed. He was re-elected again in 1869, and when the ministry resigned in consequence he formed a new cabinet himself, taking the position of minister of the interior. This cabinet remained in power until 1873, when Lanza resigned because the parliament refused to levy the taxes necessary to the efficiency of the government. He d. 1882.

LANZAROTÉ, one of the Canaries (q.v.).

LANZI, LUIGI, a celebrated Italian antiquary, was born at Monte dell' Olmo, near Macerata, June 14, 1732. He entered the order of the Jesuits, and resided at Rome, and afterwards at Florence, where he died Mar. 30, 1810. In 1782 he published at Florence his *Descrizione della Galleria di Firenze*. His great works, distinguished for their profound erudition, are his *Saggio di Lingua Etrusca* (3 vols. Rome, 1789), in which, contrary to the prevalent opinion among Italian savants, he maintains the influence of Greece upon Etruscan civilization, and his *Storia Pittorica d'Italia*, etc. (Florence, 1792; and Bassano, 1789 and 1806). This latter work has been translated into English by Thomas Roscoe (Bohn's standard library, 3 vols. 1847). He is the author also of several poems, works on Etruscan vases, sculptures, etc. His posthumous works were published in 2 vols. at Florence in 1817.

LAOC'ÖÖN, according to classic legend, a priest either of Apollo or Neptune, in Troy, who in vain warned his countrymen of the deceit practiced by the Greeks in their pretended offering of the wooden horse to Minerva, and was destroyed along with his two sons by two enormous serpents which came from the sea. They first fastened on his children, and when he attempted to rescue them, involved himself in their coils. This legend is not Homeric, but of later origin. It was, however, a favorite theme of the Greek poets, and is introduced in the *Æneid* of Virgil. It acquires a peculiar interest

from being the subject of one of the most famous works of ancient sculpture still in existence: a group discovered in 1506 at Rome, in the Sette Sale, on the side of the Esquiline hill, and purchased by pope Julius II. for the Vatican. It was carried to Paris, but recovered in 1814. The whole treatment of the subject, the anatomical accuracy of the figures, and the representation both of bodily pain and of passion, have always commanded the highest admiration. According to Pliny, it was the work of the Rhodian artists Agesander, Polydorus, and Athenodorus, but this is doubtful. Casts of it are to be found in every European museum. For an æsthetic exposition of its merits, see Lessing's celebrated *Laocœon oder über die Grenzen der Malerei und Poesie*. See illus., **GRECIAN SCULPTURE**, vol. VII.

LAODICEA, a city of ancient Phrygia, near the river Lycos, so called after Laodice, queen of Antiochus Theos, its founder, was built on the site of an older town named Diospolis. It was destroyed by an earthquake during the reign of Tiberius, but rebuilt by the inhabitants, who were very wealthy, fell into the hands of the Turks in 1255, was again destroyed in 1403, and is now a heap of uninteresting ruins, known by the name of Eski-Hissar. Art and science flourished among the ancient Laodiceans, and it was the seat of a famous medical school. The number of Jews who were settled here at the rise of Christianity will account for its importance in the primitive history of the church. An important ecclesiastical council, the first council of Laodicea, was held here in 363, which adopted resolutions concerning the canon of the Old and New Testaments, and concerning ecclesiastical discipline. A second council was held here in 476, which condemned the Eutychians.

Not less than six Greek cities, built by monarchs of the Syrian empire, bore this name, five of them in honor of Laodice, wife of Seleucus Nicator, and one in honor of the queen of Antiochus Theos. Of these, one in Media, one in Mesopotamia, and one in Phenicia have not been identified in modern times. Of the others, one is in Iconium, on the high road from Greece to the Euphrates, and another, now known as Latakia, is in Asiatic Turkey, in the province of Syria, on the Mediterranean. The city of Laodicea described above was annexed to the Roman empire 133 years B.C., after which it became one of the most populous, wealthy, and splendid cities of Asia Minor, and the capital of the province of Greater Phrygia. The Christian church here was possibly founded by Paul, who is believed by many to have written a letter to it, which has been lost. The only evidence of this is in Col. iv. 16: "And when this epistle is read among you, cause that it be read also in the church of the Laodiceans; and that ye likewise read the epistle from Laodicea." The first epistle to Timothy, if the superscription at the end is authentic (which, however probable, is by no means certain), was "written from Laodicea, the chiefest city of Phrygia Pacatiana." The church of the Laodiceans has become familiar to the Christian world, as a type of spiritual indifference from the description in Rev. iii. 14-18. See **LATAKIA**.

LAODICEA, COUNCIL OF, was held some time during the 4th c., but whether towards the beginning, middle, or end has been earnestly debated without being determined. It consisted of 32 bishops from different provinces of Asia, and embodied its decisions in 60 canons relating to matters of ritual, church order, dignity, precedence, discipline, morals, faith, and heresy. They are all worthy of study as intimating the state of doctrine, thought, and life in the churches of that day, affected, as they had been and were, by the religion, philosophy, vices, and customs of the heathen world. The most important of them is the last, giving a list of the books of Scripture received at that time as canonical, which does not contain the Apocrypha or Revelation.

LAODICEANS, EPISTLE TO THEE. The extant Latin epistle, bearing this title and professing to have been written by Paul, is universally admitted to be a forgery of comparatively modern date. It contains 19 verses, evidently made up of clauses and sentiments from several of Paul's genuine epistles, taken out of their connection and awkwardly joined together to the great injury of their intellectual force and spiritual fervor. See **EPHESIANS, EPISTLE TO THEE**, and **EPISTLES, SPURIOUS**.

LAOMÆDON, one of the legendary Trojan kings, succeeded Ilus, who founded the city of Ilium. He is said to have been served by Neptune and Apollo by command of Jupiter, the former erecting the walls of the new city, while Apollo acted as herdsman. Laomedon having refused to pay them according to agreement, Neptune caused a monster to attack the Trojans and lay waste their fields. On this the king offered to reward, with the immortal horses previously given to Tros by Jupiter, whoever should destroy the monster. It having been declared by the oracle that a noble virgin must be sacrificed, the daughter of Laomedon, Hesione, was chosen by lot, but was saved by Hercules, who slew the monster. Laomedon, always deceitful, repaid Hercules with mortal horses, whereupon he attacked Troy, and, having captured the city, killed Laomedon, and raised Priam, his son, to the throne. Laomedon was the grandfather of Paris.

LAON, chief t. of the department of Aisne, in France, is situated in a strong position on a steep isolated hill, 80 m. n.e. of Paris. The walls (flanked with towers) with which it is surrounded, the noble Gothic cathedral (built 1112-14) on the summit of the hill, and the charming character of the scenery in the vicinity, greatly enhance the appearance of the town. Here was born Pierre Marquette, who first traversed the Mississippi.

The manufactures are nails, hats, leather, and hosiery. Here, on Mar. 9 and 10, 1814, Napoleon I. was defeated by the allies. Laon had to surrender to a German force on Sept. 9, 1870. Pop. '91, (commune) 14,129.

LA OS. See SHAN STATES.

LAO-TZU, or **LAO-TSE.** See **LAOU-TSZE.**

LAOU-TSZE, a celebrated philosopher of China, the founder of a religion as ancient and important as that of Confucius (q.v.). This sect is commonly known as the *Taou*, or sect of reason. His family name was *Le*, or Plum, and his youthful name *Urh*, or Ear—given him on account of the size of his ears. His name of honor was *Pe-yang*, his surname *Laou-tsze* ("old child"), or *Laou-keun-tsze* ("old prince"), by which he is generally known. Little authentic is known of the life of Laou-tsze, his followers having subsequently made a myth of his biography. He was born in the third year of the emperor Ting-wang, of the Chow dynasty (604 B.C.), in the state of Tseu, at present known as Hoo-pih and Hoo-nan, 54 years before Confucius. His father, according to the legends of the Taou sect, was 70 years before he married, and his mother 40 years of age when she conceived him. He was the incarnation of a shooting-star, a kind of god on earth, and was 80 years in his mother's womb. More trustworthy is the statement that he was a historian and archivist of a king of the Chow dynasty, who loved books, studied rites and history, and went to the western parts of China, where he might have become acquainted with the worship of Fuh or Buddha. Confucius was so attracted by his renown that he went to see him, but the meeting does not appear to have been entirely amicable, for Laou-tsze reproached the sage with pride, vanity, and ostentation, stating that sages loved obscurity and retreat, studied time and circumstances before they spoke, and made no parade of knowledge and virtue. Confucius, however, highly lauded Laou-tsze to his followers, and called him a dragon soaring to the clouds of heaven, which nothing could surpass. Laou-tsze asked Confucius if he had discovered the *Taou* ("path" or "reason") by which heaven acts, when Confucius answered that he had searched for it without success. Laou-tsze replied that the rich sent away their friends with presents, sages theirs with good advice, and that he humbly thought himself a sage. By this he probably meant that all he could offer Confucius was the advice of seeking the Taou. He retired to Han-kwan, where the magistrates of the place received him, and there he wrote the *Taou-tih-king*, or Book of Reason and Virtue. He died, or, according to other accounts, mounted to heaven on a black buffalo, in the 21st year of the reign of King-wang of the Chow dynasty, 523 B.C., having attained the age of 119 years.

The doctrines of Laou-tsze differ from those of Confucius—indeed, have a higher scope—the object of the last-named philosopher, or rather statesman, being the practical government of man through a code of morals; that of Laou-tsze the rendering of man immortal through the contemplation of God, the repression of the passions, and the perfect tranquillity of the soul. Hence his doctrine was, that silence and the void produced the Taou, the "Logos" or reason by which movement was produced; and from these two sprung all beings which contained in themselves the dual principle of male and female. Man was composed of two principles—the one material and the other spiritual—from which he emanated, and to which he ought to return, by throwing off the shackles of the body, annihilating the material passions, the inclinations of the soul, and pleasures of the body. By this means, the soul was to regain its origin—become immortal. This could only be effected by the renunciation of riches, honors, and the ties of life. Up to the period of Laou-tsze, the national worship had been restricted to the *Shang-te*, or "supreme ruler" of the world, and the *Teen*, or "heaven." For these Laou-tsze substituted the *Taou* ("path" or "reason") of the cosmos, not citing, as the Confucianists, the precedents of ancient kings or sages—appealing to the abstract principle, and, in fact, preaching a religion which found an echo in the Chinese breast. The followers of his sect, however, considerably altered his doctrines. The moral code of the Taou sect is excellent, inculcating all the great principles found in other religions—charity, benevolence, virtue, and the free-will, moral agency, and responsibility of man. But it subsequently became corrupted with strange doctrines and practices. They promulgated that they had discovered the drink of immortality, and obtained a host of partisans in the reign of Wan-te of the Han dynasty, 140 A.D., and many of the emperors were addicted to their rites, and some poisoned by the drink of immortality. Alchemy also became another pursuit of the sect; so did divination, the invocation of spirits, and the prediction of the future. The doctors of the sect, called *Teen-sze* ("celestial doctors"), were supposed by these means to become ethereal, and to be caught up to heaven without passing through the intermediate state of death. Such statements, however, were ridiculed by the *Joo-keou*, or sect of Confucius, the skeptics of China, who openly derided their pretensions. Innumerable gods were also introduced into the worship, which was assimilated to the Buddhist. Since the 2d c. A.D. the sect has continued to spread in China, Japan, Cochin-China, Tonquin, and amongst the Indo-Chinese nations. Monasteries and nunneries belonging to them were founded and flourished. The principal books or classics of the sect are the *Taou-tih-king*, already cited; the collections called *Taou-chang*; the *Kan-ying-peen*, or Book of Rewards and Punishments; and the *Tan-kwei-tsih*, or List of the Scarlet Laurus Cassia.

Stanislas Julien, *Le Livre des Recompenses* (8vo, Paris, 1838); Pauthier, *La Chine* (8vo, Paris, 1837, p. 114-17); Neumann, *Lehrsaal des Mittelreichs* (Munich, 1856); Grossier, *Description de la Chine* (p. 571; *Mémoires sur la Chine* (x. 425; xv. 208).

LAPAROTOMY is a term in surgery to designate the treatment of the liver, gall-bladder, etc., by means of an incision made in the abdominal walls. The affected organ is thus exposed to view for any necessary surgical treatment. It is oftener performed in removing vaginal tumors.

LA PAZ, a department in Bolivia, extending over a large portion of the valley of the Desaguadero; 171,200 sq. m.; pop. '93, 593,799. It contains the eastern Cordilleras from the Nevado de Illimani northward, the numerous valleys which lie on the e. declivity of that range, and so much of the level plain as lies w. of the Rio Beni. This latter portion and the valleys are very fertile, but are little cultivated. Great quantities of gold sand are brought down by the rivers. Capital, La Paz.

LA PAZ, a t. in lower California, 24° 10' n. lat., pop. '90, 6000; situated on the bay of La Paz. Near it is the harbor of Pichiluigo, accessible for small vessels. The land around is fertile and cultivated, and there is a considerable trade with San Francisco in tropical fruits. Formerly it was the seat of a valuable pearl-fishery, and the gold mine of St. Antonio is near the town. In 1853 a small party of Americans from upper California made an attack on the place, overcame the inhabitants, and declared a republic. They set up a temporary government, but the people of the neighborhood collected an armed force and made a demonstration, when the invaders retired.

LA PAZ DE AYACUCHO, a city in Bolivia, 16° 30' n. lat., and 68° 10' w. long., on both sides of the Chuqueapo river; pop. '90, 56,800. It is one of the finest cities in Bolivia, built at an elevation of more than 12,000 ft., and commanding a magnificent view of the surrounding scenery. The capital of the department of La Paz, it is also the leading commercial center, connected with Islay by the Arequipa railway, and by another line with Oruro and Puno. Founded in 1548. Conspicuous structures are a fine cathedral and 14 other churches, a university, schools, etc.

LAP-DOG, a name common to all those diminutive varieties of dog which are kept as drawing-room pets, and which ladies take with them in their carriages. Most of them are spaniels (q.v.), as the king Charles spaniel, the Maltese dog, etc. Gentleness of disposition, large ears, and long hair are among the approved characteristics of lap-dogs. The very smallest of the race is the MEXICAN LAP-DOG.

LAPEER, a co. in s.e. Michigan, drained by the head-waters of Flint river, whose branches uniting within its limits run s.w., the Belle river, 75 m. long, rising in it and running s.w., and Mill creek, running e. and emptying into Black river, in St. Clair co.; 660 sq. m.; pop. '90, 29,213. It is intersected by the Michigan Central and the Chicago and Grand Trunk railroads. Forests of oak and pine grow on a surface of alternate hill and prairie, and maple sugar is included in the forest product. The soil is very fertile, and produces a prodigious amount of grain; also, tobacco, wool, and hops. Stock-raising receives some attention. Co. seat, Lapeer.

LAPEER, city and co. seat of Lapeer co., Mich.; on the Flint river and the Chicago and Grand Trunk and Michigan Central railroads; 46 miles w. of Port Huron. It is in an agricultural and lumbering region, and has lumber, shingle, and planing mills, machine shops, weekly newspapers, and a large trade by rail. Pop. '90, 2753.

LA PELTRIE, MARIE MADELEINE DE, educator, 1603-1671; b. in France. She was left a widow at twenty-two, and devoted her life and fortune to the care and education of Indian girls. She founded the Ursuline convent of Quebec, the first Canadian school for girls. She was present at the foundation of Montreal.

LAPÉROUSE, JEAN FRANÇOIS DE GALAUP, Count de, a famous French voyager, b. near Albi, in Languedoc, now in the dep. of Tarn, in 1741; attained the rank of captain in the French navy; and was sent in 1782 to destroy the British forts or settlements in Hudson's bay. In this expedition he showed a remarkable power of contending with difficulties, and accomplished his object notwithstanding the storminess of the sea and the ice in which it abounded. He signalized himself also by his humanity towards the occupants of the forts which he destroyed. He was now chosen to command an expedition of discovery sent out by the French government. He sailed in Aug., 1785, with two ships, visited the n.w. coast of America, explored the north-eastern coasts of Asia, and made important discoveries in that region, although he failed to discover the n.w. passage. In Feb., 1788, he anchored in Botany bay, after which all trace of him was lost. The French government offered a reward of 10,000 francs for information, and in 1791 sent an expedition in search of him, but without success. In 1826 an English captain, Dillon, found on the island of Tucopia a number of things belonging to Lapérouse's ships, obtained from the inhabitants of Mallicollo, one of the New Hebrides. The East India company sent capt. Dillon, and the French government sent out an expedition under Dumont d'Urville to investigate all traces of Lapérouse and his fellow-voyagers. Eye-witnesses of the destruction of two French vessels were found; it was fully ascertained that both of Lapérouse's ships had been wrecked in a storm on a coral reef off the coast of Mallicollo, and that all on board had perished. The account of Lapérouse's

voyage, prepared from journals sent home by him, was published under the title of *Voyage autour du Monde* (4 vols., Paris, 1797, with atlas).

LAPHAM, INCREASE ALLEN, LL.D., 1811-1875; b. N. Y.; having gained a useful experience in Canada as civil engineer on the Welland canal, was engaged on the Miami canal in Ohio, and the canal at Louisville, Ky. In 1827 he was the author of an article in *Silliman's Journal*, entitled "Notice of the Louisville Canal and of the Geology of the Vicinity." In 1833 he held the office of secretary of the Ohio board of canal commissioners, and was a member of a special legislative committee on the geological survey of the state; combining with his official duties the study of botany, and beginning the collection of an herbarium, which at the close of his labors numbered 8,000 specimens. In 1836 he removed to Milwaukee, Wis., and subsequently filled many positions in the gift of state and city, with dignity and honor. He was elected president of the Wisconsin historical society in 1862, and held the office till his death. He called the attention of the legislature of 1867 to the careless destruction of forest trees, suggesting a remedy. In 1869 he originated the system of recording the variations of the atmosphere, since adopted at Washington, and was the discoverer of the lunar tide on lake Michigan. In 1873 he was appointed state geologist, directing, during that and the following year, a thorough topographical survey of the state, and preparing very valuable reports. Besides many important contributions to scientific literature, he published in 1844, *Wisconsin: its Geography, Topography, History, Geology, and Mineralogy*; in 1855 a *Geological Map of Wisconsin*, and *Antiquities of Wisconsin*, the latter in the *Smithsonian Contributions*.

LAPIDARY INSCRIPTIONS, a title derived from the Latin *lapis*, a stone, and applied to monumental inscriptions, epitaphs, etc. These include records of public and private occurrences, of laws, decrees, etc., and are engraved or chiseled in stone or metal. Among the ancients the custom of resorting to this method for the preservation of records was very common, and the Persians, Greeks, Egyptians, and Romans left innumerable instances of this class of memorial. Inscribed tablets of stone or metal took the place of printing, under the ancient system, since upon these being set up in the market, or other public place, every citizen could read them, or procure them to be read to him; and, if he desired, could copy them for his private perusal and study. Commonly these inscriptions, of whatever character, were engraved on metal plates; or more usually on soft clay, which was afterwards baked in an oven or kiln; or again, on marble cut in slabs, while not infrequently they were carved on the flat surface of unhewn rock. Of the metals used, brass and bronze were the most common, though lead, tin, and gold were sometimes employed. Among the very earliest inscriptions were the cuneiform or arrow-headed of the Assyrians, or Babylonians, and the later Persians. These date as far back as 20 centuries before the Christian era, and the investigations of Layard among the ruins of Nineveh, and those of Botta and Rawlinson in deciphering, first brought a knowledge of their existence and nature to the modern world. Burnouf and Lassen followed, with a more perfect rendering; but Rawlinson's translation of all then existing Persian inscriptions, published by the royal Asiatic society in 1846, afforded all that has been learned concerning them. It is sufficient to say with regard to the character of the later Persian inscriptions, that they recorded facts of the reigns of Darius, Xerxes, and Hystaspes, Cyrus, and Artaxerxes; including genealogies, the names of the Persian satrapies, historical events—assassination, insurrection, accessions to the throne, etc. These inscriptions were not only delineated on monuments, solid rocks, and the walls of the cities; but even books were found, being dried slabs of clay, and barrel-shaped masses of terra-cotta, which were closely inscribed. The first notices of the cuneiform inscriptions were brought to Europe in the 16th c. by Pietro delle Valle; a century later, Kœmpfer and Tavernier published imperfect specimens, and these were followed by the publication of Chardin a few years later. The language is said to belong to the Turanian division, and the cuneiform system is believed to have been invented by a Scythian nation. The Assyrian inscriptions appear to have been framed in a method which can hardly be termed alphabetical; but though extremely enigmatical on this account, they have nevertheless been translated by Rawlinson, Fox Talbot, and others, with considerable success. The *Corpus Inscriptionum* of Rawlinson, issued at the expense of the British government, is chiefly historical, and extends from a period 20 centuries before the Christian era, to that of the immediate successors of Nebuchadnezzar, including the reigns of the ancient Turanian monarchs. (See CUNEIFORM.) Inscriptions were a customary mode of record among the ancient Greeks and Romans; covering a period, among the latter, extending from 145 B.C. to the extinction of the Latin language. The people of Etruria also employed inscriptions liberally, but the language which they used has not been deciphered. Inscriptions in India reach back as far as 400 B.C., and those of the Chinese are believed to antedate all others except the Egyptian. The age is unknown of the Aztec and Palenqué inscriptions on the western coast of America, and of those found in the Mississippi valley. The use of abbreviations in inscriptions renders it exceedingly difficult to decipher them, and an art has grown up in that direction, as to which many published works exist. See HIEROGLYPHICS; PALEOGRAPHY; ROSETTA; RUNES.

LAPIDARY-WORK, the art of cutting, grinding, and polishing small pieces of ornamental or precious stones for jewelry. (For the engraving of figures on precious stones, see **CAMEO** and **GEMS**.) The working of the less precious ornamental stones has made great strides within the last 20 or 30 years, and nowhere has it reached greater perfection than in Scotland. A large trade is now carried on in this kind of work between Birmingham and some towns of Germany, where the Scotch patterns are imitated; and although the foreign productions are of inferior workmanship, their comparative cheapness commands a ready market.

Stones are cut by rubbing the powder of a harder stone against a softer one. There are 10 types of hardness (q.v.), from talc up to diamond; but in practice it is found most convenient to employ either diamond-powder or emery, which is next to it, for the cutting of all kinds of stones. Diamond-dust is found to cut 10 times faster than emery; so that, except where the machine is driven by water-power, it is found more profitable to employ diamond-powder, notwithstanding its high price. Diamond-powder is prepared from the inferior kind of diamonds (q.v.) called bort (costing about a guinea per carat), by grinding in a steel mortar.

To produce a plain polished surface on any stone, say a jasper, it goes through the three processes of cutting or slitting, grinding, and polishing. The slitting-wheel, which is driven by means of the handle, is a mere disk of thin sheet-iron, from 6 to 9 in. in diameter, with a turned edge, and is generally placed in a horizontal position. The diamond-dust, mixed with a little sperm-oil, is applied to the edge of the slitting-wheel with the finger, and is then pressed into the soft iron with a smooth hard stone. The wheel will then continue to cut for several hours without any renewal of the powder. When the wheel is thus prepared, a stone held by the hand to the cutting edge is rapidly slit through. During the operation, sperm-oil is kept dropping from a can, to keep the wheel from heating.

The grinding is performed on a horizontal lead-wheel, charged on its upper surface with emery-powder; the stone to be ground being pressed against it with the hand until it is smooth enough for polishing. In polishing, a tin wheel is substituted for the leaden one, the polishing material being rotten-stone.

If, instead of a plane flat surface, some ornamental surface is required, say an agate brooch in the shape of a butterfly, a model is produced in plaster of Paris, to serve as a guide, and metal size-plates are prepared for the pieces of stone which are to form the wings, etc. For these, thin slices of agate are cut at the slitting-machine, or chipped off with a hammer and chisel, and are then formed roughly into shape, by means of soft iron nippers. The several pieces are now ground and polished, as already described, and the brooch is finished. When pieces of stone are too small to be held in the hand, they are attached with cement to a wooden handle, and then applied to the wheels.

One of the most elaborate operations of the lapidary is the cutting of cairngorm (q.v.) stones. In faceting the surface, which so much enhances their beauty, the lapidary uses the ordinary grinding-wheel, with the addition of a wooden peg, stuck round with projecting wires. The stone is fixed with cement on the end of a stick, having a hole at the other end fitting on the wire-points, which, being at different heights, enables the stone to be held at any angle to the grinding surface. With this simple guide, the lapidary proceeds to cut the facets, dividing them off by the eye, aided by his sense of feeling; and in this way, in about a fortnight's time, as many as 700 facets are produced of perfect regularity upon a stone, say an inch in diameter. A cairngorm of good color, so cut, may be worth about \$150.

LAPIS LAZULI, a mineral of beautiful ultramarine or azure color, consisting chiefly of silica and alumina, with a little sulphuric acid, soda, and lime. The color varies much in its degree of intensity. Lapis lazuli is often marked by white spots and bands. It is generally found massive, and is translucent at the edges, with uneven, finely granular fracture, but sometimes appears crystallized in rhombic dodecahedrons, its primitive form. It is found in primitive limestone and in granite; in Siberia, China, Thibet, Chili, etc. The finest specimens are brought from Bokhara. The Greeks and Romans called it *sapphire*. It was more highly esteemed by them as an ornamental stone than it now is. They used it much for engraving, for vases, etc. It is extensively employed in ornamental and mosaic work, and for sumptuous altars and shrines. It is easily wrought, and takes a good polish. The valuable pigment called ultramarine (q.v.) is made from it. It is one of the minerals sometimes called *azure stone*.

LAPITHÆ, a wild race, inhabiting, in ancient times, the mountains of Thessaly. They derived their name from a mythical ancestor, *Lapithes*, a son of Apollo, and the brother of Centauros, the equally mythical ancestor of the Centaurs (q.v.). A bloody war is said to have been waged between the kindred races in prehistoric times, which ended in the defeat of the Centaurs, but the Lapithæ were in their turn subdued by Hercules.

LAPLACE, PIERRE SIMON, Marquis de, one of the greatest of mathematicians and astronomers, was b. Mar. 23, 1749, at Beaumont-en-Auge, in the department of Calvados; was for some time a teacher of mathematics in the military school there, and afterwards went to Paris, where, having attracted the notice of D'Alembert, he was,

through his influence, appointed professor in the military school, and was admitted a member of the academy of sciences. He had by this time mastered the whole range of mathematical science as then known, and had besides solved several problems which had for many years defied the attempts of geometers; and now it occurred to him to devote his mathematical powers to the service of astronomy, and he accordingly commenced to plan the work which afterwards appeared as the *Mécanique Céleste*. In his political life, Laplace presents a sorry picture. He was appointed minister of the interior by Bonaparte, but was, after six weeks, deposed for incapacity. He continued, however, to receive marks of honor from Napoleon, and on the erection of the imperial throne was made a count. In 1814 he voted for the appointment of the provisional government, for Napoleon's deposition, and the restoration of the Bourbons. After the second restoration, Louis XVIII. made him a peer and a marquis. In the chamber of peers he showed, as he had done under the revolutionary government, the greatest unfitness for political affairs, and the most extreme servility. He died at Paris, Mar. 5, 1827. Laplace was gifted with wonderful scientific sagacity; this appears especially in his explanations of certain results of mathematical analysis formerly looked upon as inexplicable, but which he showed to be the expression of physical phenomena which had hitherto escaped detection, and subsequent observations generally confirmed Laplace's conclusions. Above all his powers, his wonderful memory shone pre-eminent. His *Mécanique Céleste*, and supplements to it (5 vols., Paris, 1799-1825), are, next to Newton's *Principia*, the greatest of astronomical works. His *Exposition du Système du Monde* (2 vols., Paris, 1796; 6th ed. 1824) is intended for those who cannot follow the difficult demonstrations and calculations in his great work. All Laplace's important investigations were made for the purpose of testing the generality of the law of gravitation, and the cause of sundry irregularities in the motions of the planets. His works comprise many able treatises on particular subjects in astronomy, pure mathematics, probabilities, mechanics, heat, and electricity; most of them being memoirs communicated to the academy of sciences. As a scientist, Laplace's great field was mathematical astronomy, and he stands second to none, except Newton, in this highest of all scientific branches. To him we owe the demonstration of the invariability of the major axis of the planetary orbits, as well as the inequality of the motions of Jupiter and Saturn. He also solved the problem of the mean motion of the moon, and those connected with the moons of Jupiter. It was his knowledge of physical principles to which he owed his wonderful scientific sagacity, which was also shown in many departments of physics, as in the construction of calorimeters. In his investigation of the discrepancies between theoretical and observed velocity of sound, his calculations for barometrical measurement and for atmospheric refraction, as well as tidal phenomena, he exhibited distinguished pre-eminence. In his numerous works, however, Laplace failed to refer to the labors of his predecessors and contemporaries, which makes it difficult for the student to distinguish between his own work and that of others, and on this account some have looked upon him as a compiler quite as much as a discoverer. In one important particular he fails to give credit to his great contemporary Lagrange, and refers to one of his most splendid mathematical solutions as being a formula (No. 21 of the second book) of the *Mécanique Céleste*; and the works of other mathematicians are overlooked, while references to his own are extremely numerous; but for all this it is remarked by mathematicians that any one of his original researches would place the stamp of mathematical genius upon any man. There is a translation of the *Mécanique Céleste*, by Nathaniel Bowditch (2 vols., Boston, 1829). See BOWDITCH; and Mrs. Somerville's *Mechanism of the Heavens* is a synopsis of a portion of that work. Laplace's *Théorie Analytique des Probabilités*, the most profound investigation of this important subject which has ever been written was first published at Paris in 1812, and again in 1820, with supplements. He died after a short illness, and it has been said that his last words were: "What we know is of small amount; what we do not know is enormous;" but this has been denied, and it is said that his last words were spoken in the presence of Poisson, his favorite pupil, to whom his family had appealed to get him to speak. Poisson, after saluting him, delivered some news which had been received from Germany by the bureau of longitudes in regard to some verifications by Bessel of theoretical discoveries of Laplace upon Jupiter's satellites. He opened his eyes and said, "Man pursues nothing but chimeras," and never spoke again.

LAPLAND. The territory still known under this name does not constitute a separate political autonomy, but is included under the dominions of Sweden and Norway, and of Russia. Lapland, or the land of the Lapps, which is called by the natives Sameanda, or Somellada, occupies the n. and the n.e. portions of the Scandinavian peninsula, and the extreme north-western districts of the Russian dominion, within the grand duchy of Finland. Norwegian Lapland is included under the provinces of Norrland and Finmark; Swedish Lapland, under North and South Bothnia, and divided into Tornëa, Luleå, Piteå, Umeå, Aselå Lappmark; Russian Lapland, under Finland, in the circles of Kemi and Kola. Norwegian Lapland comprises an area of nearly 16,000 sq. m., with a native pop. of 5,000; Swedish Lapland, an area of 49,000 sq. m., with 4,000 inhabitants, and Russian Lapland, an area of 86,000 sq. m. (of which 26,000 belong to Finland),

with a pop. of 8,800. These numbers refer merely to the true Lapps, in addition to whom there are Finns, Swedes, Norwegians, and Russians, settled in various parts of the Lappish territory, whose respective numbers probably bring the pop. of the several parts to about the following figures—viz., for Norwegian Lapland, about 50,000; for Swedish Lapland, about 37,000; and for Russian Lapland, about 69,000; but the boundaries of these divisions are so loosely defined and their areas and populations so variously given by different writers, that it is difficult to arrive at an accurate estimate of either. The climate of the Lappish territory is extremely cold for nine months of the year; while the excessive heat of July and Aug., when in the northernmost parts the sun never sets for several weeks, is only separated from the cold seasons by a short spring and autumn of a couple of weeks. The general limit of the cereals is 66° n. lat.; but barley can be grown as far n. in Lapland as 70° . The country is covered over a considerable part of its surface with forests, consisting chiefly of birch, pine, fir, and alder, and having an undergrowth of lichens and mosses, which supply abundant food for the herds of reindeer which constitute the principal sources of wealth to the inhabitants. Many elevated tracts are, however, entirely destitute of vegetation, and consequently uninhabitable.

The Lapps or Laplanders, who are classed ethnologically in the same family as the Finns, Estonians, and Livonians, and who occupy the most northern parts of the Scandinavian peninsula, are distinguished, in accordance with the nature of their pursuits, as the *Soelappen* and the *Boelappen*, or the sea-faring and land-tilling Lapps. They were originally all nomadic; but the difficulty of finding sufficient food within the limited space to which the increasing civilization of the neighboring people had gradually restricted them, has compelled some of the tribes to settle near the larger rivers and lakes, where they follow the pursuits of fishing and hunting with considerable success. The nomads are lessening in number also because of the Russian laws of 1852, which restrict the pasturing of reindeer to Norwegian and Swedish Lapland. They show great skill as marksmen, and regularly supply the large annual markets of Vitangi and Kengis with game and skins, which are sent by Torneå to Stockholm, where they find a ready mart. The Lapps, who call themselves the *Sami* or *Sahmelads*, are a physically ill-developed, diminutive race, with small eyes, low forehead, high cheek-bones, pointed chin, and scanty beard. They are, however, neither wanting in mental capacity nor manual dexterity; and in the seminary for Lapp teachers at Trondenaes, in the district of Senjen, several of the students have distinguished themselves by their extensive acquirements. In the mythical sagas of Scandinavia the Lapps are represented as an inferior race, distinguished only for craft and treachery, and addicted to practices of sorcery. They are regarded, in accordance with the same authorities, as the original occupiers of the whole of Scandinavia, from the fertile and more southern portions of which they were in ancient times driven forth by the superior, god-descended race of Odin, who banished them to the inhospitable regions in which they are now circumscribed. Their tendency to leceit is probably in a great measure to be attributed to the inferior position in which they are kept by the Norwegians, Swedes, and Russians, near whom they live, for they are honest and strongly attached to their own people and country; and although they are still superstitious and credulous, they are not devoid of religious sentiment. They conform to the Christian faith of their neighbors—the Norwegian Lapps belonging to the Lutheran, and the Russian Lapps to the Greek church. The Bible has been translated into their own language, which is divided, like that of all nomadic tribes, into numerous dialects, whose many affinities and differences have of late years attracted much attention from northern and German philologists. The number of the Lapps probably falls below 20,000 (see above), of whom about half are included in the population of Sweden and Norway, and half within the Russian dominions. The reindeer is the chief source of wealth, supplying the people with most of the articles of food and clothing which they use. Their dwellings consist either of conically shaped mud-huts, raised on stakes, and almost impervious to light and air, or of hide-covered tents. Towns or villages are unknown amongst them. The contempt with which they are regarded by the tall, well-developed Norwegian peasants hinders all amalgamation between the races, while their peculiar habits, and the tenacity with which they cling to their own customs, tends still more to isolate them from the neighboring nations. See von Düben's *Om Lappland och Lapparne* (Stockholm, 1873) with included bibliography; Leem's *Beskrivelse over Finmarkens Lapper* (Copenhagen, 1767); Stockfleth's *Dagbog over mine Missions-Reiser* (Christiana, 1860); *Frøys, i Finmarken* (Christiana 1871); Aubel's *Reise nach Lappland* (Leipsic, 1874); Du Chailly's *Land of the Midnight Sun* (London, 1881); Edward Rue, *The White Sea Peninsula* (1882).

LA PLATA. A handsome city of South America, the capital of the province of Buenos Ayres in Argentina, and about 30 miles s.e. of the city of Buenos Ayres. It was founded in 1882, and has attained a remarkably rapid growth, its population in 1890 numbering 65,000. It has electric lights, handsome buildings, including hotels, cafés, and theatres, and manufactories of cotton and woolen fabrics.

LA PLATA, RIO DE. See PLATA, RIO DE LA.

LA PLATA, a co. in s. w. Colorado, formed in 1874, about 1860 sq. m.; pop. '90, 5509. It is drained by the Las Animas and Los Pinos rivers. Co. seat, Durango.

LA PLATA, a river of Colorado, rises in the La Plata mountains, in the s. e. part of the

state, and flowing southward into New Mexico, joins the Rio de Chaco. It is about 60 miles in length.

LA PORTE, a co. in n. Indiana, having a soil of great fertility, watered by the Kankakee, Little Kankakee, and Gallien rivers; about 540 sq.m.; pop. '90, 34,445, chiefly of American birth. The surface is diversified by level plains and groves of timber, with prairie land productive of cereals and adapted to the raising of stock. Wool, maple-sugar, sorghum, honey, and pork are among the staple products. Along the Kankakee river are broad marshes, lying in the s.e. and southern portion, separating it from St. Joseph and Stark counties, and it has a lake shore boundary of some extent on the n.w. corner. Co. seat, La Porte.

LA PORTE, city and co. seat of La Porte co., Ind.; on the Chicago and West Michigan, the Lake Erie and Western, and the Lake Shore and Michigan Southern railroads; 12 miles s. of Lake Michigan, 59 miles e.s.e. of Chicago. It is a city of much natural beauty, having in its vicinity several small but picturesque lakes. It contains a handsome courthouse, city hall, public library, electric light plant, waterworks supplied from one of the lakes, national and state banks, high school with library, and St. Rose's academy. There are churches of the leading denominations, daily and weekly newspapers, and manufactories of woolen goods, agricultural implements, wheels, hubs, etc. The city is on the edge of a noted prairie, is surrounded by a rich farming country, and, by the pleasures afforded by bathing and boating on the lakes, has become a popular summer resort. Pop. '90, 7126.

LAPPENBERG, JOHANN MARTIN, a German historian, was b. July 30, 1794, in Hamburg. He studied medicine at Edinburgh, but afterwards devoted himself to historical and political studies. He resided for some time in London, and afterwards studied law and history in Berlin and Göttingen. He became the representative of his native city at the Prussian court in 1820, and in 1823 was appointed archivist to the Hamburg senate, an appointment which led to his discovery of many valuable historic records which were supposed to have been lost. In 1850 he represented his native city at the diet of Frankfurt. One of his principal works is a *Geschichte von England* (2 vols. Hamburg, 1834-37; with continuation in 3 vols. Hamburg 1853, and Gotha, 1855-58, bringing down the history to the end of Henry VII.'s reign); the first volume of which has been translated into English by B. Thorpe, with the title of *A History of England under the Anglo-Saxon Kings* (2 vols. Lond. 1845), and the second with that of *A History of England under the Norman Kings* (1 vol. 1857). He was the author also of the following works, which are remarkable for the care and research which they display, viz., *Urkundliche Geschichte des Ursprungs der deutschen Hansa* (2 vols. Hamburg, 1830); *Die Geschichte Helgolands* (Hamburg, 1831); also an edition of Ditmar of Merseburg, and many valuable works relating specially to Hamburg and Bremen. He died in 1865.

LAPPS. See LAPLAND.

LAPRAIRIE, a co. in s. w. Quebec, Canada, has a fertile soil, being watered by several streams furnishing convenient water-power, and separated in the s.e. from Richelieu river by the small co. of St. John. The Chateaugay river empties into lake St. Louis in the extreme n.w., and for its n. and n.w. border the waters of lake St. Louis are met by the St. Lawrence river, which also receive the Ottawa river, by two channels from the w. around the little island of Perrot; 173 sq. m.; pop. '81, 11,436; '91, 10,900. In the extreme n. the Victoria tubular bridge spans the St. Lawrence river at the terminus of the St. Lambert division of the South-eastern railway, which forms its eastern boundary line, the Rouse's Point division of the Grand Trunk railway crossing the n.w. corner. It contains a settlement of the Iroquois tribe of Indians, called Caughnawaga, on the s. shore of lake St. Louis, opposite Lachine, which is a point of considerable commercial importance, being a rendezvous for steamers on all the navigable lakes and rivers, including the Ottawa line, and those of Kingston, Toronto, and Hamilton. Between this point and Montreal, 8 m. above, are the celebrated Lachine rapids. In 1836 the first Canadian railway line, now a matter of history only, was in successful operation between Laprairie, connected by ferry with Montreal, and the town of St. Johns. Seat of justice, Laprairie.

LAPSE. A legacy is said to lapse if the legatee dies before the testator; for as a will only operates from the death of the testator, and at the time that legatee is dead, the legacy lapses; i.e., falls into and becomes part of the residuary estate. So as to a devise.

It is held that a legacy may lapse in some cases when the legatee is alive at the time of the testator's death, as when a legacy being limited to A. B., to take effect when he reaches the age of 21 years, he dies before that age. At common law there was this distinction between a lapsed devise of real property and a lapsed bequest of personal property, that a lapsed devise passes to the heir-at-law in the absence of provision to the contrary in the will, while a legacy falls into the residue and passes to the residuary legatee, or, in case none is named by the will, to the next of kin. A lapsed devise or bequest should not be confounded with a void devise or bequest. The former occurs where the donee is dead at the time the will takes effect, i.e., at the death of the testator; the latter when the donee is dead or from any other cause incapable of taking at the time the will was executed. Where the devise is made to issue of the devisor, and the devisee is dead leaving issue, the devise will not lapse unless an intention to that effect be found in the will. See LEGACY.

LAPSED (*lapsi*), the designation applied, in the early centuries of the Christian church, to those who, overcome by heathen persecution, did not continue faithful to the Christian religion. Their number was most considerable, when, after a long time of peace, the first general persecution under Decius began; but those who saved themselves by flight were reckoned among the lapsed, although their case was not regarded as equally bad with that of those who sacrificed to idols. The lapsed were at first punished by excommunication, and their reception into the church again was strenuously resisted; but in the 3d c. a milder course was generally adopted with regard to them. The treatment of the lapsed was one of the practical questions most earnestly discussed in the early church.

LAPSUS LINGUÆ (*Latin*). A slip of the tongue; as when one accidentally makes use of one expression, when intending to use another. For such an error Mr. Richard Grant White coined the word *heterophemy*.

LAPUTA. This imaginary floating island is one of Swift's creations in his *Travels of Lemuel Gulliver*. He describes it as exactly circular, its diameter 7837 yards, or about four miles and a half, and consequently it contained about 10,000 acres. Its movements were guided by a shuttle-shaped loadstone, under the control of the wise men of the island, and it followed the direction in which the loadstone was pointed. The imaginary inhabitants of this remarkable island, he informs us, were grave philosophers devoted to mathematics and music, who wore garments adorned with representations of harps, trumpets, fiddles, flutes, guitars and instruments unknown to us; suns, moons, and stars. Their astronomers far exceeded ours in knowledge as they had located 10,000 fixed stars, and were constantly studying the influence of the sun upon the earth, which kept them in a state of continued disquietude. Every thing was done on a mathematical scale; meat was cut in rhomboids, sausages and puddings were like flutes and hautboys, and bread was in cones, cylinders, parallelograms, etc. These philosophers were wont to be so absorbed in their speculations, that they neither spoke, nor attended to what was said by others, until gently reminded by servants who stood near for that purpose. These servants were supplied with a blown bladder fastened like a flail to the end of a sharp stick, which was carried in the hand, the bladder being filled with a small quantity of dried pease or little pebbles. With this, it was the duty of the servants to strike gently the mouths or ears of their masters or any one standing near, to remind them that they should speak or listen, and it was considered a lack of dignity to do so without this reminder. Servants attended their masters as they walked about to guard them against being jostled by others or falling over precipices. See SWIFT, JONATHAN.

LA PUEBLA, Mexico. See PUEBLA.

LA PUGLIA. See APULIA.

LAPWING, *Vanellus*, a genus of birds of the family *charadriadæ* (plovers, etc.), differing from the plovers chiefly in having a hind-toe, which, however, is small. The nasal grooves are also prolonged over two-thirds of the beak.—One species, the COMMON LAPWING, CRESTED LAPWING, or PEEWIT (*V. cristatus*), is a well-known British bird. It is also a native of almost all parts of Europe, and of some parts of Asia and of Africa. It is found in Bengal, in China, in Japan, and in Iceland; but it is not a native of America. It is not quite so large as a pigeon, and has the head surmounted with a beautiful crest. The head and crest are black; the throat black in summer, and white in winter; the back is green, glossed with purple and copper color. The name lapwing is derived from the sound which the wings make in flight; the name peewit (Scottish *peesweep*), with the French *dichuit*, the Swedish *vipa*, the Danish *kivit* and *vibe*, the old English *wype*, the Greek *oia*, etc., from the plaintive note; the local Scottish *teuch-head* (tufthead), from the crested head. The lapwing is very plentiful in moors, open commons, and marshy tracts, in pairs during the breeding season; and in winter in flocks, chiefly on the seashore. Its artifices to prevent the discovery of its nest are very interesting. The nest is little more than a mere depression in the ground, and the full complement of eggs is usually four; but if some are taken away, the bird goes on laying, an instinct of which the egg-gatherers take advantage. The eggs are esteemed a great delicacy, and great numbers are sent to the London market, under the name of *plovers' eggs*, from the marshy districts of England. The bird itself is also highly esteemed for the table. Some species of lapwing have wattles at the base of the bill.

LAR, an important t. of Persia, capital of the province of Laristan, is situated on a well-wooded plain, at the foot of a ridge of hills, 60 m. from the Persian gulf, and 180 m. s.s.e. of Shiraz. The bazaar of Lar is said to be the finest and most elaborate in Persia. Pop. 6,000, who deal largely in tobacco.

L'ARAISH, or LARACHE. See EL ARAISH.

LARAMIE, a co. in eastern Wyoming, bounded on the e. by the state lines of S. Dakota and Nebraska, and on the s. by Colorado; area about 7025 sq. m.; pop. 1890, 16,777, chiefly of American birth. It is intersected in the s. portion by the Union Pacific railroad with branches to Denver. It is watered by the south fork of the Cheyenne river, an affluent of the Missouri, and numerous creeks and small rivers in the n., and in the e. by the Niobrara river, the North Platte, and Laramie. Co. seat, Cheyenne.

LARAMIE, city and co. seat of Albany co., Wyo.; on the Laramie river and the Union Pacific railroad; 57 miles n.w. of Cheyenne, the state capital. The city is on the Laramie plains between the Medicine Bow and Laramie mountain ranges, and was laid out in 1868, and chartered as a city in 1884. It is the seat of the State university, the State fish hatchery, and the State penitentiary, the last being the former U. S. government prison, which was given to Wyoming on its admission into the union. Among the points of special interest in the vicinity are the great Snowy range, the famous Dale Creek bridge, 127 feet above the creek, and the Oakes Ames monument on the summit of the mountain range. There are public and college libraries, St. Joseph's hospital, residences of the bishop of the Protestant Episcopal missionary district of Wyoming and Idaho, and of the administrator of the Roman Catholic diocese of Cheyenne, national banks, electric light plant, waterworks supplied by gravity from mountain springs, and daily and weekly newspapers. The principal industries are stock-raising, gold and silver mining, and manufacturing, the plants for the last including the extensive machine and repair shops and the rolling mills of the Union Pacific railroad company. With large deposits of gold, silver, lead, graphite, antimony, cinnabar, and other minerals within a radius of 30 miles, the city is destined to obtain a rank of high importance. Pop. '90, 6388.

LARBOARD, an obsolete naval term for the left side of a vessel, *looking forwards*. From its liability to be confused by the steersman with the not very different sound, "starboard," the word was a few years ago officially abolished, and the expression "port" arbitrarily substituted. The terms *starboard* and *larboard* were originally Italian — *questo bordo*, this side (the right); and *quello bordo*, that side (the left); which were contracted into *'sto bordo* and *'lo bordo*, and finally became starboard and larboard. The word *port* is said to be an abbreviation of *porta la timone*, "carry the helm," suggesting the analogy of porting the arms on the left hand.

LARCENY is the wrongful appropriation and carrying away by one person of the personal property of another, with a felonious intent to convert such property to his own use against the consent of the owner. By the common law larceny was either compound, i.e., the taking and carrying away with felonious intent of personal property from the person or house of the owner; or, otherwise, simple. Simple larceny was called grand larceny where the value of the stolen property was more than twelve pence; and petit where the value was less. *What may be the subject of larceny?* Only personal property can be the subject of larceny. For injuries to the realty a remedy must be sought in trespass. Thus, if one enter upon another's premises and sever and carry away growing crops from the soil or fruit from the trees, he is not guilty of larceny, but is chargeable in trespass for goods carried away; but if an interval elapse after the severing and acts of trespass, and he come upon the premises and carry away the property, now detached from the realty, he is guilty of larceny if other necessary elements of the offense, as intent, etc., concur. By the common law undomesticated animals (*feræ naturæ*) were not the subject of larceny; nor even when domesticated, unless their flesh be used for food, so that there was no such right of property in a dog, for instance, as that larceny of him could be committed. The property taken must have some value, however small; but the common law refused to recognize any value or to make assignable evidences of debt or mere rights to the recovery of debt, so that there could be no larceny of account-books, or notes, or mere personal securities of any kind. But it is otherwise by statute law, which has also removed in most of the United States the distinction between different degrees of larceny, wherever such distinction has obtained. *What constitutes larceny?* The property must be actually taken and carried away; must be in the absolute possession of the thief; the taking and carrying must be against the consent of the owner, and must be accompanied by a simultaneous felonious intent at the time the property is taken. Every larceny includes a trespass, i.e., an unlawful act, with force real or implied, to another's property, so that the intent necessary to constitute that offense really comprehends two separate intents, viz., an intent to commit a trespass upon personal property of another, and an intent to deprive him of his property. As trespass is a necessary part of larceny, and possession on the part of the owner is necessary in order to maintain an action of trespass, there can be no trespass against, and consequently no larceny from, an owner not in possession of the property taken. Thus, a common-carrier does not commit larceny if he steal a bundle which has been intrusted to him, for he and not the owner has the legal possession of the property as a result of his contract with the owner. The carrier having possession of, and a special property in, the goods, cannot commit trespass. But if he tear the bundle open and steal goods contained in it he commits larceny; for by breaking open the bundle he terminates his contract with the owner and loses his right to the possession of the goods, the taking and conversion of which added to his act of trespass, make him guilty of larceny. According to this rule, if a carrier takes the whole bundle he does not commit larceny; it is otherwise, if he break the bundle open and carry off a part of its contents. A servant who is intrusted by his master with the care of goods has no legal possession, and is chargeable with larceny of such goods. A special property with possession, such as that of a bailee makes an ownership sufficient to charge with larceny any person taking and carrying away

the personal property over which such ownership extends. Thus, the finder of lost goods is answerable only to their rightful owner, and has a full title as against others; and one stealing stolen goods from a thief is chargeable with larceny. But a finder of stolen goods who subsequently converts them to his own use is not chargeable unless at the time of taking he had an intent to permanently deprive the owner of his property. The taking necessary to constitute larceny must be against the owner's consent, and if such consent be had, though fraudulently gained, there will be no larceny, but an obtaining of goods by false pretenses. But it has been held that there is a distinction between the cases of an owner who by fraudulent representations is induced to transfer his goods, and who intends and expects to be divested of his rights of property in them, and the case of an owner who parts for a time, as he supposes, with his property; while at the same time the person who gets possession of the goods intends to convert them to his own use and to deprive the owner permanently of them. It is held that the latter case may be larceny.

LARCH, *larix*, a genus of trees of the natural order *coniferae*, differing from *firs* (*abies*)—of which, however, some botanists regard it as a mere subgenus—in having the scales of the cones attenuated at the tip, and not falling off from the axis of the cone when fully ripe, and the leaves deciduous and in clusters, except on shoots of the same year, on which they are single and scattered.—The COMMON LARCH (*L. Europæa* or *abies larix*) is a beautiful tree, growing wild on the mountains of the s. and middle of Europe, and found also in Asia, where it extends much further n. than in Europe, even to the limits of perpetual snow. The larch is not a native of Britain, and was not planted in any part of the island as a forest tree till the middle of the 18th c., when it began to be very extensively planted. Its introduction has changed the aspect of whole districts, particularly in Scotland. The perfectly erect and regularly tapering stem of the larch, its small branches, its regular conical form, and its very numerous and very small leaves, make its aspect peculiar, and very different from that of any other tree seen in Britain. It attains a height of 60 to 100 feet, and an age of 200 years. The male catkins are small and bright yellow, the female catkins generally purple and erect; the cones ovate-oblong, about an inch long, and erect. The larch grows rapidly, and is useful even from an early age; the thinnings of a plantation being employed for hop-poles, palings, etc.; the older timber for a great variety of purposes. It is very resinous, does not readily rot even in water, is not readily attacked by worms, and is much used in ship-building. It is, however, very apt to warp, and is therefore not well suited for planks.—Larch-bark is used for tanning, although not nearly equal in value to oak-bark. See *illus.*, *CONIFERÆ*, vol. IV.

In Siberia, where large tracts of larch forests are not unfrequently consumed by accidental fires, the scorched stems yield, instead of a resin, a gum similar to gum-arabic, reddish, and completely soluble in water, which is known as *Orenburgh gum*, and is used for cementing and in medicine, and, notwithstanding a somewhat resinous smell, even as an article of food. In warm countries, a kind of manna (q.v.) exudes from the leaves of the larch in the hottest season of the year, having a sweetish taste, with a slight flavor of turpentine. It is gathered principally in France, and is known as *Briançon manna*, or *L. manna*.—The larch woods of Britain have of late years suffered greatly from a disease, in which the center of the stem decays; the nature and causes of which are very imperfectly understood, although it seems to be sufficiently ascertained that those plantations are peculiarly liable to it which are formed where any kind of fir has previously grown, and those least so which are regularly thinned, so that the trees enjoy abundance of fresh air. The larch does not dislike moisture, but stagnation of water is very injurious to it, and thorough drainage is therefore necessary.—There are varieties of the common larch remarkable for crowded branches, for pendulous branches, and for other peculiarities, which are sometimes planted as ornamental trees.—The RED AMERICAN LARCH or HACKMATAK (*L. tenuifolia*), distinguished by very small cones, is common in the northern parts of North America. It is a noble tree, much resembling the common larch, and its timber is highly valued.—The PENDULOUS LARCH, or BLACK AMERICAN LARCH (*L. Americana*), is another very fine North American species, with larger leaves. The HIMALAYAN LARCH (*L. Griffithsii*) abounds in the Himalayas, but is generally a small tree of 20 to 40 ft. high. Its cones are larger than those of the common larch. One of the marked differences between these *coniferae* and the pines and firs is their deciduous character. The American larch, or *larix Americana*, inhabits North America from Virginia to Hudson's bay. It is called hackmatack in Canada, but in the middle, southern, and western states, tamarack. It sometimes grows to 70 ft. in height, but is generally much smaller. It is occasionally found on uplands, especially in its northern habitats, but in the middle and southern states it grows in moist soils and shallow swamps, often where the muck or peat is quite deep. It is a slender, beautiful tree, having horizontal branches, but its shade is not dense. The primary leaves are scattered, the secondary ones are many in a fascicle, and are developed early in the spring, as soon as the frost is out of the ground, from lateral, scaly, globular buds. They are at first of a light, yellowish-green, becoming, when mature, dark-bluish, and changing again in the fall to a yellow. The sterile catkins, erect, round, one-quarter of

an inch long, are borne near the ends of the branches. The fertile catkins are borne near the middle of the branches, half an inch in length, having a few scales, and of a crimson color during flowering. The ripe cone attains a length of about three-fourths of an inch. The distinction made on the preceding page between red American (*L. tenuifolia*) and black American larch (*L. Americana*) is not maintained by most authors, who say that the difference is at most a variety, and is caused by difference in locality. The American larch is inferior to the European tree for ornamental purposes, the latter having more fully-leaved and pendulous branches, and cones one-half larger. The *lurida* *Europaea* is indigenous to central Europe, and flourishes particularly in the Alps, where it is a fine timber tree. It has been transplanted in Scotland, and the plantations have yielded profitable returns. Those of the dukes of Athol are celebrated, 14,000,000 larches having been planted on an area of over 10,000 acres previous to 1836.

LARCOM, LUCY, b. Mass., 1826; having passed most of her childhood by the sea-side, went to reside in Lowell, Mass., contributing with her companions in the mill to a magazine called the *Lowell Offering*. She passed some years as teacher at Wheaton female seminary, Norton, Mass., and at Bradford academy, pursuing the same vocation in Illinois, and subsequently editing *Our Young Folks*, a children's periodical, since merged in the *St. Nicholas*. She resided at Beverly Farms, Mass., a delightful summer resort, and contributed regularly to the leading periodicals of the day. The winter of 1878-79 she passed in Bermuda. Her writings are distinguished for a healthy moral tone. Prior to 1866 she published *Similitudes*, a volume of poems; in 1866, *Breathings of a Better Life*; in 1868, *Poems*; in 1874, *Childhood Songs*; in 1875, *Idyl of Work*; and more recently, *Roadside Poems*, and *Hillside and Seaside*; in 1879, *American Scenery*. She assisted the poet John G. Whittier in his compilation of *Child Life*; *Child Life in Prose*; and *Songs of Three Centuries*. She is quoted by the poet Henry W. Longfellow in his *Poems of Places*. She published *Wild Roses of Cape Ann* (1883), and her complete poetical works (1884). She died April 17, 1893.

LARCY, CHARLES-PAULIN ROGER DE SAUBERT, Baron de, b. France, 1805; a lawyer, and strong defender of royal legitimacy; author of a work on the *Revolution de la France*; a determined opponent of both republicanism and Bonapartism, yet a member of Thiers's first cabinet of conciliation under the last republic, resigning his position as soon as it became evident that Thiers' government meant republicanism; made life-senator, 1877; d. 1882.

LARD, the fat of the hog. Until after the first quarter of the present century, lard was only used for culinary purposes, and as the base of various ointments in medical use. The enormous extent, however, to which pork was raised in America, rendered it necessary to find some other applications for so valuable a material, and large quantities were pressed at a low temperature, by which the stearine and oleine were separated. The former was used for candle-making; and the latter soon became a very important article of commerce, under the name of "lard oil," which was found to be a valuable lubricant for machinery. The production of lard in the United States for the year ending March 1, 1890, was 623,727,000 pounds, of which 471,083,598 pounds were exported to foreign countries, the same being valued at \$23,455,520. Of late, the manufacture of stearine candles and fine oleine from palm oil has lessened the demand for lard-oil among manufacturers. See **PORK**.

LARDNER, DIONYSIUS, LL.D., a distinguished writer on physical science, was b. in Dublin, April 3, 1793, and first became known by his *Treatise on Algebraical Geometry* (Lond., 1823), and by a work on the *Differential and Integral Calculus* (Lond. 1835). In 1828 he was appointed professor of natural philosophy and astronomy in University college, London; and in 1830 he projected a sort of encyclopædia, consisting of original treatises on history, science, economics, etc., by the most eminent authors; and 134 volumes were accordingly published, under the general name of *Lardner's Cyclopædia*, between 1830 and 1844. Some of these volumes were from his own pen. A second issue of this work was begun in 1853. He published various scientific works, the most important of which are his "handbooks" of various branches of natural philosophy (1851-56). Lardner was also the author of the *Museum of Science and Art*, an excellent popular exposition of the physical sciences, with their applications. He d. in 1859.

LARDNER, JAMES L., rear-admiral U. S. navy; b. Penn., 1802; entered the navy as midshipman in 1820; was appointed lieut. in 1828, commander in 1851, capt. in 1861, commodore in 1862, and rear-admiral on the retired list in 1866. He commanded the frigate *Susquehanna* in the battle of Port Royal, exhibiting great skill and bravery, and winning the special commendation of rear-admiral Dupont. He d. 1881.

LARDNER, NATHANIEL, D.D., an eminent English divine, was b. at Hawkshurst, in Kent, in 1684, and studied first in London, and afterwards at Utrecht and Leyden. Lardner belonged to a body of English Presbyterians, who had become Unitarians. He died in 1768. Lardner was not a popular preacher; but his *Credibility of the Gospel History*, and his *Jewish and Heathen Testimonies*, have secured for him a permanent place among the modern apologists for Christianity. The last edition of his works, in ten volumes, appeared at London in 1828.

LAREDO, city and co. seat of Webb co., Tex.; on the Rio Grande and the International and Great Northern, the Mexican National, and the Rio Grande and Eagle Pass railroads; 153 miles w. of San Antonio. It was settled by Spaniards, was long a frontier town of Mexico, and, after the annexation of Texas by the United States, many of its former citizens founded the Mexican city of Nuevo Laredo across the river. For many years the place was a rendezvous for cattle thieves and lawless Indians of the United States and Mexico, but the two governments united in making it a peaceful city. It has an area of 13 sq. miles, is in the great Rio Grande coal belt, and has national banks, a large international and local trade by rail and water, the residence of the bishop of the Roman Catholic vicariate-apostolic of Brownsville, an Ursuline convent, Mercy hospital, and several daily and weekly newspapers. Pop. '90, 11,319.

LA RES, MANES, AND PENATES were tutelary spirits, genii, or deities of the ancient Romans. The derivation of the names is not perhaps quite certain, but the first is generally considered the plural of *lar*, an Etruscan word signifying "lord," or "hero;" the second is supposed to mean "the good or benevolent ones;" and the third is connected with *penus*, "the innermost part of a house or sanctuary." The Lares, Manes, and Penates do not appear to have been regarded as essentially different beings, for the names are frequently used either interchangeably or in such a conjunction as almost implies identity. Yet some have thought that a distinction is discernible, and have looked upon the Lares as earthly, the Manes as infernal, and the Penates as heavenly protectors—a notion which has probably originated in the fact that Manes is a general name for the souls of the departed, those who inhabit the lower world; while among the Penates are included such great deities as Jupiter, Juno, Vesta, etc. Hence we may perhaps infer that the Manes were just the Lares viewed as departed spirits, and that the Penates embraced not only the Lares, but all spirits, whether demons or deities, who exercised a "special providence" over families, cities, etc. Of the former, Manes, we know almost nothing distinctively. An annual festival was held in their honor, on Feb. 19, called *Feralia* or *Parentalia*; of the latter, Penates, we are in nearly equal ignorance, but of the Lares we have a somewhat detailed account. They were, like the Penates, divided into two classes—*Lares domestici*, and *Lares publici*. The former were the souls of virtuous ancestors set free from the realm of shades by the Acherontic rites, and exalted to the rank of protectors of their descendants. They were, in short, household gods, and their worship was really a worship of ancestors. The first of the Lares in point of honor was the *Lar familiaris*, the founder of the house, the family Lar, who accompanied it in all its changes of residence. The *Lares publici* had a wider sphere of influence, and received particular names from the places over which they ruled. Thus, we read of *Lares compitales* (the Lares of cross-roads), *Lares vicorum* (the Lares of streets), the *Lares rurales* (the rural Lares), *Lares viales* (the Lares of the highways), *Lares permarini* (the Lares of the sea), and the *Lares cubiculi* (the Lares of the bed-chamber). The images of these guardian spirits or deities were placed (at least in large houses) in a small shrine or compartment called *adnicula* or *lararia*. They were worshiped every day: whenever a Roman family sat down to meals, a portion of the food was presented to them; but particular honors were paid to them on the calends, nones, and ides of the month; and at festive gatherings, the *lararia* were thrown open, and the images of the household gods were adorned with garlands.

LARGE. The longest note or mark of duration in ancient music; as, for instance, beginning with semi-breve, then breve, long, large; the proportion of time being as 1, 2, 4, 8. The breve is now the longest note in use, though its original signification did not indicate prolongation, but brevity of sound, the measure or unit of time in music having materially changed since the terms above given were in common use in the Gregorian music of the Roman church.

LARGESSE, money which, in early times, it was the practice to grant to heralds on certain state occasions, for proclaiming the style and title of the sovereign and his nobles. The regular fees, as recorded in one of the Ashmolean MSS., were: "At the coronacion of the king of England, c*l* appalled in scarlet. At the displaying of the kinge's banner in any campe, c. markes. At the displaying of a duke's banner, £20; at a marquis', 20 markes; at an earle's, 10 markes. The king marrying a wife, £50, with the giftes of the kinge's and queene's uppermost garments; at the birth of the kinge's eldest son, 100 markes; at the birth of younger children, £20. The king being at any syge with the crowne on his head, £5."

LARGO, an Italian word, used in music, to denote the slowest of all the *tempi*, and especially in compositions where the sentiment is quite solemn. *Larghetto* is the diminutive of *largo*.

LARGS, a parl. and market t. on the coast of Ayrshire, Scotland, a favorite resort for seabathers, is beautifully situated on the firth of Clyde, on a pleasant strip of shore, backed by hills, 18 m. below Greenock. The population was '91, 3187, but the number is greatly increased in midsummer. Here, in 1263, Alexander III. of Scotland, in the course of a war between that country and the Norwegian colonies of Man and the Isles, defeated

Hacon, king of Norway, who, with 160 ships and 20,000 men, had descended upon the coast of Ayrshire. The results of this battle were the immediate withdrawal of the invading force, and the abandonment within three years of the Norwegian pretensions to the Scottish islands.

LARI, a t. in n. Italy, in the vicinity of a number of walled cities, 14 m. s.e. of Pisa, and in the province of that name. It contains an ancient castle, and fortifications still in good condition; pop. under 2000. The country in its vicinity is divided into small farms of from 4 to 15 acres, planted with vineyards, and producing large quantities of red and white wine. Corn, rice, and olives are raised, also fruit of every kind, and chestnuts, which often take the place of bread. The Arno, having its source in the Apennines, clothes the neighboring pastures with constant verdure. The clear and mellow atmosphere invests the landscape with the rich warm tints for which Italy is celebrated. Near by are a number of salt springs, and mines remarkable for the abundance and richness of their copper ore; also quarries of alabaster, adding to its material wealth. The neighboring small ranges of mountains, sloping toward the Mediterranean sea, are dotted with groves of pine, oak, and beech, and near the base are woods of chestnut and holm-oak; the plains being shaded by groves of the cypress, orange, citron, carob, and palm.

LARIAT (Spanish, *la reata*), also called a *lasso* and a *riata*. It is used on the plains for catching and picketing wild horses or cattle, and consists of a rope, usually made of raw-hide strips, twisted or braided, but sometimes of sea grass; it is finished with a noose or slip knot at the end.

LARICIO. See **PINE**.

LA RIDÆ, a family of birds, of the order *palmipedes* or *natatores*, called *longpennies* by Cuvier, from the length of wing which is characteristic of them. They are generally capable of protracted as well as of rapid and graceful flight; all of them are sea-birds, although some resort to breeding-places at some distance inland, and some follow the course of rivers to very considerable distances from the sea. Some of them are the most oceanic of all birds, being often seen far from any shore. They generally take their prey either by a sudden descent to the water during flight, or whilst swimming, and are not good divers. The hind-toe is small and free; the bill is pointed or hooked, but destitute of lamellæ. Gulls, skuas, terns, petrels, shearwaters, albatrosses, noddies, skimmers, etc., belong to this numerous family, which has many representatives in all parts of the world. They prey chiefly on fishes and mollusks, and are in general ready to eat any animal garbage.

LARI'GOT, a stop of the organ, which is usually termed the "nineteenth." It is tuned an octave above the twelfth stop, or two octaves and a fifth above the diapasons. It has a single rank of metal pipes, and is found in some organs as one of the ranks of the mixture stops.

LARIMER, a co. in n. Colorado, separated from the North park by the Medicine Bow mountains, belonging to the Snowy range of the Rocky mountains on the w., and having for its n. boundary the state of Wyoming; 4100 sq.m.; pop. '90, 9712 chiefly of American birth. The Cache la Poudre, rising in the Snowy range, flows s.e., emptying into the South Platte river, and Big Thompson creek, rising in Long's peak, in the extreme s.e., running e. into the same river, irrigate the country and afford water-power, which is utilized by flour and saw mills. In the e. section the country presents an undulating surface, and a rich soil along the river valleys, producing barley, oats, corn, wheat, and wool. The scenery is magnificent. Lignite and silver are found. The height of Long's peak in the s.w. corner is estimated to be 14,271 ft. above the level of the sea. The Colorado Central railroad intersects the e. portion. Seat of justice, Fort Collins.

LAR'INÆ, a group of birds often separated as a sub-family of laridæ (q.v.), including the gulls proper, the typical genus of which is *larus* (a gull). A chief characteristic of this sub-family is the hooked projecting upper bill, and also the want of a curve at the base. The genus *larus* has a square tail, and contains the largest and best-known species; *rhodostethia* has a wedge-shaped tail, and *creagrus*, a forked tail, both of the last-named genera being inhabitants of the Arctic ocean. See **GULL**.

LARIS'SA (called by the Turks *Yenitschir*), a t. of northern Greece, in the nomarchie of Thessaly, and one of the most ancient and important in that region, is situated on the Salambria (anc. *Peneus*), 33 m. n.w. of Volo. It carries on an important transit trade, with manufactures of silk and cotton goods, and Turkey-red dyeworks. Pop. '89, 13,610. In ancient times it was celebrated for its bullfights. It is the seat of a Greek archbishop. By the negotiations inaugurated at the Berlin congress of 1878, and concluded in 1881, L. was ceded by Turkey to Greece. Larissa was the headquarters of the Greek army in the war against Turkey in the spring of 1897.

LARISTAN AND **MOGISTAN**, two maritime provinces of Persia, bounded on the s. by the Persian gulf and the gulf of Oman, and on the n. by the provinces of Fars and Kerman.

LARKS AND OTHER BIRDS.—1. Head of weevil-lark (*Alauda calandra*). 2. Hooded lark. 3. Skull of green parrot. 4. Foot of pelican. 5. Stormy-petrel. 6. Rail. 7. Starling. 8. Bearded Titmouse. 9. Toucan. 10. Trogon. 11. Vulture. 12. Wax-wing. 13. Wryneck. 14. Wryneck. 15. Wryneck. 16. Wryneck. 17. Wryneck. 18. Wryneck. 19. Wryneck. 20. Wryneck. 21. Wryneck. 22. Wryneck. 23. Wryneck. 24. Wryneck. 25. Wryneck. 26. Wryneck.

3. Foot of lark (*A. arvensis*). 4. Kingfisher. 5. Magpie. 6. Night-jar. 7. Head and
 12. Secretary. 13. House-swallow. 14. Wall-swallow. 15. Swift. 16. Titmouse;
 21. Wall-creeper. 22. Widgeon. 23. Woodpecker. 24. Pigeon. 25. Crested Wren.

LA RIVE, AUGUSTE DE, 1801-73; was educated in chemistry and natural science by his father, and was appointed a professor in the academy of Geneva. In 1864 he was elected one of the eight foreign members of the French academy. He devoted himself to the study of electricity, and wrote *Traité d'Electricité Théorique Appliquée* (Paris, 1854-58, 3 vols.).

LA RIVE, CHARLES GASPARD DE, 1770-1834; b. Geneva, Switzerland; studied medicine and the natural sciences in England and in Edinburgh; in 1802 became professor in the academy of Geneva, and distinguished himself by researches in chemistry and natural history, and by his contributions on these subjects to the *Bibliothèque Universelle de Genève* and the *Bibliothèque Britannique*. Among his works may be noted: *Observations upon the conversion of starch into sugar*; and an *Essay on the Theory of Chemical Proportions, and the Chemical Influences of Electricity*.

La Rive, in the intervals of his scientific life, was much of a politician; was a member of the provisional council of Switzerland in 1813, which proclaimed a republic, and in 1817 was elected president of the council, from which he retired to his favorite studies. He was founder of the museum of natural history and the botanic garden of Geneva.

LARIX. See LARCH.

LARK, *Alauda*, a genus of small birds of the order *insessores*, section *conirostres*, the type of a family *alaudide*, to the whole of which the English name is commonly extended. In this family, the bill, although stout, and nearly conical, is more lengthened than in buntings and finches. The toes are long, and separate to the base; the claws long and little curved, that of the hind toe generally very long. The true larks (genus *alauda*) have also long wings, and great power of flight. Many of them are birds of passage. In common with almost all the family, they nestle and seek their food—seeds, insects, worms, etc.—on the ground; and in admirable harmony with this mode of life, their plumage exhibits much uniformity of coloring, so that when on the ground they may not readily be noticed by their enemies. The lark family is very widely distributed over the world. The COMMON LARK, FIELD LARK, or SKY LARK (*alauda arvensis*), is one of the best-known British birds, and notwithstanding the tameness of its brown plumage, is a universal favorite, on account of the sweetness of its cheerful song, which it pours forth whilst soaring and floating in the air, and which every one associates with pleasant scenes and delightful days. It more rarely sings on the ground. It is in great repute as a cage-bird, and sings well in confinement, but flutters its wings whilst singing, as if still desirous of soaring in the air. It abounds chiefly in open but cultivated districts. It is common in most parts of Europe, but from the more northern parts it migrates southward on the approach of winter. It is also a native of Asia, and is a winter visitant of the n. of Africa. It is not found in America. It makes its nest generally in an open field, and often under shelter of a tuft of herbage, or a clod of earth; lays four or five mottled eggs, and generally produces two broods in a season. It is not truly gregarious in summer, but in winter large flocks assemble together; and at this season multitudes of larks are taken for the table in the s. of England, in France, and other countries. They are often caught by horse-hair nooses, attached to a long line of packthread, to which the nooses are fastened at distances of about 6 in., the line being pegged to the ground at intervals of 20 yards. This mode is most successful when the ground is covered with snow, and a little corn is scattered along the line. The clap-net (q.v.) and trammel-net (q.v.) are also employed by lark-catchers, and great numbers of larks are taken in some parts of England by dragging the trammel-net over the stubbles and pastures. *Twirling for larks* is a peculiar mode of turning to account the attractiveness which any glittering object possesses for these birds. It is a French practice. A piece of highly polished mahogany, or of some common wood inlaid with bits of looking-glass, is fastened on the top of a rod, so as to reflect the sun's rays upwards, and is made to twirl by means of a string. Larks are greatly attracted by it, congregate around it, and are readily shot in large numbers.—The CRESTED LARK (*A. cristata*), very similar in size and plumage to the common lark, but having the feathers of the crown of the head more distinctly developed into a crest, although a very common bird in many parts of Europe, and abundant near Calais, has very seldom been seen in Britain. The WOOD LARK (*A. arborea*), a smaller species, not unfrequent in some parts of England, but rare in Scotland, is a bird of very delightful song, and usually sings perched on the branch of a tree. It frequents wooded districts. Its nest, however, is made on the ground.—The SHORE LARK (*A. alpestris*), which has only in rare instances been found in Britain, inhabits the northern parts of Europe, Asia, and America, and is the only North American species. Its song is very sweet, and gladdens the visitor of such desolate shores as those of Labrador, where it breeds, amidst the tufts of mosses and lichens, with which the bare rocks are interspersed. It is a winter visitant of New England, and is sometimes seen as far s. as Georgia. The head has two erectile tufts of feathers, somewhat resembling those of horned owls. Black, white, and yellow vary the brown plumage of the shore lark.

LARKHANA, the capital of a district of its own name in Sinde, stands 145 m. n. of Hyderabad. It contains about 12,000 inhabitants, and the surrounding country is probably the finest in Sinde.

LARKSPUR, *Delphinium*, a genus of plants of the natural order *rannunculacea*, annual and perennial herbaceous plants, natives of the temperate and cold regions of the northern hemisphere. They have five sepals, the upper spurred; four petals, distinct or united into one, the two upper having spurs inserted into the sepaline spur; and 1 to 5 many-seeded follicles. Some of them are well known and favorite garden-flowers, as the UPRIGHT LARKSPUR (*D. Ajacis*), a native of Switzerland, and the BRANCHING LARKSPUR (*D. consolida*), a native of most parts of Europe, and a rather doubtful native of England. *D. glaciale* is one of the most alpine plants in the world.

LARMES, in heraldry. When the field is bestrewed with an indefinite number of drops of a blue color, it is said to be *gutté de larmes*, a nomenclature peculiar to British heraldry.

LARNACA, or LARNAKA (anc. *Citium*), a t. of Cyprus in n. lat. 34° 55', and e. long. 33° 37', near the s. coast of the island. It has a good roadstead, but the town has a decayed and filthy aspect. The chief public buildings in Larnaca are the Greek church of St. Lazarus, a Roman Catholic church, and Franciscan monastery. Larnaca is the chief seat of the commerce of the island, and the residence of European merchants and consuls. There is regular steamboat communication with Constantinople, Smyrna, Alexandria, and Marseilles, and occasionally with England. There is an overland line of telegraph from Larnaca to cape St. Andreas, thence by submarine cable to Latakia, in Syria. Larnaca does not possess a harbor, but excellent anchorage is to be had in the bay. The pier has a length of 450 feet and a depth alongside of from 7 to 8 feet. Pop. '91, 7,593. Mounds of débris mark the site of ancient Citium. A bas-relief of the 8th c. B.C., with cuneiform inscriptions, was recently found here; and 600 gold staters of Philip and Alexander the Great were discovered in 1870.

LARNE, a par., civic, market and seaport t. of Ireland, in the co. of Antrim, on Lough Larne. A mail-steamer sails daily between Larne, which is connected with the Northern Counties railway, and Stranraer, in Scotland. Larne possesses two large flour-mills, and a large weaving factory. Pop. '91, 4217.

LARNED, AUGUSTA, b. Rutland, N. Y., in 1835; formerly editor of the *Revolution*, a woman's rights journal. She has published six vols. of stories which she had contributed to magazines and newspapers; has also pub. *Talks with Girls*, *Old Tales Retold*, *Tales from the Norse Grandmother* and *Village Photographs*.

LARNED, BENJAMIN FRANKLIN, 1794-1862; b. Mass.; entered the army as ensign of the 21st infantry in 1813, and served with distinction through the war with Great Britain. He was brevetted captain for gallant conduct at Fort Erie, where he commanded a company, and on the reduction of the army in 1815 was retained as regimental paymaster. During the war with Mexico he served as deputy paymaster-general, and on the death of gen. Towson succeeded him as paymaster-general of the army with the rank of col., performing the duties of the office with unsullied integrity to the day of his death. At the outbreak of the civil war his powers were overtaxed in the reorganization of his department, and he died in Washington.

LARNED, SIMON, 1753-1817; b. Thompson, Conn.; served as an officer in the revolutionary war, and in 1784 settled at Pittsfield, Mass. He was a member of congress in 1804-5, and in the war of 1812 with Great Britain served as col. of the 9th infantry. After this he was sheriff of Berkshire county.

LARNED, SYLVESTER, 1796-1820; b. Pittsfield, Mass.; graduated at Middlebury college, 1813; Princeton theological seminary, 1816; ordained as a Presbyterian minister, 1817; and soon proceeded to New Orleans, where he produced a deep impression by his eloquence. A church was organized, of which he was chosen pastor, and a large church edifice was erected. In the summer of 1820 the yellow-fever raged in the city with great violence, and though urged to leave, he remained, ministering to the sick and dying until he was attacked with the disease and died. A memoir with a collection of his sermons was published by the Rev. R. R. Gurley.

LAR'NICA. See LARNACA.

LAROCHEFOUCAULD. See ROCHEFOUCAULD.

LAROCHEJAQUELEIN, DU VERGER DE, an old noble family of France. The name Du Verger is derived from a place in Poitou. Guy du Verger married, in 1505, the heiress of the seigneur of Larochejaquelein. Several of his descendants distinguished themselves as soldiers, after the beginning of the French revolution, by their strenuous efforts in the cause of the Bourbons.—HENRI, comte de Larochejaquelein, born 1772, was an officer in the guard of Louis XVI., and after Aug. 10, 1792, left Paris, and put himself at the head of the insurgent royalists in La Vendée. He signalized himself by many heroic deeds, and for a time successfully repelled the republican forces, but was defeated by gens. Westermann, Müller, and Tilly, Dec. 13, 1793, and escaped with difficulty. He raised a new body of troops, however, in Upper Poitou, but was killed in a battle at Nouaillé, Mar. 4, 1794.—His brother, LOUIS DU VERGER, marquis de Larochejaquelein, born 1777, emigrated at the commencement of the revolution; returned to France in 1801, but resisted all Napoleon's efforts to win him, and in 1813

placed himself at the head of the royalists in La Vendée. Louis XVIII. appointed him, in 1814, to the command of the army of La Vendée, and during the hundred days he maintained the royalist cause there, supported by the British. He fell in battle at Pont-des-Mathis, June 4, 1815. His wife, MARIE-LOUISE VICTOIRE, marquise de Larochejaquelein (b. 1772—d. 1857), published *Mémoires of the War in La Vendée*, of which she was an eye-witness (Bordeaux, 1855), which are of great value, and have gone through many editions.

LA ROCHELLE, a fortified seaport of France, capital of the department of Charente-Inférieure, on an inlet of the bay of Biscay, formed by the islands Ré and Oléron, 300 m. s.w. of Paris by railway. Its harbor, the chief on that coast, consists of an outer tidal basin, and an inner wet dock, surrounded by fine quays and commodious docks, close to which lie the principal streets and squares. Many of the latter are regular and well built, and present a handsome appearance from the number of houses which are adorned with porticoes and balconies. The public buildings most worthy of notice are the arsenal, the palace, the town-hall, the exchange, and the cathedral. Besides the fine promenade of the Place du Château, there are, outside the city walls, two extensive public gardens, known as La Promenade du Mail and the Champs de Mars. Ship-building is actively carried on, especially in connection with the Newfoundland fishing trade; and besides this branch of industry, and the manufacture of coal bricks and cotton yarns, Rochelle has numerous glass-works, sugar-refineries, and distilleries for the preparation of brandy. Pop. '91, 26,800.—Rochelle, which was known till the 12th c. under its Latin name of *Rupella*, or Little Rock, of which its present name is a mere translation, originated in a colony of serfs of Lower Poitou, who, fleeing from the persecution of their lord, settled on the rocky promontory between the ocean and the neighboring marshes, which had previously been occupied by fishermen only, but which rapidly increased in importance under the new settlers. On the marriage of Eleanor of Aquitaine with Henry II. of England, Rochelle, as a part of her dowry, came into the possession of the English kings, by whom it was retained till 1224, when it was taken by the troops of the French king, Louis VIII.; and although it was ceded to England at the treaty of Breteigny in 1360, in the subsequent wars it was retaken by France, under whose sway it has remained since 1372. As a stronghold of the Huguenot party, it underwent various attacks and sieges during the religious wars of the Henries, in the latter half of the 16th c.; and on its final and unconditional surrender to the royal troops in the time of Louis XIII., its old fortifications were destroyed, and new lines of defenses subsequently erected by the great Vauban.

LAROUSSE, PIERRE ATHANASE, b. France, 1817; author of a great number of school-books designed to supplant the old routine of teaching "on the parrot plan"; and publisher and editor of the *Grand Dictionnaire Universel du XIX. Siècle*, the most elaborate biographical cyclopædia in the French language. The studies and published works of Mr. Larousse show an enormous industry. The school-books, to the formation of which the first part of his life was devoted, have been introduced into the schools of France, and made a fortune for him, which he used to establish his own flourishing publishing-house, and to extend the circulation of all his useful works. He d. 1875.

LARREY, DOMINIQUE JEAN, Baron, a celebrated French surgeon, was born in 1766 at Baudéan, near Bagnères-de-Bigorre, studied medicine with his uncle, Alexis Larrey, and attended the two hospitals, the Hôtel Dieu and the Hôtel-des-Invalides, having previously served for a short time both in the army and navy. In 1792 he was appointed second physician to the Hôtel-des-Invalides, and in 1793 accompanied the French army to Germany and Spain, making at this time the important invention of the *ambulance volante*, for the convenience of transporting the wounded. Napoleon summoned him to Italy in 1797, after he had been for a short time a professor in the medico-surgical school at Val-de-Grâce; and he accompanied the expedition to Egypt. In 1805 he was placed at the head of the medico-surgical department in the French army, and was created a baron of the empire, receiving also a considerable pension. He was wounded and taken prisoner at Waterloo, and at the restoration lost his rank and pension; the latter, however, was restored in 1818; and he continued to fill important and honorable offices till 1836, when he retired from that of surgeon-general of the Hôtel-des-Invalides. On May 15, 1842, he embarked for Algeria, having been appointed inspector of the military hospitals there, and while on his return, after having concluded his labors, he died at Lyons July 24, 1842. Apart from the skill, talent, courage, and humanity shown in the course of his practice, Larrey has a high scientific reputation, and is the author of a number of very valuable books on various subjects connected with his profession, most of which have been translated into other languages. Larrey's works have been considered by eminent authorities to be "the connecting link between the surgery of the last age and that of the present day."

LARTET, EDOUARD, b. at St. Guérand, France, 1801. He was distinguished for his researches in fossil paleontology and prehistoric anthropology. Of the former science he was for many years professor in the museum of natural history in Paris. He made numerous discoveries, among them the mammalian remains in the miocene deposits of Gers, including skeletons of *mastodon angustidens*, and affording the first sure evidence of the existence of fossil monkeys in Europe. He was subsequently

engaged with Gaudry in paleontological investigations, and with Christy in exploring the caves of Périgord and publishing the results.

LA RUE, a co. in central Kentucky, watered by the Rolling Fork, an affluent of the Salt river, forming its northern boundary and emptying into the Ohio river: 260 sq.m.; pop. '90, 9483, chiefly of American birth, and 1100 colored. It is equally divided into forest and plain, the latter undulating, and possessing a soil of great fertility, producing oats, Indian corn, rye, and winter wheat, and is adapted to the raising of cattle, horses, sheep, and swine. It has four distilleries, and flour and saw mills. Seat of justice, Hodgenville.

LARVA, in natural history, is the denomination of animals which undergo transformation, in that state in which they first exist after issuing from the egg. Until recently, the larva state was known in insects only, and the term larva is still commonly used only with regard to them; but it has been discovered that many marine animals spend a considerable part of their existence in such a state, during which they are often extremely different from what they become after their next transformation; some of them, as the young of the cirrhopods, swimming about freely in the larva state, whilst they become firmly fixed to one spot when they have reached their perfect development, and—which seems still more remarkable—possessing eyes in the former state, and becoming destitute of them in the latter. The larva state of crabs exhibits a very singular form, long known as a distinct genus of crustaceans, under the name *zoëa*. The young of at least some entozoa pass through a larval state; those of the tape-worms were formerly regarded as creatures altogether distinct, and received the generic name *scœlez*, which when now used is with regard to these animals equivalent to larva.—The larvæ of insects differ very much in the degree of their development, the differences being characteristic of different orders; some of them much resembling the perfect insect, except in the want of wings, and others being very unlike it. The larvæ of many insects, particularly those which are very unlike the perfect insect, as grubs (coleopterous larvæ), maggots (dipterous larvæ), and caterpillars (lepidopterous larvæ), accumulate fat in great quantity, which serves to sustain them during their *pupa* (q.v.) state, in which they take no food. The same accumulation of fat does not take place in larvæ more nearly similar to the perfect insect, as in neuropterous insects, the pupæ of which are active and voracious. For interesting specimens, see *illus.*, BEETLES, ETC., vol. II..

LARVA. See GHOSTS.

LARYNGITIS, or INFLAMMATION OF THE LARYNX, may be either an acute or a chronic affection. Acute laryngitis, in its more severe form, commences with a chill, which is followed by fever, with a full strong pulse, a hot skin, and a flushed face. There is also soreness of the throat, hoarseness of the voice, great difficulty in swallowing, and a feeling of extreme constriction of the larynx. There is a painful stridulous cough, but only a little mucus is ejected. Great difficulty of breathing soon comes on, the act of inspiration being prolonged, and wheezing, in consequence of the swollen membrane of the glottis impeding the entrance of air. On examining the fauces, the epiglottis (see LARYNX) is observed to be of a bright red color, erect, and so much swollen as not to be able to descend and close the glottis during deglutition. The patient exhibits symptoms of great anxiety and distress; his lips become blue, his face of a livid paleness, his pulse irregular and very feeble, and at length he sinks into a drowsy state, often preceded by delirium, and quickly followed by death. The disease is very rapid, ending, when fatal, in three or four days, and occasionally in less than one day.

The most frequent cause of laryngitis, whether mild or severe, is exposure to cold and wet, especially when in a state of perspiration. It frequently also arises from direct injury to the larynx, as from attempting to swallow boiling water or corrosive fluids, from inhaling irritating gases, etc.

In severe cases, the strongest antiphlogistic treatment must be at once adopted, as general bleeding, leeching, and either tartar emetic or calomel. If these fail, the only remedy upon which much reliance can be placed is tracheotomy. In chronic laryngitis, there is hoarseness, the voice is altered, and various morbid sensations are felt in the larynx, which excite cough. If the disease goes on to ulceration, phthisis or syphilis is probably its cause. The treatment of ulcerated larynx is noticed in LARYNX, DISEASES OF.

LARYNGOSCOPE AND LARYNGOSCOPY. Although attempts had been previously made by Avery and Garcia to explore the recesses of the larynx by means of a reflecting mirror, it was not until two German physiologists, Drs. Turck and Czermak, took up the subject in 1857 and 1858, that the great importance of laryngoscopy was first generally recognized.

The laryngoscope is a small mirror placed on a stalk attached to its margin, at an angle of from 120° to 150°, the stalk being about 6 in. in length, and being composed of flexible metal, so that it can be bent at the will of the operator.

The mouthpiece of a large reflector, with a central opening through which the observer looks, is held between the molar teeth; or, which is better, the reflector may be attached to a spectacle frame by a stiffly working ball-and-socket joint. The rays of the sun or of a good lamp are concentrated by means of this reflector on the laryngeal

mirror, which is placed against the soft palate and uvula. The laryngeal mirror, introduced with the right hand, which rests by two fingers on the jaw, is maintained at such an inclination that it throws the light downwards, and illuminates the parts to be examined, while at the same time it reflects the images of these parts into the eye of the observer through the central opening of the reflector. By this means he can look through the larynx into the trachea or windpipe.

By means of this instrument we can see the actual position of small tumors, ulcers, etc., whose existence would otherwise have been at most only suspected; and the precision and accuracy of diagnosis to which we can thus attain, enable us to employ rational means of local treatment to an extent that was previously quite impossible before the introduction of laryngoscopy.

LARYNGOTOMY. (Greek). A medical term signifying the operation of cutting into the larynx (q.v.).

LARYNX, THE (Gr. *larynx*), is the organ of voice, and takes a part in the respiratory process, as all air passing either to or from the lungs must pass through it. It is a complex piece of mechanism, resembling a box composed of pieces of cartilage, which may be moved on each other, and inclosing the membranous bands (the *chordæ vocales*) by which the vocal vibrations are produced.

It is situated between the *trachea*, or windpipe, and the base of the tongue, at the upper and front part of the neck, where it forms a considerable projection (especially in men) in the mesial line; and it opens superiorly into the *pharynx*, or throat, and inferiorly into the windpipe.

The cartilages of which the skeleton of the larynx is composed are five in number—viz., the thyroid and the cricoid cartilages, the epiglottis, and the two arytenoid cartilages.

The *thyroid* (Gr. shield-like) cartilage consists of two square plates of cartilage united in front at an acute angle, which forms the projection which is commonly known as the *pomum Adami*, or Adam's apple. Each of these plates is prolonged at the upper and lower posterior corners. The thyroid cartilage forms almost the whole of the anterior and lateral walls of the larynx.

The *cricoid* (Gr. ring-like) cartilage is a ring whose lower margin is parallel to the first ring of the trachea, to which it is united by fibrous membrane. Its upper border is connected in front with the lower border of the thyroid cartilage by a thick yellow fibrous tissue. It presents two articular surfaces on either side, viz., a lower one, which articulates with the inferior cornua of the thyroid cartilage, and an upper one, which is oval in form, and supports an arytenoid cartilage. The *arytenoid* (Gr. ladle-like) cartilages are pyramidal bodies resting on the oval articular surfaces at the upper and posterior part of the cricoid cartilage. When *in situ*, they present a concave posterior surface. From their connection with the vocal cords, and from their great mobility as compared with the two larger cartilages, the arytenoids play a very important part in the mechanism of the larynx. The *epiglottis* is a very flexible cartilaginous valve, situated at the base of the tongue, and covering the opening of the larynx. Its direction is vertical, except during deglutition, when it becomes horizontal. It is attached inferiorly by a kind of pedicle to the angle of the thyroid cartilage. Upon removing the investing mucous membrane, the cartilage is found to be perforated by numerous foramina. Each perforation admits some fasciculi, of yellow, elastic, ligamentous tissue, which expands on its anterior aspect, and secures the return of the epiglottis to its vertical position, independently of any muscular action. Such is the skeleton of the larynx which hangs from the hyoid bone, with which it is connected by the thyro-hyoid ligament and certain muscles.

The various cartilages which have been described are connected to one another by ligaments, the chief of which are those known as the true and false vocal cords. In their quiescent state, the true vocal cords do not lie parallel to each other, but converge from behind forwards. The length of the vocal cords is greater in the adult male than in the adult female, in the ratio of three to two. In infancy, they are very short, and increase regularly from that period to the age of puberty. The mucous membrane of the larynx is part of the great respiratory tract (see MUCOUS MEMBRANE), and is remarkable for its great sensibility.

The length of the chink or aperture of the glottis, which is directed horizontally from before backwards, varies, like the vocal cords, until the period of puberty, when its length, in the male, undergoes a sudden development, while in the female it remains stationary. In the adult male, it is about eleven lines in length.

The larynx is provided with two sets of muscles, viz., the *extrinsic*, by which the whole organ is elevated or depressed, and the *intrinsic*, which regulate the movements of the various segments of the organ in relation to one another. By the action of these latter muscles, aided, in some cases, by the extrinsic muscles, the tension of the vocal cords may be increased or diminished, and the size of the opening of the glottis regulated at will.

The nerves of the larynx are derived from the superior and inferior laryngeal branches of the pneumogastric or vagus nerve. The superior branch is for the most part sensory (being mainly distributed to the mucous membrane), while the inferior branch communicates motor-power to all the intrinsic muscles except the crico-thyroid.

In the preceding account of the cartilages, vocal cords, mucous membrane, muscles,

and nerves of the larynx, we have included only the most essential points. For details regarding the attachments of muscles, etc., the reader must consult any standard work on anatomy. That the larynx is the organ of voice, is proved by numerous facts, amongst which the following may be mentioned: "First, the least alteration in the condition of the mucous membrane covering the vocal cords is invariably accompanied by a change in the tone of the voice, e.g., hoarseness; secondly, ulcerative disease, eating through one or both of these vocal cords, destroys or greatly impairs the voice; thirdly, opening the trachea below the vocal cords, so as to divert the current of air in expiration from the larynx, will destroy the voice; fourthly, section of the inferior laryngeal nerves, by which the influence of the will is brought to bear on the muscles which regulate the tension of the vocal cords, destroys the voice; and lastly, by experiments on the dead larynx, sounds may be produced resembling those of the voice."—Todd and Bowman's *Physiological Anatomy*, vol. ii. p. 431.

Diseases of the Larynx.—Of these, the most serious is *acute inflammation* of the larynx, or laryngitis (q.v.).

Edema, or *swelling of the glottis*, although of common occurrence in laryngitis, may be developed independently of inflammation, from obstruction of the veins leading from that part, or from other causes. The symptoms are those of acute inflammation, except that there is no fever or inflammation, and less difficulty of swallowing. Tracheotomy (the operation of making an opening into the windpipe, below the seat of the disease) affords the patient almost his only chance of life.

Chronic inflammation and *ulceration* of the larynx are very common in tubercular consumption and in secondary syphilis. In these cases, the laryngeal affection is merely a local manifestation of a general disease. The chronic hoarseness and cough are often remarkably relieved, in these cases, by swabbing the epiglottis and upper part of the air-passages with a strong solution of lunar caustic.

LASALLE, a co. in n. Illinois, receives the Fox and Vermilion rivers, flowing into it from other counties, uniting with the head waters of the Illinois river within its borders; 1152 sq. m.; pop. '90, 80,798, chiefly of American birth. It has a surface of broad prairie land slightly undulating, generally well timbered, and possessing a soil of remarkable fertility, adapted to stock-raising and the raising of fruit and cereals. Large deposits of bituminous coal, sandstone, and limestone are found. It is intersected by the Wabash, the Chicago and Alton, the Atchison, Topeka and Santa Fé, the Illinois Central, the Chicago, Burlington and Quincy, and the Chicago, Rock Island and Pacific railroads. Co. seat, Ottawa.

LASALLE, a co. in s. Texas, with an uneven surface, very few trees, and a soil entirely uncultivated, but furnishing excellent ranges for cattle and sheep; 1460 sq. m.; pop. '90, 2139 of American birth. Fort Ewell, an old trading post, is situated in the southern portion. The Rio Nueces in the s., and Rio Frio in the n.e., with their tributaries, irrigate their respective sections, but the greater portion is not well supplied with water. Co. seat, Cotulla.

LASALLE, a city in Lasalle co., Ill.; on the Illinois river at the head of navigation, the Illinois and Michigan canal, and the Burlington Route, the Chicago, Rock Island and Pacific, and the Illinois Central railroads; 99 miles s.w. of Chicago. It is in a rich bituminous coal region, and is the centre of a large trade by rail, river, and canal. There are several coal mines in operation in the city and its immediate vicinity, and near by are two popular resorts, Deer Park and Starved Rock. The city has gas and electric light plants, waterworks, an abundance of artesian water, electric street railroads, hospital, public library, national bank, good sewerage system, and daily and weekly newspapers. The industries include, besides coal-mining, zinc smelting, and the manufacture of sulphuric acid, ornamental pressed brick, common brick, hydraulic cement, sewer pipe, bottles, and clocks. Pop. '90, 9855.

LA SALLE, JEAN BAPTISTE DE, a benevolent ecclesiastic, and founder of the *Ordre de la Doctrine Chrétienne*, or Brethren of the Christian Schools (q.v.), was born at Rheims in 1651. In 1669 he was appointed a canon of the cathedral, and in 1670 went to Paris to complete his course in theology. Ordained to the priesthood in 1671, he chose as his life-work the education of the working classes, whose ignorance in religious matters had made a profound impression upon him, and founded a brotherhood for the especial purpose of teaching poor boys. He opened schools in the different parishes of Rheims, and as the number of teachers increased, secured a house for their headquarters and residence, laying down some simple rules for their guidance, adopting a distinctive dress for the fraternity and requiring its members to take the vows of poverty, chastity, and obedience, though unwilling that any priest should become a member. The secular teachers of the city opposed him, brought him before the courts, and finally drove him from the city, when he repaired to Rouen, and purchased the establishment of St. Yon, which he made the headquarters of the order. Schools were soon established in the principal cities of France. La Salle died April 7, 1719. He was placed among the blessed by Pope Gregory XVI., and was canonized by Pius IX. Some of his books for the education of children are still in use.

LA SALLE, RENÉ ROBERT CAVELIER, Sieur de, 1643-87; b. in Rouen, France, of a wealthy merchant family; discoverer of the Ohio and the main part of the Mississippi river. Studious and grave in youth, he entered a school of the Roman church and became a Jesuit priest. About his twenty-third year he withdrew from this service with the good-will of his superiors, and sailed for Canada, where an older brother was priest at Montreal in the seminary of St. Sulpice. This seminary was a religious corporation to which had been given a sort of feudal proprietorship of Montreal and its vicinage. The superior, seeing in La Salle a youth of high character, granted him a tract of land with seigniorial rights, where the village of La Chine now stands, near the rapids of the St. Lawrence. The youthful lord built a fort, laid out a village, subdivided and leased lands in the seigniorial form of that day, set apart a park or common, and in his own personal reservation cleared the land and erected buildings. He studied the Indian languages, and in a few years was master of seven or eight dialects. Trade with the Indians in furs, explorations into the surrounding country to extend this trade, and easy communication by the upper St. Lawrence with the tribes on its borders, gave La Salle the means to make improvements at La Chine, and enabled him to obtain that vague knowledge of the great interior which fired his ambition to learn more. Even down to that time men believed in a navigable passage to the South sea, to China and Japan, through this continent. The vast extent of the lakes, then dimly known through information gleaned from savages, seemed a probable connecting route to the Pacific. A band of the Senecas spent the winter at La Salle's fort and told him of the great Ohio rising in their country and flowing to the sea, but so long that eight or nine months were required to paddle to its mouth. La Salle believed that this stream must empty into the gulf of California on the Pacific. He quietly formed his plans to be its Columbus, obtained the governor's consent, and letters patent authorizing the exploration, *but at his own expense*. He sold his seignory and all improvements to get the means. July 6, 1669, with 14 men and four canoes the expedition started up the St. Lawrence. It took them 30 days to pass the rapids, the Thousand islands, and to reach lake Ontario. Thence they skirted the s. shore to the mouth of the Genesee, where they remained a month, seeking information and friendship among the Indians. Then coasting westward they passed the mouth of the Niagara, heard the far roar of the cataract, and reached the w. end of lake Ontario. There he found a Shawnee prisoner who promised to conduct him to the Ohio river in six weeks. Here he met Joliet, afterwards with Marquette discoverer of the upper Mississippi, returning from a futile search for copper mines on lake Superior. From him he procured a map of the lake country which he had visited. From this point the records of La Salle's movements are not full. It is known, however, that he went southward and embarked on the head stream of the Alleghany river e. of lake Erie and followed it down to the Ohio, which he explored to the rapids at Louisville. There he learned from the natives that, far beyond, this stream joined the bed of that great river which lost itself in the vast lowlands of the south. Here his men deserted in a body. La Salle returned "400 lieues" to Canada alone, living upon the chase, herbs, and the hospitality of the natives. Nicholas Perrot, a famous early *voyageur*, states that he met La Salle in the summer of 1670 hunting on the Ottawa with a party of Iroquois. This gives the required time for his return, and indicates both his reduced circumstances and that he was energetically at work to get the means for another expedition. The season of 1671 finds him embarked on lake Erie, which he skirted in canoes to the mouth of the Detroit river; thence through lake Huron to Mackinac and lake Michigan. Beyond Green bay he explored the western shore of the lake, not known to have been visited before by white men, and made the portage to the Illinois river either where Chicago now stands, or by the way of the St. Joseph and the Kankakee on the s.e. shore of the lake. He followed down the Illinois to, or nearly to, the Mississippi, and made a map of its course and tributary streams. This map indicates that he made the Chicago portage, though his subsequent explorations via the St. Joseph and Kankakee portage indicate that he did not so early learn of the Chicago trail to the Illinois. He returned to Montreal and reported his discoveries. In 1672-73 he seems to have been busy in the fur trade. The latter year he laid before the governor, Count Frontenac, the project for the exploration of the Mississippi. The governor could promise no money, but the project had collateral mercantile advantages in which he might participate with La Salle, so that he gave the sanction of his authority to the enterprise. Ostensibly, the project was to build forts westward of Canada to hold the country for Louis XIV., and to prevent the rich trade in furs from being diverted to the Dutch and English at Albany and New York. In effect it would give him a base of operations for the great discovery to which his imagination and energy impelled him. The forts were to be made centers for the fur trade beyond the competition of Montreal. The project met with strong opposition from the traders of Montreal and from the directors of the Jesuits, but Frontenac's imperious will had its way. By official strategy he managed to have a fort built for La Salle at a point designated by him near where Kingston, Canada, now stands, and invited the Iroquois to a grand council there. La Salle's scheme embraced forts at Niagara and on the upper lakes.

In Nov., 1674, Frontenac sent him to France favorably commended to the king. He was received with honor at the court. In consideration of his services as an explorer he was made an untitled noble, governor of the new fort Frontenac, and given a valu-

able seigniorial grant around it. The season of 1675 finds La Salle back at fort Frontenac and in a position of great power, where his trading plans could hardly fail to realize great profits and ample facilities for his explorations. Wealthy relations at Rouen, now very proud of him, furnished him with ample means to make the improvements and maintain the garrison required by the terms of his grant; which he fulfilled.

About this time a bitter feeling between La Salle and the Jesuits threatened to endanger the success of his enterprises. Evidently a man of settled religious belief in the Catholic faith, he was at the same time advanced in his views of what tends to a people's development, and of the controlling power of commerce. He saw little advantage to France or the Indians in missions merely to induce an outward worship of the cross by the savages. The Jesuits could retain their control over the Indians only by excluding traders from among them. They were therefore enemies of any trading around their distant missions which they could not control for the support of their order. The profits derived from the fur trade under their direction at the missions was an important part of their revenue. Thus a monopoly of trade as well as of religion grew up in their hands, and divided Canada into two parties. The imperious and clear-headed Frontenac and La Salle, with the power of the temporal government, and one branch of the church, were on one side, and the solid Jesuit power was on the other. With the latter were numerous traders who thrived by their favor at the missions. La Salle was considered the head of the former party, and no means were spared to break his influence and injure his good name. The Jesuits procured an order from the supreme council prohibiting traders from going into the country of the Indians to trade, thus giving their missions the monopoly. La Salle circumvented this by inducing a large settlement of Iroquois around his fort, who could range the country for him as hunters and trappers without being considered traders. Besides a new fort and barracks, he built a flouring mill, a bakery, and groups of houses for French settlers. His fort was surrounded by Indian villages. Absolute lord of the colony, he seemed to lay the foundation of his own fortune by multiplying the means and incentives to industry for others.

Early in 1678 he again visited France to secure confirmation and extension of the privileges of discovery before granted. Colbert, the prime minister of Louis XIV., authorized him to build forts in any region which he might discover, and to hold them on the same terms before obtained in the grant of fort Frontenac; authorized a monopoly of trade in buffalo skins, before hardly thought of; but forbade trade with Indians who brought furs to Montreal. In July, 1678, he set sail for Canada, amply supplied by the wealth of his relatives, and the favor of the government. In Nov. the several parts of the expedition assembled at fort Frontenac. Father Hennepin had a commission under him. On Nov. 8, 1678, disregarding the lateness of the season, he embarked to begin the great journey to the sea. Winter frowned upon the lake, but in eight days the vessel anchored in Toronto bay. On Dec. 5 they crossed to the mouth of the Niagara, and commenced a palisade fort. The vessel was wrecked soon after, and the stores saved from her were carried up the cliffs of Niagara, and thence by sledge to the shore of lake Erie. There, at the mouth of Cayuga creek, they laid the keel of the first vessel built above the falls—the *Griffin*, a bark of 45 tons. A hard winter, scant supply of provisions, the loss of the vessel and stores in lake Ontario, hostile Indians all around them, made the settlement a dreary one. La Salle made his way back to fort Frontenac, 250 m., on foot, through the snows of tangled forests, with two men, a dog and sledge. On his arrival he found his property seized by creditors. He sacrificed it and adhered to the enterprise; returned with equipment for the *Griffin*, which was completed in the spring and summer of 1679. On Aug. 7, La Salle and 34 *voyageurs* embarked. A favoring breeze carried them to the mouth of the Detroit in four days. Nearly wrecked by a storm on lake Huron, they reached Mackinac and anchored behind the point St. Ignace, where the Jesuits had a settlement already strong in numbers and trade. In Sept. the voyage was continued to Green bay. Here he found his advance party had collected a quantity of rich furs. He at once loaded them on the *Griffin* and sent them back to his creditors, but the vessel was never again heard from. La Salle now continued his voyage in canoes along the western shore of lake Michigan. Storms kept them company. Through weeks of constant danger in the surf that lashed the coast, they reached the bay of Milwaukee. South of that, fairer weather, game, and fruit welcomed them; and reaching the mouth of the St. Joseph river he erected fort Miamis. Dec. 3, 1679, with a party of 32 men and 8 canoes they ascended the St. Joseph to where South Bend now is, where shown trails leading to the Kankakee, and carrying their canoes over the portage, launched them in a stream little more than their own width, but growing hourly in volume as they floated down. Near the present village of Utica they found an Indian town of 460 lodges. Here, on New Year's day, 1680, they landed and said mass. A few days later they were at the present site of the city of Peoria, below which they came upon an Indian town occupying both banks of the river. La Salle succeeded in making peace with the natives, though even in that far interior prairie the dark hand of the Jesuit power had found means to stir the Indians to enmity against him. Attempts had previously been made to poison him. It seemed as though every obstruction that Nature and human malignity could join was henceforward to lie in his path. The ice had closed the river. Surrounded by Indians, deserted by six of

his men, undermined by the secret influence of his enemies among the Indians, apprised of the loss of the *Griffin* which he had relied on to bring back the means to build a boat on the Illinois in which to sail down the Mississippi to the gulf and thence to the West Indies, this lion heart still kept faith with his great aim. He built a fort near the Indian town called *Crèvecoeur*. That done, he began a vessel of 40 tons on the bank of the Illinois; and then, with four Frenchmen, a Mohican guide, and a canoe, started back to Montreal via his fort at the mouth of the St. Joseph, where they arrived Mar. 24; thence, on foot to the Detroit river, which they crossed by raft, and on to the fort of the Niagara river. There he learned that a vessel from France, with cargo consigned to him, had been wrecked in the gulf of St. Lawrence. At the fort he took three fresh men, and pushing through the woods of the northern shore of lake Ontario, on May 6 he sighted the walls of Fort Frontenac. Here he found that some of his agents had robbed him; his creditors had crippled those who were faithful, and his *voyageurs'* canoes, richly laden with furs, had been wrecked in the rapids of the St. Lawrence. But with a proud front he shamed his enemies by his advent when they hoped to hear of his death. In a short time he secured another outfit, and was on the point of returning to the Illinois when he learned that his Fort Crèvecoeur had been deserted and plundered by his men, who, organized as banditti of the woods and lakes, had also visited and destroyed the fort on the St. Joseph, plundered Michilimackinac of his furs, came on to fort Niagara, and plundered that, and there divided, one part going to Albany and the other being then on their way to fort Frontenac to surprise and kill La Salle. Warned at the critical moment, with a small party he surprised them in detail as they came in canoes, and captured or killed nearly the whole party. Having lodged these men in prison, on Aug. 10 La Salle, at the head of 25 men for the Illinois, prepared to finish his vessel for the descent of the Mississippi. He traveled by the eastern shore of Georgia bay to Mackinac. It was Nov. 4 when he reached the ruined fort at the mouth of the St. Joseph. Leaving his stores there, he went on to Fort Crèvecoeur. There not only was the fort destroyed, but where he had left a populous Indian village the blackened remains of lodges and human bodies half-burned told of the bloody visit of the Iroquois. He followed the river to the Mississippi, seeing along that whole valley the horrible evidences of the retreat of the whole tribe of the Illinois under the murderous attacks of their powerful enemy. Leaving a mark on the shore of the Mississippi to show that he had been there, his party returned to the mouth to recommence preparations for the great voyage. It was Jan. 6, 1681, when he reached the Kankakee, and soon after the St. Joseph. The horrors of the Iroquois invasion of the Illinois country had made a great impression upon him. He conceived the idea, and at once put it in execution, to unite the western tribes in self-defense by rallying them around the French flag at his forts. His tact, noble presence, and oratory had always given him a wonderful influence among the Indians, swaying them to his will. Soon the discords of warring tribes were made to yield to his plan. Late in May he went to Michilimackinac; thence 1000 m. by canoes to Fort Frontenac. This time the great governor had kept La Salle's enemies at bay. Before winter he was again at the head of a strong party pushing in canoes all around the lakes to the St. Joseph, where he arrived early in December.

On Dec. 21, 1681, the party of 54 men in all crossed the lake in canoes to the mouth of the Chicago to find that portage to the Illinois. The streams were frozen. The canoes were put on sledges and dragged over prairie and woodlands of the river margin till they came to open water below lake Peoria. Thence they floated down the Illinois, and on Feb. 6, 1682, emerged on the Mississippi. Floating ice delayed them, but a week later, safely on its rapid current, they were borne toward the gulf. On the 24th they encamped near the third Chickasaw Bluffs, where they built fort Prudhomme. Then in the realms of spring they floated down the tortuous river, finding not only more genial skies but a kindlier and more intelligent race of Indians. La Salle, as usual, won their good-will and planted monuments in their villages to claim the new dominions for the king of France. On Mar. 31 they were at the mouth of the Red river; on April 6, at the divergence of the three mouths of the Mississippi; and April 9, 1682, he erected at the mouth of the river a monument and a cross bearing the arms of France, upon which, with all the ceremonies that could add to the impressiveness of the event, La Salle proclaimed the river and all the lands drained by it to be by right of discovery the dominions of Louis XIV., king of France.

In Sept. of that year the indefatigable explorer was back at Michilimackinac, then at the St. Joseph, and before winter set in was building a fort for the protection of the Illinois at Starved Rock, a natural castle rock that rises abruptly from the Illinois river not far from Peoria. The following year 20,000 Indians are said to have settled near it for protection. In the spring of 1683 it seemed that La Salle had conquered success. He had discovered the valley of the Mississippi. It is true De Soto had crossed it nearly a hundred years before near its mouth, and Joliet and Marquette had explored it at the north, but to La Salle belongs the glory of tracing the great river for the first time from source to sea, and determining the connection between the two discoveries. But his troubles thickened with his success. Frontenac, his determined and powerful friend, was no longer governor of Canada. An enemy was in his place, La Barre, who not only set the king against La Salle but authorized the Indians to consider him and his property

as legitimate spoil, seized his forts, and ordered him to Quebec. The king wrote this curious letter to La Barre: "I am convinced, like you, that the discovery of the Sieur de la Salle is very useless, and that such enterprises ought to be prevented in future, as they tend only to debauch the inhabitants by the hope of gain, and to diminish the revenue from beaver skins"! La Salle went back to Quebec, where it does not appear that the governor dared proceed further against him. He sailed for France to see the king—less king than he. At the luxurious court of Louis XIV. this intrepid traveler on lonely coasts and northern snows, this denizen of savage huts, fresh from beds on the frozen ground of Michigan and in the malarious delta of Louisiana, had no difficulty in making powerful friends. Count Frontenac was one. The government reversed its policy, ordered the restoration of all his forts and privileges, and ordered four vessels and money to be placed at his disposal to make the voyage direct from France to the mouth of the Mississippi. The fleet, which sailed July 24, 1684, unluckily was placed under the command of one Beaujeu, a man filled with villainous pride of rank and envy of other authority. La Salle had supreme command of the expedition, but this captain, as the naval officer of the fleet, lost no opportunity to thwart and balk his plans. The voyage was a series of misfortunes from this cause, and when at last in the gulf of Mexico the mouths of the Mississippi were passed unobserved, and La Salle searched vainly for them along the reefs and sandbars of the Texas coast, anchoring at last in Matagorda bay in the belief that there was the western mouth of the Mississippi known as bayou La Fourche, Beaujeu sailed back with all but one of the fleet, leaving the colony to its fate. On Feb. 16, 1685, the ship laden with stores for the colony foundered on the reefs at the entrance to the bay. "A lonely sea," says Parkman, "a wild and desolate shore, a weary waste of marsh and prairie; a rude redoubt of driftwood and the fragments of a wreck, a few tents and a few wooden houses; bales, boxes, casks, spars, dismounted cannon. Indian canoes, groups of dejected men and desponding home-sick women—this was the forlorn reality to which the air-blown fabric of an audacious enterprise had sunk. . . . The tall form and fixed, calm features of La Salle" were all that remained to stamp with dignity this essay to found an empire for France in the valley of the Mississippi. From this time forth successive misfortunes made La Salle's life but as a dirge anticipating death. He established his colony on the river Lavaca, and found by exploration of Matagorda bay that the great river at its e. end is not a part of the Mississippi, but the Colorado of Texas. Summer and autumn passed in herculean labors without results except a fort and houses for those whom death had not kindly taken. He had resolved to traverse the continent to Canada on foot and again discover the Mississippi on his way, and get succor for his colony from Canada. On Nov. 1, 1685, he parted from the colony at the head of a party to search for the fatal river. At the end of Mar., 1686, with half the party lost or dead, he returned baffled. In the entanglements of strange rivers and swamps, among Indians from whom he could learn little and who had to be placated as he went, the months passed fruitlessly. Fever seized him on his return, from which unhappily he recovered. Again he set out to make the overland journey to Canada. Again in the cane-brakes of Louisiana he was forced to return with the loss of eight men. Now out of 200 who had landed on that desolate shore but 45 remained. After a sickness without sign of despair, having made every provision possible for the safety of the colony, on Jan. 7, 1687, this hero of misfortune again led a little forlorn hope to reach Canada. But desperate men in his little party organized a mutiny, murdered three of their companions while sleeping, and shot La Salle from an ambush as he went to face them down.

Thus ended a life under 44 years in length, which had covered half a continent with its explorations, with a record not surpassed in all history for indomitable will and great achievements. Yet ever as he reached out for their fruits he grasped but the ashes of his hopes. Noble in aims, in character, in person, he was only too much elevated in natural capacity above those around him, too haughty and imperious, to attract the kindly good-will of average men; and his misfortunes were jointly the result of these qualities and of the network of warring interests with which the Jesuits of his time constantly beset his path. Sparks's *Life of La Salle* and Parkman's *History of the Discovery of the Great West* give vivid details of his life.

LAS ANIMAS, a co. in s.e. Colorado, has for its southern boundary New Mexico, and the county of Baca on the east. The Sangre de Christo range of the Rocky mountains rises in the extreme west, and the surface is broken by low hills and by the Mesa de Mayo, the table-lands, in the south; about 4700 sq.m.; pop. '90, 17,208, chiefly of American birth. It is intersected by the Union Pacific, Denver, and Gulf, the Atchison, Topeka and Santa Fé and other railroads. It is drained by branches of the Cimarron river, rising in the Raton mountains in the extreme s.e.; the Las Animas or Purgatory, rising near Purgatory peak of the Rocky mountains, having deposits of coal; and the Apishapa, rising near the Spanish peaks in the n.w.; and by other affluents of the Arkansas river. In the eastern portion are good tillable lands. The coal in this co. is noted for its coking qualities. The leading products are corn, wool, wheat, and oats; of minerals, lignite, coal, marble, and iron ore are found. The land slopes eastward from the Rocky mountains and furnishes fine pastureage on the elevated portion. Fisher's Peak of the Raton mountains rises 9460 ft., in the w. Trinchera peak in altitude 13,546 ft., and Culebra peak 14,079 ft. above the level of the sea. Co. seat, Trinidad.

LAS CAR, in the East Indies, signifies properly a camp-follower, but is generally

applied to native sailors on board of British ships. The Lascars make good seamen, but being of an excessively irritable and revengeful nature are generally kept in the minority in a ship's crew.

LASCARIS, CONSTANTINE, a celebrated Greek refugee, after the capture of Constantinople by the Turks, and one of the first founders of Greek studies in the west. He was received with distinction by Francesco Sforza, duke of Milan, in 1454, who intrusted to him the education of his daughter Hippolyta; but a more important scene of his labors was Rome, where he settled in the train of the learned Greek cardinal, Bessarion, and, finally, Naples and Messina, where he taught rhetoric and Greek letters until his death in 1493. His Greek grammar, entitled *Erotemata*, and dated 1476, is the earliest printed Greek book. To him his contemporaries were also indebted for several other elementary Greek books of less note. His grammar is known chiefly through a Latin translation printed at the Aldine press, and frequently reprinted. His library, which is very valuable, is now in the Escorial.—**JOHN JANUS LASCARIS**, a member of the same family, surnamed **RHYNDACENUS**, has also acquired a place in the history of the revival of letters. He was one of those whom Lorenzo de' Medici employed in the collection of ancient, and especially Greek classical authors, of whom Lascaris brought home a valuable collection from Mt. Athos. On the death of Lorenzo, Lascaris went to Paris, where he taught Greek under Charles VIII. and Louis XII.; but he eventually settled in Rome, where he was appointed by Leo X. to the superintendence of the Greek press which that pontiff established. Lascaris edited several of the *editiones principes* at the Roman press. He was employed as ambassador at the court of Francis I., and afterwards at Venice, and died in Rome, at a very great age, in 1535. See Villemain's *Lascaris, ou les Grecs du 15^{me} Siècle* (Paris, 1825).

LAS CASAS, BARTOLOMÉ DE, Bishop of Chiapa, in Mexico, surnamed the *Apostle of the Indians*, a celebrated evangelist and philanthropist, was of French descent, and was b. in Seville in 1474. He studied at Salamanca. In 1502 he accompanied Don Nicolas Ovando, who was sent out as governor, to St. Domingo. Eight years after his arrival there, he was ordained to the priesthood, and was subsequently appointed to a charge in Cuba. Here he began to signalize himself by his exertions in favor of the oppressed Indians. To oppose the law which divided them amongst the conquerors, he went to Spain, where he prevailed on Cardinal Ximenes to send a commission of inquiry to the West Indies; but the proceedings of the commission by no means satisfying his zeal, he revisited Spain, to procure the adoption of stronger measures for the protection of the natives. Finally, to prevent the entire extirpation of the native race by the toils to which they were subjected, he proposed that the colonists should be compelled to employ negro slaves in the more severe labors of the mines and sugar plantations; and the proposal was adopted. Las Casas has, on this account, been represented as the author of the slave-trade, although it has been proved to have existed long before this proposal was made. Las Casas afterwards attempted to carry out Castilian peasants as colonists to the West Indies, with the view of giving more complete effect to his schemes on behalf of the Indians; but failing in this, he retired to a Dominican convent in Hispaniola. He again visited Spain in 1539 out of benevolent regard to the native inhabitants of the West Indies, and published his *Brevísima Relacion de la Destruccion de las Indias*, which was soon translated into the other languages of Europe. The rich bishopric of Cuzco was offered to him, but he preferred the poor one of Chiapa, in a wild and almost unexplored region. The colonists received him with no friendly feelings, and as he went the length of refusing the sacraments to those who disregarded the new laws in favor of the Indians, he drew upon himself not only the resentment of the planters, but the disapprobation of the church, so that he was compelled to return to Spain, where he ended his life in a convent in Madrid, July, 1566, at the age of 92. In the course of his ardent career, he crossed the Atlantic sixteen times. A collection of his works appeared in his lifetime (Seville, 1552), but his most important work appeared after his death, the *Historia General de las Indias*. See *Life*, by Helps (1868).

LAS CASES, EMMANUEL AUGUSTE DIEUDONNÉ, Count, the companion and historiographer of Napoleon in St. Helena, said to be of the same family as the preceding, was b. in 1776, in the château of Las Cases, near Revel, was a lieutenant in the navy before the revolution, and then fled from France, served in the prince of Condé's army, spent some time in England, where he supported himself by private teaching, and took part in the expedition to Quiberon. After Napoleon's accession, he returned to France, and labored in the preparation of his admirable *Atlas Historique*, which was published under the name of Le Sage (Par. 1803-4; last ed. Par. 1824-28). This work attracted the attention of Napoleon, who made him a baron, and employed him in offices connected with the home administration. After the battle of Waterloo, he offered to share the exile of Napoleon; and in St. Helena, the ex-emperor dictated to him a part of his memoirs. A letter which Las Cases contrived to send to Lucien Bonaparte, led to his separation from Napoleon; and after eight months' confinement at the cape of Good Hope, he was brought to Europe, and resided mostly in Belgium till Napoleon died, when he returned to France, and published the *Mémorial de Ste. Hélène* (8 vols. Par. 1823; amended edition, 1824, often reprinted), a work which must be always a chief source of information respecting Napoleon, but in which the author has taken too much liberty with his materials. After the revolution of 1830, he was for some time a member of the chamber of deputies, where his place was on the extreme left. He died May 15, 1842.

LASKER, EDUARD, b. 1829, in the province of Posen in Prussia; student of jurisprudence in Prussia and England, and a lawyer in Berlin. In 1865 he became a member of the German house of deputies from Berlin, and afterwards from Magdeburg and Saxe-Meiningen. Allied by conviction with the liberal party, he still became, by his desire to promote the unity of Germany, the support of the imperial policy of Bismarck to that end. He was one of the great leaders of the national liberal party in the German parliament, where his treatment of economic questions has marked him as one of the most able and independent of German statesmen. He died in New York, 1884. A resolution of sympathy with the German people was adopted in the U. S. house of representatives immediately after his death, and the refusal of Prince Bismarck to transmit it to the president of the reichstag led to heated debate in congress, further resolutions, and some diplomatic correspondence.

LASKER, EMANUEL, noted chess-player, b. Dec. 24, 1868, Germany; at first chose mathematics as his profession, but became so proficient in chess that since 1892 he gained an unbroken series of victories against much older antagonists. He won the first prize in the London tournament in 1892, and in the New York international tournament in 1893.

LAS PILAS, one of a chain of volcanic mountains, is situated on the w. coast of Nicaragua bordering on the Pacific ocean; n.w. of Leon lake and on the plain of Leon. It belongs to the Marrabios chain. It rises to a height of 3,985 feet. In 1850, by an eruption of subterranean fires, a gradual accumulation of lava was begun that in a few weeks increased to a height of hundreds of feet; but the volcanic action suddenly ceased and appears to be extinct. It stands at the base of the larger volcano, making one of a number of smaller surrounding craters.

LASSA, the capital of Thibet, situated on the Dzangtsu, in lat. 29° 39' n., and long. 91° 5' e.; the largest town in Central Asia, about 9,500 ft. above the level of the sea. It is famous for the convents in and near it, composing the ecclesiastical establishments of the dalai-lama, whose personal residence is in a convent on the adjacent mount. Lassa is to Buddhism what Rome is to Catholicism; it is the headquarters of the hierarchy of lamas, who, by means of the dalai-lama, exercise priestly control over nearly all Mongolia, as well as Thibet. The city lies in a fertile plain, extending about 12 m. from n. to s., and about 125 m. in length. Mountains and hills encircle it. A Chinese garrison is quartered near the Mt. Botala, whose temples are resplendent with gold and precious stones. Since the expulsion of the Nepaulese in 1792, no foreigners are allowed entrance from the south. Pop. conjectured at 25,000.

LASSALLE, FERDINAND (1825-64), a German social agitator, founder of the social democracy in Germany, was the son of a rich Hebrew silk merchant and destined for a commercial career. He studied philosophy, however, in Berlin, and traveled, meeting in 1844 the countess Sophie Hatzfeldt, whose champion he became in her suit against her husband. His political life dates from 1848, when he was imprisoned six months for a political speech. About 1858 he published *Die Philosophie Herakleitos' des Dunkeln von Ephesos*, and *Das System der erworbenen Rechte*, etc., which attracted much attention and also a tragedy *Franz von Sickingen*. In Leipsic in 1863 he organized and became president of the *Allgemeine Deutsche Arbeiterverein*, which had not, however, a very large membership. His plan was to get a universal franchise and a grant of money from the state to capitalize a productive association of working men. He was killed in a duel at Geneva. His collected writings and speeches were edited by E. Bernstein and published (1891-94).

LASSEN, a co. in n.e. California, has Nevada for its e. boundary, and on the s. and s.e. is bounded by a range of the Sierra Nevada mountains; 4890 sq. m.; pop. '90, 4239, chiefly of American birth, 400 colored. The Pitt river flows w. through the n.w. portion, emptying into the Sacramento in Shasta co., which forms its western border. The Susan river and Willow creek empty into Honey lake in the s.e., a considerable body of water, shallow, but with no known outlet, at an altitude of 4200 ft. above the level of the sea. Co. seat, Susanville.

LASSEN, CHRISTIAN, a most eminent orientalist, was b. on Oct. 22, 1800, at Bergen, in Norway; studied at Christiania, and afterwards (1822) at Heidelberg and Bonn, and assisted Schlegel in the publication of the *Rāmāyana* and *Hitopadesa*. He also associated himself with Eugène Burnouf in the production of the *Essai sur le Pali* (Par. 1826). In 1830 he became extraordinary, and in 1840 ordinary, professor of ancient Indian languages and literature at Bonn. He edited many Sanskrit works, deeply investigated the relations of the oriental languages and antiquities, and published several very important works, the chief of which are *Die altpersischen Keilinschriften* (Bonn, 1836); *Vollständige Zusammenstellung aller bis 1845 bekannt gemachten altpers. Keilinschr. mit Erklärung*, embodying Westergaard's investigations (Bonn, 1845); *Beiträge zur Geschichte der griech. und indo-scythischen Könige in Bactrien, Kabul und Indien* (Bonn, 1838); *Institutiones Linguae Praeriticae* (Bonn, 1837); *Gitagovinda Yayadewa* (Bonn, 1837); *Anthologia Sanscritica* (Bonn, 1838); *Indische Alterthumskunde*, a critical history of Indian civilization (Bonn, 1847-61; new ed., 1861-74), etc. He has contributed much to our knowledge of the cuneiform inscriptions, and of the ancient and modern Iranic dialects, on which and kindred subjects numerous articles from his pen are to be found in the *Zeitschrift für die Kunde des Morgenlandes*, Ersch and Gruber's *Encyclopædia*, etc. Lassen died at Bonn, May 9, 1876.

LASSEN, EDUARD, musician, b. in Copenhagen, April 13, 1830. He was educated at the Brussels Conservatoire, where he won the first prize for pianoforte in 1844, for harmony in 1847, and the grand prize in 1851, which enabled him to travel in Germany and Italy. In 1858 he was made court musician in Weimar, and in 1861 succeeded Liszt as hof-kapellmeister. Lassen is an eminent conductor, but his fame rests principally upon his songs, which are of high merit and deservedly popular. He has also written operas, overtures, and symphonies. His last work is a violin concerto. The university of Jena has given him the degree of PH.D.

LASSEN'S PEAK, a spur of the Sierra Nevada mountains, rising 10,437 ft. above the level of the sea, where three counties of California—Shasta, Tehama, and Plumas—meet. It is an extinct volcano, and its soil consists partly of lava essentially composed of felspar. Its top is covered with snow; pine and fir trees grow to a mammoth size on the slopes beneath, and groves of nut pine, oak, and manzanita flourish on the foot-hills. It is one of the highest peaks of the Sierra Nevada range.

LASSO, a long stout cord or thong of skin, with a leaden ball at each end, employed by the South Americans in capturing wild horses, oxen, etc. It is thrown in such a manner, that when it strikes the neck or leg of the animal to be captured, the impetus of the ball causes the cord to coil round the limb. The hunter's horse is furnished with a saddle having a high pommel, so that the hunter may coil his end of the lasso round it, or even fix it, if he chooses, though this latter practice often leads to dangerous consequences. The lasso was frequently used against European soldiers during the contest of the South American republics for independence; and, though with very little success, by the barbarians in the Russian army against the French sentinels during the Crimean war. Similar in its name and application is another implement consisting of a stout thong of hide with a slip-noose, used in many countries, but chiefly among the South American and Mexican hunters. It requires much greater address to use it successfully. In Mexico the lasso is called a *lariat*.

L'ASSOMPTION, a co. in w. Quebec, Canada, n. of the island of Montreal, and bounded on the s. and s.e. by the St. Lawrence river. The eastern portion is formed into a little peninsula by the L'Assomption river, which flows through it to the St. Lawrence; 248 sq.m.; pop. '91, 13,674, mostly of French descent. Directly s. of it the Jesus and Prairie rivers, branches of the Ottawa, encircling the Isle of Jesus, meet the St. Lawrence at the mouth of the L'Assomption river. The surface is mountainous, and is drained by the Mascouche and Achigan rivers. The leading industry is the procuring of timber, supplied from extensive forests of white and red pine; other kinds of timber are black walnut, maple, cherry, and basswood. The winters begin on the last of November and last till the end of March, and the atmosphere is clear and bracing. It has some trade in grain and potash, and the water-power is utilized by flour, grist, carding, and saw mills. Seat of justice, L'Assomption.

LA STAGE, in maritime language, denotes the ballast or lading of a vessel.

LAST TESTAMENT, or **WILL**, is the last instrument in point of date, and it revokes prior wills so far as inconsistent. See **WILL**.

LASUS, or **LASSUS**, about 510 B.C.; b. at Hermione in Argolis; a Greek dithyrambic poet, reputed to have counted Pindar among his pupils. He lived in Athens in the reign of Hipparchus, and, that of Darius, satrap of Persia. Only one of his poems is said to be extant, in Bergk's Greek lyric poets.

LATAH, a co. in Idaho, formed since 1880; 1080 sq.m.; pop. '90, 9173.

LATAKIA (Turkish, *Ladakiyyeh*; anc. *Laodicea*), a seaport of Syria, in the pashalic of Tripoli, and situated 75 m. n. of the town of that name, and 60 m. s.w. of Antioch, is surrounded by plantations of myrtle, pomegranate, mulberry, and olive trees. It consists of the decaying upper town and the lower town, which are separated by magnificent gardens. On the hills in the vicinity, a mild and finely-flavored tobacco is grown, and is extensively exported. Pop. 12,000, about 2,000 Christians. Latakia occupies the site of the ancient *Laodicea ad Mare*, and is the chief town of the country, and the outlet for the produce of the plains of Antioch. The ruins of the aqueduct built here by Herod the great are still extant.

LATANE, JAMES ALLEN, D.D., b. Essex co., Va., 1831; educated at the univ. of Virginia, ordained presbyter in the Prot. Epis. church, 1856; entered the Reformed Epis. church, 1874; and was consecrated bp., 1879.

LATEEN-SAIL, a large triangular sail, common in the Mediterranean. The upper edge is fastened to the lateen-yard, a spar of considerable length, which is held at about an angle of 45° with the deck, by means of a mast crossing it at a third or a fourth of the way up.

LATENT FAULT. In the contract of sale, it is a rule that the buyer takes the risk of all latent faults or defects in the thing sold which were unknown to the seller at the time of the sale, all that the seller answers for being, that the thing is, so far as he knows, what it appears to be. This, which was the English rule, was extended to Scotland by the statute 19 and 20 Vict. c. 60, s. 5.

LATENT HEAT. See **HEAT**.

LATERAN, CHURCH OF ST. JOHN, the first in dignity of the Roman churches, and styled in Roman usage "the mother and head of all the churches of the city and the world," is so called from its occupying the site of the splendid palace of Plantius Lateranus, which, having been escheated (66 A.D.), in consequence of Lateranus being implicated in the conspiracy of the Pisos, became imperial property, and was assigned for Christian uses by the emperor Constantine. It was originally dedicated to the Savior; but Lucius II., who rebuilt it in the middle of the 12th c., dedicated it to St. John the Baptist. The solemn entrance of the pope into office is inaugurated by his taking possession of this church; and over its portico is the balcony from which the pope, while still sovereign of Rome, was used, on certain festivals, to bless the entire world. The original church is said to have been the Basilica which was presented to Sylvester by Constantine, but it has been several times rebuilt, its final completion dating from the pontificate of Clement XII. It has been the scene of five councils, regarded as ecumenical by the Roman church. See COUNCIL. The Lateran palace was the habitual residence of the popes until after the return from Avignon, when they removed to the Vatican. It was afterwards occupied by officials of the chapter, and is now under the control of the Italian government. The late pope, Pius IX., had converted a portion of it into a museum of Christian archæology. In the piazza of St. John Lateran stands the celebrated relic called the "scala santa," or "holy staircase," which is reputed to be the stairs of Pilate's house at Jerusalem, made holy by the feet of our Lord as he passed to judgment.

LATERAN COUNCILS, the general name given to numerous councils held in the Lateran church at Rome, among the more important of which may be mentioned: I. That of 649 A.D., consisting of over 100 bishops of Italy, Sicily, Sardinia, and Africa, was called by Martin I. to consider the doctrine of the Monothelites. Five sessions were held, the writings of the leading advocates of the theory were examined and condemned, and the judgment of the council, expressed in 20 canons, anathematized all who did not confess that in the one person of the Lord Jesus there are two wills and two methods of working. II. Councils held in 1105, 1112, 1116, and 1123, with reference to the contests between the pope and the emperor concerning the right of investing bishops. The last of these, containing 300 bishops and 600 abbots, all belonging to the Latin church, and presided over by the pope, Calixtus II., adopted the principles of the concordat passed at the imperial diet the preceding year. This declares that "the emperor surrenders to God, Peter and Paul, and to the Catholic church all right of investiture by king and staff. He grants that elections and ordinations shall take place freely in accordance with ecclesiastical laws. The pope agrees that the election of German prelates shall take place in the presence of the emperor, provided it is without violence or simony. In case any election is disputed, the emperor shall render assistance to the legal party, with the advice of the archbishop and bishops. The person elected is invested with the imperial fief by the royal scepter pledged for the execution of everything required by law. Whoever is consecrated shall also receive in like manner his investiture from other parts of the empire within six months." By this arrangement the pope, apparently, made large concessions, but in fact through his influence he was able to control the elections. This council renewed the grant of indulgences, first made by Urban II. in 1095, in furtherance of the first crusade. It also passed additional decrees for enforcing the celibacy of the clergy. III. The council of 1139, under Innocent II., consisting of about 1000 bishops, at which the antipope, Anacletus II., was condemned, and all who had received office under him were deposed. Roger of Sicily and Arnold of Brescia were also condemned. Thirty canons of discipline were published, among which were several against simony, marriage, and immorality among the clergy. IV. The council of 1179, under Alexander III., containing 280 bishops, the most of whom were Latins, was called to correct the abuses which had arisen during the schism brought to a close by the peace of Venice two years before. The most important of the canons published by it decreed that "hereafter the election of the popes shall be confined to the college of cardinals, and two-thirds of the votes shall be required to make a lawful election, instead of a majority only as heretofore." This council also condemned "the errors and impieties" of the Waldenses and Albigenses. V. The council of 1215, usually called the 4th Lateran, was the most important of them all, as it marked the summit of the papal power. It consisted of 71 archbishops, 412 bishops, 800 abbots, the patriarchs of Constantinople and Jerusalem, and legates of other patriarchs and of crowned heads. It made the doctrine of transubstantiation an article of faith; required that all persons, of both sexes, who had reached the years of discretion, should confess to their proper priest at least once a year; appointed the time and place of assembly for another crusade; and laid a foundation for the persecution of the Albigenses and others by anathematizing all heretics who held anything in opposition to the faith; enjoining that, after condemnation, they should be delivered over to the secular arm; excommunicating all who received, protected, or maintained heretics; and threatening with deposition all bishops who did not use their utmost endeavors to clear their dioceses of them. VI. The council of 1512-17, under Julius II. and Leo X., was important chiefly because it abolished the Pragmatic sanction of Bourges, 1438, wherein France had accepted the decisions of the council of Basle, so far as they were consistent with the

liberty of the Gallican church—and substituted for it the concordat agreed on between Leo X. and Francis I., in which the liberties of the church were greatly restricted. The first article of the concordat declared that the chapters of the French cathedrals should no longer, in case of vacancy, proceed to elect the bishop; but that the king should select a proper person whom the pope should nominate to the vacant see.

LATERITE, a mineral substance, the product of the disintegration and partial decomposition of gneiss. It forms a bright red earth; which, where it abounds, as in some parts of Ceylon, being blown about as a fine dust, imparts its hue to every neglected article, and to the dresses of the inhabitants. The redness of the streets and roads attracts the notice of every stranger at Galle and Colombo. Laterite, however, is not always red. Its redness is supposed to be owing to the presence of iron in considerable quantity. When feldspar preponderates in the gneiss, it is whitish; when hornblende preponderates, it is yellow.

LATEX, in botany, the sap of plants after it has been elaborated in the leaves. It returns from the leaves to the bark by vessels called *laticiferous vessels*, which branch, unite, and anastomose very variously. They are not always of uniform thickness, but present many distentions, often almost as if articulated. Peculiar currents are observed in the *latex*, which were first pointed out by Schultz, who has bestowed great attention on this subject, and on the branches of physiology connected with it. The latex differs very much in different plants, in color and other qualities, but in all it is full of granules.

LATH, or **LATHE**, a division of a county, still used in England to designate a number of hundreds amounting to less than a shire. Formerly there was a lathe-reeve, or bailiff, in each lathe. The same number of hundreds which constitute the *lathe of Kent* are called the *rapes of Sussex*. In Ireland the lathe is intermediate between the tything and the hundred.

LATHAM, JOHN, 1740-1837; b. Eltham, Kent, England; pursued his medical studies under Dr. William Hunter, and in the London hospitals; commenced the practice of medicine in 1763, in Dartford; early applied himself to the study of natural history, and assisted sir Ashton Lever in arranging his great museum; in 1775 became a fellow of the royal society, and one of the founders of the Linnæan society; in 1778 made a corresponding member of the London medical society. He received the honorary degree of M.D. from the university of Erlangen, and was elected corresponding member of the natural history society of Berlin and of the royal society of Stockholm. In 1781-85 he published *General Synopsis of Birds*, in 6 vols. 4to. Differing from Linnæus, he divided birds into but two orders, those of land and water. In 1790 he published the valuable book of reference, *Index Ornithologicus*. Retiring from medical practice in 1796, he devoted himself to the study of ornithology. An edition of his works in 10 vols. 4to, under the title of *General History of Birds*, was begun in 1821, and finished in 1828.

LATHAM, ROBERT GORDON, an eminent English philologist and ethnologist, was b. in 1812 at Billingborough, Lincolnshire. He was educated at Cambridge, and took the degree of M.D., but having made a tour in Denmark and Norway, he was led to direct his attention particularly to the Scandinavian languages. For several years he was professor of the English language and literature in University college, London. As a physician, he held important appointments. His well-known work, *English Language*, was published in 1841, and has gone through numerous editions. The *Natural History of the Varieties of Mankind* (Lond. 1850) is a valuable contribution to ethnology. Among his other works may be mentioned his edition of Tacitus's *Germania*, with philological and historical notes (1850); *Ethnology of the British Colonies; Man and his Migrations* (Lond. 1851); *Descriptive Ethnology* (1859); *The Nationalities of Europe* (1863); a new edition of Johnson's *Dictionary* (1870); *Outlines of General or Developmental Philology* (1878); *Russian and Turk from a Geographical, Ethnological, and Historical Point of View*. He d. in 1888.

LATHROP, GEORGE PARSONS, b. Sandwich Islands, 1851. Early in life he came to the U. S., where he has since resided, devoting himself to a literary career. He married Rose, Nathaniel Hawthorne's second daughter, who has made a name for herself as a magazine contributor and poetess. Among his best known works are: *An Echo of Passion; In the Distance; Newport; A Study of Hawthorne; Spanish Vistas; Representative Poems; Two Sides of a Story; Dreams and Day*, etc. With his wife he edited *A Story of Courage* (1894). His wife started a private movement in New York to relieve sufferers from cancer in 1896, and published *Memoirs of Hawthorne* (1897).

LATHROP, JOHN, D.D., 1740-1816; b. Norwich, Conn; graduated at Princeton, 1763; taught the Indian school which became Dartmouth college; was a Congregational minister of the Old North church, and of the Second church, Boston, 1768-1816.

LATHROP, JOHN HIRAM, LL.D., 1799-1866; b. Sherburne, N.Y.; graduated at Yale in 1819, and was tutor there 1822-26, after which he entered the legal profession, but soon left it to engage in teaching, first at Norwich, Vt., then at Gardiner, Me. He was professor of mathematics and natural philosophy in Hamilton college, 1829-35, and of law, history, etc., 1835-40, when he became president of the university of Mis-

souri, serving until 1849, after which he became successively chancellor of the university of Wisconsin, president of Indiana university, professor of English literature in the university of Columbia, Mo., and finally its president from 1865 until his death.

LATHROP, JOSEPH, D.D., 1731-1820; b. Norwich, Conn.; graduated at Yale college in 1754; ordained pastor of the Congregational church of West Springfield in 1756, retaining the position 64 years. He received the degree of D.D. from Yale college in 1791, and from Harvard university in 1811. In 1792 he was elected fellow of the American academy of arts and sciences. His works, mostly sermons, were published in 7 vols., the last containing an autobiography.

LATHS AND LATHWOOD. Laths are small strips of wood of various lengths, rarely more than 4 ft.; they are made either by splitting lathwood, which is the Norway spruce fir (*pinus abies*), or else they are sawn from Canada deal. The sawn laths are a modern introduction, due to the development of steam saw-mills in Canada, which thus use up the small portions of the lumber. Laths are used for nailing to the uprights of partition-walls, and to the rafters of ceilings in our buildings; they are placed slightly apart to receive the plaster, which, by being pressed into the intervals between the laths, is retained, and when dry, is held securely on the wall. Slaters' laths are longer strips of wood, nailed on to the framework of the roof, for the purpose of sustaining the slates, which are fastened to the laths by nails.

LATHYRUS, a genus of plants of the natural order *leguminosae*, sub-order *papilionaceae*. The leaves are furnished with tendrils, and are pinnate, but often only with one pair of leaflets. The species are numerous, annual and perennial herbaceous plants, natives of temperate countries in the northern hemisphere. Few of them are American. A number are natives of Britain. Some have very beautiful flowers of considerable size, on account of which they find a place in flower-gardens, as *lathyrus latifolius* and *lathyrus sylvestris*, the latter a native of England, and the former of the s. of Europe, both perennials, and known by the name of EVERLASTING PEA. The SWEET PEA (*lathyrus odoratus*), a native of the east, is one of the best known ornaments of our flower-gardens, a hardy annual, esteemed not only on account of the beauty of its flowers, but of their delightful fragrance. Many varieties are in cultivation, differing in color, etc. The most common British species is the MEADOW VETCHLING (*lathyrus pratensis*), with bright yellow flowers. *Lathyrus sativus*, the CHICKLING VETCH or LENTIL OF SPAIN, a native of the s. of Europe, with flowers generally of a bright blue color and winged pods, is cultivated in India and in Germany, France, and other countries for its seeds, the flour of which, however, is mixed with other flour rather than used alone, on account of narcotic qualities which it possesses, and which caused its cultivation for food to be interdicted in Würtemberg in 1671. An incurable paralysis of the limbs has sometimes been produced by it, both in human beings and lower animals. The seeds of *lathyrus cicera*, although sometimes used by the country people of France, are even more dangerous. Those of *lathyrus aphaca*, a species sometimes found on gravelly soils in England, possess similar qualities when ripe, but in an unripe state are eaten with the pods which contain them, and are quite wholesome. *Lathyrus tuberosus*, a native of Germany and other parts of Europe, but not of Britain, is cultivated on the continent for its amylaceous tubers. The tubers are sometimes called *Dutch mice*; in Germany, they are known as *earth-nuts*. The herbage of the plant is relished by cattle.

LATIMER, HUGH, one of the most distinguished of the English reformers, was b. at Thurcaston, in Leicestershire, in the year 1490 or 1491. He was educated at Cambridge, and after a brief period of zealous devotion to the papacy ("I was as obstinate a papist," he says, "as any in England"), he became attached to the new learning and divinity which had begun to establish themselves there. He very soon became a zealous preacher of the reformed doctrines. The consequence of this new-born zeal was, that many of the adherents of the old faith were strongly excited against him, and he was embroiled in many controversies.

The dispute about Henry VIII's marriage with Catharine of Aragon brought Latimer more into notice. He was one of the divines appointed by the university of Cambridge to examine as to its lawfulness, and he declared on the king's side. This secured Henry's favor, and he was appointed one of his chaplains, and received a living in Wiltshire. In 1535 he was appointed bishop of Worcester; and at the opening of convocation on June 9, 1536, he preached two very powerful and impressive sermons, urging the necessity of reform. After a while, the work of reform rather retrograded than advanced, and Latimer found himself with his bold opinions in little favor at court. He retired to his diocese, and labored there in a continual round of "teaching, preaching, exhorting, writing, correcting, and reforming, either as his ability would serve, or the time would bear." This was his true function. He was an eminently practical reformer. During the close of Henry's reign, and when the reactionary party, headed by Gardiner and Bonner, were in the ascendant, Latimer lived in great privacy. He was looked upon with jealousy, and closely watched, and finally, on coming up to London for medical advice, he was brought before the privy council, and cast into the Tower.

On the accession of Edward VI. he again appeared in public. He declined, however, to resume his episcopal functions, although his old bishopric was offered to him at

the instance of the house of commons. He devoted himself to preaching and practical works of benevolence. The pulpit was his great power, and by his stirring and homely sermons, he did much to rouse a spirit of religious earnestness throughout the country. At length, with the lamented death of Edward, he and other reformers were arrested in their career of activity. Latimer was put in prison, and examined at Oxford in 1554. After his examination, he was transferred to the common jail there, where he lay for more than a year, feeble, sickly, and worn out with his hardships. Death would not have long spared the old man, but his enemies would not wait for the natural termination of his life. In Sept., 1555, he was summoned before certain commissioners, appointed to sit in judgment upon him and Ridley; and after an ignominious trial, he was condemned to be burned. He suffered along with Ridley "without Bocardo Gate," opposite Balliol college, on Oct. 16, 1555, exclaiming to his companion: "Be of good comfort, master Ridley, and play the man: we shall this day light such a candle, by God's grace, in England, as I trust shall never be put out."

Latimer's character presents a combination of many noble and disinterested qualities. He was brave, honest, devoted, and energetic, homely and popular, yet free from all violence; a martyr and hero, yet a plain, simple-hearted, and unpretending man. Humor and cheerfulness, manly sense and direct evangelical fervor, distinguish his sermons and his life, and make them alike interesting and admirable.

Latimer's sermons were reprinted at London, 2 vols., 1825. The latest edition is by Rev. G. Corrie, 4 vols., 1845.—See Tulloch's *Leaders of the Reformation* (1859); and *Latimer*, a biography, by Demaus (1869).

LATIN CHURCH. The Christian church having been disrupted in the 9th c. the two divisions were called the eastern and western, or Greek and Latin churches, the term Latin having reference to the section which recognized the Roman pontiff as its governing head, and whose services were conducted in the Latin language. See **ROMAN CATHOLIC CHURCH**.

LATIN CROSS, a cross with the lower limb considerably longer than the other three.

LATIN EMPIRE, the name given to that portion of the Byzantine empire which was seized in 1204 by the crusaders, who made Constantinople their capital. It was overthrown by the Greeks in 1261. See **BYZANTINE EMPIRE**.

LATINI, an Italian people, who in prehistoric times had established themselves on the lower part of the Tiber and the Anio, between the sea and the nearest Apennines. The limits of their territory (**LATIUM**) cannot, however, be fixed with precision. The Latini had the Volsci for neighbors on the s., the Æqui and Hernici on the e., and the Sabines on the n.; but after the subjugation of these tribes by the Romans, the name of Latium was given to the whole of the conquered districts.

LATINI, BRUNETTO, 1230-94; b. Italy; son of Bonaccorso. Exiled in 1260 on account of his devotion to the cause of the Guelphs, of whom he was the leader, he took up his residence in Paris as teacher of belles-lettres, remaining there many years. In 1284 he held the office of syndic in Florence, whence he had returned in the change of dynasty, and became the tutor of Dante. He is celebrated as an orator, and poet. His portrait is one of the four which decorate the tomb of Dante, being set in a medallion in the cupola. In 1253 he published *Tesoretto*, a didactic poem, and subsequently *Libro du Trésor*, a compilation in French, containing extracts from classical history, philosophy, and rhetoric; in the first part mention is made of the use of the mariner's compass. Italian translations of this work were published in 1474 and 1824. Previous to 1863 his manuscripts were published by F. A. P. Chabaille in his *Documents Inédits de L'Histoire de France*. In 1855 *Libro du Trésor* was published in Paris at the public expense. He was buried in the church of Santa Maria Novella at Florence.

LATIN LANGUAGE. The Latin language derives its name from the Latini, a people inhabiting the plain of Latium (q.v.). As late as the 3d century B.C., its range as a vernacular was still practically limited to the plains bounded by the Tiber and the Liris. It is a member of that great family of languages known as the Indo-European, Indo-Germanic or Aryan (better Arian). The pro-ethnic language, or *ursprache*, from which the various members of this family are originally derived, is long since dead. The historic record also of the various individual developments begins, says Brugmann, at very different periods. E.g., the Indian development is known to us from about the year 1500 B.C., the Latin from about 300 B.C. Some developments have perished utterly. Others have left traces so meagre that no grammar of them is possible. Such are the Phrygian, Macedonian, Messapian, Gallic and Burgundian.

Those developments or groups of languages which have come down to us with a supply of material comparatively abundant may be arranged in two main divisions: an Asiatic branch and a European branch. The former comprises (1) the Indian family, (2) the Iranian or Persian group. The latter includes Armenian (connected with the European branch by the possession of the vowel *e*, which in the other Asiatic languages was confused with *a*), Hellenic, Italic, Celtic, Germanic or Teutonic, Baltic or Lettic, Slavonic, Albanian.

Of these different groups the Italic is that with which we are here chiefly concerned. Of

the languages spoken in the peninsula of Italy, the Iapygian or Messapian in the extreme southeast, the Ligurian in the north, and the Etrurian in the west and northwest are so little known that it is impossible to say with any certainty to what stock they belonged. The remaining languages of the peninsula constitute two principal divisions, the Latin and the Umbro-Oscan (Umbro-Sabellian, Umbro-Samnitic). The second of these embraces the Umbrian, spoken in the east or north midlands of Italy, the Oscan, spoken in the south midlands, and the dialects of central Italy (some of them only variations of Oscan), namely, Volscian, Picentine, Sabine, Marsian, Æquiculan, Vestinian, and Marrucinian. The dialect of Falerii in southern Etruria was perhaps Oscan, but closely akin to the Latin.

These dialects are known to a limited extent through inscriptions, and through words quoted by Roman writers. We are best acquainted with Umbrian, through the Eugubine tables, discovered at Gubbio (*Iguvium*) in the 15th century (Bréal, *Les Tables Eugubines*, Paris, 1875; Bücheler, *Umbria*, Bonn, 1883), and with Oscan, which is represented by about 200 inscriptions. Of these the *Tabula Bantina*, containing the Roman laws for the town of Bantia, and discovered in 1793, is perhaps the most important (Zvetaieff, *Sylloge inscriptionum Oscanarum*, Petersburg, 1878, cited by Brugmann). (For the rest, of which we have only very scant remains, consult Zvetaieff, *Inscriptiones Italiae Medie dialecticae*, Leipsic, 1884, cited by the same.)

All these dialects were pushed aside and obscured at an early period by the Latin.

The question of the relation of the Italic languages to other Indo-European groups has not yet been satisfactorily answered. The opinion has been prevalent that the closest connection was with the Greek, the next being with the Celtic, a theory urged by Mommsen. On the other hand, Professor Nettleship, in an essay on early Italian civilization (*Lectures and Essays*, Oxford, 1885), discusses some of the evidence afforded by the Latin language in regard to the migrations of the Greeks and Italians into southern Europe, and concludes that the affinities of the Italians were stronger with the northern and western (Celtic) branches of the Indo-European family than with the Hellenes.

But the close relation of the Latin with the Umbro-Oscan group is without question. It has been aptly remarked by Mommsen that while the Italian language held an independent position by the side of the Greek, the Latin dialect within it bore a relation to the Umbro-Samnite somewhat similar to that which the Ionic dialect bore to the Doric, and that the differences of the Oscan and Umbrian and kindred dialects may be compared to the differences between the Dorism of Sicily and the Dorism of Sparta.

Among the points which distinguish the Umbro-Oscan dialects from Latin are the use of *p* (Umbrian and Oscan) for the hard velar guttural *qu*, as *pis* for *quis*, *pam* for *quam*; the frequent occurrence of *r* (Umbrian) instead of *s* (Roman) between vowels (*eru*, *erom*=*esse*); the employment of double consonants (Oscan) where the old Latin (and Umbrian) had but one; the termination *s* in the genitive singular and nominative plural of the A and O declensions (Umbrian and Oscan); the maintenance of the locative (Umbrian) which the Latin endeavored to discard; the termination *d*, found in the ablative singular, in imperatives and in adverbs (Oscan); a tendency to weaken or drop the final syllable which in classical Latin was preserved, e.g., Umb. *Katel-Catulus*—a tendency exhibited by the vulgar Latin also, and by the Romance languages; and the preservation of the sigmatic future, e.g. in *beniest* (*veniet*), *habiest* (*habebit*), etc. Again, the old Latin alphabet was taken from the Dorian alphabet of Cumæ; the Oscan and Umbrian were derived from the Etruscan. Cf. King and Cookson (S. and I., ch. II.); Mommsen (*Hist. of Rome*, vol. 1, bk. I., ch. 2), *et al.*

But of all the members of the Italic group, Latin alone, so far as we know, attained the rank of a literary language, and, owing in part to Roman conquests, extended itself not only over all Italy, but over Africa and all western Europe, where it still holds ground, as it were, in the form of the Romance tongues.

Three stages or states of development are distinguishable in the history of the Latin language. The first is anterior to the beginning of literary culture, and may be termed the archaic stage. This period may be regarded as continuing to the time of Ennius (239 B.C.). Its monuments consist in the main of inscriptions. Some isolated forms have been preserved by the grammarians, and a few characteristic tendencies are revealed by the early dramatists. Perhaps the most ancient relic of this time is the very obscure Duenos inscription discovered in 1880, in the valley between the Quirinal and Viminal Hills, the date of which is conjectured to be as early as 300 B.C. Other monuments are the very ancient *Carmina Saliaria* preserved by Varro (*De Ling. Lat.* VII., 26, 27); the *Carmen Fratrum Arvalium*, dating from the time of the kings, and engraved on a bronze tablet which was dug up in 1778 on the very site of the grove of the ancient college; the text of the twelve tables (about 450 B.C.) which is known to us in quotations and has not been preserved in its integrity; the *Columna Rostrata*, or column of Duilius (260 B.C.), and the *Scipionum Elogia*, or epitaphs of the Scipios, the earliest of which is perhaps that of L. Cornelius Scipio, son of Barbatus, and consul in 259 B.C. These and many others are given by Wordsworth (*Fragments and Specimens of Early Latin*, Oxford, 1874).

During this early period the language developed almost without extraneous aid or additions. Hence Cicero called the age of the Scipios the age of the true Latinity.

The second stage is that of literary culture. The literary language had now become something separate and apart from the vulgar dialect, the *sermo plebeius*, and its history may be conveniently traced through three distinct periods, namely, the Ante-Classical, the Classical, and the Post-Classical, the middle period being conveniently subdivided into the Golden Age and the Silver Age.

The first period (240-80 B.C.) includes all the writers from Livius Andronicus to Lucilius (d. 103), and is rendered conspicuous by such names as Nævius, Plautus, Ennius, Cato, Terentius, Pacuvius, and Attius, whose language is characterized not only by the frequent use of archaic forms and expressions, but by a servile imitation of Greek models. The Romans had been brought by conquest into close contact with the Greek cities of southern Italy and Sicily, Macedonia and Achaia, and Greek literature had become a subject of study and imitation. This imitative tendency, however, is combined with great originality and vigor in Plautus, and unlimited freedom of thought and expression in Lucilius.

The Golden Age (80 B.C.-17 A.D.) is ushered in, as it were, by Varro and Cicero, and may be said to come to an end with the death of Livy. The writings of Lucretius, Cæsar, Catullus, Sallust, Vergil, Horace, Propertius, Tibullus, and Ovid lend lustre to this interval, and exhibit the literary language in its fullest maturity, its most perfect stage. The standard of prose was set by Cicero and Cæsar, that of poetic art by Vergil. To Cicero in particular the language of prose owed that elaboration and finish which have rendered it a standard of perfection in style for all time, and evoked the gratitude of his countrymen toward the man who alone among prose-writers had brought to light the utmost capacities of Roman speech. His diction is an exemplification of the true Roman *urbanitas*, and a protest against the intrusion of the *sermo plebeius*. But the changes wrought by Vergil are more marked even than those which Cicero accomplished, and his language became the norm in poetry, departures from which were accounted irregularities.

Meanwhile the speech of ordinary life may be traced in such writings, of minor character, as the accounts of the African and Spanish wars appended to Cæsar's commentaries, Book VIII. of the *De Bello Gallico*, and the story of the *Bellum Alexandrinum*. To these add many of the letters of Cicero, the *Sermones* of Horace, the writings of Vitruvius, Pompeian inscriptions, and the Satyricon of Petronius, a work remarkable for the number of examples it affords of the *sermo cotidianus* in use among all sorts and conditions of men both at Rome and in the provinces.

The Silver Age (17-180 A.D.) is marked by the gradual disappearance from literature of simplicity and directness of expression, and a constant striving after effect by means of rhetorical elaboration and ornament, defects which are not glaring in writers of the first fifty years after the accession of Tiberius, although sufficiently conspicuous in the authors of Nero's age. The Silver Latinity is most thoroughly represented in the writings of Tacitus. His style and diction are typical, and present this stage of the language in the best as well as the truest light.

But the language, like the empire itself, was on the decline. The African Latinity of the time of Hadrian (117 A.D.) shows a great falling off in refinement and general quality, when compared with the Spanish Latinity of the preceding century. Affected archaisms, wearisome repetitions, and Græcisms are especially noticeable, as well as numberless newly created forms and extensive draughts on the plebeian dialect, all of which mark an extreme departure from classical usage.

The death of Fronto (170 A.D.) may be conveniently assigned as the close of the classical period. The post-classical period is commensurate with the third and last stage in the history of the Latin tongue—the stage which exhibits the popular speech (which since the time of Plautus had entered as an insignificant factor into literary expression) as reappearing in literature and as developing into the languages of the Romance period. Thus the literary language itself was impoverished and disorganized, for its approximation to the vulgar Latin could no longer be checked even by Claudian and other poets of the revival.

This state of things was due in no small measure to the influence of Tertullian and the other fathers of the Christian church, who introduced the barbarisms of the people into their religious writings. The transformation begun in the second century was completed in the fifth. The events which mainly conduced to it were the transplanting of the seat of the empire to Constantinople and the invasions of the barbarians. In the East secular literature again found an organ in the Greek language; in the West the Latin language was flooded with foreign forms and idioms through the inroads of the Lombards, Goths and Vandals. In this condition it was termed the *lingua Romana*, and distinguished from the *lingua Latina* which was cultivated only by the learned.

From the *lingua Romana* sprung the eight so-called Romance tongues of modern Europe: Portuguese, Spanish, Catalan (in north Spain and Roussillon), Provençal, French, Italian, Rhetoromantic (in the Tyrol, Engadine, etc.), and Roumanian or Wallachian. As perpetuated by Christianity, the Latin language continued to live, though in a state of deterioration, long after the total dismemberment of the Roman empire. It remained, in fact, the ecclesiastical, political and official language of Europe for centuries.

[For information on the subject of Latin pronunciation the reader is referred to Pro-

fessor H. T. Peck's convenient and trustworthy manual, and the bibliography there given.]

In the matter of spelling much irregularity prevailed at all times. There was frequent conflict between sound and etymology. Hence such variations as *imperium*, *imperiū*; *atque*, *adque*, and the like. Between such conflicting forms the best writers were unable to decide. But much light has been let in upon this somewhat obscure subject by the labors of such scholars as Brambach, Ritschl, Corssen, Ellis, Lachmann and Munro.

In addition to the authorities already mentioned, the following are recommended for reference: Ludwig, *De Petronii Sermone Plebeio* (1869); Rönsch, *Italia und Vulgata* (1869); Stinner, *De eo quo Cicero in Epistulis usus est sermone* (1879); Wölflin, *Ueber die Latinität des Africanus Cassius Felix* (1880); Landgraf, *De Sermone Cotidiano in Ciceronis Epistulis* (1884); Köhler, *De Auctorum Belli Africani et Belli Hispaniensis Latinitate* (1877); Crain, *Plautinische Studien* (1858); Allen, *Early Latin* (1884); Taylor, *Etruscan Researches* (1874); Corssen, *Ueber die Sprache der Etrusk.* (1874); Hallam, *Introduct. to the Lit. of Europe* (1854); Dräger, *Syntaxis Priscorum Latinorum*; Ritschl, *Monumenta Epigraphica* (1881); Wilser, *Die Herkunft der Deutschen* (1880); Bücheler, *Grundriss der lateinischen Declination* (1879); Wölflin, *Archiv für lateinische Lexicographie und Grammatik* (1884); Buchholz, *Præce Latinitatis Origines*; Mommsen, *Die unteritalischen Dialekte* (1850); La Grasserie, *Les Divisions de la Linguistique* (1888); Pauli, *Altitalische Studien* (1883); Diez, *Grammaire des Langues Romaines*, and Lindsay, *The Latin Language* (1894).

LATIN LITERATURE. It would be impossible, within reasonable limits to give anything like an adequate account of the origin and growth of Roman literature. Nor would a bare enumeration of authors and their works, even if confined to a list of extant writings, be feasible within the prescribed space, or profitable reading if it were feasible. The best that can be done is to make brief mention of the more prominent writers, beginning with the earliest and continuing to the close of the Silver Age, and to add such spare criticism of their works as may lead to some estimate, on the part of the reader, of the actual merits of the authors themselves and their relative importance in the literature. To this a few observations on the beginnings of the literature will be prefixed.

Rome can scarcely be said to have had any literature before the time of the first Punic War (B.C. 264-241). The yearly registers of magistrates, the sacred hymns, books of ritual, treaties with other states, the laws of the XII Tables, certain meagre notices known as the *Annales Maximi*, and formulas of various kinds, together with a few speeches like that of Ap. Claudius Cæcus (280 B.C.) against Pyrrhus, and probably the funeral orations of some of the prominent families of the state, make up the sum and substance of what was regularly and consistently committed to writing in Rome at this early period. The scanty notices of a primitive ballad literature, which have given rise to a theory of an early Roman epos analogous to the Homeric poems, are insufficient to warrant us in crediting such an hypothesis. Extemporaneous effusions like the Fescennine verses, of a semi-dramatic character, were probably not committed to writing at all until a very much later period. The same is to be said of the *saturæ* (medleys), which were at first only merry farces of an impromptu nature, although they contained the germ of that plant of native growth, the *Satura*, afterwards developed into pure poetic satire in Lucilius, Horace, Persius, and Juvenal. The *mime* also and the *fabulæ Atellanæ* must have existed from very remote times in Italy, and were undoubtedly at first purely extemporaneous. The metre employed in most of these semi-literary products was the Saturnian, which Niebuhr and Macaulay consider to be of purely Italian origin. But Bentley has shown (Ep. Phal. XI) that, like all other metres, it was at least known to the Greeks. Examples of it are the fragments of Nævius and Livius Andronicus and the Scipionic epitaphs. The underlying principle is a succession of six trochaic beats, preceded by a single syllable, the beat (*ictus*) having nothing to do with quantity.

Two other elements in the early Roman civilization contributed to the development of a literature. These were forensic eloquence and jurisprudence. The first was the natural result of active participation in public affairs, to which the Roman was trained from his youth. The second was the simple and unalloyed product of Roman thought and genius. The early practice of extemporaneous speaking and the rapid progress of judicial knowledge lent an impulse to the growth of a prose literature, which, though at first retarded by the custom of recording speeches and legal decisions merely in the bare form of registers, was subsequently developed under Greek influence into a great and enduring monument.

Five periods of Roman literature may be conveniently distinguished:

- I. The Archaic Period: from Livius Andronicus to Cicero: 240 to about 80 B.C.
- II. The Ciceronian Period: from 80 to 42 B.C.
- III. The Augustan Period: from 42 B.C. to 14 A.D.
- II. and III.—The Golden Age.
- IV. The Silver Age: from 14 A.D. to the accession of Hadrian, 117 A.D. (or better, the death of Juvenal, about 130 A.D.)
- V. The Period of Positive Decline: to the 6th century.

First Period: From 240 to about 80 B.C. The first awakener of literary effort at Rome was Livius Andronicus, a Greek captive, brought to Rome after the taking of Tarentum in B.C. 272, and employed in teaching Greek in the family of his master, who

was probably M. Livius Salinator. After his manumission he opened a school, and, being at a loss for books in the vernacular, translated the *Odyssey* into Saturnian verse. Fragments of this version survive. But this was not his first literary attempt. In the year following the close of the first Punic war (240) he had ventured (Livy, VII. 2.) upon the exhibition of a play with a regular plot, which was intended to take the place of the *Satura* hitherto in vogue. The venture was successful. We have the names of ten of his tragedies—all translations from the Greek. Like his *Odyssey*, they were written to supply a popular want and were wholly lacking in literary merit.

After Livius came Cn. Nævius (? 269–204 B.C.), a poet whose genius determined the ultimate character of the regular drama. He adapted both tragedies and comedies from the Greek, but preferred the latter, to which he gave a political and satiric turn, after the manner of the Aristophanic Comedy. His comedies, like those of Plautus, were *palliatae*. The *fabula prætecta* is said to owe its origin to his inventive genius, two specimens of which species of drama have reached us in name merely—*Clastidium*, celebrating the success of Marcellus in 225 B.C. over the Gauls, and *Alimonium Romuli et Remi*, the latter a most genuinely national theme. But of most interest to us is his long Saturnian poem on the first Punic war, in which he gave shape to the story of the settlement of Æneas in Latium, after his visit to Carthage, and related in detail the events of the great conflict in which he had himself taken an active part. Only a few fragments of this poem remain. Nævius was popular for centuries after his death and was highly appreciated by Cicero (Brut. 19. 75).

A younger contemporary of Nævius was T. Maccius Plautus (254–184 B.C.). While our opinion of Roman tragedy is based on the testimony of ancient authors, our estimate of Roman comedy is formed from the plays themselves of the two great masters of this department of poetry, Plautus and Terence. The former was undoubtedly the greatest comic and dramatic genius of Rome. His plays are *palliatae*; that is, their entire surroundings are Greek. Now the temperament of a Roman audience lent itself far more readily to the rough jokes and coarse banter of the Aristophanic comedy than to the more refined style and gentler satire of such dramatists as Philemon and Menander. But in Rome the censorship of the Senate would have fallen at once upon a playwright who should introduce upon the stage anything resembling the virulent attacks upon the characters and motives of public men, which were characteristic of the Old Comedy at Athens. Plautus, who wrote to please the people, succeeded in solving the problem by a skillful and happy mingling of the two elements. Of the 130 comedies ascribed to Plautus, only 21 were thought by Varro to be genuine. The Varronian list has descended to us entire with the exception of the *Vidularia* which was lost in the Middle Ages.

But a new spirit was creeping over the Italian Camenae in the time of Plautus. Thus far the sole purpose of Roman literature had been to amuse. It now began to assume that dignity and earnestness of purpose which constitute so important and distinctive a feature of the writings of the best period. Moreover, it gradually ceased to be in sympathy with the popular taste, and sought rather to express the sentiments and aspirations of the aristocratic and governing class. This spirit was apparent to a limited degree in Cæcilius Statius (? 219–166 B.C.), who began to write plays when Plautus was at the zenith of his fame. His treatment of his Greek originals resembled the method of Terence more closely than that of Plautus. The latter sought to be amusing by a deliberate confusion of Greek and Roman manners. Cæcilius attained the same end, though in less degree, rather by the legitimate means of character and incident. He is known to us only by fragments, of which the most extensive are preserved by Aulus Gellius. His reputation must have been considerable in his later years, for it was through his influence that Terence secured an introduction to the Ædiles and an opportunity of exhibiting his first play, the *Andria*. The story of the first meeting of the two dramatists is told by Suetonius.

It is easier to form an estimate of the merits of P. Terentius Afer (185–159 B.C.) than of those of either of his predecessors, for we have his work exactly as he left it, the six extant dramas being all that he adapted to the stage. He is, however, credited with the composition of ninety plays, mainly translations from the Greek. The favorable judgment of Cæcilius was ratified by succeeding generations. His Latin is pure and idiomatic, his style formed and his views of life mature. Yet he was a Carthaginian by birth, had been the slave of Terentius Lucanus, and could not have been more than 21 years old when the *Andria* was presented at the Megalesian games in B.C. 166. Comparing him with his predecessors we see a gain in literary refinement, but a loss in literary freedom. He adhered more closely to his Greek models than Plautus, and wrote to please, not the people, but a select circle of friends, among whom were Furius and Lælius and Scipio Africanus the younger. The Scipionic circle of litterati were imbued with a genuine appreciation of what was most striking and excellent in Greek thought, and to this taste Terence catered. It was natural therefore that his influence should not have been great with the public of his day. But it increased after his death, chiefly through the reading of his plays, and when Cicero and Cæsar took up the study of the Latin language as a fine art, Terence became generally popular. His language is favorably compared by Munro with that of Cicero, Cæsar and Lucretius.

Another species of literary comedy had taken its start in the country towns and maintained a certain antagonism with the Græcised comedy at Rome. It soon found

its way to the city, however, where its chief representative was L. Afranius, who flourished about a generation later than Terence. This was the *comœdia togata*, so called because the characters were Latin and wore the Roman dress. But the transfer of the scenes from Greek towns to Latin towns did not imply a total abandonment of all dependence on Greek comedy. Terence had worked on the common element in Greek and Latin life with Greek characters. Afranius did the same with Latin characters. But since these were always taken from the lower orders, the way was being gradually prepared for the almost total abandonment of the stage to the *Mimi* and the *Atellane*, and the consequent lowering of the dramatic art.

Meantime tragedy was not without its admirers. As the Italian talent for buffoonery might have given rise to a national comedy, so the deeper feelings of the Romans, which found expression in rhetoric and oratory, might have produced a native and home-sprung tragic drama. But what happened in Greece did not take place in Rome. Rome borrowed her tragedy as well as her comedy from Athens. Drama thus transplanted lacked its original sources of inspiration, patriotism and the national religion. Nevertheless it secured and retained for many generations a strong hold on the Roman mind. This was largely owing to the good judgment of the men who introduced it. Instead of drawing extensively upon Æschylus and Sophocles for their material, poets preëminently national and religious, they made Euripides the main source of their inspiration. Tragedy with him was broad, many-sided, cosmopolitan, free. As Menander denationalized Greek comedy and rendered it capable of transmission to a foreign soil, so Euripides modified the character of the drama of his predecessors and rendered it suitable for imitation in a foreign tongue.

Now, although both Livius and Nævius had transplanted tragedies from the Greek, it was Quintus Ennius (239-169 B.C.) who first lent the powers of a brilliant imagination to this kind of composition, and conceived for it a definite aim and purpose. By animating the early heroes of Greece with the ideal virtue and sagacity of Roman soldiers and senators, he sought to elevate the morals and refine the taste of his countrymen, and this spirit of moral elevation which he breathed into tragedy had an enduring effect on the ethical and didactic writings of succeeding generations. His *Annales* and *Saturæ* will be considered later. Only fragments of his works have reached us.

The tragedy of Ennius was continued by his sister's son M. Pacuvius (219-129 B.C.), who wrote much less than his uncle. Twelve tragedies, one *protexta* and a few *saturæ* are all we know of his having composed in a period of thirty years. But his plays were popular and his reputation great. The fragments and notices of him are insufficient to enable us to determine wherein consisted his alleged superiority to Ennius; but he must have refined upon the latter, for his fame and authority are acknowledged to have been due to the care with which he elaborated his writings. He was the smoothest in his metres of the classical tragedians.

His successor in the field of tragedy was L. Attius (170-94 B.C.), who wrote thirty-seven plays, a history of Greek and Roman poetry called *Didascalica*, *Annales*, and other works. The fragments of Attius contain much noble sentiment and should obtain for him a place equal to that of Pacuvius, in our estimation. His style is marked by such old-fashioned ornament as assonance, alliteration, plays upon words and archaic forms. These peculiarities connect him very closely with the age of Ennius, although in point of time he is but little anterior to Cicero. He may be regarded as forming the connecting link between the anti-classical and Ciceronian periods. With him died this early and better kind of tragic writing at Rome, for, although old works were for some time kept alive by excellent actors like Æsopus and Roscius, yet new ones like the tragedies of Varius and Pollio in the Augustan age, and those of Seneca in Imperial times, became ever increasingly tainted with rhetorical and declamatory ornament, until the true aim and end of dramatic writing, the delineation of character, was utterly lost to view.

But let us retrace our steps for a moment and glance at the epic poetry of this early period as it is exemplified in the Annals of Ennius. This was a record of Rome's entire career from the earliest traditions down to 172 B. C. It was the author's greatest work and won for him endless fame. The idea which inspired Ennius had previously inspired Nævius and subsequently quickened the creative mind of Vergil. But Nævius had shown better judgment than Ennius in limiting his subject to the single episode of the Punic war, while Ennius endeavored to give epic unity to the entire history of the nation. Yet this very endeavor, though a mistake from an artistic standpoint, proved eminently successful where the popularity of the author was concerned, for Ennius succeeded in touching a chord in the nation's heart which responded readily to his theme. He seems to have been satisfied with his work. The fragments are sufficient to cause decided regret for the loss of the poem as a whole.

But there is another work of Ennius that requires mention, namely, the *Saturæ*, presumably six in number. Unlike the early farce of the same name, the *saturæ* was addressed to a reading public, and was the immediate forerunner of the satirical compositions of Lucilius. It was written in a variety of metres and touched upon a variety of subjects, its scope being commensurate with, if not exceeding, the entire range of the Satires and Epistles of Horace and the Fables of Phædrus. It was mainly the non-dramatic character of the *saturæ* of Ennius that distinguished them from the *δράμα*

σατυρικόν of the Greeks, and justifies the Roman claim to originality in this branch of literature. Ennius was honored by his countrymen with the title of "the father of Roman poetry." His works were read throughout the Middle Ages and were only lost as late as the 13th century.

But it was C. Lucilius (? 166–103 B.C.) who so defined the scope and application of the *satira* as to deserve the sobriquet of "father of Roman satire." Satire in the modern sense of the word, and as we find it more or less exemplified in the pages of Horace and Juvenal, may justly be regarded as owing its first true development to Lucilius. The particular direction which he gave to it was that of a systematic criticism of literature and life, which often took the form of parody. Nothing escaped him. Politics, morals, society, all things sacred and profane came in for their share of treatment. Even his own life and personality were laid bare to his readers. His satires filled thirty books. The dominant metre was the hexameter. In this he differed from Ennius whose *satiræ* mingled trochaics, hexameters and iambs indifferently, and from Varro, who wrote his Mennippean satires in both prose and verse. On the whole he used his powers on the side of patriotism and virtue. Both Horace (Sat. 2. 1. 69) and Juvenal (1. 165) testify to his worth, though the former cannot shut his eyes to his evident faults (Sat. 1. 10). The loss of his works is without doubt a serious one.

Although poetry made its appearance before prose in Rome's case as in that of other nations, yet the utilitarian genius of her people was naturally more productive of great prose writers than of poets. The first kind of prose literature to establish itself was history. The underlying principle in Roman history was not to treat actions and events in relation to their causes or their general human interest, but as incidents showing the continuity and progress of the Roman commonwealth. Truth was not recorded for its own sake, but for the sake of the national pride and from considerations of utility. Hence the Roman conception of history was a narrow one, and this narrowness is perceptible throughout the entire range of Roman historical literature.

In the earliest times the nearest approach to history were the notes and records kept by the pontifices and the civil magistrates, already alluded to, and other registers of events, names, treaties and the like. But, although Nævius afterwards chronicled the events of the first Punic war, and Ennius composed his *Annals*, yet the first two Roman historians, properly so called, were Q. Fabius Pictor and L. Cincius Alimentus. They wrote immediately after the war with Hannibal, and both wrote in Greek. C. Acilius Glabrio (184 B.C.) was a third writer of the same period. Like the others, he began with the foundation of the city, and wrote in Greek. Other writers of history and memoirs of this time, who used the Greek tongue as the vehicle of their thoughts, were Aulus Postumius Albinus, and P. Cornelius Scipio, son of the elder Africanus, and adoptive father of P. Cornelius Scipio Æmilianus.

But the creator of Latin prose writing was M. Porcius Cato (234–149 B.C.), a younger contemporary of Ennius. He strove to give literature a practical and utilitarian bias, and in doing so set himself in opposition to Greek influence, which was making itself felt through the creative and imaginative mind of Ennius. Cato was preëminently a Roman—patriotic, honest, industrious, and of a vigorous understanding. But even his genius was powerless to stem the tide of Greek culture and Greek philosophy which, as he himself correctly foretold, was destined to prove a fatal solvent to the Roman theory of discipline and duty. Yet in spite of his prejudices Cato studied Greek literature in his old age and was heard to express his admiration of Thucydides and Demosthenes.

As an orator Cato wielded an important influence, and won deserved renown. He was the first man after Appius Claudius to publish his speeches. Cicero had seen or heard 150 of them and praises their shrewd wit and acuteness (Sen. 17. 65). A few fragments of them remain. As an historian he was the most original of Roman writers. His *Origines* are evidence of an enlarged view of history and an honest independence in carrying forward research. He enters upon the legendary history of all or most of the Italian states, without endeavoring to magnify Rome, or even his own native town, Tusculum, at the expense of the other nationalities. His truly national spirit was afterwards reflected in Vergil, who seems to have drawn upon the *Origines* for his account of the Trojan immigration into Italy. Only fragments of this treatise survive; but his *De Re Rustica* has reached us in a fair state of preservation. The latter is only a hand-book of cultivation for a particular farm. It is, however, embellished with much practical wisdom and numerous useful maxims and precepts.

Cato's labors were encyclopædic; but his other writings have perished or exist only in detached fragments. Among them were a treatise on eloquence, a volume on the art of war, a partial essay on the principles of jurisprudence, and an essay on conduct, entitled *Carmen de Moribus*. He wrote letters also, and collected ἀποφθεγγματα or pithy sayings, from various sources, which, with his own sayings, were afterwards published under the title of *Catonis Dicta*. The age was one of literary activity and produced a very considerable number of annalists besides those already mentioned. But none of them were writers of unusual merit and their names may be passed over in silence.

The department of Latin prose in which the Romans most excelled was oratory. In no country was there a grander or a wider field for public speaking than in Rome. In every sphere of action, whether at home or abroad, it was necessary for the Roman to express his views in clear and vigorous language if he wished to win success. But the

failure, in the early period, regularly to commit speeches to writing after delivery has lost for us most of those examples of strong native eloquence which carried conviction wholly through the "spoken word."

The first published orations of special character and importance were those of Cato, whose eloquence, though rough and rude, was dignified and forceful, and touched upon every department of human life. Among Cato's contemporaries in oratory there were many men of talent and influence, and among his more immediate successors were Scipio Æmilianus and C. Lælius (185-129 B.C.), whose characters have been well summed up by Horace in the well-known verse: *Virtus Scipiadae et mitis sapientia Læli*. The latter was thought to be the wisest statesman of his day.

But the advent of the Gracchi formed an epoch in oratory as well as in history, for their diction was far freer and easier than that of their predecessors. The fame of Tiberius (163-133 B.C.) was obscured by that of his brother Caius, whose most striking characteristic was vehemence. The impassioned character of his delivery is attested by Plutarch and Dio. (Fragments of his speeches are given by Wordsworth). After him there appeared, among many others, two speakers whose advent Cicero regarded as analogous to that of Demosthenes and Hyperides at Athens—M. Antonius (143-87 B.C.) and L. Licinius Crassus (140-91 B.C.). Other orators of the time were the elder Curio, noted for the purity of his Latin, and C. Julius Cæsar the elder, whose speeches were remarkable for their wit and good breeding. But the last name of importance in the very large number of public men whose eloquence adorned the ante-Ciceronian period is that of the epicure Q. Hortensius (114-50). After the death of Antonius he rose at once to be the leader of the Roman bar, and to use Cicero's own expression, was "prince of the courts" when the latter began public life. His style of oratory was the Asiatic, and was marked by a copiousness of expression and richness of ornament exceeding anything that had ever been heard in Rome before. As he advanced in life he became self-indulgent and lacking in sustained effort, and his fame as an orator left him. He was moreover eclipsed by Cicero, who was successively his antagonist, coadjutor and intimate friend.

Of the vast number of speeches delivered in the Roman law courts and assemblies before the appearance of Cicero in the arena of political life, there are but a few fragments left. But mention of their merits is made by Cicero and other ancient writers whose works have reached us. Were it however possible for us to peruse the orations of such men as Cato, Gracchus, Antonius, Crassus, Hortensius, we should behold the Roman character and intellect more vividly portrayed than in any other form of literature.

It was to oratory then that prose composition mainly owed its development, and the growth was constant and ceased not till it culminated in the finished eloquence of Cicero.

Meantime grammar, rhetoric, philosophy and law were not without their devotees; but no work of this period has reached us except the treatise on rhetoric known as *Ad Herennium* (80 B.C.). This was probably from the pen of Cornificius, though for a long time ascribed to Cicero.

The preponderance of the prosaic over the poetic element in Roman literature in the first period was due to the essentially native character of the literature before the social war. The semi-Greeks of the south of Italy had given only an impulse to literary energy, and the nations of central and northern Italy, from whom sprang subsequently most of the higher types of poetical imagination, had not yet been brought into intimate contact with the life and thought of the capital. The social war may be conveniently regarded as dividing the first and second periods of the literature.

Second Period: From 80-42 B.C. This is the first half of the Golden Age, and corresponds with the declining years of the Republic. It is the time when prose reached its highest perfection and poetry took a new and vigorous start. It is the age of Cicero and Cæsar and Sallust, of Lucretius and Catullus. It is the age also when Nepos composed his memoirs and Varro astonished the world with his learning; and it was the age when, for the first time, an intelligent reading public sought systematic relief in books from the cares of business and political life.

The first writer claiming our attention is M. Terentius Varro (116-27 B.C.). The question of his position in Roman literature is a puzzle. He was born ten years before Cicero and died fifteen years after him. There was scarcely a single department of prose or poetry in which he did not excel. Both his industry and versatility were unexampled. But he was deeply conservative and national and recalls the age of Cato rather than that of Cicero. When we compare the diction of his work on husbandry with that of the Georgics of Vergil it seems hardly credible that the two authors should have been writing at the same time. His extant works are the following: (1) About 600 lines of Menippean Satires (*Saturæ Menippææ*). These were a medley of prose and verse, and dealt with a great variety of topics. Though not exactly satires in the modern sense, they are perhaps to be regarded, says Cruttwell, as lineal descendants of the old *saturæ* which existed before any regular literature. The name is taken from that of the Greek Cynic Menippus, whose humorous writings Varro seems to have imitated; (2) A treatise on the Latin language (*De Lingua Latīna*), in twenty-five books of which only V.-X. remain, and those in a mutilated condition; (3) A treatise on hus-

bandry (*De Re Rustica*), already mentioned, which has descended to us entire. This treatise was perhaps the last thing Varro wrote. Yet the style is brisk and shows none of the signs of old age, though the author was in his 81st year. As the work of a man endowed with both practical experience and elegant and varied learning, it must rank above the treatises on the same subject by Cato and Columella.
